Flash collaborations are one-off, brief inter-organizational digitally-enabled collaborations that are growing increasingly popular. Due to the ubiquity of the Internet, potential partners can connect and engage in an encounter to solve a collaborative problem, and then move on independently. This experimental research leverages interactive self-regulatory theory to determine how interactions adjust due to changes in uncertainties during inter-organizational flash collaborations. The participants for the experiment were randomly paired and assigned to three different information-sharing strategies. Our findings found that as differences in information sharing openness between the partners increased, cues gained through situational awareness decreased, leading to a need for complex information-sharing strategies. When information-sharing strategies were unmatched within the partners, benevolent actions were beneficial for successful pairs. Due to even less situational awareness cues available during the mismatch strategy, pairs who reciprocated benevolent actions succeeded. Our findings offer important implications for organizations in determining the best strategy to use during inter-organizational interactions.

Managing Data-Driven Development: An Ethnography of Developing Machine Learning for Recruitment

Author: **Elmira Van Den Broek**; Vrije U. Amsterdam

Author: **Anastasia Sergeeva**; Vrije U. Amsterdam

Author: **Marleen Huysman**; Vrije U. Amsterdam

With the increased pervasiveness of Machine Learning (ML) applications in real-world settings, such as healthcare, criminal justice, and recruitment, scholars have started to call for more attention to how ML systems are actually developed in practice. This study draws on a 23-month ethnography of a scale-up vendor that develops a recruiting application powered by ML and neuroscience to support clients in making hiring decisions. Our in-depth analysis reveals that the development of a real-world ML system is different from conventional information system development (ISD), in that it calls for a shift from eliciting domain expertise to feeding the algorithm, from coding domain expertise to training the algorithm, and from adjusting domain expertise to growing the algorithm. While much of the existing scholarship on ISD has focused on interacting with domain experts in order to transfer their knowledge into the system, we demonstrate that data-driven development, required for ML, calls for managing a triangular relationship between developers, clients (“domain experts”), and the algorithm. The paper contributes to the literature on (data-driven) ISD, work on the construction of algorithmic technologies in practice, and responsible artificial intelligence (AI).

Examining Communication Visibility and Social Technology Platform Use in Organizations

Author: **Jeffrey Treem**; U. of Texas at Austin

Author: **Ward Van Zoonen**; Amsterdam School of Communication Research, U. of Amsterdam

Author: **Anu Sivunen**; U. of Jyväskylä

Organizations are increasingly adopting social technology platforms in an effort to support greater knowledge sharing among workers. Though scholarship has indicated that the use of social technologies can increase multiple forms of communication visibility within organizations, little is known about the nature of these relationships and how visibility may differ based on engagement with different functionalities of platforms. This study examines how different uses of a social technology in a global organization relate to visibility of who knows what (message transparency) and who knows whom (network translucence). Additionally, analysis examines how communication visibility relates to workers’ knowledge sharing intentions and engagement. Findings extend theory by indicating that forms of communication visibility do indeed differ based on whether employees use functionalities that connect communication partners, or interact with communal communication available to third parties.

Tacit Knowledge Sharing: An Integration of Social Capital and Transformative Learning Theories

Author: **Neethu Mohammed**; Department of management studies, Indian Institute of Technology Madras

Author: **T J Kamalanabhan**; Department of management studies, Indian Institute of Technology Madras

Tacit knowledge ingrained in individual brains can be shared and applied efficiently only with the active involvement and cooperation of the knowledge source and recipient. Since tacit knowledge sharing

The management of complex data initiatives has raised much attention in the research and practice of smart cities. Of particular interest is understanding how city authorities can manage the resource transfer and coordination of activities to successfully underpin initiatives like open data, smart devices, planning analytics and other data-intensive applications. However, research on how capabilities can be developed at the city data level as an aggregated unit of analysis remains scarce. Our paper develops a process study of capability development in smart city data ecosystems by drawing on a case study of London's city data. The study focuses on two key entities within London's smart city environment: the London Datastore (2010-2019) and the City Analytics Programme (2016-2019). The analysis discusses the evolutionary phases of each entity characterised by key actors, level of coordination and prominent mechanisms of capability development. Further to extending our theoretical understanding of capability development within an ecosystem context, insights from the paper are of value to city authorities considering how to scale up and integrate local data projects.

Image Analytics: A Consolidation of Visual Feature Extraction Methods

Author: **Xiaohui Liu**; Antai College of Economics and Management, Shanghai Jiao Tong U.

Author: **Yijing Li**; UNSW Sydney

Author: **Fei Liu**; Copenhagen Business School

Author: **Eric.T.K. Lim**; UNSW Sydney

Author: **Chee-wee Tan**; Copenhagen Business School

Revolutionary advances in computer vision and deep learning have dramatically expanded our opportunities to decipher the merits of images in the business world. Though prior research on computer vision has yielded a myriad of approaches to extract core attributes from images, the esotericism of the advocated techniques hinders scholars from delving into the role of visuals in driving business performance. Consequently, this tutorial aims to consolidate resources of visual features' extraction tactics that employ both conventional machine learning and deep learning

is not mandated by organizations, employees often view it as a time consuming activity. This turns out to be a potential hindrance to workplace learning and hence, identifying factors that drive employees to voluntarily engage in tacit knowledge-sharing constitutes an important research area. This study aims to empirically examine how the perception of social capital in work teams motivates individuals to voluntarily engage in tacit knowledge sharing with teammates, and the subsequent impact on individual creative performance. Questionnaire-based survey was employed and data was collected from 440 professionals working in the Information Technology industry. Structural equation modeling using AMOS 22 was used for hypothesis testing. As per the findings of the study, all social capital dimensions, except shared language and shared language, demonstrate a significant positive influence on tacit knowledge contribution and knowledge seeking behavior of employees. The results also provide evidence that point to a significant positive relationship between tacit knowledge contribution, tacit knowledge seeking and creative performance of employees. Furthermore, the moderating role of bisociative cognitive style of individuals on the association between tacit knowledge sharing behavior and creative performance is confirmed.

The Role of Organizational Foci and Physical Proximity in Scientific Collaboration

Author: **Jonathon N. Cummings**; Duke U.

Author: **Bryan Stephens**; Duke U.

This paper examines how organizational foci (i.e., shared affiliations within an institution), disciplinary diversity, and physical proximity shape scientific collaboration and research outcomes. We examine scientific collaboration (via publication co-authorship) among 1138 biomedical faculty members over a 10-year period at a medical school in the United States. We use archival data to measure organizational foci (shared institutional affiliations at the medical school such as secondary appointments and center/institute membership), physical proximity (walking distance among collaborators), and disciplinary diversity (different

models. We describe resources and techniques based on three visual feature extraction methods, namely calculation-, recognition-, and simulation-based method. Additionally, practical examples are provided to illustrate how image features can be accessed via python and open sourced packages such as OpenCV and TensorFlow.

departments). Modeling both the dyadic and team level of analysis, we find that collaborations are more likely to form and persist among faculty with more overlapping organizational foci, and this association is moderated by the physical proximity of collaborators. We also find the positive influence of team disciplinary diversity on publication impact is significantly reduced as the physical proximity among collaborators is reduced. These results support the idea that organizational foci and physical proximity, which can lower the cost of interaction, can alleviate some of the coordination issues that can arise with higher team diversity. We discuss the implications for future research on team science, managerial practice regarding office space allocation, and strategic planning of initiatives aimed at promoting interdisciplinary collaboration.

Opening up the Black Box of Technology When Studying Organizations and People (session 947)

The 2020 All-AOM conference theme is Broadening our Sight. Because work and organizations are now almost entirely dependent on technology, the 2020 theme suggests that management scholarship could profitably broaden its sight on the study of technology, organization, and management.

Technology is difficult for management scholars to study because of its strong engineering undertones, variability, uncertainty about the proper mid-range theories to consider, as well as questions concerning how to study technology so that its incorporation into management scholarship does not divert scholars from examining their core interests. The panelists in this proposal are noted scholars on the study of technology in management scholarship. Together, their insights offer a way to study technology so that any scholar's interest area can be broadened and enriched. As is often the case, we are proposing that by looking back at the roots of studying technology and socio-technical systems, we

Opening the Black Box of Team Adaptation

ODC Division Best Paper Finalist

Author: **Eleni Georganta**; TUM School of Management, Technical U. of Munich

Author: **Felix Claus Brodbeck**; Ludwig Maximilian U. of Munich (LMU)

The interest in team adaptation has continuously increased for both research and organizations. However, whether team experience collected by adapting to prior nonroutine events supports teams to adjust their processes and cognition to later nonroutine events and to perform successfully, remains unclear. Building on theories of team adaptation, we explore the team adaptation process as a whole, the role of updated Transactive Memory System (TMS) under nonroutine conditions and extend their scope towards team adaptation experience (input) and team performance (outcome). Using a between-subjects design, we manipulate team adaptation experience on a

can produce new understandings of how to move forward in broadening our sight.

sample of 72 teams (288 individuals) completing a team task over four consecutive rounds. In the present laboratory experiment, we test the relations between team adaptation experience, team adaptation process, TMS updating and team performance under nonroutine conditions. The results indicate that team adaptation experience supports TMS updating but not the team adaptation process and team performance. Supporting hitherto theoretical suggestions, findings show that the team adaptation process is positively related to team performance. Results also indicate that the team adaptation process and TMS updating vary with team adaptation experience, demonstrating their dynamic nature. We discuss the theoretical and practical implications of gaining team adaptation experience and highlight the importance of the team adaptation process under nonroutine conditions.

Reframing Group Development: Diagnosis and Appreciation in the Practice of Team Building

Author: **Ignacio Pavez**; U. del Desarrollo

Author: **David Bright**; Wright State U.

Organizations development research suggests the existence of two approaches to facilitated group development: conventional and appreciative. Conventional practices construct group aspirations or shared goals by addressing group tasks and problems, whereas appreciative practices create generative images of the future that are grounded in the strengths of the group. To explore the effects of these approaches, we studied the interpersonal dynamics of ten work teams who implemented either conventional or appreciative team development practices. We discovered that these two approaches enable the emergence of two modes of development that are substantially different from each other. Consistent with previous research, we found that the conventional mode relies on conflict resolution and constructive feedback as a developmental mechanism. However, the appreciative mode relies on the power of positivity (conceptualized as positive affect, positive meaning, and positive thinking) as a catalyst for development or change. In addition, each mode

follows the same general pattern of group development, based upon the needs of a group at different phases of its developmental cycle. We propose that teams may exist in either mode depending on the focus of team's conversations and interactions. Thus, current theories of group development should incorporate the appreciative mode as an alternative or complementary form of development.

The Influence of Instrumental Leadership on Team-Change Success and Individual Change Support

Author: **Catrin Millhoff**; TU Dortmund U.

Author: **Jens Rowold**; TU Dortmund U.

The aim of this study is to explore the potential of instrumental leadership in times of change. The instrumental leader seeks opportunities in the environment and uses them strategically, while helping employees to adapt in their day-to-day work. These behaviors are becoming increasingly important in a continuously and more and more unpredictably changing work environment. To investigate whether, how and when instrumental leadership can promote team change success and individual change support, a multilevel moderated mediation model is developed. Affective change commitment is considered as the central mechanism to explain the influence of the leaders' behavior. To examine the conditions under which instrumental leadership enhances the affective change commitment of the employees, the moderating effect of the leader's affective change commitment is analyzed. The sample consists of 125 teams composed of one leader, at least two employees (in total 375) and the leader's supervisor. The results indicate that instrumental leadership is positively related to team-change success and individual change support via affective change commitment in the team. The indirect effects are strengthened by the leader's affective change commitment. Implications for leadership and change management literature as well as for practice are discussed.

Co-Construction of Shared Understandings Under Uncertainty: Computational Linguistic Approaches (session 956)

Stakeholders with different values and perspectives find it challenging to reach common understanding amongst themselves. Given the nature of pluralistic beliefs among various stakeholders that engage in interactions, the assumption that collective meanings emerge as a linear combination of knowledge by a set of actors is insufficient to understand how social understandings dynamically unfold over time through interactions. As such, the goal of this symposium is to showcase works that shed light on how different stakeholders dynamically co-construct shared meanings under uncertainty. The papers invited to the symposium study a wide range of contexts – entrepreneurship,

Adaptation and Transformation: Transition in a Self-organizing Team

Author: **Claire K. Wan**; National Chung Hsing U.

This study looks into a less explored question - how does a self-organizing team initiate and implement changes – when the capacity of spontaneously generating transition and transformation is usually assumed in the literature of self-organization. I examine this inquiry through an inductive theory-building approach. On basis of single-case longitudinal design, I conducted an in-depth, ethnography oriented study with a product development team in the software industry. The study showed that, the nuanced dynamic consisting of contingency enactment, dialectical processes of tensions, and linkage between design conception and synchronized practices constitutes the mechanism of transition in a self-organizing team.

Research examining field level transformation is generally fragmented into literature either focusing on patterns of change in the socio-cognitive evolution of institutional logic or in the materiality of technological innovations. We seek to bridge these growing, but largely independent streams of inquiry by developing a co-evolutionary model where logic construction and technological innovation interact to escalate or constrain field level transformation. We first synthesize institutional logic and technological transition literatures into a compatible framework with complementary stages across de-institutionalization and re-institutionalization. Drawing on several historical examples, we then build propositions to explain how socio-cognitive and technological change pathways interact with each other enable or constrain field transformation. Our co-evolutionary theory of field transformation bridges disparate literatures examining a common phenomenon and advances understanding of factors driving the pace and scope of field transformation.

Business Models as Artefacts Driving Temporal Segmentation and Logic Consolidation

Author: **Taija Tuulia Turunen**; Aalto U. School of Business

Author: **Pekka Töytäri**; Aalto U.

We investigated coexistence of alternative business logics by studying business model differences as manifestations of the underlying logic. We build on institutional complexity by studying the ways in which existing and entering actors rationalize the external and internal drivers of change and turn these into business models. Our results show the close connection between business model and the underlying logic that confines the available business model options for institutionalized actors. The study contributes to the institutional logic theory by illustrating the institutional foundation of a business model, identifying key characteristics of competing business logics, and suggests novel mechanisms of temporal segmentation and logic consolidation for managing the co-existence of the alternative logics.

Author: **Yuan Li**; Shanghai Jiao Tong U.

In the existing survival literature, a fundamental and important question is why some firms survive but others fail. By integrating a motivation-ability perspective and social network theory, we develop a novel model to examine the process mechanisms of the job satisfaction and creativity of store managers in linking relationships between their network advantages, namely, centrality and brokerage, and store survival. Our findings suggest that the centrality of store managers exerts a positive effect on their job satisfaction; brokerage, their creativity. The job satisfaction and creativity of store managers are important mediators. Job satisfaction mediates the relationship between the centrality of store managers and store survival, and creativity mediates that between the brokerage of store managers and store survival. Our study provides meaningful theoretical contributions and managerial implications.

Engaging with Institutional Voids in Contexts of Poverty: The African Wildlife Foundation in Kenya (WITHDRAWN)

Author: **Jakomijn Van Wijk**; Maastricht School of Management

Author: **Ayse Saka-Helmhout**; Radboud U. Nijmegen

Drawing on a historical case study of the African Wildlife Foundation from 1960 to 2015, we propose a dynamic model of institutional void experience, enactment and theorization as guided by an evolving constellation of institutional logics. We show that micro-level practices embedded in particular institutional logics can collide with social reality and hamper the organization in achieving its mission (void experience), which prompts organizations to experiment with novel solutions embedded in seemingly opposite logics (void enactment) and leverage their organizational identity to legitimate these novel solutions (void theorization) in a cyclical manner. By adopting a social constructivist lens in studying voids, we provide a fresh perspective on institutional voids and address scholarly calls for a synthesis of

strength and the proportion of structural holes which characterize inventor networks exert an inverted U-shaped effect on both intraorganizational knowledge absorption and transfer by inventors, and that these four curves become flatten in the case of star inventors, when compared to inventors in general.

Agency in Network Signaling: When Do Biotech Firms Signal their Alliance Formation in Press Releases

Author: **Seungho (Andy) Back**; U. of Toronto

Social network research suggests that actors are strategic in forming and activating social structures. Actors strategically manage their networks in order to reap the direct benefits of networks such as access to information or resource. Yet, network research has not fully investigated the extent to which agency exists in reaping the indirect benefits of networks. I examine whether agency extends beyond formation and activation to also apply to the signals organizations send to audiences about the status of the partners with which they affiliate. I address the following research question: to what extent does partner's relative status influence the organization's choices of sending signals about their networks? In an analysis of press releases about strategic alliance formation by biotechnology firms, I find support for the claim that firms are strategic in sending signals to audiences about their alliance partner. This paper contributes to social network research by connecting research on agency in networks and signaling benefits of networks. The key implication advanced by the paper is that signals about partners constitute another source of network benefit, in addition to the direct materials resources derived from actors' relations and positions within a social structure.

Selective (De)coupling and Change in Clinical Outcomes

Author: **Gabriel A. Huppe**; Ivey Business School

Through an in-depth longitudinal study of hospitals' implementation of quality improvement initiatives within a single jurisdiction, I build on previous empirical findings of heterogenous organizational responses to common institutional pressures. Yet, rather than honing the causes of this heterogeneity, I examine its relationship to desired outcomes. I use Fuzzy-set Qualitative Comparative Analysis (Fs/QCA) to uncover intended and unintended consequences of hospitals' heterogenous responses and theorize on why some configurations are associated with improved or worsened clinical outcomes. Findings suggest that management and healthcare scholars ought to pay greater attention to the subversive and superficial nature of some responses, as these are associated with a decline in clinical outcomes. Indeed, scholars have recognized that: "In fragmented and rationalized environments, organizations seek to respond to a greater number of external stakeholders; adapting to these external pressures can generate both internal complexity and inconsistency (Bromley & Powell, 2012, p. 20)." I find that coupling to two conflicting pressures, such as pressures to reduce costs while improving the quality of clinical services, creates internal inconsistencies which results in dynamics of subversion. In contrast, implementing clinical standards in the absence of an ambition to improve clinical services leads to the superficial implementation of these standards.

Author: **Russell James Funk**; U. of Minnesota

Author: **Sohyun Park**; U. of Minnesota

Social networks are everywhere, but until recently, the particularities of the structures were seldom remarked upon outside academia. Today, however, policymakers and managers are becoming more aware both of how networks are structured and how those structures create opportunities and constraints. Consequently, network interventions—deliberate efforts to shape a network configuration—are increasingly common. Nevertheless, researchers have devoted little systematic attention to them. We take a first step towards building systematic understanding of network interventions by examining the relationship between the structure of existing networks in targeted groups and responsiveness to network interventions. Specifically, we theorize that groups with greater fragmentation are less likely to engage with incentive-based network interventions and conditional on engaging, the interventions are less likely to be effective at transforming the network. To evaluate these ideas, we conducted a study of accountable care organizations. Our approach leveraged data on 100 million patient sharing relationships millions of providers in 3,000 communities across the United States. Additionally, we used several instruments to better identify the proposed relationships, including the Medicaid expansion and local political environments. Our results reveal a network intervention paradox—groups that may benefit most from such interventions appear least equipped to respond positively to them.

Using Semantic Networks to Identify the Meanings of Leadership

Author: **Ingo Marquart**; ESMT European School of Management and Technology

Author: **Matthew S. Bothner**; ESMT European School of Management and Technology

Author: **Nghi Truong**; ESMT European School of Management and Technology

We develop a novel method that integrates techniques from machine learning with canonical

concepts from network analysis in order to examine how the meaning of leadership has evolved over time. Using articles in Harvard Business Review from 1990 through 2019, we induce yearly semantic networks comprised of roles structurally equivalent to the role of leader. Such roles, from which leader derives meaning, vary in content from coach and colleague to commander and dictator. Yearly shifts in the structural equivalence of leader to clusters of thematically-linked roles reveals a decline in the degree to which leadership is associated with consultative activities and a corresponding rise in the extent to which a leader is understood to occupy a hierarchical position. Our analyses further reveal that the role of leader comes to eclipse the role of manager, measured through changes in pagerank centrality as well as betweenness centrality over the course of our panel. Implications for new research on leadership, culture, and networks are discussed.

Ecological Perspective on Organizational Resilience: Ethnography of Korean Buddhist Temple

Author: **Hee-Chan Song**; Sasin Graduate Institute of Business Administration, Chulalongkorn U.

Organization scholars tend to conceptualize the notion of resilience as recovery capacity. The concept is often operationalized by return time, i.e., a measure of how quickly an organization bounces back to an initial state from an external shock. Such conceptualization and operationalization reflect an engineering perspective on resilience. This tendency, however, omits a much richer framework for understanding resilience—an ecological perspective that focuses more on adaptive capacity of organizational system. Drawing upon ecological perspective, we aim to unpack internal mechanisms that shed more light on the adaptive aspects of

Stigma Process and Theory (session 953)

Stigma Entrepreneurship: Theorizing the Role of Moral Anger in Entrepreneurship

Author: **Sophie Catherine Bacq**; Indiana U. - Kelley School of Business

Author: **Ifeoma Ajunwa**; Cornell U.

Author: **Madeline Toubiana**; U. of Alberta

Author: **Jarrold Ormiston**; Maastricht U.

Author: **Trish Ruebottom**; Brock U.

Negative emotions are usually described as hindrances, impediments, or discouragements of entrepreneurial action. We contend that this is not always the case, offering a new explanation of how negative emotions associated with stigmatization might spark entrepreneurial action. We argue that stigmatization, as both an individual (i.e., first-person) and collective (i.e., third-person or group) experience, generates negative emotions, particularly moral anger. We explain how moral

resilience. We conducted three-month ethnography in one of the most revered Buddhist temples in Korea. Korean Buddhist temples are situated to adapt to rapidly changing socio-economic environment in Korea over the last decades, yet they also hope to protect historical tradition against change. Our real-time participant observation and inductive analysis show how a Korean Buddhist temple has maintained its core historical identity while adapting to changing environment. We theorize two contradicting elements of the mechanism 'pushing' and 'pulling' that enable an organization to simultaneously balance change and tradition in the midst of environmental change.

The Effect of Sustainability Manager's Field Engagement on Organizational Adoption of Sustainability

Author: **Tae-Ung Choi**; Northwestern U.

Author: **Grace Augustine**; Cass Business School, City U. London

Author: **Brayden G. King**; Northwestern U.

Social activists are often successful in their disputes with target organizations, as is evident from the concessions targeted organizations often make. However, concessions do not necessarily result in substantive changes. This is because over a longer period of time, activists are not fully capable of monitoring and maintaining direct pressure on targets or continuing to generate negative publicity. This paper contributes to research at the intersection of movements and organizations by investigating if, and if so, how individuals that are formally tasked with instituting movement-aligned changes, termed "insider allies," achieve subsequent and substantive changes in their organization. Using data on U.S. higher education organizations, we examine the effect of field-level engagement from sustainability managers—the insider allies, in our case—on adopting a voluntary sustainability reporting tool which is an indicator of change beyond initial commitments. The results of a longitudinal quantitative analysis of 622 schools demonstrate that the more sustainability managers have participated in field interactions, the greater the likelihood that their school adopts the voluntary

anger can then spur an individual to start an entrepreneurial venture with the aim of reducing relevant stigma(s). In doing so, we develop a theoretical process model for what we call stigma entrepreneurship, which we define as entrepreneurial efforts primarily directed at stigma reduction. We contribute to the literatures on entrepreneurship and on stigma management by highlighting the overlooked role of entrepreneurship as a tool for stigma reduction that goes beyond individual identity management strategies or collective action. Answering calls for research on the illegitimate, the informal, and the underdog, our exploration of stigma entrepreneurship challenges conventional wisdom and expands understandings of the possibilities within entrepreneurship.

Not on Skid Row: Stigma Reduction in Addiction Treatment Organizations

Author: **Jennifer Ling Bagdasarian**; Florida Atlantic U.

Author: **Elizabeth Goodrick**; Florida Atlantic U.

We studied the discursive processes through which core stigmatized organizations attempt to reduce their stigma by analyzing the websites of addiction treatment organizations. While it is well accepted that organizational stigma is socially constructed, there has not been much explicit attention to how language contributes to the construction, maintenance, and deconstruction of stigma. We contribute to the nascent literature on organizational destigmatization by focusing on the process through which stigma can be deconstructed through rhetoric. Based on our discursive findings, we theorize four ways that core stigmatized organizations can reduce their stigma: (1) Reconstructing the underlying cause of stigma; (2) Emphasizing similarities with social expectations; (3) Separating from stigma; (4) Collaborating with other actors in the field. In doing so, we contribute to the ongoing discussion of the relationship between stigma and legitimacy by showing how destigmatizing and legitimating tactics were intertwined.

[view paper \(if available\)](#)

reporting tool. Our findings indicate that engagement in field-level interactions with a range of actors around central issues that are pertinent to the movement enables insider allies to mobilize resources and craft identities as change agents that enable them to drive substantive change within their organizations.

Enhancing Linguistic Inclusiveness in Organizations: A Russophone Bank in Post-Soviet Kazakhstan

Author: **EunJoo Koo**; McGill U. - Desautels Faculty of Management

Author: **Anna Kim**; McGill U.

With the growing demand for linguistic inclusiveness in society – a condition where different languages are respected – organizations often face pressure from stakeholders (e.g., governments, customers) to incorporate multiple languages into their operations. Nevertheless, organizations often pursue linguistic homogenization (e.g., using a single dominant language) to achieve greater efficiency or to enter the global market, excluding other languages from their core activities. Reflecting this phenomenon, organizational scholars largely focus on the selective use of languages and its exclusionary effects on intra-organizational dynamics. As a result, little is known on how organizations can embrace low-status languages and enhance linguistic inclusiveness over time. Our qualitative study of a Russophone bank in Kazakhstan shows how monolingual employees gradually changed their linguistic practices in a context where incorporating a low-status language (Kazakh) into business operations was a very low priority for the organization. We found that a small group of language workers, initially hired to help the organization maintain monolingual practices, could behave outside the boundaries of what they are originally hired to do, and sparked changes in the organization's linguistic dynamics. Our analysis shows the ways in which language workers demanded respect and contributed to the creation of a linguistically more inclusive environment. By theorizing a process through which previously marginalized languages can gain recognition and

Organizational Event Stigma: Typology, Processes, Stickiness

Author: **Kim Clark**; Saint Mary's College of California

Author: **Yuan Li**; Saint Mary's College of California

What do events such as scandals, industrial accidents, activist threats, and mass shootings have in common? They can all potentially stigmatize the organization involved. Despite the prevalence of these stigma-causing events, management research has provided little conceptual work to characterize the nature and dimensions of organizational event stigma. This article takes the perspective of the audience to unpack the audience evaluation process that is triggered by these events, identify critical dimensions for categorizing types of event stigma, and explore the role of the stigmatizers, the stigmatized, and the bystanders in producing what we call “sticky stigmas.” We postulate that volitional and collateral event stigma are likely to lead to stigma stickiness. Our conceptual framework clarifies the antecedents and consequences of the different types of event stigma, highlights the importance of emotional evaluation, and opens avenues for further research into the role of diverse audiences in the stigmatization process.

Sexy Work Not Sex Work: How Dirty Work Gets Clean

Author: **Theadora Carter**; Alberta School of Business

Author: **Madeline Toubiana**; U. of Alberta

Author: **Trish Ruebottom**; Brock U.

Research on stigma is often divided between areas focusing on organizational stigma and job-based stigma, also known as dirty work. The dirty work literature has made strides in outlining the various ways in which dirty workers cope with stigma, but, unlike the organization stigma literature, has not elaborated de-stigmatization strategies. Drawing on interviews with 33 women working in the burlesque and stripping segments of the exotic dance industry, we explore how dirty work can get clean. Our findings reveal the ways in which the stigma of dirty

become part of everyday organizational practices, we provide important insights on multilingualism and linguistic inclusiveness in organizations.

Integrating Multiple Sustainability Objectives Through Deliberation: The Case of Degrowth Businesses

Author: **Maximilian Schormair**; Trinity Business School, Trinity College Dublin

Author: **Jakob Reuter**; U. of Hamburg

In times of pressing global sustainability challenges, companies need to find ways to integrate economic, environmental and social aspects into all their business activities in order to address all sustainability dimensions simultaneously without emphasizing one dimension over another. Degrowth businesses are considered to combine multiple sustainability objectives to an intense degree, while implementing elements of deliberative democracy by enabling and empowering affected people to participate in and actively shape the value creation process. Although recent hybrid organizing research points to the potential of deliberative democracy to support the integration of multiple (contradicting) objectives in organizational contexts, we lack research into the underlying processes and mechanisms. This paper addresses this research gap by investigating how degrowth businesses manage the integration of multiple sustainability objectives. Based on a qualitative-inductive analysis of in-depth interview data, a dynamic model of deliberative objective integration is developed elucidating the dynamic and iterative process of objective integration as a process of steady readjustment in order to achieve stability in the sense that all objectives are achieved simultaneously over time. This model shows that deliberation in organizational contexts represents an effective mechanism that fosters a high degree of objective integration and hence ensures the successful simultaneous pursuit of multiple sustainability objectives over time.

[view paper \(if available\)](#)

work is not only attached to the work and workers, as existing literature suggests, but to the organizations it takes place in, and the associated audiences and scripts linked to these organizations. We show that by shifting out of stigmatized organizations, finding new audiences, and developing new scripts, actors without resources or power can shed the stigma of their work. Our findings thus enable us to link the dirty work literature to organizational stigma literature by pointing out the important ways in which they are related, and how dirty workers can clean their work without changing the primary elements of it.

The Emergence of Employee-Driven Pro-Environmental Innovations in Public Organizations

Author: **Alexander Yuriev**; FSA ULaval (Laval U.)

Author: **Olivier Boiral**; Laval U.

Author: **David Talbot**; École National d'Administration Publique

Employee-driven pro-environmental innovations ameliorate the performance of public organizations and contribute to social well-being. Based on semi-structured interviews with 33 managers and sustainability advisors in the public sector, this study explores the main factors that impede the emergence of such innovations. The data analysis led to the identification of three types of obstacles (individual, organizational, and public-sector-related). The results indicate that pro-environmental innovations encounter fewer barriers in organizations where environmental concerns are substantially integrated with internal practices. Surprisingly, however, employees with sustainability-related duties are affected by more factors when attempting to launch eco-friendly innovations than are their colleagues from other departments.

Workplace Bullying, Well-Being, Motivation, and Engagement (session 958)

An Examination of Workplace Bullying in the Public Sector: A Multilevel Moderated Mediation Model (WITHDRAWN)

Author: **Diep Nguyen**; Edith Cowan U.

Author: **Stephen Teo**; Edith Cowan U.

Author: **Thanh Truc Le**; U. of Economics Ho Chi Minh City

Workplace bullying is a negative psychosocial factor discouraging public servants to stay engaged and committed to the organization. This study contributes new insights into the understanding of the antecedents and outcomes of workplace bullying in the public sector. Drawing from three theoretical perspectives such as Social Learning, Social Information Processing, and Affective Events, we tested the multi-level relationships between ethical leadership, workplace bullying, and affective commitment of public servants under the moderating effects of power distance orientation and displaced aggression. Using data collected from 289 public servants nested in 59 teams in a province of a Southeast Asian country, there was empirical support for the importance of ethical leadership in decreasing workplace bullying and increasing affective commitment. Employees with high-power distance orientation who work with ethical leaders are more likely to accept workplace bullying behaviors. In situations where workplace bullying is high, employees who express a moderate level of displaced aggression will report a lower level of affective commitment. These findings highlight the importance of a consideration of contextual contexts and emotional reactions in understanding workplace bullying and its outcomes.

The Adoption Drivers of IS-based Innovations in the Public Sector at the Organizational Level

Author: **Francois Duhamel**; U. de las Américas Puebla

Author: **Isis Olimpia Gutierrez Martinez**; U. de las Américas Puebla

Author: **Hugo Cordova**; INAI

Author: **Sergio Rafael Cue Funes**; -

This article examines the factors favoring the adoption of IS-based innovations in the public sector at the organizational level. First, we propose a literature review to identify those factors from the literature. Second, we develop a case study of an outsourced IS-based document management system in a state government in Mexico. Strong contrasts appeared in the degree of adoption of that innovation between the various ministries involved in the State government, revealing key differences in the presence or absence of four key variables: perception of external pressure, perception of benefits and risks, knowledge and process design. We also highlight the importance of political, socio-technical and economical inertia in the institutional conditions in which projects are embedded in the context of the public administration in Mexico.

Author: **Matthieu Mifsud**; Audencia Business School
Author: **Anthony Perrier**; U. of Toulouse I, Capitole

What motivates public servant, and when do they engage optimally at work? In this research, we propose to adopt a self-regulation perspective with Self-Regulatory-Focus Theory (SRFT; Higgins, 1997, 1998) as a central component to shape individuals ("public service") motivation and engagement. More especially, our model investigates how public employees' goal orientation (promotion vs prevention) affect their self-sacrifice (SS) behavior (as the key component to the whole of public service motivation) and their Public Service Engagement (PSE, Levitas et al., 2019). Results based on a three-wave study of 1509 police officers support expectations that self-promotion and self-prevention focus positively affect SS and PSE Our study underlines the key role of self-regulation in the public sector for promoting motivation and engagement. The findings are discussed with reference to existing literature on Public Administration Management.

Your Rival's Impression Management and Your Impression Management Motives in Public Organizations

Author: **Min-Jeong Kim**; Chonnam National U.

Author: **Guo Shitao**; SCEGC MECHANIZED CONSTRUCTION GROUP COMPANY LTD

This study explores the effects of a rival's impression management tactics on employee impression management motives in Chinese public organizations. Based on social comparison theory, social learning theory, and the literature on peer effects, this study hypothesized that the impression management tactics used by your rival, who is a colleague in rivalry with you, had a positive effect on your motives to use the same tactics. The analysis of a sample of 259 Chinese public employees showed that this hypothesis was supported for all five types of impression management tactics such as ingratiation, self-promotion, exemplification, supplication, and intimidation. This study also attempted to highlight the moderating effects of

Design thinking is actively promoted in the military to accelerate innovation. However, governments do not provide adequate funding or prioritise design methods in defence innovation programs. Our study audits global defence innovation programs, the strategic direction for innovation labs, funding and the role of design. The purpose of this paper is to explore the extent and effectiveness of design methods used in defence innovation labs. We also examine the structure, methods and outcomes of three lab case studies within the global defence context. Results reveal a disproportionate focus on science and technology in innovation labs. Few organisations incorporate design methods, seen as critical to successful innovation, in their R&D programs. Where design is encouraged in military organisations, it is primarily directed at bottom-up innovation programs. In contrast, government and defence heavily support science and technology innovation programs as part of organisational strategy, with funding as well as sponsorship from senior officers. Therefore, government and military organisations have systematically constrained the potential to accelerate innovation using novel strategies such as design. We discuss the unrealised opportunity for use of design in defence as well as the potential model for increasing cross discipline collaboration and disruptive innovation.

Well-Being of Public Servants Under Pressure: Analyzing the Causal Demands and Buffering Traits (WITHDRAWN)

Author: **Rick Borst**; Utrecht U., School of Governance

Author: **Eva Knies**; Utrecht U.

As the health-impairment process from job demands to lower well-being among public servants is still understudied, this article fills this gap by analyzing this process using the increasingly applied Job Demands-Resources model. To test the health-impairment process, we asked ourselves the question: What is the relationship between sector specific job demands and work-related well-being (work engagement and emotional exhaustion) of public servants and which big five personality traits ensure that either the hindering effect of these demands is lowered or the challenging effect enlarged? We analyzed four public sector demands including organizational restructurings, technological innovations, aggression from citizens, and integrity pressure. Based on the analysis of two representative subsamples of the Dutch public sector (respectively 8.537 and 8.310 respondents) it can be concluded that all job demands negatively relate to well-being. However, the results show that organizational restructurings is the strongest hindering job demand, as it worsens well-being while the experiences with the demand are predominantly negative. At the same time, technological innovations is the least hindering demand due to the rather positive perceptions. Moreover, some personality traits turned out to be demands instead of resources, opening new doors for future research in the health-impairment process of public servants.

The Predictive Power of Latent Variables: An In-Depth Analysis of Crowdfunding Project Descriptions

Author: **Frederik Situmeang**; Amsterdam U. of Applied Sciences

Author: **Johan Chou**; Amsterdam Business School, U. of Amsterdam

This paper outlines a research methodology based upon Latent Dirichlet Allocation (LDA), an unsupervised machine learning method to extract latent topics from crowdfunding project descriptions and examine the relationship of these topics and project funding success. This paper also analyzed whether sentiment, subjectivity and text positioning of a project content description have an impact on the funding rate. By analyzing 10.000 past crowdfunding projects, this study identified 8 latent topics that can be used in predicting project funding by backers. The findings also indicate that textual content that have a positive sentiment increases the likelihood of funding success. Furthermore, project descriptions that are objective in the middle and at the end have a positive effect on funding success. This study also found that there are interaction effects present with the identified variables that impact the rate of funding depending on their location within a project content description. The analysis presented in this paper can help to improve on the identification of the success factors of entrepreneurial and crowdfunding projects.

Exploring New Methodological Avenues: Opportunities & Challenges of Qualitative Meta-Studies (session 961)

Systematic knowledge syntheses in qualitative research has long been given only limited consideration. However, recently there has been an increasing interest in qualitative meta-studies as evidence-based approaches to synthesize the richness of qualitative studies in management studies. In this symposium, we want to demonstrate that management scholars can largely benefit from the ever-expanding amount of qualitative evidence that is available in our field to refine, extend, and build new theory and to steer subsequent research into new directions. Notably, there are different methodologies available for synthesizing qualitative studies. The symposium will highlight different approaches to synthesize qualitative research, their aims, their challenges, and how they can be fruitfully applied in management research. We believe it is time to consolidate the learnings from work in this area by having a discussion on the most promising, as well as most contentious, issues around qualitative meta-studies.

Author: **Konstantina Valogianni**; IE Business School

The objective of this paper is to map the development and the application of Social Identity Theory (SIT) in management studies to understand why and how a unique theoretical structure spurs into multiple and different applications across idiosyncratic fields. Although rooted in psychology and with primary initial application in the sociological field, SIT theory has expanded increasingly in management studies. By employing machine learning, we analyzed title, abstract and keywords published in top-tier business journals from 721 articles published in the period 1995-2019. Specifically, through Natural Language Processing, we identify 4 main topics that employ SIT as underpinning theory: teamwork, organizational theory, marketing studies of green consumption, and strategic studies. Beyond their thematic content, these four topics differ in the use of the three mechanisms of identification, categorization, and comparison that are the backbone of the SIT development. We argue that this is due both to the abduction logic, which is typical in management research, and the nature of the fields where these mechanisms are applied.

Validity Concerns of Using Machine Learning in Management Research

Author: **Nan Zhang**; American U., Kogod School of Business

Author: **Heng Xu**; Pennsylvania State U.

Author: **Mo Wang**; U. of Florida

The adoption of machine learning (ML) techniques in business research has significantly grown in recent years, with many studies using off-the-shelf ML algorithms to replace the labor-intensive coding of large unstructured datasets. Most published studies, however, failed to examine how errors in ML outputs affect the validity of the study results. This article shows, if unchecked, even a very small machine learning error (e.g., 5% for a binary output) could be amplified in subsequent statistical analysis to produce significant changes in research outcome, hence threatening its validity. After clearly

differentiating two seemingly interchangeable concepts (i.e., ML error in the ML output vs. ML-induced bias in the empirical-analysis output), we develop a theoretical framework that demonstrates the possibility of having a large ML-induced bias despite of a small ML error. We discuss three common sources of the error-to-bias amplification stemming from the design of an ML algorithm. To mitigate the amplification, we introduce a novel correction process that not only significantly outperforms baseline approaches commonly adopted in the existing literature, but also can be readily adopted for a wide variety of ML algorithms and empirical studies. These advantages are demonstrated through a study that applies a state-of-the-art ML algorithm for facial recognition using real-world data.

Machine Learning in Management Research: An Integrative Typology, Review, and Research Agenda

Author: **Shuang Liu**; Clemson U.
Author: **Zeki Simsek**; Clemson U.

Machine learning research has a long history in several disciplines, but its use and applications in the management field remain limited and disjointed. Recent technological advances in computational power and architectures, increasing availability of big datasets, and innovative algorithms have transformed the implications that ML holds for management scholarship. These implications make it necessary to develop a systematic and systemic understanding of ML in management research. Towards that end, we first advance an integrative typological framework that specifies and clarifies major categories of ML for different research purposes. After clarifying how each ML category may look like in management research, we then use the framework to provide an integrative review of all published ML studies in the field. We conclude with an integrated agenda for future research informed by the framework and results of review.

Abusive Supervision and Managerial Punishment (session 964)**Contextual Influences on Managers' Restorative vs. Punitive Responses to Workplace Wrongdoing**

Author: **Kenneth D. Butterfield**; Washington State U.

Author: **Jerry Goodstein**; Washington State U.

Author: **Nathan Robert Neale**; U. of Houston, Downtown

Author: **Mengjiao (Rebecca) He**; Washington State U.

A growing stream of management literature examines how reparative or restorative responses can be integrated with traditional punishment in responding to employee wrongdoing (e.g., Goodstein & Aquino, 2010). However, little is currently known about the influence of the organizational context on the manager's decision to respond with a more restorative vs. punitive approach. Using data from 638 employees in a wide variety of organizations and industries, we tested hypotheses regarding contextual influences on the manager's decision to respond in a more restorative or punitive manner. Results suggest that forgiveness climate, punishment climate, type of wrongdoing, and seriousness of wrongdoing had significant effects on the manager's response beyond the effect of individual factors such as managers' retributive/restorative justice orientation. We discuss implications for practicing managers as well as avenues for future research.

Artificial Intelligence, Emerging Technology, Algorithms (session 968)**Blockchain's Potential Impacts on Supply Chain Sustainability in Developing Countries**

Designated as a "Best Paper" for SIM

Author: **Nir Kshetri**; U. of North Carolina, Greensboro

Many high-profile initiatives have been undertaken to incorporate blockchain in supply chains. While researchers have recently focused their attention on blockchain's impact on supply chain management, little is known about this phenomenon from the standpoint of sustainability and in the context of developing countries. The article seeks to address this gap. Multiple case studies of blockchain projects in developing countries to assess product quality, environmental accounting and social impact measurement have been discussed, which are likely to address these challenges. Seven propositions have been developed, which consider blockchain's technical potential in developing sustainable supply chains in developing countries with respect to institutional, economic and technical factors as well as power distribution-and integration- related issues in inter-organizational networks. This article contributes to the existing literature by providing new insights into blockchain's role in promoting sustainable supply chains in the context of developing countries.

Morality 2.0: A Model of Individual Moral Behavior Within Human-Machine Interactions

Author: **Scott Reynolds**; U. of Washington

Author: **Ussama Ahmad Khan**; U. of Washington, Seattle

Drawing from theory and research in a several areas including anthropomorphism, social power, and behavioral ethics, we propose a model of human-

workplace is staggering. Despite it being in the best interest of organizations for managers to apply consistent, fair sanctions aimed at reducing misbehavior, punishment is often variant—either perpetuating misconduct or leading to adverse secondary effects. While previous literature has made clear the experience of subordinates and those observing punishment, current literature fails to account for the processes underlying managers' reactions during punishment. In this paper, we outline an identity-based model of punishment that makes explicit managers' felt identity threat across three relevant identities during the evaluation of the misconduct and the subordinate: a manager's relational identity, organizational identity, and/or moral identity. The resulting sense of anxiety from this threat burgeons concentrated identity work on the part of the manager, which in turn influences the application of sanctions and long-term effectiveness of the leader. In conclusion, we offer practical implications for both managers and organizations that will bolster successful punishment, aimed at reducing misconduct in the workplace.

Moral Feedback: A Theory of its Mechanisms, Contingencies, and Implications

Author: **Young Won Rhee**; U. of Washington

Moral self-regulation has attracted substantial research attention as a mechanism that explains employee moral behavior. However, an important piece of moral regulation has been largely overlooked in the literature, namely, supervisory moral feedback. To theoretically explain the behavioral corrective function of moral feedback, we define two different forms of supervisory moral feedback: criterion referenced and social comparison moral feedback. Drawing from the feedback intervention and moral decision-making literatures, we argue that criterion referenced moral feedback decreases subsequent employee immoral behavior through cognitive pathways, while social comparison moral feedback does so by distinct mechanisms involving social pathways. We also define three different dimensions of the behavioral correction, duration, breadth, and immediacy, and

machine interaction and moral behavior. In contrast to existing social psychological perspectives on this topic, we do not limit our theorizing to current machine capabilities but acknowledge that machines can and will dramatically surpass humans in many of their most key capabilities. Thus, we specify the first step in the dyadic relationship as a general assessment of humanness and propose that individuals can perceive machines as sub-human, humanlike, or super-human. We then argue that each conclusion elicits a different moral paradigm that results in different approaches to moral decision-making and moral conduct within the relationship and potentially beyond. Ultimately, we provide a comprehensive and more accurate understanding of how individual morality is shaped by interactions with machines.

The Problem of Value Alignment in Business Decision Making: Humans vs. Artificial Intelligence

Author: **Thomas J. Donaldson**; The Wharton School, U. of Pennsylvania

Author: **Cristina Neesham**; Newcastle U.

The new robotic revolution promises, or threatens, to delegate increasingly important, higher-order business decisions to artificial intelligence (AI). In this paper, we analyze how humans treat values as instrumental or intrinsic; discuss two important sources of value misalignment in traditional, humans-led business decision making (namely, over-instrumentalization of value judgments, and psychological distance); and examine the problem of value misalignment between decision-maker and society in terms of moral dissonance with personal values, highlighting the capacity of humans to self-correct and achieve value re-alignment (for example, using dissimulation resources such as beneficent hypocrisy). We identify AI as currently unable to replicate this human capacity, and call for the application of a precautionary principle as normative default in all innovations involving the introduction of AI in business decision making contexts where value alignment problems are likely to occur.

[view paper \(if available\)](#)

propose that the behavioral correction effect of moral feedback varies contingent upon factors at the individual, team, and organizational levels. The present conceptual analysis highlights supervisors' role in guiding subordinates who are "morally astray" and offers practical guidance on how to administer moral feedback consistent with the moral goals of an organization.

Antecedents and Outcomes of Abusive Supervision: An Approach-Inhibition Theory of Power Perspective

Author: **Ying-Ni Cheng**; National Defense U.

Author: **Changya Hu**; National Chengchi U.

Author: **Sheng Wang**; U. of Nevada, Las Vegas

Author: **Jui-Chieh Huang**; National Taipei U. of Business

Author: **Yen-Yu Chen**; National Chengchi U.

With serious negative consequences of abusive supervision, the need to identify factors leading to abusive supervision is critical. Drawing upon the approach-inhibition theory of power, we propose that supervisors' coercive power leads to abusive supervision and employees may passively react to abusive supervision with silence. Furthermore, we argue that organizational contexts, perceived organizational politics (POPs), will moderate the above relationships. Using time-lagged data collected from 187 supervisor-subordinate dyads, we found that supervisors' coercive power was positively related to abusive supervision and supervisors' POPs enhanced this positive relationship. Furthermore, subordinates' POPs moderated the relationship between abusive supervision and silence, such that abusive supervision was not related to silence in high POPs subordinates whereas a negative relationship was observed for subordinates with low POPs. The theoretical and practical implications of this study were discussed.

Who is Responsible? Transparency, Affordances, and Accountability of Ethical Algorithms

Author: **Maggie Minghui Cheng**; McMaster U.

Scholarship across different disciplines has reached a consensus that algorithms cannot themselves be held responsible for the ethical implications of decisions. However, while management research argues that the designers of the algorithms should be held accountable for the ethical implications of management decisions, computer scientists believe that such accountability must be attributed to the owner or operator of the algorithms, except in the case of malfunctioning code. This article critiques the assumptions of both competing views and provides a perspective based on affordance theory to attribute the ethical obligation of management algorithms to different actors. The article uses an artifact-centric approach to create a framework that diagnoses transparency and accountability issues of algorithms in management practices.

Recommendations for both research and practice are provided.

Corporate Irresponsibility (session 965)

Event and Core Stigma in Corporate Scandals

Author: **Ralf Barkemeyer**; Kedge Business School

Author: **Arno Eerikki Kourula**; U. of Amsterdam

Author: **Lutz Preuss**; Kedge Business School

Author: **Olivier Gergaud**; Kedge Business School

Author: **Christophe Faugère**; Kedge Business School

This paper argues that event and core stigma play an important role in shaping how the media cover corporate scandals. We utilize a novel dataset of 200 corporate scandals to analyze the interaction of different forms of stigma and corporate responses as well as their effects on scandal-related media coverage. As the dataset covers the period of 1988 to 2017, we are able to provide a dynamic and contextualized picture of how event and core stigmas affect the extent, length, and peak of media coverage. Our findings point to distinct roles for both core and event stigma in shaping media attention to a corporate scandal. Counterintuitively, we consistently find corporate scandals that are characterized by high levels of stigmatization to be associated with lower levels of media coverage. We attribute this pattern to the fact that a scandal linked to a stigmatized organization confirms existing preconceptions regarding the deep-seated flaws that characterize this organization. For non-stigmatized organizations, we find the choice of response strategy of denial to aggravate media coverage relative to a strategy of accommodation, whereas this pattern does not hold to the same extent for stigmatized organizations.

When Benefits are Lost: Contextualizing CSR, Marketing Capability, and Firm Performance in China

Author: **Xu Wang**; U. of hong kong

Author: **Kevin Zheng Zhou**; U. of hong kong

Author: **Kui Wang**; Shenzhen Audencia Business School

Prior research tends to view corporate social responsibility (CSR) as beneficial to firm performance, building on the premises that the public holds strong demand for CSR and that CSR actions are the strategic choices made by firms. However, such a view overlooks the conditions in which these two premises no longer hold. Challenging prior views, we propose that when institutional environments question these premises, CSR may lose its benefits and become a liability for firm performance. Based on analyses of data on listed firms for the period running between 2008 and 2017 in China, we show that CSR negatively affects performance by reducing firms' marketing capability, and such negative effect is weaker in regions with higher density of Buddhist beliefs but is stronger when government influence is more difficult to avoid. These findings carry strong implications for broadening our theoretical understanding of CSR research.

MNCs and Grand Challenges in Areas of Limited Statehood: MNCs and Grand Challenges in ALS

Author: **Sameer Azizi**; Roskilde U.

This paper problematizes the CSR-Grand Challenges nexus by stressing that profit-seeking motives and logic of multinational corporations condition their role as agents for development. An analytical framework is developed to analyze how corporations balance the business vis-à-vis development case of three corporate modes of

corporate social irresponsibility (CSiR) imperil corporate reputations. Yet, there is little theoretical or empirical evidence regarding how and to what extent reputations are harmed by CSiR. Drawing on the availability heuristics literature and attribution theory, this study examines how stakeholder perceptions of CSiR generate reputational effects. By exploring a unique dataset of 1,518 CSiR events, we explain how and why organizations with greater cognitive availability to assessors, i.e. celebrity firms – suffer especially significant reputation damage following CSiR. We elaborate on how cognitive availability influences assessor application of availability heuristics and how this process may be largely responsible for the influence of organizational celebrity as an interpretive frame.

Justified by Ideology: Why Conservatives Care Less about Corporate Social Irresponsibility

Author: **Anna Jasinenko**; U. of Lausanne, HEC Lausanne

Author: **Fabian Christandl**; Hochschule Fresenius

Author: **Timo Meynhardt**; HHL Leipzig Graduate School of Management

This study examines the cognitive and motivational process underlying the effect of conservatism on corporate social responsibility (CSR) perceptions, as well as the contrast in the effect of conservatism on the perceptions regarding irresponsible versus responsible companies' CSR. Building on political psychology and system justification theory, we identify and successfully test market system justification (MSJ) as a specific form of motivated social cognition underlying the ideological differences in CSR perceptions and reactions. Using three empirical studies, we find that conservatives' (compared to liberals) relatively high MSJ results in less critical CSR perceptions of irresponsible companies and, in turn, in less penalizing reactions. Moreover, we find that conservatism influences the CSR perceptions regarding irresponsible companies more strongly than those of responsible companies because MSJ affects only behavior threatening the idea of fair markets (i.e., low CSR). Overall, the results improve the prediction of consumers' reactions to socially irresponsible and responsible

engagement in CSR. The study focuses on an embedded case study of four MNCs operating in the mobile telecommunications industry in Afghanistan that is conceptualized as Areas of Limited Statehood. Such analytical approach provides rich opportunities for MNCs to act upon prevalent and urgent Grand Challenges. The findings reveal that all four MNCs are actively undertaken philanthropic, integrative and innovative modes of engagement in addressing key Grand Challenges. However, the findings indicate that the 'business case' of such engagements condition and even determines the 'development case' of their CSR practices. In order to act as development agents (i.e. allocate resources to pro-poor issues, give primacy to the poor, and account for their impact) for-profit corporations need to overcome managerialism, lack of scalability/sustainability and commodification in Areas of Limited Statehood.

Measuring CSR by Aim, Approach, and Action: Impact on Accounting and Market Performance in China

Author: **Ke LU**; U. of hong kong

Author: **Ri Wang**; Cornell U.

We adopt a new model called SDV (Sustainable Development Value), built upon 3A (Aim, Approach, and Action) as a strategic management process to measure CSR. We explore the CSR-CFP relationship by distinguishing accounting performance (return on assets) and market performance (risk-adjusted return on stock). Regression results from 1,245 observations of large listed companies in China from 2014 - 2019 prove that SDV has a significant positive relationship with accounting performance but no significant relationship with market performance when controlling for factors like company size and industry. However, if we divide SDV into three groups of 415 (with low, middle and high SDV), the t-test demonstrates the high SDV group has the highest market performance. The contradictory results indicate different mechanisms of CSR-CFP relationship with regards to accounting and market performance, which are further explained by the 3A model.

companies.

Hidden in a Group? Market Reactions to Multi-Violator Corporate Social Irresponsibility Disclosures (WITHDRAWN)

Author: **Chang Liu**; Rutgers Business School

Author: **Stephanie L. Wang**; Indiana U., Bloomington

Author: **Dan Li**; Indiana U.

The public media often discloses multiple firms' corporate social irresponsible (CSI) behaviors all together (i.e., multi-violator CSI disclosures). Drawing on attribution theory, we propose that multi-violator CSI disclosures generate perceptions of high consensus across all implicated firms' behaviors. Such consensus leads shareholders to attribute each firm's CSI behaviors to external factors and subsequently lessens negative market reactions to the implicated firms. Further, the situational distinctiveness and temporal consistency of the focal firm's past CSI behaviors mitigate the relationship between CSI disclosure type (i.e., multi-violator vs. single-violator CSI disclosures) and stock market reactions. Empirical findings based on a sample of 30,739 public media CSI disclosures linked to 1,166 S&P 1500 firms between 2008 and 2017 support our hypotheses.

Slacks and Capabilities: Investigating the Conditions that Enable CSR to Reliably Create Value

Author: **Hao Lu**; U. of Calgary

Author: **Xiaoyu Liu**; Saint Mary's U.

Current literature has shown that an increase in CSR may not reliably lead to an increase in firm value. Yet, theoretical arguments and empirical evidence that investigate the trade-off between an increase in firm value and an increase in uncertainty is scarce. More importantly, research on when CSR can be a reliable strategic asset is scarce. In this paper, we attempt to fill these gaps by: (1) investigating the relationship between CSR and both the mean (measuring the level of impact) and variance (measuring the reliability of impact) of firm value distribution simultaneously, and (2) exploring the conditions under which CSR can be a reliable value enhancer (increase mean but does not increase the variance of value distribution). Using the multiplicative heteroscedasticity estimation model and dynamic panel regression structure, we find that CSR by itself is an unreliable value enhancer (increase value but also increase the variance of value distribution). We also find that the impact of CSR on firm value is more reliable when a firm has more slack in hand or when a firm has higher capabilities in future profitability and risk management. This research provides practical guidance to managers on the conditions under which the efficacy of CSR can be reliably realized.

Unethical Behavior Seen from a Different Angle (session 969)

Stigma and Firm Reactivity: Understanding the Drivers of Human Rights Policy Adoption at MNEs

Author: **Tricia Olsen**; U. of Denver

Author: **Kathleen Rehbein**; Marquette U.

Author: **Annie C. Snelson-Powell**; U. of Bath

Author: **Michelle Karen Westermann-Behaylo**; U. of Amsterdam

While global supply chains have long been implicated in human rights abuses, the processes firms use to discover, remedy, and prevent abuses in their operations are still emerging. The primary objective of this research is to analyze the emergence of new corporate behaviors, specifically the diffusion of corporate human rights policies amongst MNEs. We build an "Awareness-Motivation-Capability (AMC)" model to identify and analyze firm and industry-level factors that shape a firm's decision to adopt a human right policy. This paper contributes to empirical research on business and human rights by systematically analyzing corporate adoption of human rights policies at 7,400 global companies over time, 1999 – 2018, using ASSET4 data. Given the dynamic nature of policy adoption, we employ a Cox proportional hazard model. This enables us to understand the significance of each factor and whether it delays or advances the timing of policy adoption. Recognizing that the human rights abuses of MNEs are "stigma-producing" events helps explain our surprising finding; the occurrence of human rights controversies motivates firms to respond with human rights policy activity only when the firm itself is affected, implying reactive rather than proactive policy adoption strategy is at play for MNEs.

External Work Locus of Control and Unethical Pro-Organizational Behavior: A Dual-Path Model

Author: **Chen Tang**; U. of Illinois at Urbana-Champaign

Author: **Ying Chen**; U. of Rhode Island

Author: **Wu Wei**; Wuhan U.

Drawing on the person-situation interactionist perspective of ethical behavior, we examine whether and how external work locus of control influences employees' unethical pro-organizational behaviors (UPB). We propose a dual-path model in which the external work locus of control has both a direct and an indirect effect on UPB. For the indirect effect, we hypothesize a moderated mediation structure in which the indirect effect of external work locus of control on UPB through the perceived performance pressure is conditional on employees' leader-member exchange (LMX) quality with their direct supervisors. The results from a time-lagged, three-wave sample of 452 employees in the service industries support our theoretical model. We find that external work locus of control is related positively to UPB. Moreover, LMX moderates the indirect relationship between external work locus of control and UPB through performance pressure, such that the indirect effect is stronger when LMX is high. These findings highlight the important role of external work locus of control as a dispositional antecedent of UPB, as well as the role of performance pressure and LMX, two situational factors, in predicting employees' propensity to engage in UPB. Theoretical and managerial implications are discussed herein.

Corporate Greed: Formalizing the Construct and Explicating its Organizational Consequences

Author: **Katalin T. Haynes**; U. of Delaware

Author: **Nathan A. Bragaw**; U. of Delaware

Our conceptual paper explores the merits of stakeholder versus shareholder capitalism through the concept of corporate greed. We define and set boundary conditions for the construct, summarize its precursors, and theorize about its organizational consequences. We posit corporate greed incorporates the simple rule, or shared heuristic, of

behavior, an overlooked area of research. By employing a multiple case and inductive approaches, this paper aims at better understanding the responses to crises emerging from irresponsible organizational behavior and analyses the context of the oil industry, illustrated by the case of the Brazilian company Petrobras, in order to do it. Our findings indicate five different strategies and three mechanisms to minimize externalities caused by organization's irresponsible behavior. As a result, our study presents three main contributions. First, it contributes to the field of crises management, especially in what concerns the use of CSR to respond to events of crises, for it draws attention to the rupture that characterises crises as source of new practices, new ideas and new commitments organisations may assume. Second, it advances the development and discussion of the concept of corporate social irresponsibility, which deserves consideration due to its importance and its recurrence within organizations. Third, it extends the use of CSR as a response to CSI within contexts of crisis, highlighting the positive and negative aspects of the interactions between both fields.

From Signals to Reform Narrative: Reputation Repair Following Corporate Environmental Misconduct

Designated as a "Best Paper" for SIM
Author: **Guido Berends**; U. of Groningen
Author: **Jordi Surroca**; U. of Groningen
Author: **Bjoern C. Mitzinneck**; Groningen U. (RuG)

Past research has devoted significant attention to understanding how firms behave in the aftermath of misconduct to counter reputational threats. This research, however, primarily focused on identifying individual responses, without considering that in practice firms often combine multiple actions to signal reform. By integrating insights from narrative theory into signaling research, we argue that signals to conjointly restore reputation need to follow a certain pattern and logic—signals need to tell a reform narrative. Empirically, we conduct a longitudinal analysis examining and comparing different signaling behaviors of publicly traded U.S.

shareholder primacy, which leads to mutually opposing effects on firm performance: it benefits performance in the short term through a focus on short term horizons and exploitation strategies but hurts performance in the long term as it develops an instrumental ethical climate that decreases organizational commitment. A discussion of the implications follows.

Job Tenure, International Work Experience, and the Acceptance of Corruption

Author: **Christian Hauser**; Swiss Institute for Entrepreneurship

Author: **Petra M. Moog**; U. of Siegen

Author: **Arndt Werner**; U. of Siegen

In the past, management studies have paid insufficient attention to the relationship between professionals' career-related backgrounds and their corrupt business practices. Therefore, the aim of this paper is to gain deeper insights into career-related factors shaping professionals' tendency to condone corruption. Specifically, we focus on two central career-related factors: job tenure and international work experience. Based on a survey of 184 professionals – employed and self-employed – we find an inverted u-shaped relationship between job tenure and the likelihood of condoning corruption meaning that in the middle of their career professionals show the highest tendency to condone corrupt behavior. Moreover, we find an almost J-shaped relationship between international work experience and the acceptance of corruption. This indicates that professionals who spent most of their business lives abroad, are the most likely to condone corruption. Based on these findings, we discuss theoretical explanations and implications for research and practice.

CEOs to the Pillory: Punishment Reactions to CEO Pay Ratios

Author: **Maria Cristina Zaccone**; U. Cattolica del Sacro Cuore

firms in response to environmental misconduct. Consistent with our theory, we find that the effectiveness of multiple signals in restoring reputation rests upon their appropriate orchestration into a comprehensible and credible reform narrative. Taken together, our findings advance signaling theory by providing insights into how firms combine multiple signals over time. With it, we challenge prevailing assumptions of what renders signals effective. We show that when multiple coherent signals are logically sequenced and conjointly used, they do not necessarily need to be costly to be effective.

Doing Well by Doing Wrong: Stakeholders Salience, Wrongdoing, and Reputational Penalties

Designated as a "Best Paper" for SIM

Author: **Michael Carney**; Concordia U., Montreal

Author: **Gwyneth Edwards**; HEC Montreal

Author: **Andrea Kim**; John Molson School of Business, Concordia U.

Recent research challenges the instrumental view that a good reputation can generate positive benefits to a firm. Accumulating research finds that there are costs associated with a positive reputation and potential benefits for a bad reputation. We argue that firm adherence to economic imperatives of technology platforms can produce attractive capital market evaluations along with negative evaluations of a firm's character reputation. In a qualitative case study, we describe the divergent trajectories of Uber Technologies' emerging market and character reputations over the firm's first decade. Our study sheds new light on the process of new firm reputation formation.

Author: **Matteo Pedrini**; U. Cattolica del Sacro Cuore
Author: **Lori Verstegen Ryan**; San Diego State U.

Increased CEO compensation has given rise to a wave of public criticism and new legislation, such as the latest CEO pay ratio rule in the US. Although understanding stakeholders' reactions to corporate behavior has never been so important, relatively little is known about what influences their punishment reactions. Using a two-level, two-factor experimental design, this study examined whether CEO pay fairness and company performance influence punishment reactions. We found systematic differences in the outcome levels of the four treatments groups. Our results suggest that an effective punitive reaction occurs when corporations display what are perceived to be unfair and undeserved compensation policies. We contribute to the existing literature by integrating equity theory and deservingness theory, and shed light on the impact that apparently unfair and undeserved CEO compensation can have on individuals' reactions and corporate operations. Our findings have both theoretical and practical implications, as corporate disclosure is increasingly common and likely to influence a wide range of stakeholder reactions, including punishment reactions that can damage both a firm's reputation and its financial stability.

Victimization in Domestic and Work Contexts: Victim and Third Party Perspectives (session 970)

SIM

Women and Marginalized Entrepreneurs (session 966)

Victimization, both at home and at work, is a ubiquitous social issue that needs continued scholarly attention. While advances have been made in understanding the consequences of victimization, much work is needed to understand the phenomena from the victim and bystander's perspectives. Through a collection of four papers, this symposium aims to broaden our understanding of victimization by 1) examining its occurrence both at work (i.e., sexual harassment) and at home (i.e., intimate partner aggression), 2) examining the role of bystanders in the victim's experience of victimization, and 3) elaborating on the specific contextual and personal factors that facilitate, mitigate, and link victimization and work-related outcomes. The symposium also provides insights on current conceptual, methodological, and practical issues related to victimization research through an interdisciplinary review of the literature. Collectively, the four papers set the stage for further scholarship on victimization and the development of policies that help mitigate its negative effects at home and at work.

Gender Composition, Loan Repayments, and Financial Capital Formation in Microcredit Groups

Author: **Denis John Griffin**; U. of Otago
Author: **Bryan W. Husted**; Tecnologico de Monterrey

Whereas theories in various disciplines explain why men generally create more capital than women as business owners, development literature has demonstrated that poor female business owners with access to microcredit perform comparatively well. We build on object relations theory in order to explain the reported high loan repayments of all-female groups. A comparison is made based on a sample of 182 microfinance groups collected in central Mexico. Utilizing structural equation modeling, tests of latent mean differences and t-tests, this study finds support for females applying more peer-group pressure in microfinance groups than males even though social sanctions hinder loan repayments. Moreover, questioning assumptions made by object relations theory and microfinance literature, we find all-female groups do not participate more harmoniously than groups with a greater composition of males. Overall, however, all-female groups perform comparatively well in regards to the repayment of loans and financial capital creation.

Time for Impact: Temporal Mechanisms for Investing in Women and Minority Entrepreneurs

Author: Liz Tracy; North Carolina State U.

Author: Garima Sharma; Georgia State U.

Author: Jeffrey M. Pollack; NC State U.

The field of impact investing is growing at a fast pace, and yet women and minority entrepreneurs have been left out of this growth. Prior research has described the challenges that these entrepreneurs face in raising capital. However, we do not yet fully understand how these challenges can be addressed. In this paper, we surface the notion of 'time' in the discussion to ask: "How can impact investing practices include women and minority entrepreneurs in the growth of the impact investing field?" We answer this question by collecting interview and qualitative survey data from entrepreneurs and investors of an impact fund, specifically designed to invest in women and minority entrepreneurs. We found the challenges described by prior work, which can be understood from a temporal lens. Additionally, unlike prior work we found that investors in this fund saw impact as unfolding and lasting, offering a different assumption of time from the one based on a business case of trading short and long term. Finally, we found practices which address the challenges to move the enterprises toward impact. Our study contributes by building a temporal theory of impact investing which allows for including entrepreneurs who have traditionally been excluded.

Freemium Killer Apps

Author: **Joost Rietveld**; UCL School of Management
Author: **Joe N. Ploog**; U. College London School of Management

Freemium and paid products often compete on the same platforms. More so than paid products, however, freemium products disproportionately rely on a large user base for their success. As a result, freemium products are more likely to be “hit or miss” than paid products. This raises important questions relating to which freemium products are best positioned to becoming a killer app, and under what conditions? We argue that those freemium products that unlock strong product-level network effects, which are also released when the platform has a large installed base, have a higher probability of becoming a killer app than freemium products without these features and paid products with similar characteristics. We test these arguments using a unique data-set of 9,700 video games

bricoleur entrepreneurs in rural India, and as a result, introduce an integrative framework for contextual care ethics. The study shows that context is not something “out there”, but instead, enacted in the caring practices of social entrepreneurs. This study has two major contributions. First, by departing from the notion of ethics as a characteristic of an individual we show how social entrepreneurs are ethical through human interaction. Second, by adding the analysis of formative context to care ethics, we identify how social entrepreneurs seek to make meaning of and enact the context through these relational caring practices. Bringing together analysis of care ethics and formative context deepens our understanding about care ethics as a relational practice in social entrepreneurship.

Innovation Strategy: Value Creation and Valuation (session 971)

Smart Power, Innovation, and Firms' Valuation in High-Velocity Environments

Author: **Cristina Oana Vlas**; U. of Massachusetts, Amherst

Author: **Eugene See**; U. of Massachusetts, Amherst

Author: **Rishabh Chaudhary**; U. of Massachusetts, Amherst

This paper proposes a model of firm valuation in high-velocity environments. Such environments are characterized by extreme uncertainty that decrease the explanation power of most of the known theoretical perspectives explaining valuation. Adopting a smart power perspective, we hypothesize why some firms succeed in such environments while others fail. Smart power refers to a combination of hard- and soft-power mechanisms such as resource dependencies (hard power) and timing, illusion of power, and exploitation of others' tendencies (soft power). We identify high-velocity environments as pertaining to intense internal innovation and claim that firms'

released on Steam, the market leading platform for digital PC games. Results show that freemium games with more rather than fewer social features, that are also released when the platform has a larger rather than smaller installed base, have a 27 percentage points higher probability of becoming a hit game.

Cheered by the Crowd, Rejected by the Firm: The Ripple Effect of Rejections in Contest-Based Online

Author: **Michela Beretta**; Aarhus U.

Author: **Linus Dahlander**; ESMT European School of Management and Technology

Author: **Lars Frederiksen**; MGMT, BSS, Aarhus U.

Author: **Morten Fenger**; Aarhus BSS, Aarhus U.

Author: **Shahab Kazami**; Aarhus BSS, Aarhus U.

Scholars have examined how rejections affect people who generate ideas, but rarely studied how it shapes those who supported them. Those who support an idea by providing feedback on it, often invested cognitively and emotionally in this idea, and a rejection may therefore exercise a second-order effect on the wider community of participants. This effect we label the “ripple effect”. We contribute theoretically by first establishing if such ripple effect exists as well as explain what may cause this effect to work. We build on an original data set including more than 1.5 million participants involved in an online community to investigate how firm rejection of ideators’ ideas has wider effects for the idea supporters. Using a unique approach by studying popular ideas that by the design of the hosting firm trigger a selection or rejection decision, we find in differences-in-differences estimates that such ripple effects of rejection exists affecting the subsequent behavior of supporters in a negative way. These findings have broader theoretical implications by turning our attention to how rejections change the social fabric of communities.

Integration of Platform Features and Intra-Platform Competition: A Study in the Video Game Industry

Author: **Irfan Kanat**; Copenhagen Business School

internal innovation drives firms’ valuation following an inverse U-shape relationship. We further identify CEO regulatory focus as driving firms’ motivations to pursue smart power tactics. The analysis of a panel of innovation-intensive firms from high-velocity industries supports our framework. We conclude that while perspectives involving competency, efficiency, and learning may be useful frameworks in explaining firm valuation in established markets, a perspective focused on smart power is better fitted to explain firms’ valuation in environments plagued by extreme uncertainty. Our main contribution is to the study of power in high-velocity environments.

Strategizing the Co-Developments of Business Models and Ecosystems for Platforms

Author: **Sungu Ahn**; Cass Business School, City U. London

Author: **Charles Baden-Fuller**; Cass Business School, City U. London

Business Models and Ecosystems represent two important theoretical lenses for understanding value creation (and subsequent value capture). Each perspective brings great insights to understanding platform firms. When explaining platform’s value creation and capture mechanism, strategy scholars tend to focus on just one perspective. While each perspective has usefully explained mechanisms for value creation and capture and acknowledged the conceptual significance of another, interactive aspect between them has been under-explored. We suggest that bringing the two perspectives together brings added insights, especially in the cases where complementors can both create and destroy value. This paper advances theory by offering a preliminary integrated framework . Building on interdependencies as foundations of both ecosystem and business model, it shows how platform entrepreneurs can choose to design different interdependencies on a same service. With each design choice having different implications for both scale and scope, entrepreneurs can co-develop both platform business model and ecosystem. The integral view offers theoretical insights on 1) platform competitive dynamics, 2) changes in value creations and capture mechanisms understood as

Author: **Philipp Hukal**; Copenhagen Business School

We investigate the effects of complementors using technical features offered for optional integration by the platform operator in their own products. Drawing from three years of game sales data from the popular video game platform, Steam, we find that complementors generally benefit from aligning their product development with the platform. In particular, our results suggest that these benefits differ by the type of complementor. While major game developers increase their sales performance immediately as well as over time, niche complementors increase sales only over time as a result of integrating platform features. However, the effect over time is much stronger for niche complementors. Through our analysis, we argue that the digital technology foundation on which many digital platforms operate matters for intra-platform competition and we discuss these findings in the light of recent work on the digital platform ecosystems. Our study adds to the platform literature by highlighting the effects of integrating platform features for the intra-platform competition and how these effects differ by the type of complementor.

Strategizing for Dynamic consistency in Digital Innovation: The Role of Intellectual Property

Author: **Marcus Holgersson**; Chalmers U. of Technology

Author: **Sarah Gerlinde Van Santen**; Chalmers U. of Technology

IP strategy has moved from a primary focus on value capture to increasingly also consider aspects of value creation, not the least in digital innovation. Digital innovation has created a plethora of business models and enabled business models to change, sometimes rapidly, over time. All of this has complicated the general advice that the IP strategy should be integrated with the business model. In this research, we seek to better understand how digital technology-based startups use IP strategy to support their business models under uncertainty, and especially when business models are likely to change. We study seven digital technology-based startups through 35 semi-structured interviews with elite informants. In addition to IP strategizing for value creation and value capture we find that decision-makers strive to build and maintain dynamic consistency of their IP strategies, meaning that the strategies should be compatible with, and balance between, the firms' current components of value creation and value capture, while simultaneously being compatible with future changes in the business models. The capability to achieve an IP strategy that is dynamically consistent is a dynamic capability of significant importance for innovative firms facing an uncertain future where business model change is likely to happen. We find several principles used by decision-makers to enable dynamic consistency.

[view paper \(if available\)](#)

A Firm's Concentration of Vertical Value Chain Partner Exchanges and Effects on Innovation Returns

job-postings that yielded no contract. Using conditional fixed-effects logistic regression, controlling for service-pitchers' bidding price and other characteristics, we found that the certainty with which service-pitchers pitch their services is positively associated with being selected by service-seeking buyers up to a threshold, after which online service-pitchers' message-certainty harms their contract-acquisitions; and thus, the contract-winning benefits of online service-pitchers' message-certainty was in the shape of an inverted U-shape, consistent with the "too much of a good thing" (TMGT)-effect. Also as hypothesized, we found that the TMGT- effect of online service-pitchers' message-certainty was moderated by their extent of rapport-building, such that the online service- pitchers who accompanied words of certainty with more (rather than fewer) rapport-building words tended to be more likely selected and to be less prone to suffering backlash. These two patterns repeated, also as hypothesized, when examining how the message-certainty in selected online service-pitchers' pitches affected their buyers' satisfaction with their job-completion. Our findings' theoretical and practical implications are discussed.

Competition and Privacy in Online Markets: Evidence from the Mobile App Industry

Designated as a "Best Paper" for TIM

Author: **Reinhold Kesler**; U. of Zurich

Author: **Michael Kummer**; U. of East Anglia

Author: **Patrick Schulte**; Deutsche Bundesbank

Policy makers are increasingly concerned about the combination of market power and massive data collection in digital markets. This concern is fueled by the theoretical prediction that more market power causes firms to collect ever more data from their users. We investigate the relationship between market power and data collection empirically. We analyze data about more than 1.5 million mobile applications in several thousand submarkets of Google's Play Store. We observe these data for over two years and combine information on an app's data collection with information about its competitive environment. Our analysis highlights a robust positive relationship between market power and data collection. We find that more data are

Author: **Vidya Oruganti**; Grenoble Ecole de Management

Author: **Isabel-Maria Bodas-Freitas**; Grenoble Ecole de Management

Author: **Jojo Jacob**; Grenoble Ecole de Management

A firm's investment in internal and extramural R&D activities is critical for its ability to innovate. However, ability to generate returns from its innovation investments might not be similar across firms. In this regard, a firm's upstream and downstream value chain partners can influence its innovation preparedness by enriching it with knowledge about new components, technologies and market changes. But, these interactions may cause vulnerabilities to a firm such as knowledge spillovers and opportunistic behaviours, thereby constraining its ability to innovate and gain returns from innovation. We empirically address this issue in our study, and show how that there are detrimental effects when a firm has concentration of value chain partners and that they are contingent upon certain firm strategies and technological environment of the firm. We highlight that a firm's cooperation with its value chain partners may weaken the unfavourable effects their high concentration. We postulate a similar effect when the speed of technological change is faster in a firm's industry. We use secondary survey data for 770 French firms, and our findings provide broad support for our predicted relationships.

Innovation via Inter-Firm Collaboration: The Role of Partner Organizational Design

Author: **Sarath Balachandran**; The Wharton School, U. of Pennsylvania

Author: **John Eklund**; U. of Southern California

Firms are increasingly leveraging external knowledge to facilitate their innovation. However, accessing the required knowledge within partner firms may be challenging due to how partners are structured. Yet, we currently have a limited understanding of how firms' innovation outcomes may be influenced by partners' organizational structures. We investigate this in the context of relationships between established firms and startups that arise from corporate venture capital investments. Using the theoretical lens of knowledge search and access costs, we argue that centralization of Research and Development (R&D) of the established firm is associated with lower search costs associated with startups finding the relevant knowledge. However, decentralization of R&D is associated with lower access costs in leveraging the located knowledge due to the more effective usage of higher powered incentives to share information within the established firm. We examine this theoretical tension within the context of the global pharmaceutical industry through 496 startup- established firm partnerships. We find that, on average, search costs outweigh access costs, thus R&D centralization of the established firm is

An Empirical Investigation of Knowledge Processes in Absorptive Capacity Development

Author: **Alireza Javanmardi Kashan**; Queensland U. of Technology

Author: **Kavoos Mohannak**; Queensland U. of Technology

Studies on absorptive capacity development in firms have provided extensive evidence of the important role of knowledge processes and new knowledge development. In spite of this importance and the critical role of absorptive capacity in firms' performance, we are less clear about the micro processes of absorptive capacity development and particularly about the role of knowledge processes and knowledge development at project level. Therefore, this paper reports an in-depth case study of the process of absorptive capacity development in an automaker and in the course of four product innovation projects. Findings suggest that absorptive capacity develops step by step as knowledge processes co-evolve with new knowledge development across different levels of product architecture. Furthermore, this study finds that such maturation of absorptive capacity includes the development of different routines of absorptive capacity across a series of product innovation projects.

Innovation Shocks and Knowledge Creation of Emerging Technologies: Evidence from a Quasi-

of Manitoba

Author: **Yongjian Bao**; U. of Lethbridge

Author: **Brad Olson**; U. of Lethbridge

To cope with discontinuous change, recent research advocates top executives to adopt a paradoxical cognitive frame or ambivalence that accepts and accommodates the juxtaposition of both threats and opportunities as the contradictory evaluations of a strategic issue. Concomitantly, the literature on organizational ambidexterity advocates firms to implement exploitation and exploration simultaneously. Little research has yet examined whether CEO ambivalence drives or hinders organizational ambidexterity. Moreover, both exploitation and exploration require the deployment of technological capability. Whether technological capability complements or attenuates the effects of managerial cognition on firm strategic action remains in debate. Based on the theory of paradoxical frames, this study predicts that CEO ambivalence follows a U-shaped effect on organizational ambidexterity while technological capability enhances the curvilinear effect. A longitudinal survey among 260 CEOs of Chinese firms provides empirical support to the hypotheses. The research findings contain rich theoretical and managerial implications.

Responding to Exploration and Exploitation Pressures via a Contingency Framework

Author: **Carolina Rojas**; U. Catolica del Norte

Author: **Julio A. Pertuze**; Pontificia U. Católica de Chile

Author: **Amanda Jasmine Williamson**; Waikato Management School

According to the ambidexterity literature, organizations tend to favor either exploration or exploitation activities. Yet few articles have integrated our knowledge of why these imbalances occur, what an ideal balance is, and how to remedy any disparities between what organizations do, and what they should do. This article addresses this paucity, by situating these questions within the context of an organization's resources and level of environmental uncertainty. We present a conceptual

Experiment

Author: **Wei Yang**; George Mason U.

Author: **Yuchen Zhang**; Tulane U.

Author: **Hanyang Li**; Ohio State U.

This study explores how innovation shocks – sudden and exogenous breakthrough events – shape the evolution of emerging technologies by influencing the knowledge creation of individuals. Drawing on the literature on technological evolution and the conceptualization of knowledge creation as recombinant process essentially at the individual level, we argue that innovation shocks stimulate knowledge creation as their generic nature bridges nascent technologies with individuals' existing knowledge and experiences, enabling better search for components and configurations compatible with emerging technologies. Our empirical examination exploits an exogenous innovation shock in artificial intelligence - the winning of deep learning algorithm AlphaGo over Go grandmaster Lee Sedol in 2016. The analyses of coding activities of developers on GitHub reveals their knowledge creation of deep learning projects significantly increased after the winning, compared with that of blockchain - another influential emerging technology unaffected by any innovation shocks during the same period - providing causal evidence supporting our theory. Moreover, we found this positive effect of innovation shocks on knowledge creation is enhanced by developers' absorptive capacity and knowledge scope. This study advances the understanding of individual dynamics in the evolution of emerging technologies and the impact of artificial intelligence in creating new forms of innovation.

Antecedents of Strategic Ambidexterity in Firms' Product Innovation

Author: **Liang Mei**; National School of Development at Peking U.

Author: **Francesco Rentocchini**; U. of Milan

Author: **Jin Chen**; School of Economics and Management Tsinghua U.

Previous literature highlights how the potential conflict between "faster, better and cheaper" and the high uncertainty of the business environment force a firm choose among a number of different strategies for new product development. This study contends that companies can develop strategic ambidexterity in product innovation and rely on a wide range of different product innovation strategies, as long as effectively exploiting internal and external resources. This work explores the relationship between external knowledge sources and internal organizational capabilities and the strategic ambidexterity in product innovation. We draw on a dataset of 600 Chinese manufacturing firms and show the breadth and depth of knowledge source and three types of organizational capability (information sharing, lean management, and training and learning practices) are positively associated with strategic ambidexterity in product innovation. We also find, when external knowledge depth is associated with internal information sharing, strategic ambidexterity in product innovation tends to increase.

[view paper \(if available\)](#)

Asynchronous

Taking a fuzzy-set qualitative comparative analysis (fsQCA) approach, this study explores the relationship between a firm's absorptive capacity, external knowledge search strategies, and radical innovation from a holistic perspective. The results verified the complex complementarities between external knowledge search and absorptive capacity in affecting radical innovation and indicated a number of different configurational paths for high radical innovations. This study extends the theoretical framework of absorptive capacity, resolves competing findings in external knowledge search literature, and provides different pathways to high radical innovations.

Society & Technology: TIM Conversations - Institutions and Technology (session 975)

Innovation or Problem? Context Makes the Difference

Author: **Thinley Tharchen**; EMLYON Business School

Author: **Raghu Garud**; Pennsylvania State U.

We examine the constitution of different institutional pathways for e-cigarettes by actors in the US and the UK—as an innovative product in the UK, and as a problematic one in the US. These differences arose because of the different historical contingencies, future imaginaries, and current justifications present across the two contexts, leading to institutional actors in the US adopting a precautionary approach and those in the UK adopting a harm-reduction approach towards e-cigarettes. Consequently, while stringent regulations for e-cigarettes as a tobacco product were enacted in the US, “light touch” regulations for e-cigarettes as a consumer product were adopted in the UK, where it was also considered as a medicinal product. Based on these findings, we discuss how differences in contexts inform the institutional pathways for novel technologies.

University Regulations, Regional Development, and Technology Transfer: The Case of Brazil

Author: **Thiago J. Soares**; Insper Institute of Education and Research

Author: **Ana Lúcia Vitale Torkomian**; Federal U. of Sao Carlos

Author: **Marcelo S. Nagano**; U. of Sao Paulo (FEA/USP)

In this study, we explore how the quality of university internal regulations and regional economic development impact new patent applications and licensing agreements in the context of Brazilian universities. To do that, we rely on data from a recent survey conducted by the Brazilian Innovation and Technology Transfer Managers National Forum (FORTEC Innovation Survey). Employing negative binomial models, we find that the quality of technology-transfer-related regulations has a positive impact on both patenting and licensing activities. In turn, the availability of regulations per se has no (or only little) effect on technology transfer outcomes. We also find that regional economic development has a negative

[view paper \(if available\)](#)

The Effect of Asset Ownership on Project Selection: Evidence from 1970's Television

Author: **Ankur Chavda**; HEC Paris

Existing theoretical and empirical work on contracting highlights the efficiency gains possible from optimizing asset ownership when projects span firm boundaries. However, in settings where firms are able to choose among heterogeneous projects, asset ownership can also determine which projects are selected for execution. Using a regulatory shock to the US broadcast television industry, this study finds restricting television network ownership over television shows altered the types of shows commissioned by the networks. This result extends prior theoretical and empirical work on contracting by showing asset ownership not only determines the efficiency of outcomes given a project, but also can change the relative attractiveness of different projects. The relationship between asset ownership and project selection is especially important in innovation contexts where project selection has a cumulative effect by changing the marginal returns to future projects; an industry's contracting environment can therefore be a driver of the direction of innovation.

Exploring the Relationship Between Regulation's Strictness and Destabilizing Innovation

Author: **Michael Park**; U. of Minnesota

This paper provides a first look at how a firm's likelihood of engaging in destabilizing innovation—as opposed to consolidating innovation—is affected by the strictness of the regulation in the focal firm's industry. Although there has been past work in the management literature exploring the characteristics that distinguish the two different types of innovation, there has not been much work on how regulation can influence a firm's inclination to engage in more or less of either type of innovation. There has been work in the applied economics

impact on patenting outcomes. On the other hand, universities located in regions with higher levels of economic and innovative activity generate more licensing agreements. Finally, our results suggest that the marginal effects of the quality of both IP protection and licensing regulations is higher in more developed regions. These findings have important implications for both theory and practice.

The Effect of University Research on Industrial Innovation: Evidence from China

Author: **Ying (Sophie) Wang**; Boston U. Questrom School of Business

University research is well-recognized as playing an important role in boosting industrial innovation. However, empirical works that causally justify and comprehensively explore this relationship are rare. In this paper, I make use of a novel natural experiment, the reform on Chinese universities' personnel management system starting from 2008, to examine the effect of an increase in university research on industrial innovation. Using the difference-in-difference strategy, I find evidence for a positive, causal, and robust effect. I also show that the effect is driven by indirect knowledge spillover rather than direct R&D collaboration; and it is attributable mainly to high-ranking universities, though not confined to the few top-tier universities. The patterns this paper unveils have implications for the design of science & technology policies, especially on university funding and university-industry collaboration.

Entrepreneurial University in Practice: Synthesizing Two Decades of Evidence

Author: **Marisol Velasco Montañez**; Eindhoven U. of Technology

Author: **Madis Talmar**; Eindhoven U. of Technology

Author: **Miguel Bruns Alonso**; Eindhoven U. of Technology

Author: **Isabelle Reymen**; Eindhoven U. of Technology

Over the last two decades, the entrepreneurial

literature on how regulation in general affect all forms of innovation. However, much of their findings remain contradictory. This calls for a need to focus on a specific dimension of regulation and also a specific type of innovation. Previous literature has found the strictness of regulation to be an important dimension of regulation that influences firm strategy. Furthermore, destabilizing innovation tend to have more significant consequences for other firms. Thus, this paper chooses to explore how the strictness of regulation tends to affect a firm's likelihood of engaging in destabilizing innovation. It also considers the degree to which a firm's entrenchment in the political process—through lobbying —moderates this relationship between regulation strictness and destabilizing innovation. The paper tests the hypothesis using a novel dataset that includes 1,801 public U.S. firms across 34 years. It finds that when regulation are stricter, firms engage in less destabilizing innovation on average. However, when firms lobby, they engage in more destabilizing innovation when regulation are stricter compared to firms that do not lobby.

The Competition Between Chinese and American Digital Firms in China: A Dynamic Equilibrium Model

Author: **Feng Li**; Cass Business School, City, U. of London

American digital firms (ADFs) have successfully internationalized around the world, but they have all failed in China. Using comprehensive longitudinal data over six years, this study examines the competition between ADFs and Chinese digital firms (CDFs). Some ADFs initially dominated the Chinese market, but CDFs exploited their institutional advantages to erode the competitive advantages of ADFs based on superior resources and capabilities and dominant market positions. Their competition evolved over three distinctive stages, and CDFs used successive temporary advantages to achieve sustainable competitive advantages dynamically; and accomplish radical changes cumulatively through a successive pipeline of incremental innovations. A three-staged dynamic equilibrium mode of competition between ADFs and CDFs is

university has been accepted and promoted in policy circles as an ideal for universities to aspire to. Consequently, a second academic revolution is under way, adding an entrepreneurial objective to the education and research missions of the university. However, while previous research has suggested a number of approaches for universities to fulfill this mission, the body of research on the entrepreneurial university has had a limited impact on universities actually becoming more entrepreneurial. On one hand, research on the entrepreneurial university includes an elevated number of conceptual papers that develop models and typologies with no or little empirical content. On the other hand, the empirical research literature on entrepreneurial universities has consisted predominantly of case studies. No aggregation or systematic analysis of the evidence about the entrepreneurial university has thus far been performed. To address these shortcomings, we systematically synthesize two decades of evidence arising from 118 empirical studies. Toward future research, we critically evaluate the state of literature in terms of research progress and develop research continuation paths, both from a methodological and topic point of view.

China's Bayh-Dole Act and University Patenting: A Contingency Perspective (WITHDRAWN)

Author: **Yeyanran Ge**; National U. of Singapore (NUS)

Author: **Wei Yu**; National U. of Singapore (NUS)

Author: **Dongbo Shi**; Shanghai Jiao Tong U.

Author: **Jianwei Dang**; Tongji U.

Around the world, universities are playing an increasingly important role in the technological development of industries. Many countries emulate policies like the Bayh-Dole Act in the US by giving universities full property rights of government-funded research. Bayh-Dole-like laws have been empirically examined with mixed findings, but few studies have considered the institutional conditions and investigated the causal effect of the Bayh-Dole like policy in developing and transition economies like China. Based on the 2002 Bayh-Dole-like reform in China, we conduct the difference-in-differences (DiD) analysis at the university-IPC level and find that

developed, and contributions to extant literature are discussed. Future studies should further test the validity of the model and its boundary conditions, and explore other emerging phenomena in the digital economy.

Art of Adversity Thinking: Political Turnover and Innovation

Author: **Daxin Sun**; Shanghai Jiao Tong U.

By integrating political strategies literature and research on innovation, this study develops a theoretical framework and empirically test how and why political turnover affects corporate innovation. Facing political risks, information asymmetry and policy uncertainty created by political turnover, in addition to passively reducing the sense of existence, we argue that firms also use innovation as an attention-catching strategy to seek opportunities in uncertainty environment. Furthermore, we highlight how the uncertainty rooted in political turnover varies by identifying two kinds of contingent values: (1) politician's career concerns and (2) firm's political hierarchy. Using a longitudinal dataset of industrial enterprises above the scale in the context of China, we found that there is a significant positive relationship between political uncertainty and firm innovation. This is more likely to occur when new government leaders are promoted locally, while less salient if they are at the early career stage and firms are affiliated with higher hierarchies. Our research expands the literature on political uncertainty and innovation by highlighting the role of political agents, and improves our understanding of how firms strategically respond to political shocks in emerging economies.

Generating and Leveraging Customer Data Assets: Solutions Business Models

Author: **Charles Baden-Fuller**; Cass Business School, City U. London

Author: **David J. Teece**; U. of California, Berkeley

Filling a gap that has been largely ignored by the literature on technology and digital strategy we explore how machine learning (artificial intelligence) has brought about two mechanisms that create superior value from the data that customers generate from their consumption experiences. We then explore how these two mechanisms can increase demand and shelter the firm from competition; and how the resulting business models give rise to significant profit opportunities. We do this first in the context of the single firm having a simple dyadic relationship with its customers; and then for the platform firm and their complementors. To gain the greatest benefits, firms generally, and platform firms in particular, need to choose business models (value creation-capture combinations) that trade-off the value of extending the range of complementary offerings, with the need to control the complementors ability to capture value from those data. In the final section we consider how the firm might organize itself internally – and why they need to adjust the relationships between the central authority of top management and the front line – that has day to day contact with customers.

Busting the Black Box of Big Data: Dimensions, Effects, and Insights Creation

Author: **Maryia Zaitsava**; U. of Cagliari

Author: **Elona Marku**; U. of Cagliari

Author: **Maria Chiara Di Guardo**; U. of Cagliari

Author: **Azar Shahgholian**; senior lecturer

Based on the case study of the large-scale pilot project run in four European cities, the paper aims at opening up the black box of Big Data dimensions taking a close look at their characteristics, interactions, and effects that influence the ability of Big Data to create different types of insights for enhanced decision-making. Existing literature has mostly focused on the Big Data Analytics role in the valuable and actionable insights creation, neglecting the better understanding of the underlying mechanism of different insights creation at the level of Big Data. To take the challenge, we built a conceptual framework that explains the underlying mechanism of different types of Big Data insights creation based on what we called proliferation and additive effects. In this vein, our study contributes to the strategic management literature by uncovering and busting the black box of Data for enhanced competitive performance; it also adds new insight to technology innovation studies by disentangling the Big Data fine-grained subdimension, their distinct effects, and insight creation. Finally, several managerial implications are highlighted and further discussed.

Can't Stop the Feeling: Influence of Incidental Emotions on Manager's Willingness to Delegate to AI

Author: **Michelle Heber**; U. of Kassel

Author: **Sabrina Schneider**; U. of Kassel

Artificial Intelligence (AI) based technologies provide manifold opportunities to augment managerial decision-making. Managers can delegate decisions to the increasingly available and capable AI-enabled decision-making systems. This study looks into the managerial willingness to do so with a particular emphasis on the influence of emotions on the manager's choice to hand over strategic decisions to AI. Prior research has shown that both cognitive and emotional aspects influence decision-making. Furthermore, we know that emotions induced by technology influence a system's adoption and use. However, despite the acknowledged relevance of emotions, prior research has not yet emphasised the impact of incidental emotions – emotions triggered by events unrelated to the decision or the AI-enabled system use – on decision-making and delegation. Using an experimental research design enhanced by data collected through cognitive neuroscience methods, we analyse the impact of positive, incidental emotions and their states valence and arousal on a manager's willingness to delegate a strategic decision to an AI-enabled system. The findings reveal that positive incidental emotions, as well as high values of valence, positively impact a managers willingness to delegate strategic decisions to an AI-enabled system. The paper concludes by discussing the study's implications for technology adoption and managerial decision delegation by highlighting the relevance of emotional factors in managers' adoption of AI and the additional value of neuroscientific data.

Innovation Practices Using AI technology: Exploring Human-Machine Knowledge Conversion

Author: **Soo Young Choi**; Cass Business School, City U. London

Author: **Stefan Haefliger**; Cass Business School, City U. London

The use of AI in innovation practices creates a conundrum for knowledge creation theory. Current AI technology possesses the ability to engage with data in ways that differ from the original design due to their response to contextual input data. AI may be said to embody tacit knowledge as it evolves and learns about the human collaborator and the organisational and technological context. We explore knowledge conversion involving human and AI to understand the process of digital innovation starting from the mutually constituted innovation agency. We articulate a process model of knowledge creation extending Nonaka's seminal SECI model starting with a sociomaterial lens on knowledge conversion and a recursive relationship between the outcome of knowledge creation and the material interactions of human and AI. Our analysis links characteristics of digital innovation with the potential of AI to perform skilful work or, in other words, appear to act on tacit knowledge. This insight contributes to the literature on digital innovation a missing link for seeing material agency as intermingled with human agency and to organizational knowledge creation theory the possibility of the machine becoming part of a team. We discuss theoretical and practical implications of our study for the economics of digital innovation and suggest avenues for future research.

Broadening our Sight Through Replication: Insights about Replication as a Research Methodology (session 288)

This PDW was born from the learning acquired by a group of guest editors while editing a special issue on replication for The Leadership Quarterly. The special issue used a registered research report method for all submissions, so that the review process could benefit the design of the studies and ensure rigor in the replication process. For each review of the registered research report, we invited one of the original authors of the proposed replicated study to serve as a reviewer. What we learned is that, first, replication as a methodology is misunderstood and underestimated in the field in terms of the complexity and challenges associated with it. In this first lesson, we will unpack what we observed regarding close and conceptual replications and how to answer such fundamental questions as: how does one know when a replication was successful? Second, we also found that replication's challenges are more than methodological, and that some of our obstacles to successfully replicating the science of management hinge on our social and professional identities, particularly identity threat, when the theories or studies that are central to our professional identities have the potential to not replicate. Our panel of editors will suggest future direction for replication and provide insights into how to pursue replication research.

Do We Belong Here? Practicing Consensual Allyship for Community and Inclusion (session 295)

In response to the OB Division call for practically-oriented PDWs that focus on “better understanding and enacting of successful inclusion among our own colleagues”, this PDW utilizes evidence-based, accessible training and learning practices to foster skill development and community building among attendees, through the conceptual framework of fostering consensual allyship within our profession. Consensual allyship avoids speaking for others, and instead requires consent from those with whom we wish to engage in allyship (Hunt & Holmes, 2015). Instead of inclusion efforts that are directed at getting individuals to fit in the mold of the power and privilege structures that govern our communities, consensual allyship fosters the practice of creating a community of belonging, with the dominant group as allies who ensure the leadership and direction of those most affected by oppressive systems and structures. Participants will learn to recognize and describe consensual allyship; apply the principles of consensual allyship to their personal and professional roles and generate approaches for practicing consensual allyship in their professional communities to foster community creation and belonging. This practice-oriented session will include active learning methodologies such as conversational lecture segments; individualized reflection and processing activities; case studies and paired and group discussions. The session will be delivered from an inclusive, anti-oppressive, and judgment-free perspective.

Pre-registration is required for this session.

Language, Meaning, and Organizing: Linguistic Theories and Methods of Organizing (session 301)

Over the last 30 years, our field has experienced a proliferation of theoretical perspectives that examine the language in organizational and institutional settings (e.g., impression management, framing, rhetoric, discourse, narratives, vocabularies). This proliferation of perspectives has been helped by the vast public availability of texts as well as recent methodological developments that enable us to analyze these texts like never before. However, the explosion of theoretical and methodological perspectives and increasing data availability have challenged researchers to think more carefully about selecting the most appropriate theoretical and empirical approaches for their desired research objectives. This professional development workshop (PDW) builds upon and extends a successful symposium on language held during AOM 2019 in Boston and aims primarily to provide a forum for bringing together a variety of theoretical and empirical approaches to language in the study of organizations and organizing. Our secondary goal is to broaden the scope of this growing community by inviting the participation of scholars who have used language directly or indirectly in their research and would like to contribute to this area of work in the future.

Last year, the second half of our session, the feedback roundtables, was over-subscribed. In order to help ensure you can attend, we ask that you add your information to our Google form: <https://forms.gle/8Tn7ZLPk8Loh3vWGA>. Using Sport Data to Advance Management Theory: Broadening our Sight and Developing Future Direction (session 299)

Publishing rigorous and relevant research in top management journals often requires rich and suitable data that allow challenging and compelling research questions to be investigated. The surge of accessible sport data in recent years has increased the number of studies that make use of such data to advance management theory. Beyond the fact that professional sport comprises multi-billion dollar industries worthy of attention per se, sport also provides settings in which fundamental themes of competition and cooperation are at play, making it attractive for scholars seeking to advance management theories. However, sport settings combine research opportunities with non-trivial challenges and dichotomies that require further reflection: First, sports greatly differ in their nature, and it is not always easy to choose the most suitable sport contexts to respond to particular research questions. Second, in sport settings, generalizability of results is less evident than in traditional industries, and readers and reviewers often display skepticism about external validity and generalizability of findings to business contexts. Building on successful editions of this workshop at AOM in the previous four years, this two-part PDW will (1) bring together a panel of scholars to share experience in publishing management research with sport data and (2) provide developmental support in the second part of the workshop for scholars that are in the process of using sport data in their projects or who plan to use sport as a setting to study their research questions.

New Directions in Research on Occupations and Professions (session 300)

Even as occupational and professional group membership has become increasingly salient in the workplace, the field of management has only begun to recognize and examine the importance of occupational and professional dynamics relative to organizational dynamics. This workshop seeks to explore new directions in research on occupations and professions by bringing together leading scholars with participants in an interactive format to advance perspectives on the past, present, and future of this growing area of management research. The goals of this professional development workshop are three-fold: (1) provide both historical and contemporary perspectives on occupations and professions research in management and organizational theory; (2) develop new research at the cutting-edge of this occupational turn in management scholarship; and (3) build a community of scholars who are engaged in theoretical and empirical research on occupations, professions, and similar communities of practice. Through presentations from senior scholars, combined with interactive panel discussions, and research roundtables where faculty and PhD students can receive feedback on ongoing research projects on occupations or professions, we seek to advance scholarship in this important area while simultaneously building community.

Understanding the Relationship Between Divestitures and Innovation: The Role of Organization Design

Designated as a "Best Paper" for STR

Author: **John Eklund**; U. of Southern California

Author: **Emilie Feldman**; U. of Pennsylvania

This paper investigates a tradeoff that may exist between the quantity and quality of innovation outcomes in divesting firms, as moderated by their organization designs. On one hand, divesting firms would be expected to produce fewer inventions after undertaking divestitures due to the knowledge loss that these transactions may entail. On the other hand, divesting firms would be expected to produce more original inventions and to progress a greater proportion of those inventions into development after undertaking divestitures due to the knowledge recombination and resource reallocation benefits of these transactions. These two innovation benefits of divestitures should be lower for firms with decentralized rather than centralized Research and Development (R&D) units. We find support for these arguments in the context of the global pharmaceutical industry.

[view paper \(if available\)](#)

Weathering a Demand Shock: Firm Downstream (non-)Integration and Market Exit

Designated as a "Best Paper" for STR

Author: **Najoung Lim**; U. of Maryland

Author: **Seojin Kim**; U. of Maryland

Author: **Rajshree Agarwal**; U. of Maryland

A sudden decrease in demand can require firms to cope with adjustment and selection pressures. Focusing on the firm's pre-established vertical structure, we examine how a negative demand shock may differentially impact market exit rates of integrated and non-integrated firms. We provide theoretical reasons for advantages and disadvantages of each vertical structure and adopt a research question-based approach to allow the empirical analysis to adjudicate this relationship. Our empirical context is the U.S. medical diagnostic imaging industry (2005-2009), wherein a major legislative reform on Medicare created a derived demand shock. Using a difference-in-differences-in-differences approach, we find that treated integrated manufacturers were more likely to exit product markets post-shock. Our corroborative qualitative insights indicate non-integrated firms were better able to minimize adjustment costs than integrated firms.

Rumelt (1991) Revisited: Does Industry Really Matter More Than Corporate?

Designated as a "Best Paper" for STR

Author: **Ming zhu Wang**; Washington U. in St. Louis, Olin Business School

In a classic paper, Rumelt (1991) conducted variance components analysis on a sample of U.S. firms from 1974 to 1977 and concluded corporate effects to have almost no importance in explaining variation of firm performance. Follow-up studies using alternative methodologies have found the contrary, and show corporate effects to matter more than industry effects. Whether the discrepancies in the order of importance results are due to reasons beyond inconsistent methodology remain unknown. To reconcile the divergent findings across existing studies, I conduct a year-by-year replication of Rumelt (1991) using up-to-date longitudinal data of U.S. business segments. Holding methodology constant, I find that the order of importance of industry and

corporate effects has shifted relative to what was found in the timeframe of the original study. Consistent with Rumelt (1991), industry effects indeed mattered more than corporate effects using data from around the 1970s. However, when the analysis is replicated with over 40 years of data, the results show that corporate effects matter more than industry effects. A year-by-year analysis shows that the shift in order of importance occurs gradually and corporate effects become more important with more recent years of observation.

Do Companies Pay a Wage Penalty For Having Offshored?

Designated as a “Best Paper” for STR

Author: **Alina Grecu**; Copenhagen Business School

Author: **Wolfgang Sofka**; Copenhagen Business School

Author: **Torben Pedersen**; Copenhagen Business School

Like many well-intended strategies, offshoring has unintended consequences. We explore how companies with a history of offshoring are able to attract new employees in the future. We reason that companies need to pay a wage penalty to newly hired employees to compensate for the job insecurity signal they send when offshoring. Our theoretical model integrates mechanisms from the offshoring literature to models of compensating wage differentials. We test our predictions using offshoring survey data merged with employer– employee data for Denmark, resulting in a sample of 15,096 matched, newly hired employees by offshoring and non-offshoring companies. Our results suggest a 5% wage penalty in the case of offshoring companies, and show that this effect is stronger for domestic and cost differentiation oriented companies, but weaker when the newly hired employees join profitable companies. Taken together, this article advances our understanding of the adverse consequences of offshoring by emphasizing the labor market effects.

CAR

Lost...or Found in Translation? Exploring Ways to Broaden our Sight on Careers Research and Beyond (session 289)

This year's conference is like no other before. We decided, thus, to have a plenary for the Careers division like no other before. We are taking this opportunity to have a discussion with leaders from other AOM Divisions, as well as previous leaders of the CAR division. The discussion will revolve around where the CAR division stands with regards to other divisions (i.e., ENT, GDO, HR, IM, MED, OB) of the Academy of Management, and how the divisions could benefit from each other. In a broader sense, it will focus on how we can spur interdisciplinary research crossing the boundaries of our AOM divisions. The plenary will be articulated around an inside-out (CAR to other Divisions) and outside-in (other Divisions to CAR) perspective on mutual benefits from connecting CAR with other Divisions and disciplines. To do so, we asked the panelists the following questions: - How do you believe that other divisions could benefit from the CAR division, and from careers research? How could the CAR Division enhance other divisions? - How do you believe that YOUR division could contribute to the CAR division, and to careers research? Any ideas (e.g., joint PDWs, special issues in journals) to put some actions in place? - How do you think it would be best to integrate CAR topics with other topics (from your own division or experience) to advance research in top journals? Any ideas or suggestions on integration of themes, theories, and concepts? Any ideas of overlapping, yet complementary themes? How do we overcome difficulties in publishing this interdisciplinary research? This session is of interest not only to careers scholars, but to the broader management scholarship community. Please join us for a thought provoking and hopefully inspiring discussion about these topics with the current representatives of each division in the Academy of Management. NOTE: the panel debate is a prerecorded session that you can watch on the AOM conference platform at your own convenience. The session on Monday August 10th 2020 (noon EDT) will feature a live Q&A with part of the panel, who

The Architecture of Relationships at Work: How Strangers Become Relationship Partners (session 294)

This year's Academy of Management theme is "broadening our sights." An important lens through which people perceive and make sense of their organizational environment is through the interactions and relationships that they have with other people at work. Work in organizations is inherently relational (Blustein, 2011), and people have an intrinsic need to connect with each other (Baumeister & Leary, 1995). Scholars have even argued that interpersonal relationships "are the foundation and theme of life" (Reis, Collins, & Berscheid, 2000, p. 844). Indeed, individuals' interpersonal interactions and relationships shape many aspects of their work lives, from how they see themselves and their work, to their workplace attitudes and behaviors (Sluss & Ashforth, 2007, 2008; Ashforth, Schinoff, & Rogers, 2014; Dutton & Ragins, 2007), to how they collaborate or compete with each other (Ballinger & Rockman, 2010; Garrett, Spreitzer & Bacevice, 2017). Despite these important consequences of relationships at work, the question of what relationships actually are has been a surprisingly elusive question in organizational studies. There seems to still be an "absence of a precise and widely used definition of relationships, as well as a paucity of systematic theory construction based on a commonly accepted definition of relationships" (Broom, Casey, & Ritchey, 1997: 7). Building on this point, there is very little work diving into the process of how individuals go from strangers to being in a relationship at work and how relationships evolve or persist over time. Given the paucity of theory in this area, we would like to bring together a group of experts on relationships, high-quality connections and emotions to address the foundations and dynamics of relationships and their evolution over time.

The Need for a New Narrative on Value Capture in Open Innovation Environments (session 305)

Following Chesbrough et al. (2018: 932), we define value as "all actor-perceived consequences arising from the deployment of a resource in a collaborative process" and value capture as "the process of securing an actor-perceived benefit from participation in collaborative value creation." A large body of research has investigated the different mechanisms of value creation. However, most of this research has argued from the perspective of a focal firm, capturing input and knowledge from its periphery to enhance its innovation productivity. How the overall system of actors and contributors in an open innovation environment benefits and captures value from open innovation has been investigated much less. Value capture seems to be still an under-researched topic in the field of open innovation management. A number of researchers (Chesbrough, 2019; Jap, 2001; Moller, 2006; Wagener et al., 2010) have criticized the lack of studies of how value is appropriated. Recently, there have been calls to examine value capture in open innovation systems (Chesbrough and Appleyard, 2017; Chesbrough, Lettel, and Ritter, 2018) to address the imbalance in research between value creation and value capture. Hence, this symposium strives to examine the nature of value capture in different open innovation environments from a multi-stakeholder perspective, and to start and develop a new narrative on value capture. The format of the 90-minutes symposium will be as a moderated panel discussion, with strong interaction with the audience ? Introduction to the topic and the panelists ? Each panelist discusses the topic from his/her perspective ? Summary of key points by the discussant (5 minutes) ? Concluding statements from the panelists and organizer (5 minutes) Panelists' Discussion: Henry Chesbrough: The Need to Understand Value Capture in Open Innovation Christopher Tucci: The Changing Nature of Value Capture in a Crowdsourcing Context Ann Majchrzak: A new approach to crowdsourcing: From ideas to solutions for wicked problems Ian McCarthy: How consumer innovations and related "emotional property" impact a firm's brand value

**Organizing Psychological and
Sociological Approaches to 'Micro'
Corporate Social Responsibility
(session 312)**

In an effort to broaden our sight, we propose to explore the organization of corporate social responsibility (CSR) at a micro- level in a new way. The field of micro-CSR is a fast-growing yet highly fragmented field of empirical studies with strong roots in both the OMT and the OB communities, with SIM and ONE scholars often straddling both perspectives. Micro-CSR scholars in both communities share a common goal of providing the CSR literature with empirically- informed theoretical microfoundations – i.e., foundations based on individual actions and interactions underlying any CSR-related activity – pertaining to how individuals engage in, affect, and are affected by, CSR practices. While operating under the same 'micro- CSR' banner, OMT and OB scholars bring distinct disciplinary perspectives and methodological approaches to study different types of individual-level CSR phenomena. In this workshop, we aim to describe, review and contrast theory and research in two distinct sub-areas within micro-CSR literature: 'sociological micro-CSR' research that members of the OMT division find familiar and typically conduct, and 'psychological micro-CSR' research that is familiar to and largely conducted by members of the OB division. Our PDW contributes to this year's AOM theme of "Broadening our Sight": our goal is to overcome theoretical and methodological dichotomies that currently characterize micro-CSR research. To that end, we have invited OMT and OB

Broadening Entrepreneurial Diversity: Seeing Diverse People, Contexts and Missions (session 307)

This symposium highlights the importance of gender and diversity in entrepreneurial opportunities and the role that entrepreneurial ventures play in solving social and environmental challenges. By exploring entrepreneurial diversity in terms of people, contexts, and mission – by women and minorities, in higher education, Latin America, through crowdfunded organizations, etc. – the key objective of this symposium is to explore how communication, team diversity, and the practice of sustainable entrepreneurship can be enhanced by gender and diversity considerations. The papers in the symposium broaden our understanding of factors that have come to shape the practice of sustainable entrepreneurship and opportunities for new venture creation to generate social impact.

**Organizing for the Climate
Emergency: Organizational
Underpinnings of Climate Action
(session 313)**

In 2019, the Oxford Word of the Year was climate emergency, “a situation in which urgent action is required to reduce or halt climate change and avoid potentially irreversible environmental damage resulting from it.” Indeed, with other developments such as the rise of the Fridays for Future school strikes for the climate and the naming of 16-year old Greta Thunberg as TIME Person of the Year, it is no stretch to say that it was a monumental year for climate change. Sadly, while the science behind climate change is clear and tens of thousands of scientists have declared a climate emergency that could bring catastrophic effects for humanity, society continues to face grave challenges of

Best Papers I: Institutions, History, and Disasters (session 311)

Historical Protestant Influence, Subnational Institutions, and Organizational Structure in the U.S.

Finalist for the Louis R. Pondy Best Paper Based on a Dissertation Award

Designated as a "Best Paper" for OMT

Author: **Kunyuan Qiao**; Cornell U.

I argue that variation across U.S. states regarding historical Protestant influence leads to discernible subnational institutions. These varying institutional patterns among states in turn lead to differences in organizational structures of firms. I also suggest that Catholic activities tend to reshape the historical Protestant influence. Using a hand-collected longitudinal dataset of states from 1776 to 2017 and a panel dataset of publicly traded firms in the U.S. from 1992 to 2017, I found that historical Protestant influence results in flatter hierarchy and greater gender equality in firms, partly through formal and informal institutions that promote liberalism and equality. This effect is weakened by the role of Catholic immigrants through political contestation. Finally, the Catholic reform in 1960s diminished the Protestantism-Catholicism divide, thereby reducing the dampening effect of Catholic immigrants on the historical Protestant influence. My study contributes to (1) institutional theory by unraveling the emergence and evolution of subnational institutions through a religious lens, (2) imprinting perspective by considering the dynamics introduced by counter-imprinting entities (i.e., the Catholic activities), and (3) literature on organizational structure by revealing overlooked antecedents from the nexus of history, religion, and institution.

Playing with Trash: How Gamification Contributed to the Bottom-Up Institutionalization of Zero Waste

Finalist for OMT Division Best Paper on Environmental and Social Practices Award

Designated as a "Best Paper" for OMT

Author: **Olivier Cristofini**; IAE Paris - Sorbonne Business School

Author: **Thomas J. Roulet**; U. of Cambridge

The microfoundational turn in institutional theory has focused on how mechanisms of institutionalization at different levels of analysis are intertwined. However, how social actors can more specifically incentivize and motivate individuals to engage in a new practice, ultimately triggering institutionalization, remains to be studied. From individual engagement to institutionalization, trickling-up mechanisms from micro- to macrolevels of practice engagement are not fully understood. To empirically address those questions, we investigate, across eight local communities, how authorities convinced households to adopt innovative waste management practices using gamification—the application of game principles to nongaming contexts. We draw on rich longitudinal qualitative material including interviews, observation, and secondary data, to give voices to multiple stakeholders. Our empirical design includes a variety of stakeholders: from those who promote the practice, to those who engage with it. We inductively build a multilevel model explaining how gamification can lead, from the bottom up, to the institutionalization of new practices. We flesh out the role of game mechanics in pushing individuals to adopt and spread the practice through their groups and communities and become themselves advocates of the emerging institution.

Strangers at the Bedside: Subaltern Solidarities and New Form Institutionalization

Winner of the OMT Division Best International Paper Award

Designated as a “Best Paper” for OMT

Author: **Devi Vijay**; Indian Institute of Management Calcutta

Author: **Philippe Monin**; EMLYON Business School

Author: **Mukta Kulkarni**; Indian Institute of Management, Bangalore

In this study, we examine how socially subordinated — or subaltern— actors may organize with dominant actors to create and institutionalize a new organizational form that addresses a complex social problem. Drawing on an in-depth qualitative study of the emergence and subsequent institutionalization of a community form for palliative care in Kerala, a southern Indian state, we delineate subaltern solidarity-making as a generative mechanism underpinning new form institutionalization. Specifically, dominant and subaltern actors constituted mutual recognition, reconfigured spatial relations, and built accountability into communities to institutionalize the new form. These relational and spatial processes of solidarity-making shift theorizing from prevailing accounts that emphasize conflict and contestation in political processes, to a generative engagement with heterogeneity in form institutionalization. We discuss contributions to research on new organizational forms addressing complex social problems and subaltern tactics in institutional processes.

When Institutional Factors Matter Most: Cross-National Variation in Disaster Risk Reduction Planning

Finalist for OMT Division Best Paper on Environmental and Social Practices Award

Designated as a “Best Paper” for OMT

Author: **Mickaël Buffart**; Aalto U. School of Business

Author: **Liudmila Ivonen**; Grenoble Ecole de Management

Author: **Grégoire Pierre Antoine Croidieu**; Grenoble Ecole de Management

Author: **Patricia Bromley**; U. of Utah

In this study, we show that institutional influences are stronger than technical ones in predicting the cross-national diffusion of standards on disaster preparedness. We examine the adoption of the first global disaster

risk reduction standard, the Hyogo Framework for Action (HFA), in 186 countries from 2005-2015. Although practical accounts emphasize the technical benefits of the framework in mitigating potential harm and damage, surprisingly, these explanations do little to explain country-level adoption – even when a nation has recently experienced a disaster. Thus, we test and find strong support for an alternative explanation, which draws on the influence of organizational sociology: that institutional influences are the primary driver diffusion of global standards. Specifically, the enduring effects of historical legacies play a particularly important role in adoption. Taken together, our results suggest that preparedness against natural disasters is a culturally mediated practice. A practical implication of our work is that many of the countries most in need of disaster preparedness may, at present, be the least prepared.

Psychological Safety and Speaking Up: New Insights from Health Care (session 1001)

Caring Work Environments and Nurse Burnout: Empirical Test of a Moderated-Mediation Model

Author: Cheryl Rathert; Saint Louis U.

Author: Ghadir Ishqaidef; California State U., Chico

Author: Tracy Hopkins Porter; Cleveland State U.

Burnout has been a chronic problem in the workplace, especially in health care. Although the literature has examined many antecedents to burnout, specific workplace practices to reduce burnout remain elusive. Empowerment has been shown to have strong effects for reducing burnout. Although psychological safety has been proposed as an important variable, it has not yet been empirically examined. Underpinned by conservation of resources theory, we argue that a caring work environment, in which compassion and interpersonal support are key priorities, provides resources for workers, which should increase psychological safety and in turn help reduce emotional exhaustion. Using a cross-sectional sample of 631 clinical health care providers, we examined a moderated-mediation model in which psychological safety, a resource, partially mediated relations between a caring climate and emotional exhaustion, and this effect was stronger for those who were less empowered in their jobs. Our findings suggest that a caring work environment holds psychological resources that may help buffer against resource losses, particularly for less empowered workers. A work environment in which decisions consider effects on others and encourages interpersonal caring and support, may provide psychological and social resources that protect against emotional exhaustion. Although health care work environments will continue to experience constraints on key resources, worker emotional exhaustion may be mitigated through a focus on increasing caring and compassion for workers, through its resultant impact on psychological safety.

Strategic Management and Health Care Performance (session 1002)

Correlates and Motivations for Provider-Sponsored Health Plan Ownership in the Post-Reform Era

Author: Katherine A. Meese; U. of Alabama, Birmingham

The rise and fall of managed care in the 1980s and 1990s saw many hospitals and health systems in the United States enter and subsequently exit the health insurance market in the form of provider-sponsored health plans (PSHP). The passage and implementation of the legislation such as the Patient Protection and Affordable Care Act (ACA) and the Medicare Access and CHIP Reauthorization Act (MACRA) has ushered in an era of value-based reimbursement methods and a heightened focus on population health management, which has stimulated health care organizations to contemplate health plan ownership as a logical strategy. This study examined market and organizational factors associated with PSHP ownership in the post-reform era, as well as motivations for engaging in PSHP. This study used a sequential quantitative to qualitative mixed-methods design. The quantitative analysis examined 5,849 U.S. hospitals using binary logistic regression and ordinary least squares regression models for the year 2017. Ten semi-structured interviews were conducted representing eight health systems in five states. Thematic analysis was conducted and results were synthesized with quantitative findings. The results indicated that hospital and payer concentration, percentage of the state population on Medicare, income per capita, unemployment rate, presence of salaried physicians at the hospital, participation in risk-bearing arrangements, absorptive capacity score, participation in a clinically integrated network, profit-status and CBSA indicator were all significantly associated with health plan ownership at $p < .05$. Interviewees reinforced these findings and described PSHP as the culmination of the journey along the continuum of volume-based incentives to value-based incentives, as well as a strategy to

Resilience vs. Vulnerability: Psychological Safety and Reporting of Near Misses

Author: **Olivia Jung**; Harvard Business School

Author: **Palak Kundu**; UCLA

Author: **Amy C. Edmondson**; Harvard U.

Author: **John Hegde**; UCLA

Author: **Nzhde Agazaryan**; UCLA

Author: **Michael Steinberg**; UCLA

Author: **Ann Raldow**; UCLA

Introduction: Psychological safety, a shared belief that interpersonal risk-taking is safe, is an important determinant of incident reporting. However, how psychological safety affects near-miss reporting is unclear. Unlike incidents, near misses do not result in patient harm, but do contain cues that highlight contrasting sensemaking: resilience (“we managed to avoid failure”) and vulnerability (“we nearly failed”). Herein, we examine the relationship of psychological safety to near-miss reporting in radiation oncology. Methods: We surveyed radiation oncology department staff in an academic hospital (n=127). The survey assessed psychological safety and presented five scenarios: “standard care” involving no patient harm, three near misses with varied timing of the chance occurrence averting harm (“could have happened”, “fortuitous catch”, “almost happened”), and one “hit” involving harm. Respondents evaluated each event as success or failure and reported willingness to report on a 7-point Likert scale. Our analysis employed ordered logistic regression models. Results: 78 staff (61%) completed the survey. The odds of reporting “hit” (OR: 1.96, 95% CI 1.19-3.23), “almost happened” (OR: 1.58, 95% CI 1.05-2.38) and “fortuitous catch” (OR: 1.61, 95% CI: 1.10-2.36) were higher in respondents indicating psychological safety. The relationship of psychological safety was not statistically significant for reporting “standard care” (OR: 1.46, 95% CI 0.78-2.71) and “could have happened” (OR: 1.30, 95% CI 0.91-1.88). The odds of reporting were higher when a near miss was discerned as failure (vs. success). Conclusions: Near misses are not all processed and reported equally. Psychological safety seems to influence reporting when an event underscores vulnerability rather than resilience of care delivery processes. Educating healthcare workers to properly identify near misses and fostering psychological

better compete, and diversify revenue streams. Implications for policy and practice are discussed.

Author: **James Byrd**; U. of Alabama, Birmingham

In today’s dynamic healthcare landscape, hospitals face uncertainty and pressure from changing reimbursement schemas, intense government regulation, technological advances, consumer demand and workforce scarcity. These increased pressures have led to an acceleration of consolidation activities as hospitals position themselves to cope with a dynamic and complex external environment by maximizing resources, creating economies of scale and expanding access to care. Despite increased hospital consolidation activity, little is known about what makes a hospital attractive as a consolidation target to an acquiring hospital, particularly post-ACA. The purpose of this study was to evaluate the organizational characteristics and environmental factors associated with hospitals identified as consolidation targets through the lens of Resource Dependence Theory (RDT) and Resource Based Theory (RBT). A multivariate binary logistic regression model was used to analyze the differences between hospitals selected as consolidation targets and hospitals that were not targets. The findings in this study were somewhat mixed with weak support found for one hypothesis (socio-demographic factors), partial support found for two of the six hypotheses (structural characteristics and competitive factors), and no support found for three of the hypotheses (operational performance, financial performance and physical factors). The results suggest that while operational performance is important to hospital success, when selecting a hospital target, traditionally viewed organizational characteristics (i.e. ownership status) and market factors (i.e. HHI)

safety to encourage reporting would help to improve care and ensure patient safety.

The Impact of Psychological Safety Congruence on Safety Citizenship in Healthcare Organizations

Author: **Morgan Davidson**; U. of Toronto, Institute of Health Policy, Management & Evaluation

Patients continue to experience significant morbidity and mortality from preventable harm in healthcare organizations despite considerable investment, oversight and increased attention to patient safety. This paper explores the impact of psychological safety congruence between supervisors and workers on safety citizenship behaviours as a potential explanation for the stall in healthcare's safety progress. High reliability organizations are defined and discussed as exemplars of safe and reliable operations. Psychological safety, safety climate and safety citizenship behaviours are explored as important components of safety cultures. A conceptual model which uses Festinger's cognitive dissonance theory to augment Ajzen's theory of planned behaviour is outlined and used to illustrate how psychological safety incongruence can affect the performance of safety citizenship behaviours at a unit level. Finally, the theoretical and practical implications of this model and psychological safety congruence are discussed in order to provide directions for future work aimed at developing new mechanisms through which healthcare safety culture can be understood and ultimately, enhanced.

Doing Well by Doing Good: A Study of Corporate Social Responsibility Among Nonprofit Hospitals

Author: **Daniele Mathras**; Northeastern U.

Author: **Amir Grinstein**; Northeastern U.

Author: **Ngoc Thai**; Northeastern U.

Author: **Gary J Young**; Northeastern U.

Research on corporate social responsibility (CSR) offers mixed findings about the impact of CSR on organizational outcomes and the value of CSR fit with the organization's core mission. As such, the CSR of nonprofit hospitals offers a valuable opportunity to study CSR fit as these organizations combine a social mission with business-related strategic objectives. The current research presents a theory-driven model of how customer expectations-based dimensions of CSR affect satisfaction. Our demand-based approach (e.g., customer expectations for CSR) advances prior work that has typically focused on supply-side dimensions of CSR (e.g., philanthropic vs. strategic). We address gaps in the CSR literature by: (i) studying CSR within a nonprofit context (over 1,500 nonprofit hospitals in the US) rather than for-profit context, (ii) using actual organizational spending on CSR dimensions rather than self-reported perceptions of CSR, and (iii) utilizing longitudinal data (2009 – 2014) rather than cross-sectional data. Results find that CSR fit alone does not explain organizational outcomes, but rather does so only when CSR goes above and beyond customer expectations. The study also raises an important consideration that how patients rate the quality of their hospital care is influenced by their pre-experience attitudes toward the hospital.

hierarchical distance in medical teams and task volatility, deciding whether to speak up is a delicate situation: remaining silent can endanger patients, but questioning superiors brings its own risks. Our sample comprises 12 acute care teams that solved cases in the simulation suite of a leading hospital. We deployed a microethnographic approach to analyze the unfolding of upward voice through vocal, emotional, and spatial cues. Facilitation emerged as the leadership style that resulted in most speaking up. Leaders must not only acknowledge input from team members, but also provide an explanation for acting (or not) on their remarks. This finding contributes to voice literatures by suggesting an interpersonal strategy for leader-member exchange in the discrete moment of speaking up. Besides verbal cues, the gesticulation of some participants revealed a physical tension when engaging in speaking up, which provides evidence for the balancing of opposing forces in such emotionally charged moments. We also add to an emerging theme in management that connects the discussion of emotions to that of behavioral change, which we ground in Schein and Lewin's early theorizing.

Author: **Erin Marie Reid**; McMaster U.

Author: **Susan J. Ashford**; U. of Michigan

Author: **Steve E. Granger**; U. of Calgary

Gig workers face a number of challenges that differ in nature or intensity from those experienced by traditional organizational workers. We developed and tested a measure of six challenges commonly faced by independent workers—viability, organizational, identity, relational, emotional, and

With this article we study the dynamic interrelationship between stigmatization and legitimation processes during a series of scandals in the financial sector. We adopt a communication-based audience perspective and analyse how audiences transform legitimizing conversations through targeted labelling, vilifying, and mobilising against banks in social media. We observe how this stigmatization process reinforces itself through a vicious loop, and later becomes diluted through the re-emergence of legitimizing conversations that render banks as a broader legitimate business category, yet how partial stigmatization remains. Our analysis based on 2.8 million tweets contributes to our understanding of stigma emergence and dilution based on an exploration of the complex interrelationship between stigmatization and legitimation in the so far little understood social media arena of Twitter.

AI Affecting Local Search in Strategic Decision-Making

Finalist for MOC Division Best Submission with Practical Implications for Organizations
Author: **Jane Seppälä**; Aalto U., Department of Industrial Engineering and Management

Artificial intelligence technologies could be used to direct executives' scarce attention to improve the quality of decision making and in particular, improve strategic search. However, use of such technologies could also amplify bias or induce local search. We draw from literature on local search as well as literature on managerial implications of AI technologies to specify how the use of AI technologies could affect search in the context of strategic decision-making. We propose that AI tools can broaden search space, change cognitive-attentional dynamics of the search process, or affect interpretation of cues. We further detail what factors are likely to affect this, including managerial, organizational and industry characteristics. We thus contribute to the literature on local search by detailing how technologies might alleviate or aggravate the situation, and to literature on AI technologies by providing guidance on how these technologies could be used in the strategy process

career-path uncertainty—in three samples of platform-based workers, including Mechanical Turk workers and highly skilled independent scientists. Initial evidence for the measure's validity included its convergent and discriminant validity in relation to measures of depletion, thriving, resilience, and loneliness. We confirmed the measure's factor structure, showed its relationship with thriving and perceived meaningfulness of work, and examined differences across different subgroups in the sample of independent scientists. Our findings help us to better understand the types of stressors independent workers face in the gig economy, and our diverse set of samples provides evidence of the universality of these stressors. Further, our developed measure represents an important research tool for future studies of independent (gig) workers' experiences.

From Clear Skies to EF5s: How Storm Chasing Teams Stay Engaged with Temporally Uncertain Work

Finalist for MOC Division Best Paper Award
Author: **Derin Kent**; Aalto U. School of Business
Author: **Nina Granqvist**; Aalto U.

How do people in teams engage with temporally uncertain activities, where the work bounces from slow and uneventful to exciting and chaotic, often unpredictably? Existing management theory focuses on temporal uncertainty as a coordination or strategic problem. This view, however, misses the extent to which people respond emotionally to the temporal dimensions of work. Its timing, pace and rhythm can foster role engagement among organizational participants, or disappoint and disengage them. Based on an ethnographic study of storm chasers in Tornado Alley, we propose that teams coordinate their sense of time in part to maintain collective role engagement with temporally uncertain work. Theorizing temporal organizing as a process of group emotion work, we explain our seemingly counterintuitive observations, like storm chasing teams creating ambiguous, open-ended or less plausible expectations about the future. We show how these findings contribute to the literatures on temporality and collective role engagement, and draw practical implications for

in an optimal way.

Algorithmic Decision Making Undermines Affective Commitment

Finalist for MOC Division Best Submission with Practical Implications for Organizations

Author: **Chunchen Xu**; Stanford GSB

Author: **Arthur S. Jago**; U. of Washington, Tacoma

We propose that using algorithms to make human resource decisions (e.g., selection, promotion, compensation, etc.) will undermine employees' affective commitment. Specifically, we posit that algorithms signal a lack of individualized concern, which lowers perceived organizational support, and, in turn, feelings of affective commitment. In a series of five studies, we find strong support for this model, using a wide range of samples, methods, and contexts. We also identify a potential intervention: human beings teaming with algorithms to jointly make decisions partially restores perceptions of individualized concern, as well as feelings of organizational support and affective commitment. We discuss the implications of these findings for future research on how organizations can integrate algorithms into decision processes and successfully navigate the process of automation.

The Future is Now – Temporal Work, Sensemaking, and Agency During Planned Organizational Change

Finalist for MOC Division Best Student-Led Paper Award

Author: **Jack Lewis Fraser**; Cambridge Judge Business School

Coping with major change is a formidable challenge for organizations, triggering a process of sensemaking as managers must confront competing strategic accounts of how the firm is expected to behave 'now' versus going forward. If unreconciled, these competing accounts can drive cognitive breakdowns as managers attend to pressing present demands that clash with those of the desired future. While 'temporal work' to create coherent accounts of the present-past-future is one way to address such impasses, at times it is hard to achieve coherence due to disparity between current demands and future expectations. From our in-depth account of Fincorp, we explore how organizational members address this challenge by adjusting their orientation in time while engaging in temporal work to 'discount' the fixation on the present and overcome seemingly irreconcilable conflicts between present and future demands. We contribute to the literature on temporal sensemaking, and organizational change by showing how managers engage in temporally reflexive thinking – a kind of "mental time travel" – in which they make decisions in the present from the perspective of the future. In doing so, they mitigate the significance of present concerns that impede organizational change by using "hindsight" as a cognitive tool to make decisions in the present.

Allies or Adversaries? Making Meaning of the Gig Employment Relationship

Designated as a "Best Paper" for MOC

Author: **Lindsey Cameron**; The Wharton School, U. of Pennsylvania

Task Rabbit. Doordash. Instacart. The gig economy,

working memory (WM) performance via hindrance stressors because of intrusive thoughts occupying cognitive resources. On the other hand, given that proactivity is primarily geared towards increasing effectiveness and progress in core tasks, we also consider the potential positive impact of such proactive behavior on end-of-day WM performance via perceived work goal progress freeing up cognitive resources. We conducted a daily diary study ($n = 163$, $k = 701$) over five consecutive days. Using multilevel modeling, we found that proactivity was positively associated with hindrance stressors which in turn have a negative impact on end-of-day WM performance. We also found that proactivity was positively associated with perceived work goal progress which in turn had a positive impact on end-of-day WM performance. Our findings suggest that higher levels of daily proactive behavior are associated with impaired executive functioning, supporting the resource intensive nature of proactivity.

a labor market that relies on algorithms to facilitate short-term assignment, has transformed how work is executed and experienced. Algorithms are taking over managerial functions enabling more distributed work leaving workers themselves become more atomized with little – if any – contact with managers or co-workers. How do workers make meaning of and come to understand their relationship to work in such an environment, particularly in the absence of managers and co-workers? Drawing on a qualitative field study, including three years of working in the gig economy and longitudinal interviews ($n=107$) of gig workers (ride-hailing drivers), I examine how these workers make meaning of their work in such a context. Focusing on the practices and perspectives of the two most salient features of this work environment—customers and technology—I find that workers engage in job crafting activities that either expand or constrict their work role. These practices and perspectives lead drivers to understand their relationship with their work as either an alliance or as adversarial which culminates in different outcomes. This paper contributes to literatures in the meaning of work and customer service work.

Identity Conflicts in Multiteam Settings

Author: **Jana Wilhelm**; Johannes Gutenberg-U. Mainz

Multiple team membership (MTM) has become a typical feature of today's work environments. In this study, we investigate how MTM (i.e., the number of simultaneous team assignments) affects individual employees' perception of identity conflict. Existing research is ambiguous regarding this relationship. While individuals have been found to be capable of incorporating as many social identities into their self-concepts as they have memberships on groups, they are particularly prone to experience conflict when they are required to actively employ the various identities associated with the memberships. We reconcile these two competing views by proposing an inverted U-shaped relationship between MTM and identity conflicts that assumes the perception of identity conflict to exacerbate until a certain level of MTM is reached beyond which the tensions eventually ease. Analyses of a comprehensive sample of multiteamers provide

Workplace Incivility: New Frontiers and Research Directions (session 1016)

Research on workplace incivility is blossoming (see Schilpzand, De Pater, & Erez, 2016) with many new quality papers published each year on experienced incivility, witnessed incivility, and instigated incivility. The goals of this symposium are to showcase the various ways in which the incivility literature is evolving and to stimulate ongoing incivility research that builds on these new theoretical and empirical insights. In pursuit of these two missions, for this symposium we invited a group of researchers who are conducting novel direction-setting and cutting-edge research on workplace incivility to contribute their latest work. The five included studies will reveal novel theoretical directions and empirical insights about uncivil workplace conduct that organizational behavior scholars may build upon in their own research.

Profiling Performance Trajectories in the Internal Hiring and Adjustment Process

Author: **Jingyang Gu**; U. of hong kong

Author: **Helen Hailin Zhao**; U. of hong kong

Author: **Shun Yiu**; The Wharton School, U. of Pennsylvania

Author: **Shanshi Liu**; South China U. of Technology

Internal hiring has been recognized as an important staffing strategy and a strong driver of employee internal mobility. The current study explores whether different performance change patterns exist for successful and unsuccessful internal applicants after their application and how their abilities relate to performance change patterns. In Study 1, using the latent class growth analysis, we identify the coexistence of three distinct longitudinal change patterns of successful applicants' job performance (i.e., maintenance, upward, and downward patterns) and four distinct change patterns for unsuccessful applicants' (i.e. slightly increase, downward, inverted-U from medium performance, and inverted-U from low performance patterns). In Study 2, we replicate these patterns and demonstrate that workability and adaptability are important antecedents of such performance change patterns. Specifically, successful applicants with high workability displayed an upward pattern; Successful applicants with low adaptability displayed a downward pattern; Unsuccessful applicants with low workability displayed an inverted-U from low performance pattern; Unsuccessful applicants with low adaptability displayed downward pattern.

Occupational Stability in Turbulent Times

Author: Guri Medici; ETH Zurich

Author: Ivana Igic; U. of Bern

In today's dynamic work environments, individuals are increasingly required to manage their own career trajectories. Also in careers that appear stable for the outside observer, constant adjustment takes place, where the fit between the person and their work environment is repetitively (re-)established. Prior research on career management and person-environment fit mostly focused on jobs and organizations, missing the role of occupations as important points of orientation. Person-occupation fit is usually explored in the context of occupational choice but how employees manage to (re-)establish this fit over time has not yet been addressed. Hence, little is known about the process of occupational stability maintenance. This study addresses this gap and explores how occupational stability is maintained through the continuous adjustment of individual needs and environmental requirements. Understanding occupational stability as a process calls for a qualitative research design. Therefore, 32 semi-structured interviews with employees from different vocational backgrounds were conducted. Qualitative content analysis inductively revealed eight major categories underlying the process of occupational stability maintenance, condensed into the three overarching conceptual themes: growth, meaning, and balance. We discuss these themes using job crafting and work role adaptation as theoretical lenses, thereby showing the relevance of these concepts not only for understanding behavior related to one's job, but also to one's occupation.

University Presidents' Careers: A Career Ecosystem Perspective of Cultural and Institutional Factors

Author: Katja Dlouhy; U. of Mannheim

Author: Torsten Biemann; U. of Mannheim

Author: Yehuda Baruch; Southampton Business School, U. of Southampton

Building on the theory of boundaryless careers and career ecosystems, we explore what it takes to attain the highest rank in academia and become a university president. We assess how characteristics of the career ecosystem influence university leaders' careers, and what career paths to the top in academe look like. To answer these questions, we study careers of university leaders in 40 countries, employing sequence analysis methods. We find typical career patterns that university leaders follow, represented by six distinct clusters, and relate similarity in cultural and institutional characteristics to similarity in the careers of university leaders. Our findings expand contemporary theoretical paradigms, in particular boundaryless career theory and career ecosystems theory, and advance the understanding of career paths to the upper echelons in academe.

The Evolution of U.S. Top Executives' Career Trajectories: An Empirical Examination

Author: **Rocio Bonet**; IE Business School

Author: **Monika D. Hamori**; IE Business School

Author: **Melis Yucel**; IE Business School

We explore changes in the career trajectories of the top executives of U.S. corporations over the last decades. We focus on two aspects of career trajectories: work-context specific experience and work- context diversity. Building on prior literature, we argue that environmental and business changes have altered the relative costs and benefits of having work-context specific human capital and diverse work-context skills. We also argue that these changes have differently affected executives, depending on their roles. Using data on individuals appointed to top executive roles in the Fortune 100 corporations between 1949 and 2011, we find evidence of important changes in the paths taken by top executives to their executive roles. There has been a decrease in firm- and industry-specific experience for all executives, though the decrease has been bigger for general managers and product functional specialists than for administrative functional specialists. We also find that there has been an increase in employer and industry diversity for all executives, but a decrease in functional

New New, New Old: Understanding Individual and Contextual Influences on Graduates' Career Choices (session 980)

Young graduates are the talent of the future and they will become an important group in organizations in the next decennial. Individuals' career preferences and work values have shifted over time and, as a result, claims in literature posit that the traditional career will slowly fade away in order to make way for the modern career. In addition, strong contextual forces such as globalization, technology, organizational restructuring, and the growth of services have altered the way we look at careers and challenge what older generations have hitherto taken for granted. Research presented at this symposium will add substantially to the existing literature on what new cohorts of graduates expect from their future career and employer. Authored by scholars from eleven European countries, the papers included in this symposium integrate individual and contextual factors influencing graduates' career intentions across contexts.

Same Same But Different? Career Orientations of Generation Y Between Tradition and Modernity.

Broadening Our Understanding of "Doing Justice" in Organizations (session 982)

Many of society's pressing challenges — conflict, discrimination, well-being — can be linked to injustice within organizations. Effectively addressing workplace injustice requires scholars to broaden our understanding of what it means to “do justice” in organizations. In this symposium, we aim to “broaden our sight” (Academy of Management, 2020) by bringing together a diverse panel of leading scholars who are tackling critical questions related to the obstacles and challenges associated with fostering justice and fairness in the workplace. Using disparate methodologies (e.g., experiments, field studies, interviews) and theoretical frameworks (e.g., appraisal theory, fairness theory, goal prioritization, moral disengagement), our presenters provide insight into (a) the situational factors that can impact whether managers act justly, (b) who is likely to enact justice and the role of emotions in the process of enactment, (c) how managers make sense of having acted unjustly, (d) how perceptions of unfairness can stem from a mismatch between the amount of trust one desires and receives, and (e) the process by which managers are personally blamed and held accountable for unfair situations. The symposium will conclude with an interactive discussion that highlights key themes and directions for future research as well as practical insights into how managers and organizations might promote fairer workplaces by encouraging justice enactment

Why Don't Top Management Journals Publish More Papers on the Big Challenges Facing Humanity?

Author: **Bill Harley**; U. of Melbourne
Author: **Peter Fleming**; U. of Technology, Sydney

Our paper analysed approximately 5500 articles published in 'top-tier' management journals between 2008 and 2018 to identify the extent to which they engaged with 'societal grand challenges' (e.g., critical investigations of wealth/income inequality, global warming, racism, gender inequality, etc.). Only 2.8 per cent did so. The reason why, we argue, is not because management scholars are oblivious to major problems facing societies around the world. For example, the Academy of Management even themed its 2013 conference 'Capitalism in Question'. We instead examine the relationship between a) practices in contemporary business schools that reduce the likelihood academics will submit 'critical' papers and b) journal norms that favour rejecting such papers if submitted. We term this the 'business school/elite journal gridlock'.

Business Education in India: Harvard, Highly Placed People, and the Cold War (WITHDRAWN)

Author: **Keshav Krishnamurty**; U. of Massachusetts, Boston

Business education has either been viewed as transferring from one country to another as a matter of course, or as the postcolonial imposition of a colonizing country's management knowledge upon a former colony. I question these assumptions by studying the development of the Indian Institute of Management(IIM) at Ahmedabad using archival materials stored at Harvard Business School(HBS), which reveal that the establishment of the IIM was purposive, and that postcolonial power structures were to some extent reversed. I also bring into account the influence of individuals during this process, which were crucial in establishing the IIM.

Mechanisms of Micro-Terror? CMS Early Career Academics' Experiences of 'Targets and Terror'

Author: **Olivier Ratle**; U. of the West of England

Author: **Sarah Robinson**; U. of Glasgow

Author: **Alexandra Bristow**; The Open U. Business School

Author: **Ron Kerr**; U. of Edinburgh

In this paper we apply the concept of 'targets and terror', previously applied in the healthcare sector, to the audit culture within business schools. We explore to what extent terror, or the inculcation of fear through processes of domination, may be identifiable in the micro-level experiences of early career academics (ECAs). Drawing on an international study of 38 Critical Management Studies ECAs from 15 countries, we develop a theoretical framework combining Bourdieu's modes of domination and Meyerson and Scully's Tempered Radicalism (TR) which helps us identifying top-down and horizontal processes of micro-terror and bottom-up processes of micro-terrorism, specifically self-terrorization. In extending the study of 'targets and terror' cultures to contemporary business schools, we develop a clearer understanding of how domination plays out in the everyday processes of management and self-management. From Bourdieu's modes of domination, we discern a dark picture of institutional and interpersonal overt and symbolic violence and bullying in the name of target achievement. The TR lens helps us to understand ECA challenges that can lead to self-terrorization but also brings possible ways forward, showing ECAs how to resist mechanisms of terror through their own small acts of counter-terrorization, providing some hope as the basis for collective resistance.

The 99 Percent Economy: A Discussion of P. Adler's Proposals for Democratic Socialism in the U.S. (session 984)

The CMS Division domain statement calls for us to develop critique of “established management practices and the established social order” and to “generate radical alternatives.” Paul’s recent book, “The 99 Percent Economy: How Democratic Socialism Can Overcome the Crises of Capitalism” (Oxford University Press, 2019) offers just such a twin argument — developing a critique of the prevailing conditions which links major problems we face to the capitalist character of the economy on which our society depends and describing characteristics of a radical “democratic socialist” alternative. His book should be of interest to a wide range of CMS members for several reasons: it is a detailed, political economy critique of capitalism

Author: **Mats G Alvesson**; Lund U.

Author: **Betina Agata Szkudlarek**; U. of Sydney Business School

This paper addresses the temporality of resistance in work context. We focus on the challenge of increasingly diminishing professional autonomy in higher education institutions, as well as the vulnerability of staff subjected to academic managerialism. A case where a lecturer is exposed to requirements to revise grading by senior administration is investigated. Power is understood from the ‘target’s’ perspective and viewed as the erosion of resistance. We introduce the concepts honorable surrender and smoothers to capture the process of giving up of resistance. We argue that these concepts are of special significance in autonomy-espousing work contexts where multiplicity of power resources are employed to subordinate employees and influence their professional identities.

“Maybe Baby?” The Risky Business of Potential Parenthood

Author: **Jamie L. Gloor**; U. of Exeter Business School

Author: **Tyler Gene Okimoto**; U. of Queensland

Author: **Eden King**; Rice U.

Research grounded in lack of fit and gender role theories has shown that women face numerous employment disadvantages relative to men, with mothers often facing even greater obstacles. Integrating intersectionality theory, we challenge this dichotomy, proposing that motherhood is not a necessary condition for women to face motherhood penalties. Instead, we argue that managers’ expectations a childbearing-aged applicant will have a child in the near future (i.e., “maybe baby” bias) increase their perceptions of risk associated with

formulated for a non-academic U.S. audience, it goes beyond critique to describe specific characteristics of democratic socialist practices, and it draws on organizational analysis of “high road” capitalist corporations for examples of such practices. CMS members – and fellow traveler AOM participants - are likely to embrace parts of Adler’s analysis and proposals. And some will be critical of other parts of what he says and omits. This panel will offer a range of responses to Adler’s arguments and encourage audience participation. The goal of the symposium is to foster productive discussion that clarifies effective strategies for building alternatives to capitalism.

employing women—but not men—especially for more costly positions (i.e., with more maternal leave benefits). Conceptualizing hiring as a risk assessment process, we further propose that managers’ perceived risk and cost drive more risk-averse employment conditions (e.g., shorter job tenure, less likely to be hired) for these women. Results largely supported our predictions across attitudinal and objective indicators, triangulating evidence via a field study with early-career employees (Study 1) and an experiment with hiring managers (Study 2). Extensive research has shown that mothers face greater employment obstacles than their childfree or male counterparts. However, the current findings suggest that the perceived risks and costs of parenthood can be more hazardous for the employment of women who simply have the potential to become parents.

Gendered Accent Penalty: An Informal Network Perspective on Employment Discrimination

Author: **Farnaz Ghaedipour**; McMaster U.

Author: **Erin Marie Reid**; McMaster U.

Author: **Aaron CH Schat**; McMaster U.

Does having a non-native accent have different effects for men and women’s chances of getting hired? Through two studies of hiring that include job applicants with native (North American) and non-native (Indian) accents, we draw on the stereotype content model to demonstrate that in recruitment and competence ratings, men with non-native accents are penalized more severely for their non-native accent compared to women. In Study 1, we found that women were not really penalized for their accents. We then replicated the findings of Study 1 in a second study with a managerial sample and tested informal network attractiveness as a key mediator in the relationship between male job applicant’s non-standard accent and their job suitability ratings. We found that informal network attractiveness mediates the relationship between male job applicant’s accent and job suitability ratings. The theoretical and practical implications of our research for scholarship on accent bias, intersectionality and hiring discrimination are discussed.

Identity-Conscious and Identity-Blind Pay Equity Statements & their Effect on Applicant Perceptions

Author: **Melanie Ward**; U. of South Carolina, Darla Moore School of Business

Author: **William Benjamin Ward**; U. of South Carolina

Attracting top talent and increasing workforce diversity have been persistent concerns for scholars and practitioners alike (e.g. Avery, 2003; Ployhart, Schmitt, & Tippins, 2017) as employers seek to determine the best ways to attract the right people for the right jobs. In the process, they must ensure their recruitment material contains signals, or messages, which align with the values and needs of their applicants. One of these signals is pay equity. Integrating theory on social identity, signaling, and social comparisons, we explore the effects of identity-blind and identity-conscious pay equity statements and their effects on applicant perceptions. Specifically, we find that identity-conscious messages are more attractive to female applicants who highly identify with their gender and are less attractive for males who highly identify with their gender. We also find that women have higher salary expectations for an organization when pay equity is communicated regardless whether it is framed as an identity-blind or identity-conscious practice. Theoretical and practical implications are also discussed.

The Influence of Sexual Orientation on Academic Self-Concept as a Mediator of Gender and Leadership

Author: **Jeffrey Miles**; U. of the Pacific

Author: **Stefanie E Naumann**; U. of the Pacific

Previous research on the influences of both gender and sexual orientation on leadership effectiveness have been mixed, with some studies finding that women and/or sexual minorities as more effective leaders than men and/or heterosexuals, and some studies finding the opposite or no differences at all. Additionally, although attitudes have recently been changing, biases in people's perceptions about leaders (e.g., that the image of a leader is associated with masculinity and heterosexuality) persist. We believe that this inconsistency may be explained, in part, by the social identity theory of leadership (Hogg, 2001). In this study, we seek to contribute to a more complete understanding of these conflicting findings by proposing and testing an innovative model that integrates different research streams on gender, sexual orientation, academic self-concept, and self-perceptions of leadership. Specifically, we propose that academic self-concept underlies the

in-depth interviews with senior leaders in organizations that employ Persons with Disability (PwD), the study highlights emerging themes regarding organizational constraints that leaders consider, while designing the strategy. The various themes are identified as: accessibility of infrastructure; organization structure (rigid/flexible); familiarity with the disability type; budget for inclusive interventions; nature of work; and variety of roles. Based on present findings and the contextual approach to targeted recruitment, we discuss implications for research and practice.

Gender Roles and Bias (session 998)

A Cross-Industry Comparison of How Women Leaders Experience Gender Bias

Author: **Amber Stephenson**; The David D. Reh School of Business, Clarkson U.

Author: **Amy Diehl**; Shippensburg U.

Author: **Leanne Dzubinski**; Biola U.

Though gender inequality has recently received heightened attention from scholars and policy makers, it is estimated that economic parity remains more than two centuries away. It is established that overt and subtle forms of gender bias obstruct women's advancement in organizations. While much research has examined the nature of such biases, little is known about how women leaders experience gender bias across different industries. We used a convergent mixed-method approach for data collection. Using survey responses and data from open-ended responses from four disparate industries in the United States (higher education, faith-based non-profit organizations, healthcare, and law), we assess how women leaders experience 15 different aspects of gender bias and compare these experiences across industries. The results of MANOVA and qualitative content analyses indicate that, while gender bias is prevalent in all industries, differences exist across the industries, suggesting a

relationship between gender, sexual orientation, and self-perceptions of leadership. In a sample of 964 undergraduate students, we found that academic self-concept mediated the relationship between gender and leadership for all subjects and for self-reported heterosexual subjects, but not for self-reported non-heterosexual subjects. These findings contribute to a more complete understanding of college students' perceptions of their academic self-concept and leadership. In addition, they offer key insights for interventions aimed at closing the gender and sexual orientation gaps in self-perceptions of leadership and academic self-concept. We explore the theoretical and practical implications of our findings.

Workplace Incivility and Job Performance: The Role of Anxiety and Psychological Capital

Author: **Inamul Haq**; Monash U., Malaysia

Author: **Humera Sattar**; Children's Hospital and The Institute of Child Health, Lahore

Author: **Usman Raja**; Brock U.

Author: **Muhammad Umer Azeem**; U. of Management and Technology, Lahore, Pakistan

Building on conservation of resource (COR) theory, we investigated the relationship between workplace incivility and job performance through anxiety. We also explored the mitigating role of psychological capital (PsyCap) in these relationships. Using time-lagged multi-wave and multi-sources (self- and supervisor-reported) data (N = 208) from employees in service sector supported our predictions. Results indicated workplace incivility arouses anxiety, which in turn leads to decline in job performance. PsyCap reduces the harmful effects of incivility such that the relationship between incivility and anxiety is weaker when PsyCap is high. Similarly, the indirect effects of incivility on job performance through anxiety are dampened for those with high PsyCap. We discuss implications and significance of the findings of our study and provide directions for future research.

The Paradox of Workplace Anger: How Women Can Level the Playing Field

Author: **Aitong Li**; Columbia U. Teacher's College

Author: **Avina Gupta**; Chick-fil-A, Inc

While male leaders are rewarded for expressing anger in the workplace, female leaders are punished through negative characterizations and employee-manager relationship outcomes. Research has demonstrated that one mechanism that accounts for this differential treatment of male and female leaders who express anger is the attribution made about their anger (Brescoll & Uhlmann, 2008). As compared to male leaders, female leaders anger expression is attributed more to internal factors (e.g., personality) and less to external factors (e.g., situation with colleague). The purpose of the current study is to examine whether a pre-existing relationship between a leader and an employee can buffer female leaders who express anger from employees' negative characterizations and backlash through changing the attribution of the anger expression so that it is attributed more to external factors and less to internal factors. Participants were given scenarios in which they were depicted as employees and their manager (either a male or a female) had expressed anger at them. In addition, half of the participants were told they had a pre-existing relationship with their manager while half were told they did not know their manager well. As hypothesized, a pre-existing relationship buffered female managers who expressed anger from employees' negative characterizations (competence, communality and interpersonal hostility, advancement potential and boss desirability) and employee-manager relationship outcomes (trust toward the manager, intention to quit the manager, and retaliation toward the manager) through attributing the anger more to external factors and less to internal factors.

Sex Differences in Core Self-Evaluation: A Meta-Analytic Review

Author: **HeyIn Gang**; Iowa State U.

Author: **Marc H. Anderson**; Iowa State U.

Author: **James Summers**; Iowa State U.

Self-confidence is one of the most important characteristics in understanding employee behaviors. Confident employees show better job performance, have higher job satisfaction, and more successful leadership behaviors. It is widely believed that women have less self-confidence than men and this is considered a major reason for women making slow progress in business world. However, is it really true that women lack self-confidence? Although this a widely held belief, there is no systemic evidence regarding whether it is supported. Consequently, this meta-analysis intends to answer this question by focusing on core self-evaluations (CSE). We argue that CSE is the most comprehensive construct that captures self-confidence. CSE is a broad dispositional trait that represents an individual's basic evaluations of themselves and comprises the four specific traits of self-esteem, generalized self-efficacy, locus of control, and emotional stability. In this meta-analysis, we discovered that sex differences in CSE are significant but small, and, in many cases, there is no difference in various moderating conditions. Further, the gap is declining over time. Unexpectedly, the sex gap is greater in Western than Eastern cultures. Our findings have crucial implications for research on leadership and gender differences, and refute the lay beliefs that women lack self-confidence compared to men.

Author: **Estelle Archibold**; Case Western Reserve U.

Author: **Diana Bilimoria**; Case Western Reserve U.

Current conceptualizations of confidence are characterized by being individual, static, and masculinized. By focusing on self-beliefs, existing constructs present a problematic framework to intervene in women's (lower) self-confidence as

How Does Expressing Humility Affect Females? The Role of Supervisors' Gender

Author: **Chia-Yen Chiu**; U. of South Australia

Author: **Elsa Chan**; City U. of Hong Kong

Author: **David R. Hekman**; U. of Colorado, Boulder

Author: **Brad Paul Owens**; Brigham Young U.

Does showing humility generate positive outcomes for female leaders? On the one hand, from the gender-role congruence perspective, the expression of humility matches observers' expectation of a female leader's communal quality and thus amplifies her leadership influence. On the other hand, implicit leader theories suggest that the expression of humility by a female leader might degrade others' judgments on her leadership capability. To address these seemingly contradicted viewpoints, we differentiate leadership outcomes into leadership effectiveness (e.g., bringing positive influence on others) and leadership impression (i.e., whether an individual is seen as a "qualified leader"). We argue that for a female leader, expressing humility would improve her leadership effectiveness in coaching followers and promote their satisfaction at work. However, being humble could hurt her supervisors' impression about her leadership capability, especially in the eyes of male supervisors. We conduct two empirical studies (experiment and scenario manipulation) to test our hypotheses and conclude that (1) humble (vs non-humble) female leaders have a greater positive impact on followers' received coaching and satisfaction (2) male supervisors (vs female supervisors) will give a humble female leader a lower leadership impression rating on her promotability through a lowered perceived leadership competence. The research conclusion should bring important insights and suggestions for improving leadership development and assessment programs in organizations.

The Perpetuation of Gender Inequality Through Costly Gender Congruent Choices

Author: **Yei Rim Suh**; Boston U. Questrom School of Business

Author: **Evan P. Apfelbaum**; MIT Sloan School of Management

asserted in the popular literature. We offer a different way of understanding confidence in the workplace, and propose a new construct—relational confidence—that takes into consideration the dynamic, contextual and interactive nature of confidence. Instead of singularly viewing women as needing to project more self-confidence behaviors, for example in applying for leadership positions, the notion of relational confidence highlights the importance of interpersonal relationships and working with the organizational system to address issues in women's confidence. We discuss the mechanisms of relational confidence, how confidence occurs in the interaction between the self and others, and not just as an internal property of the self. We describe the process of workplace validation that emerges from projecting and endorsing between the self and others at three levels: intrapersonal, interpersonal, and system validation. We conclude by offering thoughts for future research and implications for women's confidence in the workplace.

Asynchronous

PAPER SESSION

ASYNCHRONOUS

Author: **Michael Norton**; Harvard U.

Classic theories of gender inequality focus on women's experiences to understand processes in play (e.g. backlash, glass ceiling). We considered how men's reluctance to act in ways that may be perceived as feminine could be an unexplored mechanism through which gender inequality is perpetuated. Studies 1 and 2 demonstrated the existence of an asymmetry in how men and women approach gender incongruence in self-expressive contexts. Results indicated that though both men and women prefer gender congruency, there exists an asymmetry whereby men care more to avoid gender incongruence. Men's willingness to bear disproportionately greater costs to avoid incongruence was so much that they forwent higher quality choices (e.g. better fitting clothes), whereas women did not disregard quality. In Study 3, we extend the implications of this asymmetry to career decisions. We examined an asymmetry in the magnitude of costs (e.g. higher salary/stability) that men and women are willing to incur to remain gender consistent in the labor market, and again found that men are more reluctant to make gender incongruent choices than women. We further discuss how the function of this asymmetry in perpetuating gender segregation differs from, and can add to, literature on gender inequality.

Knowledge is Key: Unlocking the Positive Effects of Age Diversity in Organizations (session 995)

The working population is more age-diverse than ever before (Truxillo, Cadiz, & Hammer, 2015). At the same time, knowledge loss has become a real threat to organizations due to massive waves of retirement because members of the Baby Boomer generation are gradually leaving the job market. These trends affect organizations at large and require evidence-based solutions to successfully manage the consequences of demographic change and to unlock the benefits of an age-diverse workforce.

GDO

Social Networks and Gender (session 999)

The Status Costs of Building High-Status Network Ties: The Pivotal Role of Gender

Dorothy Harlow/McGraw Hill Best (Conference) Paper Award

Designated as a "Best Paper" for GDO

Author: **Siyu Yu**; New York U.

Four multi-method studies examine individuals' status attainment as a function of the status of their social network contacts. Results demonstrate that

Motivational changes across the lifespan and differences in socialization, education, and on-the-job experiences suggest particular benefits from intergenerational knowledge sharing. However, like other types of diversities, age diversity can lead to both positive and negative outcomes (Horwitz & Horwitz, 2007; King & Bryant, 2017) and the underlying mechanisms and boundary conditions facilitating positive effects remain largely unclear (North, 2019). This symposium sets out to open this black box and identify underlying mechanisms and boundary conditions that unlock beneficial outcomes of age diversity. First, Li, Burmeister, Wang, Asencio, Zhu, and Jin empirically examine whether age diversity in teams is positively related to innovation via knowledge exchange density and novelty, and whether team task reflexivity is a boundary condition of these mechanisms. Next, Burmeister, Gerpott, Hirschi, Scheibe, Pak, and Kooij demonstrate the effectiveness of two newly developed age diversity training interventions intended to improve intergenerational contact quality and knowledge transfer. Third, Pfrombeck and Burmeister present a dual path model to explain how and when older employees' learning from younger coworkers can contribute to successful aging at work (i.e., work motivation, performance, well-being). After that, Truxillo, Cadiz, Brady, and Zaniboni examine the role of generativity as a driver for older employees' engagement in job crafting to realize their age-based motivational shifts toward passing knowledge and experiences to the younger generation. Finally, De Meulenaere, Allen, and Kunze investigate the effects of age-based subgroup development (i.e., age separation) on turnover-related outcomes at the individual and organizational level. Following the presentations, Kurt Kraiger and Lisa M. Finkelstein, two renowned researchers in the fields of learning and age diversity, will discuss and integrate the insights from the five presentations in the larger context of current research in these fields, pointing to important implications for practice and future scholarly work. This symposium brings together five presentations from researchers from China, the USA, and multiple European countries using different methodological approaches at the individual, team, and organizational level. Our intention is to contribute to a deeper and broader understanding of how organizations and employees themselves can unlock the beneficial outcomes of

women accrue significantly less status than men when they build a status-rich network (i.e., when they form ties, on average, with higher-status contacts). Study 1 finds that professional women with status-rich networks are rated as lower in status in comparison to men. Study 2, a longitudinal study, finds that women with status-rich networks at Time 1 predicted their lowered status at Time 2, while this negative relationship does not exist for men. Study 3, an experimental study, finds that women (but not men) who connect with high-status contacts are seen as being lower in communality, which leads to lower status attainment. Study 4 corroborates the findings in Study 3 in a longitudinal field setting. Results suggest that women who build status-rich networks reap lower status benefits than men engaging in the same social networking tactics. Implications for working women and organizations are discussed.

Know-How or Know-Who: Sociocultural Upbringing and Organizational Social Networks

Author: **Jacqueline Tilton**; Appalachian State U.

Author: **Kristie Joy Neff Moergen**; U. of Arkansas

Organizations are a key venue where individuals from different backgrounds have the opportunity to interact and yet we know very little about how social class background shapes interactions within the workplace. There is reason to believe that the differing value systems of social class groups influence their attitudes and behavior towards workplace connections and relationship formation. This research considers how social class background affects organizational social networks as well as the class-distinct values and attitudes that shape networking behavior of employees. To study this phenomenon, we analyze a sample of 490 employees from a broad range of roles and organizations across the United States to find that (a) the attitude toward networking varies by class groups and mediate social class's effect on network outcomes; (b) social class background affects class composition; and (c) social class mobility may affect these relationships. Additionally, I provide quantitative support that the middle social class hold central positions within organizations,

an age-diverse workforce, specifically, to retain knowledge and promote intergenerational knowledge transfer, issues which are relevant for both research and practice.

Setting the Fox to Guard the Hen House? Impacts of Men's Admission into Women's Internal Networks

Author: Denis Monneuse; UQAM U. of Quebec in Montreal, Canada

This paper reports a longitudinal case study within an IT consulting company that succeeded in dramatically reducing gender inequality despite an unfavorable institutional and organizational environment. Participant observation, archival data, and 52 semi-structured interviews revealed that the opening to men of a women's internal network (WIN) contributed to decreasing men's initial resistance to gender equality policy and raising their awareness of gender inequality, encouraging them to move from gatekeepers to gate openers. It also contributed to increasing women's social capital by providing them with more opportunities to network with men. The advantages of opening the WIN to men appeared to far outweigh the disadvantages, even if it remained necessary to preserve some women-only social gatherings. Building on this case and a supplementary study conducted with 21 diversity experts, I propose a grounded theory of gender inequality remediation based on men's involvement. Implications for practice and research are discussed.

and will be selected for funding. In this study, we explore in what ways the social network of an idea creator may influence idea funding decisions. For this purpose, we use data of and about research proposals which were submitted to a national science foundation by early-career scholars in 2014 and 2015. We argue that the benefits of network cohesion—a network structure where the contacts of the idea creator are connected to one other—depend on whether the applicant and idea creator is a man or a woman. Controlling for the reviewer-assessed quality of the research idea and its creator, we find confirmation for our hypothesis that the effect of cohesion depends on the gender of the idea creator: While men have a significantly higher likelihood of getting their idea funded when they have a cohesive network with few structural holes, for women the opposite holds true. That is, women are more likely to get their ideas funded when they have an open network with many structural holes. We discuss the implications of this finding for theory and practice.

A Process Model of Employees' Remedial Voice: An Empirical Analysis Based on Chinese Data (WITHDRAWN)

Author: Xiaotao Zheng; Shanghai Normal U.

Author: Mingchuan Yu; Shanghai Normal U.

Author: Xiaoling Yang; Shanghai Jiao Tong U.

Author: Bingqing Wu; U. of Wisconsin Parkside

Prior studies have treated employees' remedial voice as a single stage after experiencing mistreatment at work. In this paper, we present a three-stages' process model to indicate employees' possible voice response to mistreatment in workplace. In addition, surveying 382 Chinese employees who have experienced mistreatment, we suggest that mistreatment severity, mistreatment source and employees' power will influence employees' remedial voice process. That is, in Stage 1 (remedial voice versus. silence), employees, who experience the harsh mistreatment, or experience the mistreatment committed by supervisor, or have more power, will be more likely to voice their discontent instead of remaining silent. Once employees decided to voice, in Stage 2 (formal versus. informal voice), employees, who experience the moderate mistreatment, or experience the mistreatment due to supervisor's discretionary actions, or have less power will be more likely to choose informal voice instead of formal voice. If informal voice doesn't work, in Stage 3 (formal voice versus. silence), employees who experience moderate mistreatment or have less power will be more likely to choose silence instead of formal voice. Implications for theory and practice, limitations and future directions are also discussed.

The Intersection Between HR and Entrepreneurial Performance: Review and Roadmap for Future Research

Best Student Paper Award for Human Resources-Entrepreneurship Research

Author: Joonyoung Kim; Cornell U.

Despite the proliferation of research on entrepreneurship across disciplines, our understanding of the impact of HR on entrepreneurial performance is rather limited. In this article, I apply a review framework based on systems theory to organize and review prior work on the influence of HR on entrepreneurial performance, and then to provide a roadmap for future research. Four review questions are proposed and discussed: (1) what are the operational definitions used by previous studies when measuring HR as the input? (2) how have previous studies dealt with the mechanisms through which HR impacts entrepreneurial performance? (3) what are the operational definitions used by previous studies when measuring entrepreneurial performance? (4) how have previous studies dealt with the causal relationship between HR and entrepreneurial performance? My findings suggest that the impact of firm-level inputs, including HR systems/practices, on entrepreneurial performance has been understudied and deserves more research attention. Much of the research to date has not investigated the mechanisms through which HR affects entrepreneurial firms, how HR factors interact with one another to create synergies, and insufficient attention has been paid to the careful operationalization of outcome variables and the reciprocal relationship between HR and entrepreneurial performance.

Logics, Levels, and Voice: Recovering Human Relations in Management of Health Services

Author: **Teresa Carla Oliveira**; U. of Coimbra

Author: **Nélia Cristina Filipe**; U. of Coimbra

In the context of globalisation and a dominant market ideology since the 1980's several earlier assumptions concerning Human Resource Management in both the private and public sectors have been thrown into question. The command-and-control presumptions of models of New Public Management are being challenged as embodying an outdated Fordist and Taylorist production paradigm, while recent management perspectives more consistent with the earlier Human Relations approach of Elton Mayo and stress on the need for Voice of Albert Hirschman are recovering concern with employee well-being for both competitive and mutual advantage. This paper seeks to contribute to these by distinguishing macro institutional from meso organizational and micro operational levels and to enhance the case for greater relative autonomy at such intermediate and lower levels. It draws on audio-taped semi-structured interviews with 46 doctors and 3 nurses as managers and 3 administrators through a period of change within a recently formed Hospital Trust of a major teaching hospital and two other hospitals in a southern European National Health System. In particular, to capture their perceptions over three phases from their internal reorganisation on New Public Management lines (2009), their merger (2011) and post-merger scenarios (2014-18). It then discusses the findings in relation to the case for recovering a human relations approach in the management of public services and offers suggestions for future research.

contribution to firm performance. The underlying reason is that a well-designed and implemented system of HR management practices can create a source of sustained competitive advantages by attracting talented employees and motivating their behaviors. Understanding employee motivations and providing sufficient HR support are the focal job of HR professionals. Employee motivation is multidimensional and takes different forms in the nature of the individual mindset. By distinguishing employees' promotion-/prevention-focused motivations, the regulatory focus theory provides a basis for understanding employees' goal setting. To motivate employees, companies not only need a well-structured HR practices but also to implement the practices in a quality way, i.e., providing efficient and effective HR service, that meets employees' multidimensional motivations. Utilizing the regulatory-focus theory as the mechanism linking HR practices and HR service-quality to employee behaviors, we show that (1) promotion-focused motivation mediated the relationship between discretionary HR practices and employee outcomes (including in-role performance, organizational citizenship behavior, and turnover intention); furthermore, (2) only HR service-effectiveness was found to moderate the mediated relationship between discretionary HR practices and employee outcomes via employees' promotion-focused motivation.

Why Should We Care About External Workers? Towards Total Workforce Management

Author: **Francois Pichault**; U. of Liege

Author: **Frederic Naedenoen**; U. of Liege

The growing use of external skilled workers (or Independent Professionals) by modern organizations raises many unsolved questions in HRM. Who is responsible for managing their careers? What kind of actions can be developed to foster their engagement in lieu of pure transactional contracts? What kind of relations can be organized between client organizations and the third-party actors likely to intervene? In an attempt to answer such questions, the paper explores the conceptual foundations of the new rhetoric on 'total workforce management', an emerging concept in the managerial literature, and provides a research agenda on this topic. The proposed research agenda is based on an extensive literature review on the management of external skilled workers. The available empirical evidence however remains scattered: our paper aims at providing an integrated analytical framework around this topic. Three main dimensions are distinguished through which total workforce management may be deployed. For each of them, new partnerships can be developed between HR managers and external and/or internal stakeholders in order to respond to the challenges of managing external skilled workers. Such partnerships offer unexpected learning opportunities to the HR function. In practical terms, the pros and cons of a blended management of workers are discussed and concrete actions are suggested to support the engagement of external skilled workers in the perspective of a 'high road' HRM strategy. Thanks to its original analytical framework, the paper goes far beyond the current rhetoric developed by consultants and HR technology vendors around this topic.

whether the effects of HR strength are subject to boundary conditions, especially regarding national cultures. A meta-analysis of 39 studies (comprising 62 samples and 27,685 unique participants) was conducted to answer these two questions and examine the effects of HR strength on different outcomes. Results show that HR strength both moderates and mediates the relationship between bundles of HR practices and employee and organization outcomes. In addition, the results show that high collectivism positively moderated the relationship between HR strength and employee proactive behavior. Theoretical and practical implications are discussed.

Human Resource Management Systems and Attachment Styles: A Multi-Level Conceptual Model

Author: **Huda Masood**; York U., Toronto

Author: **Parbudyal Singh**; York U.

Author: **Souha R. Ezzedeen**; York U.

The purpose of this paper is to develop a multi-level conceptual model outlining the interplay between human resource management and leader-follower adult attachment styles. The paper aims to further elucidate the HR systems-firm performance relationship by theorizing relational mediating mechanisms, namely the interplay between leader and follower attachment styles. We focus specifically on relationship-oriented HR systems, defined as synergized HR practices required to help employees build interpersonal relationships, and offer propositions about their role in activating leaders' individual-level attachment style and followers' group-level attachment style. Further, we theorize an indirect relationship between a leader's contextually-activated attachment style and followers' group attachment style through LMX exchange, meaning the quality of relationship between leader and followers. Drawing on social contagion theory, we posit the dispersion of group attachment as a collective mechanism. Finally, the role of discretionary work behaviors, including positive behaviors such as organizational citizenship behavior (OCB) and detrimental behaviors such as counter-productive work behaviors (CWB) are considered in predicting followers' unit-level

Workforce Differentiation, Perceived Network-Building HR Practices, and Network Outcomes

Author: **Jing Han**; Winona State U.

Author: **Jidong Zhang**; U. of Wisconsin, Eau Claire

This paper reports on a study of employee perceptions of network-building HR practices. Using a sample of 52 employees working at a Dutch bank, a series of hypotheses regarding the antecedents and consequences of employees' perceived network-building HR practices were tested. Our results showed that an employee's identification as high potential was positively related with that employee's perception of network-building HR practices, which further were positively associated with the employee's in-degree centrality and accurate perception of the advice network. Moreover, identification as high potential had an indirect effect on an employee's in-degree centrality and cognitive accuracy through perceived network-building HR practices. Our study has several important implications for talent management and workforce differentiation research. Practical implications and suggestions for future research also are discussed.

ASYNCHRONOUS

Although a large body of human capital research supports the critical role of human capital resource (HCR) in unit performance, very little research has paid attention to where HCR originates and how HCR influences team performance. Drawing on human capital, faultline, and multilevel theories, we build on two forms of a team's KSAOs that capture the level and configuration of the KSAOs (i.e., the mean level of KSAOs and KSAO-based faultlines). We examine how both the mean level of KSAOs and KSAO-based faultlines influence HCR, how team processes (i.e., communication, transactive memory system, and team positive affect) affect these relationships, and how HCR impacts team performance. Using a sample of 268 undergraduate students in 66 teams, we find that the mean level of KSAOs and KSAO-based faultlines significantly interact to influence HCR. The conceptual arguments and empirical findings developed in this study contribute to the human capital literature by building knowledge about a team's KSAOs, HCR, team processes, and team performance.

Finder, Minder, Grinder: Project Network Relations and on the Job Performance in PSFs

Author: **Michel William Lander**; HEC Paris

Author: **Stefan Heusinkveld**; Vrije U. Amsterdam

Author: **Bastiaan A. Koene**; Erasmus U. Rotterdam

A PSF's success is dependent largely on its competitive advantage: the quality of its resource base as the professionals employed by the firm and their ability to service clients' needs. The career progression of the professionals in these firms is a key topic in the literature on PSFs. The extant literature identifies a number of explanations that account for the possibility upward mobility such as a professional's ability, knowledge and work ethic, as well demographic characteristics. We focus on their day-to-day work, the network relations professionals' form through the client teams in which they participate and see how this affects their end-of-year evaluations. By distinguishing between juniors, seniors and partners, we are able to construct profiles using fs/QCA, of successful professionals and see the extent to which these

profiles require adaptation between the different hierarchical strata.

Exploring the SHRM Black Box: Investigating the Role of Community Experiences

Author: **Richard H. Jonsen**; Rowan U.

Author: **Neil M. Boyd**; Bucknell U.

Author: **Franklin Oikelome**; Eastern U.

Author: **Douglas Trimble**; Forman Christian College U., Lahore, Pakistan

Recent calls in the management literature, and burgeoning empirical work, suggest that experiencing community at work is important for employee and organizational outcomes. However, we do not yet know if community experiences play a role in the strategic human resource management (SHRM) black box. This study seeks to better understand the role of community experiences among other social variables that potentially mediate the relationship between high involvement work practices and organizational citizenship behaviors. Specifically, this study tests hypotheses regarding the relationship between high-involvement work practices, community experiences, and organizational citizenship behaviors, and the potential mediators of psychological needs fulfillment and organizational identification. Data from employees across multiple organizations were analyzed using primary least squares structural equation modeling. Results indicated that these social mediators played various roles between high-involvement work practices and organizational citizenship behaviors, and that community experiences play an important role in the SHRM black box. Implications for theory development and guidelines for leadership and management practice are discussed.

Supervisors and Feedback (session 1004)

Contextual Feedback Seeking: Conditional Effects of Individual Power Distance & Feedback Orientation

Author: **Marc Cubrich**; U. of Akron

Author: **Joelle D. Elicker**; U. of Akron

Author: **Rachel Gabel-Shemueli**; U. del Pacifico

Author: **Mary Sully De Luque**; Thunderbird School of Global Management at ASU

Employee feedback seeking may be limited by supervisor–employee relationships that feature an inherent status differential, and these effects could be magnified by higher power distance cultural values. Among the extensive research into feedback-seeking behavior, few studies offer empirical examinations of the role of cultural values or considerations of employee reactions to the feedback environment (i.e., perceptions of fit, fairness, and satisfaction with the environment). Therefore, the present study develops and tests a framework for understanding the feedback-seeking process, focusing specifically on the contextual effects of individual-level power distance values, feedback environment reactions, and feedback orientation. With data obtained from 438 employees in the finance sector in Peru, this article details a conditional, mediated relationship in which the supportiveness of the feedback environment influences feedback-seeking behavior, through employee reactions to the environment. Two conditional effects inform these relationships: the interaction of the employee’s feedback orientation with the feedback environment in predicting reactions and the interaction of individual-level power distance with reactions to the feedback environment. Together, they influence subsequent feedback-seeking behavior.

Victor or Victim: The Dynamic Advantage of MNCs' Stakeholder Approval Capability

Author: **Meng Zhao**; Nanyang Business School

Author: **Seung Ho Park**; Nanyang Technological U.

Author: **Lingli Luo**; Zhejiang GongShang U.

Multinational corporations (MNCs) face legitimacy cost and biased local stakeholder treatment in the global market. This paper rejects the persistent impact of this legitimacy cost and confirms the role of MNCs’ home-based assets in maintaining advantage in gaining stakeholder support over domestic competitors. How these assets transform into this advantage is a dynamic question. Drawing on the literature of stakeholder identification and evaluation, this study conceptualizes stakeholder approval capabilities (SACs) and suggests that two factors jointly influence MNCs’ advantage in gaining stakeholder support: stakeholders’ evaluating the fit between a SAC and their prioritized demand and MNCs’ advantage in this SAC. We elaborate this two-factor framework by differentiating three types of SACs—instrumental, CSR-based, normative—and explaining different scenarios where each SAC may or may not lead to MNCs’ advantage in gaining stakeholder support. We test theoretical arguments in the context of consumer crises in China during 2000-2013, using a paired sample of 83 MNCs and 92 Chinese firms in consumer goods industries. This study reflects on MNCs’ legitimacy cost, extends the understanding of MNCs’ home-based assets as a source of international competitiveness and informs strategies of deploying these assets to deal with changes in the stakeholder environment.

The Narrated Global Orientation and the Liabilities of Newness and Foreignness

Author: **Minsun Lee**; Korea U. Business School

Author: **Daeil Nam**; Korea U.

Author: **Hyemin Chung**; LINE Corporation

This research builds upon the liabilities that firms undergo during foreign initial public offerings (IPOs). While many studies have explored global orientation

Author: **Denise Mary Jepsen**; Macquarie Business School

Research has shown that negative feedback from supervisors tends to increase employees' negative affect, resulting in unfavorable outcomes. Despite calls for more research on emotion specifically, rather than on general affect, the utility of discrete emotions in the feedback influencing process is largely overlooked. Drawing on affective events theory, we investigate the short-term effects of supervisor negative feedback on employees' both well-being and performance, through the theoretically relevant emotion of shame. We tested the hypothesized model using a daily diary method from 119 full-time employees across five consecutive working days. Results show that at the within-person individual level, supervisor negative feedback is associated with employees' feeling of shame, which increased their end-of-work emotional exhaustion while improving their next-day in-role and extra-role performance. Further, individual-level leader-member exchange (LMX) moderated the relationship between negative feedback and shame, with the relationship being stronger under the condition of high LMX. Theoretical and practical implications are discussed.

Feedback Environment Reactions: Linking Feedback Environment to Outcomes in a Cross-Cultural Sample

Author: **Julie Chen**; U. of Akron

Author: **Joelle D. Elicker**; U. of Akron

Author: **Marc Cubrich**; U. of Akron

Author: **Chantale Wilson**; Modern Hire

Author: **Mary Sully De Luque**; Thunderbird School of Global Management at ASU

As attention on the social context has increased, feedback models have begun to expand the role of attitudes, affect, and perceptions of justice in feedback processes. Consistent with prior descriptions of reactions to traditional performance appraisals, we define reactions to the feedback environment as evaluations related to the context of informal day-to-day feedback, at the individual level. We believe that reactions to the feedback

in internationalization, not much research has focused on the IPO context and the effect upon the liabilities of newness and foreignness. Using a sample from 2008 to 2014 of foreign IPO firms in the United States (US), our study finds evidence about the impact of the narrated global orientation. To detect how a firm narratively focuses on which dimensions of global orientation, we use hierarchical topic modeling and propose a global orientation narrative strategy of a firm using the modeling. The results show that the narrated market-driven and technology-driven global orientation in an IPO process have moderating effects on the relationship between the liabilities of newness and foreignness and IPO performance.

Vantage of Foreignness: How Expansion Abroad Influences Resource Acquisition at Home

Author: **Jialin Du**; Renmin U. of China

Author: **Eric Y.-F. Zhao**; Indiana U., Bloomington

This paper examines how global expansion of privately-owned enterprises (POEs) from emerging economy influences their resource acquisition back in the home country. We argue that, while POEs confront the liability of foreignness in host countries, the same 'foreignness' through global expansion serves as a positive signal to stakeholders at home market, thus mitigating POEs' liability of privateness and facilitating their resource acquisition. Using Chinese listed companies as our research context, we found that global expansion of Chinese POEs significantly increased their subsequent financial resource acquisition from home country banks and suppliers. We also found that this positive effect was amplified when POEs entered more advanced economies and adopted greenfield investment (versus acquisition) as the mode of entry, but was attenuated when POEs had stronger political connections. We conclude the paper by discussing the implications of our findings for research on liability of foreignness, liability of privateness and internationalization of emerging economy firms.

[view paper \(if available\)](#)

environment provide a key explanatory mechanism linking the environment to outcomes. The present study replicates and tests a framework for understanding the feedback environment, predicting outcomes such as engagement, embeddedness, and feedback-seeking behaviors through reactions to the feedback environment. We also consider feedback orientation, defined as an individual's overall receptivity to feedback, to have a strengthening effect on the proposed relationships. Using 253 executive MBA students from 37 countries, results show significant mediational relationships in which the feedback environment influences embeddedness, engagement, and inquiry-feedback seeking through reactions to the feedback environment. Discussion of implications for engagement, embeddedness, and feedback-seeking behaviors follow.

Support or Neglect: Is the Effect of Job Autonomy Conditional on Trust Towards the Supervisor?

Author: **Annamaria Kubovcikova**; Aarhus U., Department of Management
Author: **Jakob Lauring**; Aarhus U.

In job design research, autonomy has generally been portrayed as a predictor of positive attitudinal and behavioral work outcomes. Some studies, however, have indicated that job autonomy under certain condition can yield ambiguous results. We therefore hypothesize that the social context can change employees' perception of granted autonomy. Using responses from 451 matched pairs of PhD candidates and PhD supervisors, we explored the effect of job autonomy on attitudinal (satisfaction) and behavioral (performance) work outcomes and the role of interpersonal trust in this relation. We found that job autonomy had a positive effect on performance partially mediated by job satisfaction. In addition to that, our results show that this indirect effect is moderated by the level of trust in the supervisor. More specifically, our study suggests job autonomy to be beneficial only if there is a certain level of trust between the supervisor and supervisee.

First Mover Survival in International Entry Strategy: An Organizational Legitimacy Perspective

Author: **Liang Li**; Ivey Business School

Author: **Andreas P.J. Schotter**; Ivey Business School

When entering a foreign market, multinational enterprises (MNEs) from the same home country do not necessarily face identical levels of institutional constraints. Taking a legitimacy perspective, we argue that first movers may confront more liabilities of foreignness and outsidership. Their pioneering efforts to build up external legitimacy can change the host country institutions, and lessen the institutional pressures for followers. Later access, therefore, may have survival advantages compared to first entry. To mitigate these entry timing disadvantages, first movers can form international joint ventures (IJVs) with local firms to quickly acquire external legitimacy from the outset. The downside to this strategy, however, is that efforts to gain external legitimacy in the host country context may undermine internal legitimacy in the internal environment of the MNE. To balance these two types of legitimacy, we suggest that the first mover needs to maintain relatively strong ownership control over the alliance. Meanwhile, although MNEs can also influence the relative allocation of control over an IJV by influencing staffing of subsidiary general managers (GMs), we argue that the nonownership control such as using a parent-country national to manage the subsidiary does not necessarily serve as a substitute for ownership control. In local partner dominated IJVs, this GM staffing strategy may further decrease the first movers' survival rate. Drawing on Japanese longitudinal data from 1991 to 2013, our analysis provides empirical evidence to support the argument.

Smallness and Newness as Export Barriers: A Configurational Approach to SMEs in Emerging Countries (WITHDRAWN)

Author: **Olivier Bertrand**; Fundação Getúlio Vargas/EBAPE

Author: **Marie-Ann Betschinger**; HEC Montreal

Author: **Humberto Brea-Solís**; SKEMA BS - U. Côte d'Azur

This study investigates firm-specific export barriers for SMEs in an emerging country, Russia. Instead of isolating the liabilities of newness and smallness as individual conditions that could prevent companies from exporting, we examine conjunctural causation, that is, the complementary factors that cause newness or smallness to become export barriers, and the presence of equifinality, that is, the existence of multiple export barrier configurations that could include smallness or newness in different ways. We took an inductive, theory-building approach based on set theory, applying a fuzzy set Qualitative Comparative Analysis to a unique cross-section dataset of privately-owned Russian SMEs in the manufacturing industry in 2013. Our findings first suggest that SMEs that do not export are not necessarily small or young. Also, the liabilities of smallness and newness do not need to occur together. To prevent SMEs from exporting, the liability of smallness or newness has to be associated with a lack of other internal resources and the absence of links to external resource providers in the local environment. External parties in the home country, such as local strategic alliances, business group affiliations, or state support, provide different types of resources and are therefore not perfect substitutes. This study provides a more nuanced and complex view of the liabilities of newness and smallness as export barriers for SMEs in the context of an emerging country.

A Behavioral Explanation of Firm's International Trade Behavior in Emerging Markets

Author: **Hongyan May Qu**; Central U. of Finance and Economics

Author: **Changqi Wu**; Peking U.

In response to the recent call for firm-level analysis in international trade, this study examines the effects of performance-aspiration level, slack resource, and firm inertia on the risk-taking behavior (export) of firms from a behavioral perspective. Using a Chinese pharmaceutical industry dataset consisting of 1904 firm-year observations for the 1998 to 2000 period, this study finds that exports would increase as the focal firm's performance level falls below or rises above its aspiration levels, and also as the focal firm's accumulated slack resources increase. However, as an indicator of inertia, firm size can moderate the relationship between performance-aspiration level, slack resources, and export behavior. Larger firms are more risk-averse and less likely to export, or export less than smaller firms, even when their performance-aspiration level is very high, or very low, or the focal firm has accumulated abundant slack resources. This study contributes to the international trade literature by analyzing firm-level factors in response to a call for management theory perspectives on firms' trade in emerging markets.

Experiment First, Register Later: On the Relationship Between Firms' Informal Legacy and Exporting (WITHDRAWN)

Author: **Marcus Møller Larsen**; Copenhagen Business School

Author: **Caroline Witte**; Copenhagen Business School

Around the world and especially in areas of widespread poverty, unregistered organizational entities start their operations in the part of the economy that either fails to adhere to the established institutional rules or is denied the protection of those rules. In this article, we explore

the export propensity of firms that start their operations in the informal economy. We argue that firms operating informally have a unique opportunity to experiment with different products and markets prior to formal registration. This experimentation reduces subsequent uncertainty related to internationalization and, hence, increases the propensity of these firms to export after formal registration. We also argue that the relationship between informal legacy and export propensity is weaker in countries with stronger formal institutional trust. Using a comprehensive sample of 9,454 African firms, we find support for our hypotheses.

[view paper \(if available\)](#)

Reference Group to Competitors: Export Behavior of Firms in Transition Economies

Author: Yun Dong Yeo; UT Dallas

This paper examines how domestic and foreign competitors, as a reference group or direct competitors, influence export intensity of firms in transition economies. Domestic competitors as reference group better equips the focal firm to compete in the domestic market thereby reducing exports of the focal firm. On the other hand, foreign competitors as reference group encourages the firm to produce better quality products that meet the standards of international markets, thereby motivating firms to increase exports. However, the generic strategies of the focal firm, namely cost-leadership and differentiation strategies, likely turns domestic and foreign firms into direct competitors, respectively. The resulting heightening competition pressure from domestic and foreign competitors likely pressures firms in transition economies to engage in internationalization as an escape strategy by increasing their exports in order to avoid competition pressure within the market. We find empirical support for our arguments using a survey data set from 26 transition economies.

Long Term Orientation in China: Generational Differences and Cultural Measurement Standards

Author: **Douglas Chun**; U. of La Verne

Author: **Zhen Zhang**; U. of La Verne

Author: **Issam Ghazzawi**; U. of La Verne

Author: **Yeri Cho**; U. of La Verne

China has undergone significant societal changes in recent decades, however, questions remain as to how these changes have influenced the values of different generations in the country. Using concepts used to measure LTO from both Hofstede's revised VSM08 questionnaire and Bearden et al.'s (2006) modified scale, we conducted a survey with 1154 people in China. We found participants born in or before 1981 have higher long-term orientation compared to individuals born after 1981. Perhaps more importantly, we found that when measured by these concepts, our overall sample scored lower on the STO/LTO scale than Hofstede's LTO scale indicate. Our findings have large implications on the instruction educators and consultants are providing their students in regards to ethnic cultures. We suggest that business practitioners should be aware of these cultural value changes when formulating strategic plans, as these attitudinal and behavioral changes have the potential to greatly impact their business interactions, and that instructors should be aware of the plasticity of living cultures.

Teaching with Cross-Cultural Simulations: Some Effects of BaFá BaFá

Author: **Mikael Sondergaard**; Aarhus BSS, Aarhus U.

Author: **Christina Kempf**; Friedrich-Alexander U. of Erlangen-Nürnberg

Intercultural simulations represent a useful instrument to improve intercultural competencies and cultural adaptation of expatriates. Existing research is mostly limited to the analysis of its affective outcomes. Based on Social Identity Theory

and Experiential Learning Theory, we analyze the effects of the intercultural simulation BaFá BaFá on participants' behavioral preferences as well as their behavioral choices in an Asian and a Western context. We assess the effects of BaFá BaFá for 190 international business students from Germany and 162 business economics students from Denmark. Our findings indicate that BaFá BaFá may improve participants' ability to behave appropriately in foreign cultures. In particular, participants learn to adapt to dominant individualistic and collectivistic behavioral patterns in diverse cultures. The learning effects seem to be stronger for participants that were assigned to an artificial culture, which differs greatly from their own. We believe that taking the perspective of a contrary culture facilitates the first three phases of Kolb's (1984) experiential learning cycle, concrete experience, reflective observation, and abstract conceptualization, and thus leads to enhanced learning. Our findings demonstrate the great potential of intercultural simulations for the preparation of expatriates and allow us to derive implications for the effective design of such interventions.

Cross-Cultural Use of Technology in Management Education

Author: **Julia Milner**; EDHEC Business School

Author: **Trenton Milner**; INternational Centre for Leadership Coaching

Author: **Sharleen O'Reilly**; U. College Dublin

Personal technologies are ingrained into our everyday living and smartphones are prominent cohabitants. Higher Education settings view the integration of technology and heavily digitized individuals into education settings as a double-edged sword. The purpose of this paper is to explore the use and effect of purposeful as well as non- purposeful digital behaviors. A mixed methods approach looked at both student (389 survey respondents) and teacher (30 interviews) perspectives and behaviors on smartphone use in higher education in China, Australia and France. The authors found that technology usage in class leads to poorer individual academic performance. This relationship was complicated by improved student outcomes for certain social media platforms usage in the classroom setting. Student in- class smartphone usage influenced teaching workloads, feelings of control and motivation. Smartphone usage in the classroom exhibited inadvertent effects on teamwork and similar effects were seen across countries for both students and teachers. Future studies need to explore the behavioral drivers behind cyberloafing to enable the creation of suitable nudges within settings to drive positive outcomes and the creation of a nurturing digital culture. Digital activities within the educational and organization environment are less transparent as the responsibility for managing this increased digitization needs a mechanism for consensus by all parties involved, in a constantly changing digital work-space. This study combines the exploration of purposeful as well as non-purposeful smartphone usage from both the student as well as the teacher perspective across two disciplines and three culture settings.

Designing a High-Impact Global Leadership Development Program: The Case of I-LEAD

Author: **Guido Gianasso**; Nanyang Technological U.

Author: **Catherine Wu**; Nanyang Technological U.

Author: **Kok Yee Ng**; Nanyang Technological U.

Although global leadership development is a top priority for organizations, existing global leadership research has focused more on “what” question – what specific competencies do global leaders need? – than the “how” question – how do leaders develop these competencies? This study responds to a call for a deeper understanding of the processes that multinational organizations can use to develop global leaders. We report a case study of a highly successful global leadership program (known as I-LEAD) in the International Air Transport Association (IATA), the trade association that represents 230 member airlines around the world. We highlight three novel and critical training design elements of the I-LEAD program: 1) using the parsimonious and validated competency model of cultural intelligence (CQ) to design and assess impact of program; 2) constructing authentic learning experiences and ensuring experiential learning; and 3) embedding the training in a larger organizational system to enhance training impact not only on individual leaders, but importantly, on the organization. We present empirical evidence of the impact of the program, based on 54 I-LEAD leader participants and their 161 team members. We also examine how I-LEAD impacts organizational outcomes, leading to financial returns for IATA.

Broadening our Sight: New Perspectives on Inclusion at Work and the Role of Inclusive Leadership (session 1019)

This session involves a conversation among participants concerning how the management, spirituality, and religion field can advance the quality, relevance, and impact of research in the area. The goals are to 1) encourage scholars to undertake qualitative research on topics in the field of MSR and other areas, 2) to provide helpful information on qualitative methods needed to launch qualitative research projects and bring them to completion, 3) discuss and share insights from experienced scholars and editors that can facilitate the publication of good qualitative research, and 4) answer questions participants have about qualitative research methods and publishing in good journals. The panel includes experienced scholars, reviewers, and editors who have published in top journals, as well as emerging scholars.

Asynchronous

Broadening our sight on inclusion at work and the role of inclusive leadership, this symposium encompasses a systematic review of the inclusive leadership literature (Veli, Schalk, Knappert, & van Engen), a quantitative (Chung, Shore, Wiegand, & Xu) and a qualitative (Carrero & Härtel) empirical study that examine leaders and their role in supporting inclusion, a contribution on the development of the construct of individuals' 'inclusion competence' (Festing & Kraus), as well as a qualitative exploration of the collective dimension of inclusive leadership (Taksa & Powell). The diversity of the papers and the symposium discussant Lisa Nishii will help participants and the audience to think "outside the box" by unpacking the different layers that scholars have envisioned in the constructs of inclusion and inclusive leadership. Orchestrated as such, we intend our symposium to "broaden our sight" (AoM conference theme 2020) on "understanding inclusive workplaces" (AoM conference theme 2019) and hence, to move the field forward, while speaking to a large AoM audience.

Challenges in Measurement and Enactment of Leadership Behaviors (session 1024)

Good Leadership as Informed by Virtue: Exploring Scholarly and Public Views

Author: **Toby Newstead**; U. of Tasmania

Addressing complex problems requires collective action, and enabling collective action requires good leadership. From a scholarly perspective, good leadership can be understood as emerging from and being enacted as virtues such as courage, wisdom, humanity, and justice. However, it is unclear how this scholarly understanding of good leadership aligns (or not) to public understanding of good leadership. This paper takes the top 25 TED talks on leadership as a public perspective of good leadership and analyzes them to assess which virtues are used explicitly and metaphorically to describe good leadership. Dichotomous views between scholarly and public views of good leadership are flagged, and a notion of good leadership as mapped in the public domain is distilled. Implications, limitations, and future research are discussed.

How Do Feedback Seekers Think? Disparate Cognitive Pathways Toward Incremental & Radical Creativity (WITHDRAWN)

Author: **Min Yu**; Seoul National U.

Author: **Jin Nam Choi**; Seoul National U.

Feedback-seeking behavior (FSB) has been identified as a meaningful facilitator of individual creative performance. Nonetheless, existing empirical findings are inconsistent, thus raising the need to reexamine the relationship between FSB and creative performance. Accordingly, we explored the effects of FSB on two different types of creativity, radical and incremental, and directed our attention to cognitive processes that mediate the relationship between FSB and creativity. On the basis of the dual pathway to creativity model, we propose that feedback-seeking (FS) frequency and breadth increase cognitive persistence and flexibility, which in turn enhance their radical and incremental creativity of feedback seekers. Our analysis of the data comprising 239 employees from 95 teams in various business organizations revealed that FS frequency is positively related to radical creativity, whereas FS breadth is negatively related to incremental creativity. FS frequency is positively related to cognitive flexibility and cognitive persistence, whereas FS breadth is positively related to cognitive flexibility. Only cognitive flexibility, not cognitive persistence, mediates the relationship between FSB and radical creativity. This study advances the literature on FSB and creativity by developing and validating a theoretical framework that considers the intervening cognitive mechanisms and the various forms of creativity.

delegation and assumed that delegation has universally positive effects on subordinate outcomes. However, recent evidence suggests that delegation is not always positive for subordinate outcomes, and it remains unclear about the conditions that make delegation more or less effective. Invoking the literature on under-qualification and destructive leadership, we examined when and how the characteristics of the delegated task and supervisor's behavior during delegation affect subordinate outcomes. We hypothesized that delegation of a task that requires new skill development increases commitment to the delegated task and the supervisor and subsequently supervisor-directed OCB. We further argued that supervisor incivility during delegation nullifies the positive effects of delegation of a task with new skill development. The result of the lab study with 162 students provided general support for our hypotheses. The current study contributes to the literature of delegation, destructive leadership, and commitment by providing nuanced understanding on what task characteristics during delegation facilitate subordinate's attachment to the delegated task and how supervisor behaviors neutralize the positive effects.

When Ethical Leadership is Not Effective: Moderating Roles of Career Age and Career Plateau

Author: **Weipeng Lin**; Nankai U.

Author: **Yiling Jin**; Nankai U.

Author: **Xianghan Zhan**; Nankai U.

Author: **Jianfeng Jia**; Northeastern U. China

Despite previous research suggests that ethical leadership promotes employees' ethical behavior, such as knowledge sharing, little has been known about the boundary conditions of the effects of ethical leadership. Drawing on work-career theory, the current study tested a mediated moderation model in which career age moderates the ethical leadership-knowledge sharing relationship through career plateau. Using multi-wave and multi-source data from a sample of 301 employees in an information technology company, results demonstrated that career age was positively related to career plateau, which in turn moderated the

How Transactive Memory System Becomes Ineffective Over Time and When it is Revitalized

Author: **Jiunyan Wu**; Kyoto U.

Author: **Tomoki Sekiguchi**; Kyoto U.

Although research on transactive memory system (TMS) generally shows that a well-developed TMS has a positive impact on team performance, less attention has been paid to the possibility that TMS could become ineffective over time. Using an agent-based modeling (ABM) approach, we directly examine how two effects—the information concentration on experts and the transaction cost incurred in TMS information processing—interplay across levels over time. We further explore the aspects of the communication networks and the membership change on TMS dynamics. Our ABM simulations reveal that along the nonlinear development of TMS, the coevolved two effects emerge and magnify over time; and ultimately override the benefits of TMS. The results also show that a TMS teamwork with a moderate-density communication network helps sustain the efficacy of TMS. Moreover, to overcome the rigidity of the team performance, we find that a delicate change of the membership in an appropriate timing weakens the team inertia through invigorating team member learning to revitalize the TMS team functioning. Based on the findings, we propose a three-stage model of TMS effectiveness, suggesting that a TMS teamwork can continue to be effective in a long run if the appropriate interventions are made.

Measures of Authentic, Ethical, and Servant Leadership Spuriously Predict Objective Outcomes

Author: **Thomas Fischer**; U. of Geneva

Author: **Joerg Dietz**; U. of Lausanne

In two experiments, we provide evidence that questionnaire measures of authentic, ethical, and servant leadership are not valid representations of leader behaviors. We demonstrate that the measures are affected by irrelevant factors and can spuriously predict outcomes. In Study 1, a manipulation of performance cues and charismatic tactics impacted ratings of these leadership measures. In Study 2, ratings of leadership style measures predicted an objective outcome, even when leader behaviors did not vary and when we controlled for performance cues and rater-specific variables. This latter finding suggests that these leadership styles measure more than leader behaviors, although researchers use these styles as if they were behavioral constructs. We speculate that leadership styles as constructs-in-use differ from leadership styles as constructs-as-theorized. Whereas leadership styles as constructs-in-use appear to confound leader behaviors and evaluations of these behaviors, theories of leadership styles treat these styles as patterns of leader behaviors. Consequently, research suggesting that authentic, ethical, and servant-like leader behaviors engender positive results might be a mere artifact of poor measurement. Thus, future research should only use questionnaire measures of leadership styles if these questionnaires actually reflect the construct-as-theorized.

view paper (if available)

conflicts: intellectual humility, consideration of change/multiple ways a situation may unfold, recognition of others' perspectives, search for compromise/resolution, and outsider's viewpoint. RS was systematically related to lower performance on each aspect of wise reasoning, above and beyond other threat-related individual differences. Effects of power position were modest and nuanced: Whereas low-(vs. high-) power position facilitated intellectual humility, consideration of change, and search for compromise, high- (vs. high-) power position facilitated consideration of others' perspectives. We discuss implications for understanding the influence of rejection-related tendencies and power on reasoning processes in social conflicts.

Exploring Team Familiarity as a Buffer to External Conformity Pressure in Decision-Making Teams

Author: **Amanda Ferguson**; Northern Illinois U.

Author: **Adam C. Stoverink**; U. of Arkansas

Author: **Pat Downes**; Texas Christian U.

Decision-making teams routinely face pressure from external stakeholders to conform to their preferences. Yet literature on conformity pressure is overwhelmingly focused on individuals conforming to others within (not outside) their groups, and literature on accountability to external stakeholders is focused on individuals acting independently (without respect to a team context). In this paper, we consider conformity pressure as applied to a collective decision-making team and how such pressure can be alleviated when team members have strong intragroup relationships in the form of high team familiarity. We examine our predictions in the context of NCAA football officiating crews facing pressure from audiences to call penalties that unduly favor the home team, a phenomenon known as the home field advantage bias. Results reveal that, as audience conformity pressure increases, officiating crews with high familiarity are less likely to conform to the pressure to call more penalties on the visiting team. Moreover, this effect results in fewer home team wins, representing an attenuation of conformity to external pressure. These findings contribute to research on team decision-making effectiveness, conformity in team contexts, and the benefits of team familiarity.

Goals and Behavioral Intentions (session 1022)

The Powerful (but Constrained) Strength of Behavioral Interventions

Author: **Hannah Benner Waldfoegel**; Northwestern Kellogg School of Management

Author: **Loran F. Nordgren**; Northwestern U.

Nations and organizations have become increasingly interested in using behavioral interventions or “nudges” to promote personal wellness and prosocial behavior. Interventions can powerfully alter behavior, but also frequently fail to produce the intended results. In three online experiments (N = 6,619) and two field datasets (N = 96,995), we test the effectiveness of a series of well-known interventions and demonstrate that the impact each intervention has on behavior depends on the motivation-effort tension, which captures the degree of balance between the desire to act (motivation) and the cost of action (effort). We find evidence that interventions can have a considerable impact on behavior when effort and motivation are balanced, but quickly lose effectiveness as they become unbalanced. These findings demonstrate that while interventions can substantially impact behavior, this window of opportunity is narrow, and interventions applied outside of it do not produce the intended results.

Humble Leadership (session 1029)

Humble Leader Behavior and its Effects on Performance in Teams

Author: **Shengming Liu**; Fudan U. School of Management

Author: **Xin Lucy Liu**; Columbia Business School

Author: **Ying Wang**; Guanghua School of Management, Peking U.

Author: **Yen Hsiang Wu**; Peking U.

Author: **Lifan Chen**; Renmin U. of China

Based on social information processing theory, this study builds a multilevel model to explore the effects of humble leader behavior on performance in teams. Analysis of time-lagged and multisource data, gathered from 298 employees across 70 work teams demonstrates that at the individual level, humble leader behavior is positively related to performance via organization-based self-esteem (OBSE). Meanwhile, at the team level, humble leader behavior is positively related to performance via team potency. Moreover, team cognitive diversity moderates the indirect effects of humble leader behavior on both individual and team performance, such that the positive indirect effects are stronger for teams with higher cognitive diversity than for those with lower cognitive diversity. The current study's results expand our understanding of the underlying mechanisms of humble leader behavior in organizations. Implications and limitations are also discussed.

Humble Leaders Under Conditions of Uncertainty? An Empirical Analysis of Its Boundary Condition

Author: **Jiang XU**; Ph.D Candidate in Organizational Behavior

This paper aims to provide insights into the theory

Author: **Hyung Koo Lee**; HEC Montreal

Escalation of commitment is an important decision problem that occurs across a wide range of decision contexts. Recognizing that escalation situations involve one's effort to achieve some form of a goal, several escalation researchers have attempted to understand escalation of commitment as a goal pursuing activity. Prior work has suggested that escalation situations consist of (1) an initial goal setting phase and (2) an escalation decision making phase, and has investigated the effect of goal difficulty and goal specificity on escalation decisions. However, to date escalation researchers have not investigated the potential role of goal source in escalation situations. In this study, we aim to advance our understanding of escalation of commitment by examining the relationship between goal source and escalation of commitment. We conceptualize three different sources of goals (self-set, assigned, and inherited goals) in escalation situations by synthesizing goal setting theory and escalation research, and empirically investigate how they influence escalation decisions. We conducted two laboratory experiments and found evidence suggesting that individuals who did not take part in initial goal setting and did not invest effort in pursuing the previous course of action, are less likely to fall into the escalation trap.

Do Members' Organizational Identity Understanding Trump Leaders' Claims About "Who We Are?"

Author: **Temi Wright**; Purdue U., West Lafayette

This study seeks to explore the co-evolution of OI claims and OI understanding in constructing organizational identity. The study operates on the premise that as a socially constructed phenomenon, organizational members are able to formulate notions about "who we are" through OI understanding. The case is set at DeVine Integrated Food Services Limited, an integrated food manufacturing organization. Research method in the study is grounded theory inductive analysis triangulated through document analysis, grounded theory interviews and ethnographic observation.

of leader humility by exploring its potential boundary condition. Extant research mostly views leader humility as a type of universally positive leadership style and discuss it within a stable organizational context, little is known about its boundary condition and effect within a dynamic context. Therefore, we specifically test perceived environmental uncertainty as an important boundary condition of leader humility. With data gathered from 219 participants, using a time-lagged research design, we find that the positive indirect effect between leader humility and subordinate task performance depends on the degree of perceived environmental uncertainty. Theoretical and practical implications for leadership and work teams are discussed.

How Perceived Overqualification and Leader Humility Interact to Influence Turnover Intention

Designated as a "Best Paper" for OB

Author: **Chao Chen**; School of Management, Xi'an Jiaotong U.

Author: **Jie Feng**; Rutgers U.

Author: **Xinmei Liu**; Xi'an Jiaotong U.

We draw on the social comparison literature to suggest that team members' turnover intentions are affected by the interactive effect of their perceived overqualification and leader humility. Focusing on the mediating role of relative leader-member exchange (RLMX)—individual's leader-member exchange (LMX) quality compared to the average LMX within teams, we posit that the relationship between perceived overqualification and RLMX is enhanced when leader humility is high. Using data from a total of 239 employees in 53 teams, we find general support for our hypothesis that RLMX mediates the interactive effect of perceived overqualification and leader humility on turnover intention. Taken together, our findings suggest that paying more attention to the impact of leaders on the dynamics of relationships within teams would enrich future research on employee overqualification.

[view paper \(if available\)](#)

Findings show that founders' OI claims are in several relationships with organizational members' understanding of "who we are." Expanding current conceptions in the literature, three types of relationships are uncovered: (1) when OI claims and OI understanding match; (2) when OI claims and OI understanding do not match creating room for what I call an OI gap; and (3) when OI understanding does not emanate from OI claims (as presumed in the literature). The study also provides support for social constructionist arguments that organizational identity is co-constructed through social interactions of stakeholders. It contributes a perspective that suggests that OI understanding occupies a central, privileged position as it directly links organizational identity, moderates the relationship between OI claims and OI, and also, may be able to form identity without the input of OI claims as rudder. Practical recommendations are also offered for managers.

How Do Followers Like Leader Humility? It Depends on Their Perception of Leader Competence! (WITHDRAWN)

Author: **Qianyao Huang**; Peking U.

Author: **Ying Wang**; Guanghua School of Management, Peking U.

Author: **Xiao Deng**; China U. of Political Science and Law

Recent studies suggest that leader humility can be positive and negative, but knowledge of when leader humility may exert influence is scarce. Utilizing attribution theory, we explore the contingency of when leader humility is likely to be perceived as effective by subordinates and hence has impact on team performance. Results from a survey study of 162 corporate executives and their direct 660 subordinates indicate that leader competence moderates the relationship between leader humility and subordinates perceived leadership effectiveness. Specifically, when a leader is low in competence, leader humility is negatively associated with subordinates' perceptions of leadership effectiveness. In contrast, when a leader is high in competence, the relationship between leader humility and subordinates perceived leadership effectiveness is positive. Our results also support our hypothesized conditional indirect effect such that leadership effectiveness mediates the interactive effect of leader humility and leader competence on team performance. Specifically, the higher competence a leader has, his/her humility would be perceived more effective and hence positively related to team performance; however, the lower competence a leader has, his/her humility is likely to be perceived less effective and hence negatively related to team performance. Our results advance theory and practice by identifying the boundary condition that determines the effectiveness of leader humility.

Psychopathy Facets and their Effects on Job Satisfaction and Well-Being: Boldness as a Moderator

Author: Yan Yi Lance Du; Singapore U. of Social Sciences

Author: Klaus J Templer; Klaus J Templer & Associates

Extant research has shown that psychopathy is generally related to poor employee and individual well-being. However, few studies have examined the differential relationship between psychopathic dimensions and well-being outcomes. Drawing from the differential-configuration model of successful psychopathy and using a measure of the triarchic model of psychopathy, this study investigated how psychopathy facets (boldness, meanness, and disinhibition) are uniquely related to job satisfaction, life satisfaction, positive affect, and negative affect. Drawing from the moderated-expression model of successful psychopathy, boldness was proposed as a moderator of the meanness-wellbeing relationship. Hierarchical regression analyses indicated that boldness was positively related to job satisfaction, life satisfaction, positive affect, and negatively so to negative affect. Meanness was negatively related to job satisfaction and positive affect, whereas disinhibition was negatively associated with life satisfaction and negative affect. Moderation analyses revealed significant interactions of boldness with meanness on job satisfaction, life satisfaction, and positive affect. Findings highlight the differential contribution of psychopathy facets to job satisfaction and personal well-being and the role of boldness as a protective factor.

HEXACO Personality and Organizational Citizenship Behavior: A Domain- and Facet-Level Meta-Analysis

Author: Jan Luca Pletzer; Erasmus U. Rotterdam

Author: Janneke Oostrom; Vrije U. Amsterdam

Author: Reinout De Vries; Vrije U. Amsterdam

Several meta-analyses have shown that personality is an important predictor of Organizational Citizenship Behavior (OCB). However, these meta-analyses have almost exclusively focused on Big Five personality domains, whereas recent evidence suggests that personality might be captured more accurately by the six HEXACO domains. Here, we provide a comprehensive meta-analysis of all HEXACO domain- and facet-level relations with OCB ($k = 21$). Extraversion ($\rho = .347$) exhibits the strongest relation with OCB, followed by Conscientiousness ($\rho = .319$), Agreeableness ($\rho = .217$), Honesty-Humility ($\rho = .208$), and Openness to Experience ($\rho = .195$). Emotionality does not correlate with OCB ($\rho = -.002$). The six HEXACO domains explain 8.8% of the variance in OCB, whereas the amount of explained variance increases by 3.4% when using the 24 HEXACO facets ($R^2 = .122$). This discrepancy can be explained by masking effects among the facets of Honesty-Humility and Conscientiousness, and by a cancellation effect among the facets of Emotionality. Theoretical and practical implications as well as limitations and ideas for future research are discussed.

When Rewards Create Obsessions with the Bottom-Line, Nobody Wins (WITHDRAWN)

Author: Mary Elizabeth Mawritz; Drexel U.

Author: Rebecca Lee Greenbaum; Rutgers U., New Brunswick

Author: Blythe Leslie Rosikiewicz; West Chester U. of Pennsylvania

Author: Andrea Farro; Drexel U.

Author: Yingli Deng; Oklahoma State U.

Author: Mark Mitchell; -

Drawing on the central tenets of social interdependence theory and recent work on

attitudes are influenced by their perceptions of managerial support and expectations. In this study, we draw on cognitive dissonance theory and studies on the dispositional nature of job satisfaction to depart from the traditional perspective of seeing job satisfaction primarily as an attitudinal response to manager perceptions. Specifically, our proposed model suggests that job satisfaction functions as a relatively stable attitudinal lens through which employees interpret their managers' behaviors. Using a two-wave panel design, we tested our model with a sample collected from 638 individuals working across 34 organizations in Finland. Consistent with our predictions, the results showed that job satisfaction is an important determinant, rather than an outcome, of employees' manager perceptions. Implications of this study provide important insights into the study of leadership and the role of attitudes in organizational processes.

Role of Benevolent Goal Attributions as Currency in Employee-Organization Social Exchange Quality

Designated as a "Best Paper" for OB

Author: **Michael Thomas Ford**; U. of Alabama

Author: **Xiaochuan Song**; Misericordia U.

Author: **Yeong-hyun Hong**; U. of Alabama

The purpose of this paper is to develop and investigate how organization's provisions of resources, employees' perceived intentions behind the provisions, and the effects of work on employee well-being collectively influence social exchange qualities. Drawing on the folk concept theory of intentionality (Malle, 1999; 2011), we suggest that employees' perception of the organizations' intentions behind resource provisions influence the social exchange quality in the employee-organization relationship. In Study 1, we performed a critical incident analysis and extracted five distinct types of perceived goals (i.e., performance enhancement, employee relations, compliance, employee well-being, fair treatment) behind help treatment from the organization. In Study 2, we developed and validated scale items for these goal attributions. In Study 3, we performed a three-wave field design study and the results showed support for the relationships among the organization's

bottom-line mentalities, we examine bottom-line mentality as a mediator of the negative relationships between negatively interdependent rewards and task performance and organizational citizenship behavior. We suggest that negatively interdependent rewards are related to a tunnel vision focus on bottom-line attainment, which in turn, influences employees to neglect aspects of their in-role and extra-role job performance. We also draw on social interdependence theory to examine the moderating role of proactive personality, suggesting that in comparison to employees who are low on proactive personality, those high on the trait are less likely to allow the tunnel vision effect of negatively interdependent rewards and subsequent BLM to influence decreases in their performance-related behaviors. We tested our hypotheses across three studies: an experimental study, a diverse, multisource, time-lagged field study, and a multisource, field study from a single organization. Our results suggest that bottom-line mentality mediates the negative relationships between negatively interdependent rewards and task performance and organizational citizenship behavior and that proactive personality mitigates the effect on citizenship behavior but not task performance.

Which Comes First, the Chicken or the Egg?: Organizational Commitment and Job Satisfaction

Author: **Peng Zhao**; Indiana U.

Author: **Xiaohong Xu**; Old Dominion U.

Author: **Richard Hayes**; PhD student at Old Dominion U.

Author: **Nhan Le**; Old Dominion U.

While consensus exists regarding the association between organizational commitment and job satisfaction, the temporal ordering of this association in proposed models frequently varies across empirical studies, depending on the theoretical focus of a study or the researcher's perspective. Indeed, there are four competing theoretical models of the causal relationship between organizational commitment and job satisfaction in the literature. We systematically test these competing theoretical models by adopting a meta-analytic method that accumulates evidence from existing panel studies ($k = 37$, $N = 7,311$). After accounting for sampling error and measurement error, the results of cross-lagged path analyses indicated that there were reciprocal relationships between organizational commitment and job satisfaction, with a stronger lagged effect of commitment than a lagged effect of satisfaction. However, time lag, organizational change, measurements of job satisfaction and organizational commitment, commitment dimensions, newcomer status, and publication status significantly moderated the causal relationship between job satisfaction and organizational commitment. These findings collectively suggest the complexity of the causal relationship between organizational commitment and job satisfaction. Theoretical and practical implications are discussed.

The Effect of Justice Expectations on OCBs and its Regulation by Professional Identification

Author: **Francesco Sguera**; UCP - Católica Lisbon School of Business & Economics

Author: **David Leonard Patient**; Vlerick Business School

In highly uncertain contexts, such as organizations undergoing major change initiatives, employees become especially attentive to procedural fairness. Although research has focused mainly on perceptions of experienced procedural justice, employees also generate expectations about the procedural fairness they will receive in the future, termed anticipatory procedural justice. In this paper, we posit that these expectations can affect employee positive behaviors that are not specifically related to the change itself, namely organizational citizenship behaviors. Further, we hypothesize that employees highly identified with their profession will be less affected by justice expectations, while employees who are less identified will rely on these expectations when deciding to engage in organizational citizenship behaviors. We test our hypotheses using a multi-method approach entailing one experiment with a heterogeneous sample of US workers ($n=183$), one three-wave panel survey with a sample of US workers from different organizations undergoing wage cuts and layoffs ($N=101$), and one field survey in a public health government agency facing a large scale organizational change ($n=315$). In all three studies, anticipatory procedural justice fully mediated the relationship between experienced procedural justice and organizational citizenship behaviors. In Study 3, where the majority of respondents worked in vocational roles (e.g., healthcare specialists and psychology counsellors), professional identification moderated this mediated relationship. Specifically, the organizational citizenship behaviors of employees highly identified with their profession

Multilevel Perspectives on the Antecedents of Work Design (session 1033)

Despite the established relationships between good work design and outcomes, poor work designs continue to persist. Little research has yet investigated the causes of this phenomenon. In this symposium we investigate how multilevel distal antecedents of work design, such as organizational change, influence employee job crafting and managers' job design behaviours, and also directly affect work design. The five included papers highlight novel antecedents of work design at different levels which are currently under-researched but which could have important implications for research and practice. We hope to stimulate conversation on the topic which helps to take this field forward in a timely manner.

New Conceptual Approaches to Make Sense of Work, Fit, and Leadership (session 1020)

When IT Professionals Choose Nonstandard Work: The Fit between Individuals and Work Arrangements

Author: Doreen Matthes; Kent State U.

Author: Mary Hogue; Kent State U.

Author: Deborah Erdos Knapp; Kent State U.

As organizations face the reality of rapidly evolving technology and the labor shortage of IT professionals, the externalization of their IT workforce is a viable way to handle IT costs and human capital needs. This workforce externalization increasingly is providing IT professionals with various alternatives to standard work arrangements, i.e., nonstandard work arrangements (NSWAs) such as independent contracting, remote work, and contract firm work. While the NSWA literature has shown that voluntarily choosing such arrangements relates to positive work-related outcomes, not much is known about the mechanism behind an individual's voluntary pursuit of a nonstandard rather than a standard work arrangement, or of one type of NSWA over another. In this study, we use person-environment (P-E) fit as a theoretical framework to provide an explanation for voluntary choice of various NSWAs. Specifically, we draw connections between a variety of individual difference characteristics and the work arrangement characteristics of some of the most prevalent NSWAs for IT professionals in the United States, highlighting the important role of personality variables and individual needs in work arrangement choices. Our conceptual framework provides a new understanding of volitional choice of NSWAs. It may

Demanding Supervision: Concept, Measure, and Different Influence from Abusive Supervision

Author: Haizhen Wang; School of Business, Xi'an International Studies U.

Supervisors often behave in demanding ways toward their subordinates, who do not necessarily regard this demanding supervision as hostile. However, this phenomenon has not as yet been formally examined, and has been confounded with abusive supervision. Such confounding has led to conflicts of opinion in the literature on abusive supervision. To formally establish the concept of demanding supervision and address related conflicts of opinion, we examine the concept and develop a scale to measure demanding supervision using an interview, a pilot study, and two formal samples (N = 217 and 475). We then use two-wave data on 162 employees to verify the criterion validity and incremental validity of our demanding supervision scale, and find that demanding supervision is positively related to self-efficacy, while abusive supervision is negatively related to self-efficacy. Thus, in this study we propose and confirm that the effects of demanding supervision on employees' psychological states are independent of and different from those of abusive supervision.

Strategic Crisis Management Team Leadership: A Psychology-Based Training and Development Approach

Author: Synnove Nesse; Centre for Applied Research, Norwegian School of Economics NHH

Many high-reliability organizations deploy an ad hoc mobilized strategic crisis management team (S-CMT) to orchestrate the overall response to large-scale crises, whether triggered by a plane crash, an oil rig explosion, or a terrorist attack at a production plant.

However, much remains unknown about what constitutes effective leadership in these teams. Indeed, leadership tends to be criticized for being ineffective, particularly in the critical initial phase of crisis response. Hence, the purpose of this article is to present a framework for what constitutes effective crisis leadership and how it can be developed in S-CMTs. Psychologists are argued to play an important role in contributing to designing, implementing and evaluating crisis leadership training in S-CMTs, particularly based on their knowledge about performing under pressure. The article extends prior work by presenting a taxonomy of crisis leadership functions in S-CMTs as well as proposing how to implement psychology-based training and development interventions.

Catalysts that Cause Individuals' Change: A Taxonomy of Cycles

Author: **Brian W. McCormick**; Northern Illinois U.

The evidence revealing just how much individuals' affect, cognition, and motivation vary over time is astounding. Yet, so much about why this fluctuation occurs remains unclear. This theoretical manuscript elucidates the effects of cycles, a classifiable series of distinct yet related factors (i.e., circadian cycles, human life cycles, organizational life cycles, macro business cycles, work and recovery cycles, tenure cycles, orbital and rotational cycles of the earth, family life cycles, etc.) that unfold in stages while creating forces that lead to changes in individuals' affect, cognition, and motivation. Using sensemaking and conservation of resources theories, I explain why cycles are a causal agent of change for individuals. By developing a taxonomy and classifying the different kinds of cycles in it, I reveal the distinctive features of cycles while also linking cycle-types that have not previously been connected. By providing a structure that highlights the multitude of factors upon which a given cycle can be categorized, the manuscript can be used in future research to prompt nuanced expectations about when, how, and why individuals experience fluctuation and change. Through the new connections established between disparate cycle-types, I hope the manuscript facilitates the transfer

Depression and Engagement in a Brexit Context: The Role of Job Type and UK Citizenship Status

Author: **Elena Martinescu**; Vrije U. Amsterdam

Author: **Martin Edwards**; UQ Business School, U. of Queensland

Author: **Ana Leite**; Durham U.

Author: **Georgina Randsley De Moura**; U. of Kent

Author: **Andre Goncalves-Marques**; U. of Kent

Author: **Dominic Abrams**; U. of Kent

This study explores the interplay between UK citizenship status, the nature of jobs for employees in the UK, and the potential role that these factors play in influencing job related depressed well-being states and work engagement in the context of a looming Brexit (where the UK proposed to leave the EU). In two waves of data collection, across six months, we survey EU and UK citizens working in the UK and test a moderated mediation model. Drawing on Conservation of Resources theory as an explanatory framework, we demonstrate that, compared to employees with UK citizenship status, EU migrants based in the UK without citizenship show higher levels of depression and that this is followed by lower levels of work engagement. Crucially, we also show an indirect relationship between being in a more vulnerable (low skilled) job and lowered work engagement mediated through states of depression, which is moderated by UK citizenship status (i.e. only significant for EU citizens who do not have citizenship). Finally, we also show that EU migrants without UK citizenship exhibit greater reductions in work engagement following an increase in depression over time compared to employees who do have the security of UK citizenship status.

Positive Norm Violating Behaviors: The Boundary Conditions and Process Mechanisms (session 1034)

In organizations, sometimes employees intend to serve "greater good" for the stakeholders of the organization or for the organization itself by violating its 'norms. This phenomenon is termed as positive norm violation. To explain and investigate such a complex phenomenon, another stream of research on workplace deviance focused on the positive norm violating behaviors. This symposium addresses the theoretical mechanisms and boundary conditions of such norm violating behaviors. Moreover, there have been new behaviors that were added under the umbrella of positive norm violations- for example, creative deviance and bootlegging. Research on such constructs is in a nascent stage, and this symposium brings the attention of the contemporary researchers to these nascent constructs.

Patterns of Diversity: An Examination of Trait Diversity, Team Behavior, Conflict and Performance (WITHDRAWN)

Author: **Emma Soane**; London School of Economics

Author: **Lisa Aufegger**; Imperial College London

Author: **Colin Bicknell**; Imperial College London

Team diversity creates a tension between knowledge exchange that benefits performance and identity threat which generates conflict. Modeling such processes is important for teams that need to overcome conflict and make high quality decisions. We draw on personality theory, the informational diversity-cognitive resource perspective and models of social identity to examine the relationships between team-level trait diversity, team behaviors, conflict and performance. Participants were 103 healthcare practitioners and 173 research laboratory participants who engaged in 68 team simulations of a 30- minute decision-making scenario set in a healthcare context. Participants completed surveys on personality before the simulation, and on conflict afterwards. Team interactions were transcribed and coded to assess behaviors, and experts rated team performance. Data showed there were no direct positive associations between trait variation and performance. However, variation in extraversion and agreeableness reduced interpersonal conflict while variation in neuroticism, openness and conscientiousness increased conflict. The relationship between agreeableness and performance was moderated by opinion seeking and mediated by interpersonal conflict. The indirect relationship between variation in conscientiousness and performance was moderated by disagreements and antagonism. We suggest that team diversity is a patterned phenomenon whereby difference is tempered by similarity, and which has several forms of relationship with performance.

Author: **Elizabeth C Ravlin**; U. of South Carolina

Despite the importance of relationships for achieving organizational objectives, we know little about how boundary spanners establish particularized relational identities with targets. Particularized relational identity refers to an individual's specific representation of themselves vis-a-vis another person. In this study, we examine how boundary spanners develop particularized relational identities with targets and the efficacy of these efforts. Collecting data exclusively from business-to-business (B2B) sellers, we expect that sellers who engage in two types of particularized relational identity claims (relationship claims, knowledge claims) will anticipate a greater likelihood of a sale occurring. We further hypothesize that perceived buyer/seller similarity and buyer influence will affect these relationships. While these two types of claims are not mutually exclusive, we hypothesize that sellers who concurrently use relationship and knowledge claims anticipate a lower likelihood of a sale. We find support for the majority of our hypothesized model. We conclude with theoretical and practical implications and promising avenues for future research.

Interorganizational Leadership: Sculpting Identities Within Collaborations

Author: **Alok Kumar**; XLRI-Xavier School of Management

I offer a theory of interorganizational leadership that explains how interorganizational leaders can be effective. They can be effective to the extent they are able to sculpt collaborative identities that satisfy identification motives of members. Dual and relational identities are particularly suited for this purpose. Leaders need to engage in sensegiving to address five key identification motives: belongingness, self-enhancement, self-consistency, uncertainty reduction, and efficacy. In interorganizational collaborations, members identify with leaders through a possession-based rather than a prototype-based social identity mechanism.

Pride and Positive Affect (session 1025)

More Equal than Other Equals: When is Positive Affect Counterproductive?

Author: **Darren Bharanitharan Karunanithi**; U. of Northern British Columbia

Author: **Somayehsadat Bahmannia**; Edith Cowan U.

Author: **Kevin B. Lowe**; U. Of Sydney

To date, the vast majority of studies on leader humility has focused on the positive influence of leader humility on followers' extra-role behavior, generally portraying humility as unequivocally beneficial. We depart from this tendency to focus on the potential detriments of leader humility on follower extra-role behavior (e.g., organizational citizenship behavior). Our study challenges the consensus by arguing that leader humility can increase followers' intention of not engaging in organizational citizenship behavior. Drawing on affective events theory, we develop a model in which leader humility fills followers with pride, which leads to entitlement, in turn triggering a disinclination to engage in organizational citizenship behavior. We tested our model in a field study and experimental study using a sample from Taiwan. Results provide general support for our hypotheses.

The Effects of Uncompensated-Telework Fairness on Work Withdrawal and Personal Initiative via Energy_(WITHDRAWN)

Author: **Sunjin Pak**; Slippery Rock U. of Pennsylvania

Author: **Amit Kramer**; U. of Illinois at Urbana-Champaign

Research has given conflicting results regarding the relationship between the use of information and communication technologies (ICTs) for work-related tasks during non-work time and the outcomes for employees and organizations. In this study, I use self-determination theory to examine the effects of uncompensated-telework fairness on potential positive and negative work behaviors – work withdrawal and personal initiative; and whether human energy mediates these linkages. I argue that when employees perceive uncompensated-telework is unfair, they will subsequently report losing energy when using ICTs to work outside of the work domain. Furthermore, these perceptions of energy loss can initiate undesirable coping strategies in which employees with low level of energy begin to withdraw from work in the work domain. In addition, I demonstrate that perception of energy gain lead to personal initiative in the work domain. Data collected in three phases over six weeks from more than 700 US employees provide support for these hypotheses.

A Dual Pathway Model of Daily Proactive Work Behavior on Hedonic and Eudaimonic Well-Being

Author: **Doris Fay**; U. of Potsdam

Author: **Christopher Schwake**; U. of Potsdam

Author: **Karoline Strauss**; ESSEC Business School

Past research demonstrated a positive relationship between the individual-level expression of positive affect and voice behaviors between employees. Our research proposes a fresh perspective suggesting that positive affect, when construed as an organizational level climate, may be detrimental for employee voice, specifically prohibitive voice. Based on the hedonic contingency theory and organizational error theory, we contend that employees in a high (vs. low) positive affective climate experience greater motivation and pressure to maintain the existing positive vibes. This gives rise to an error aversion climate that favors the censorship and cover-up of questionable practices or behaviors, thus suppressing prohibitive voice. In sum, we expect positive affective climate to negatively predict prohibitive voice, but not promotive voice, via error aversion climate. We also argue that the negative relationship between error aversion and prohibitive voice will be more pronounced for employees who have leaders with high (vs. low) humility. Humble leaders influence employees to look out for deficiencies in the work environment, which should heighten their sensitivity to factors that shape prohibitive voice. We collected two-wave, multi-source data from a sample of 399 full-time employees and their supervisors. The results supported the hypotheses. When considered in conjunction with past findings, our findings uncovered oft-overlooked multilevel complexities inherent in the affective processes underlying why and when employees might express different forms of voice, and the importance of leader humility as an enabler of prohibitive voice. We discuss the implications, limitations, and future directions of the results.

Perceived Overqualification and Interpersonal Outcomes via Pride: An Evolutionary Psychology View

Author: **Xue Zhang**; School of Management, Harbin Institute of Technology

Author: **Chao Ma**; Australian National U.

Author: **Zhongqiu Li**; Harbin Institute of Technology

The current study examines both the positive and

Author: **Tina Urbach**; U. of Potsdam

Recent research on proactive work behavior suggest that it entails negative consequences for actor's hedonic well-being. This raises the question why people persevere acting proactively. We propose that in addition to its negative consequences for hedonic well-being proactivity exerts a positive effect on eudaimonic well-being, which may counterbalance the negative effects. Drawing on resources theory and models of eudaimonic well-being the present paper develops and tests a dual pathway model which explores the effect of daily proactivity on daily well-being. The model holds that on one hand proactivity has negative effects on hedonic well-being by increasing daily workload, finally negatively affecting general well-being experienced in the evening. On the other hand, proactivity has a positive effect on eudaimonic well-being because it allows authentic expression. This path results in a positive effect on evening general well-being. We conducted a daily diary study with four daily measurement points (early morning, morning, afternoon, evening) on five consecutive working days. Our sample consisted of $n = 121$ ($k = 604$) employees in finances and administration. Data was analyzed with a multilevel structural equation modelling approach. Findings support the dual pathway model. Proactivity exerts a negative effect on evening general well-being through the hedonic pathway and a positive effect through the eudaimonic pathway. The overall effect of proactive work behavior on evening general well-being is positive. Thus, findings suggest that in order to gain a full understanding of the well-being implications of proactivity, eudaimonic processes need to be taken into account in addition to hedonic processes.

Interplay Between Employee and Leader Proactive Goal Regulation: Cascading and Moderating Effects

Author: **An-Chih Wang**; China Europe International Business School

Author: **Tae-Yeol Kim**; China Europe International Business School

Author: **Yuan Jiang**; Harbin Institute of Technology

Author: **Guiyao Tang**; Shandong U.

Based on a sample of 74 leaders and 371 employees

negative interpersonal consequences of perceived overqualification. Building on theories of evolutionary psychology and prior research, we clarify the underlying mechanism of pride through which perceived overqualification predicts different interpersonal behaviors. Specifically, we propose that perceived overqualification is positively related to authentic pride which further predicts higher interpersonal citizenship behaviors; meanwhile, perceived overqualification is also positively related to hubristic pride, leading to increased interpersonal deviance behaviors. Further, we suggest that willingness to establish positive relationships plays a crucial role in moderating the pride – interpersonal behavior relationships. We tested our predictions across two studies using time-lagged and multi-sourced data. Study 1 with a sample of 206 university students provides support to the basic mediation model specifying the effects of perceived overqualification on interpersonal citizenship and deviance behaviors through authentic and hubristic pride, respectively. In Study 2, analyses of survey responses from 213 employees replicate the results of Study 1 and further reveal that the indirect effect of perceived overqualification on interpersonal deviance behavior via hubristic pride was moderated by employees' willingness to establish positive relationships. The theoretical and practical implications of our findings, as well as future research directions, are discussed.

Shared Positive Emotions at Work – Focal Actor Perspective to Responding to Others' Positive Emotion

Author: **Miia Paakkanen**; U. of Helsinki

Author: **Frank Martela**; Aalto U.

Author: **Anne Pessi**; U. of Helsinki

The importance of sharing positive emotions in interpersonal relationships has been well established. Still, the focal actor perspective to responding to others' positive emotions has largely been overlooked, even though the focal actor plays a key role in the process. To shed light on this important phenomenon, we propose that the focal actor's response unfolds through a process of four steps – noticing, feeling care, taking action, and

of research and development teams, we find that employees' role breadth self-efficacy, psychological ownership, and activated positive affect positively related to job performance through employee proactive goal regulation. Moreover, leader proactive goal regulation played two roles: (a) it had a direct effect on employee proactive goal regulation, which positively related to job performance, and (b) it supplemented employee proactive goal regulation such that employees delivered high job performance when leaders were high in proactive goal regulation, regardless of employees' levels of proactive goal regulation. Our study highlights the importance of not only employee but also leader proactive goal regulation in connecting employees' proactive motivational states with job performance.

Empowering Leadership and Bootlegging: The Counterbalancing Effect of Directive Leadership

Author: **Ming Yi**; Tongji U.

Author: **Shenghui Wang**; Tongji U.

Drawing on conservation of resources (COR) theory, we propose an integrative model that examines the benefits and costs of empowering leadership for employee bootlegging. Further, we argue that empowering and directive leadership may exist simultaneously and work together to regulate employee bootlegging. Survey data collected across multiple time points in high-technology companies support our model. The results revealed that employee creative self-efficacy and emotional exhaustion mediated the relationship between empowering leadership and employee bootlegging. Moreover, directive leadership weakened the relationship between empowering leadership and two mediators, which, in turn, affected bootlegging. Implications for future research and practice on employee bootlegging are also discussed.

The Future of Employee Development: Fostering Developmental Relationships and Addressing Barriers (session 1031)

Employees are key organizational stakeholders; the success of any organization depends in large part on employees' continued development (Ferris et al., 1999). In today's work environment, marked by rapid and profound change, employee development is becoming increasingly critical. Despite a recognition of the importance of employee development, research on what contributes to employee development is still nascent (Nielsen et al., 2017). This leaves organizations with little direction on how to foster employee development and maintain a competitive edge. In this symposium, we include four empirical papers that explore [1] developmental relationships at work and [2] potential barriers to employee development. Following the presentations, an eminent scholar on employee development and developmental relationships, Jennifer Chatman, will serve as a discussant. She will provide both theoretical and

Recent criticisms of the application of the Design Science Research (DSR) approach have pointed out the need to make it more approachable and less confusing to overcome deficiencies such as the unrealistic evaluation of artifacts. To comprehend and discuss some inappropriate practices of this approach, which arouse feelings of confusion, and to help provide a better structure and understanding of it, we identified and analyzed 92 articles that present artifacts developed from DSR projects. We identified another 60 articles with associated actions that preceded or followed these 92 projects. The content analysis of these 152 articles enabled the preparation of network diagrams and an analysis of the longitudinal evolution of these projects in terms of the activities and types of artifacts involved. Evidence was found of a precedence hierarchy among different types of artifacts, as well as nine new opportunities for entry points for the continuity of DSR studies. Regarding the evaluation process, four aspects (codes for analysis) were identified, which helped to demonstrate that 86% of DSR artifact evaluations are artificial and unrealistic.

weighing the resulting privacy risks and benefits. We provide initial evidence from an experimental field study, showing that an individual's decision-making process can easily be disturbed. We demonstrate that providing a service when requesting data, nudges individuals into disclosing even sensitive data, although the data is not related to the service itself. Only individuals with high privacy knowledge do not fall for this 'privacy trap.' These findings have important implications for the validity and legitimacy of central assumptions of the data economy.

Enabling Managerial Decision Making: The Use of Multiple Views in Dashboards

Author: **Torsten Ringberg**; Copenhagen Business School

Author: **Ravi K. Vatrapu**; Copenhagen Business School

Author: **Kostos Pantazos**; Deceased

A very useful way to enable decision making among overloaded managers is to represent data visually in graphs, trends, bar charts, maps etc. Graphical representations are superior to textual information when it comes to trends, correlation and other quantifiable information but only if the encoding of such information is both appropriate to the data, and uses an optimal dashboard design. Several review studies find that the management literature has failed to keep pace with the developments of dashboards, and that no agreement exists on how exactly a dashboard should contain (e.g., number of views) and what it should do. Thus, to apply visual representations efficiently and effectively still represent key challenges for creating value and enabling dashboard use in B2B settings. In this paper we experimentally test the efficiency, effectiveness, subjective preference among participants, and physiological gaze fixation count/time across two dashboard settings, one with three-view inserted and one with nine-view inserted. We use questions as well as eye-tracking measures. We find effects pointing to superiority of the nine-view dashboards for some tasks while the three-view dashboard performs better on other tasks. We discuss the implication of these findings in managerial decision making.

Dynamic Competition Identification Through Consumers' Clickstream Data

Author: **Meihua Zuo**; Huizhou U.

Author: **Carol Xiaojuan Ou**; Tilburg U.

Author: **Hongwei Liu**; Guangdong U. of Technology

Author: **Zhouyang Liang**; Guangdong U. of Technology

Author: **Spyros Angelopoulos**; Tilburg U.

Brands that use online marketplaces face challenges on identifying the market structure and analyzing their competitiveness. We address that lacuna by modeling online consumers' behavior using clickstream data and considering the interdependence of brands using network analysis. We draw on a dataset of 6,549,484 records over a period of 10 weeks from one of the biggest online marketplaces in China and employ spatial autoregressive models and network structural properties of brands to predict sales. Our findings indicate that intra-brand competition is more intense than inter-brand one and is the main reason for the fluctuations of sales. Concurrently, we demonstrate the redistribution of market shares of related products after the firm adjusts the length of the production line, so as to provide a reference for how to adjust the length intra-brand. By exploring the relationship between the structural position in the network and brand sales, we show that the span of structural holes of a brand negatively influences sales, while betweenness and degree centrality has a positive impact on sales. Our study contributes to the better understanding of brand competition on online marketplaces and presents both theoretical and practical implications. We discuss the significance of our findings for brand competition on online marketplaces and platforms, while we draw an agenda for future research on the topic.

The Impact of Network Resources on Competitive Behavior of Firms

Author: **T Ravichandran**; Rensselaer Polytechnic

Institute

Author: **Ileana Simona Giura**; SUNY Oneonta

Author: **Liang Zhao**; Lally School of Management,
Rensselaer Polytechnic Institute

Firms extend access to resources and information by collaborating with other firms. This paper explores how resource endowments accessible to a firm through its social network affect a firm's competitive behavior. We suggest that a firm's partners' knowledge portfolio - stock and diversity- has a positive impact on a firm's competitive actions repertoire in terms of volume, complexity, and heterogeneity. Further, we argue that firms have different access knowledge depending on the network position, mainly its centrality and access to structural holes, that allow them to initiate actions. We find that partners' knowledge stock has a positive effect on action volume and heterogeneity, while partners' knowledge diversity has a positive effect on action complexity. Further, we found that centrality will enable firms to leverage partners' diversified knowledge to initiate more actions as well as heterogeneous actions. However, centrality has a substitutive effect where higher knowledge stock of partners dampens the volume and heterogeneity of actions taken by a firm. We interpret and discuss the implications of the findings for research and practice.

Leadership, Mindset, and Change (session 1038)

Leading Change: Process or Mindset?

Author: **Bradley J. Hastings**; UNSW Sydney

Author: **Gavin M. Schwarz**; UNSW Sydney

Mindsets have entered the discussion on organizational change and its leadership, illustrated as different orientations by which change leaders see and engage with change efforts. Common conceptualizations illustrate two mindsets, aligned

Contributed by the prevalence of digital technology, numerous cases of new ventures rapidly become disrupters of established industries. Extant literature has pointed out the importance of pivoting and effective business model design to explain the success for new ventures. Nevertheless, how to design a business model that allows new ventures to effectively pivot their strategic directions remains under-explored. Based on an in-depth case study of a digital venture, which disrupted the flower industry in China, we explore how the development of digital resources, a process termed by us as “digital resource infrastructuring” that enables the case organization to effectively design a business model that allows continuous pivoting. In particular, we critically trace three mechanisms of digital resource infrastructuring driving pivoting, namely “orchestrating”, “partnering” and “partnering”, and develop a conceptual model to conceptualize the process through which digital firms evolve from a new venture to an industrial disrupter and continuously pivot through the development of digital resource infrastructuring. This model offers significant implications to the emerging literature on digital entrepreneurship, pivoting and business model design for new ventures.

The Sharing Economy Landscape: Structuring Research from Airbnb to Zipcar

Designated as a “Best Paper” for OCIS
Author: **Valentin Clemens**; WWU Münster
Author: **Ralf Wilden**; Macquarie Business School
Author: **Stephan Nüesch**; Westfälische Wilhelms-U. Münster

The technology-enabled phenomenon of the sharing economy is an alternative to legal ownership, which led to new business models, new ways of creating value, as well as market and non-market strategies. Consequently, the sharing economy has aroused significant interest from both practitioners and researchers from various fields due to its importance to the global economy. However, much of this fairly new research field is phenomenon-driven, creating the need to take stock of the existing fragmented research. To broaden our sight, we systematically review and quantitatively analyze

with different change processes. The planned mindset for when change is a planned, managed and controlled process, and the emergent mindset when futures are unknown, outcomes are adaptive, and leaders foster environments where new possibilities evolve. A limitation of this bifurcation is that modern, complex, change contexts require concurrent application of both perspectives; for example, planned processes for strategic decision-making and emergent processes for discovering new solutions. This convergence suggests the possibility of an underlying, single, mindset guiding a change leader when choosing between these two perspectives. Separately, well-established knowledge presented by organizational psychologists presents the fixed and growth mindsets. Testing the influence of these two mindsets on change outcomes, we observe 63 cases of organizational change, finding that leaders who singly exhibit a growth mindset lead exponentially more successful change outcomes. Further, these same leaders were far more likely to concurrently apply planned and emergent change processes. As such, we propose the growth mindset as a better conceptualization of the desired mindset for change leaders. Further, we propose a new leadership development approach for change leaders – mindset priming.

Conceptualizing an Agile Team Mindset: Paradoxes and Mindsets in Times of Transition

Author: **Anastasia Grass**; LMU Munich

Teams in large corporations undergoing a transformation towards agile methods and application of the same are often confronted with a set of paradoxical challenges. In order to deal with these paradoxical challenges and make sense of them, a suitable team mindset is needed. To conceptualize such a mindset and study its interactions with the experienced paradoxes, we have accompanied a European large telecommunications corporation undergoing a second agile transformation after having already undertaken a smaller agile transformation in the past. At three points in time over the course of almost a year, we have interviewed 27 team

a large sample of 590 full-text articles. We find broad interest in the sharing economy from various angles in academia, with a focus on the two dominant domains of accommodation and mobility sharing. We uncover the poles of altruism and commerce as two reasons for sharing. Finally, we show that the majority of research on the sharing economy is phenomenological and lacks a thorough theoretical foundation. We contribute to the literature by: 1) textually analyzing which topic areas previous research has focused on; 2) describe interlinkages among the topic areas; and 3) providing directions on how future research can draw on previously used theories to lift sharing economy research towards a theory-driven debate.

To Share or Not to Share? Assessing the Impact of Self-Regulation on a Peer-to-Peer Market

Author: **Shagun Tripathi**; PhD Student at IESE Business School

Author: **Harris Kyriakou**; IESE Business School

Recent calls for regulation of peer-to-peer markets has led platform owners to self-regulate, often by replicating local regulations through digital infrastructures. We employ several econometric techniques to analyze and quantify the impact of self-regulation on matching outcomes and participants' exit in a peer-to-peer home-sharing market. First, we use a difference-in-differences approach, exploiting Airbnb's self-regulatory 90-day booking limit on entire apartments in London, and find that self-regulation led to a significant decrease in monthly matches, and significant increase in the probability of market exit for affected listings. Further, we find not all listings experience same effects; listings owned by hosts who own reputation badges experience greater drop in monthly matches. Through additional survival analysis, we find that survival rates of listings owned by hosts who own reputation badges are higher than other listings. Finally, we confirm our results on a sample constructed using Coarsened Exact Matching. Our study makes a distinct contribution relative to prior studies on peer-to-peer markets by providing empirical insights on how peer-to-peer markets relate to self-regulation. It underscores the fact that

members, Product Owners, Scrum Masters, and associated leaders, resulting in 81 qualitative semi-structured in-depth interviews. Drawing on this data, we have conceptualized the agile team mindset and developed a framework which explains its interactions with paradoxes. Thereby, we show how experienced paradoxes can foster the agile team mindset via integrating and separating sets of mechanisms and vice versa how the agile team mindset can help dealing with the experienced paradoxes. We contribute to research on mindsets, paradoxes, and integrate agile teams as specific team type into team effectiveness research.

Challenges for Leadership in the Digital Era: How to Enhance Employees' Digital Readiness

Author: **Mona Hoeyng**; U. of Duisburg-Essen

Author: **Angelika Lau**; U. of Duisburg-Essen

The purpose of this paper is to obtain deeper insights into employees' intentional digital readiness to enable organizations' digital transformation. In this context, the Employee Digitalization Acceptance Model (EDAM) was developed to investigate empowering leadership (EL), trust in management, and employees' proactive personality and their growth mindset. Based on data of 1,145 employees of an internationally operating energy supplier, structural equation modeling revealed that relations between EL and employees' intentional digital readiness are totally mediated by perceived usefulness (PU) and perceived ease of use (PEOU). While EL in terms of autonomy support is positively related to intentional digital readiness, EL in terms of development support is negatively related. Furthermore, employees' trust in management, their proactive personality, and growth mindset promote higher intentional digital readiness. Consequently, employees' intentional digital readiness is not solely dependent on employees' personality, since it can also be enhanced by EL and trust in management.

Community-Based Collaborative Consumption: Exploring an Organization-Sponsored Sharing Platform

Author: **Ulrike Schultze**; Southern Methodist U.
Author: **Anita D. Bhappu**; U. of California, Merced

The dearth of sharing platforms that are embedded in an established community is puzzling given that shared interests facilitate the sharing of goods and services and this collaborative consumption, in turn, increases communal sociality. Additionally, the chicken-and-egg challenge of recruiting sellers and buyers to a sharing platform is alleviated when this two-sided market is implemented in an established community. By studying the Zimride by Enterprise® platform that supports private ridesharing communities within universities and corporations, we unpack the challenges of managing an organization-sponsored sharing platform and empirically answer the following research question: Despite the benefits that community bestows on sharing, why are sharing platforms embedded in organizations so elusive? In answer to this question, we abductively develop three plausible explanations from our empirical case study: competing organizing mechanisms, non-generative dialectic management and insufficient community building. These explanations are grounded in our empirical insights about tensions nested within the complex service delivery model of organization-sponsored sharing platforms, which result from the competing organizing mechanisms of this hybrid organizational form. Our conceptual infrastructure and qualitative findings can guide future research on community-based sharing platforms and help managers to innovate new service delivery models for promoting sustainable consumption and corporate social responsibility.

The Development of Implicit Followership Theories in Organizational Change Processes

Author: **Annemiek Van Der Schaft**; Radboud U. Nijmegen

Author: **Omar Solinger**; Vrije U. Amsterdam

Author: **Riku Ruotsalainen**; Vrije U. Amsterdam

Author: **W Van Olffen**; TIAS/ Tilburg U.

Author: **Xander Lub**; Nyenrode Business U.

Author: **Beatrice Van Der Heijden**; Radboud U. Nijmegen

Successful organizational change requires substantial efforts from both change leaders and followers. After a long tradition of focusing on change leadership, academics increasingly focus on the role of followership. However, understanding the diverse responses of followers in change processes is complex, as a clear understanding of the underlying mechanisms that trigger followers' heterogeneous interpretations seems missing. Using a standardized process interview protocol, we content-analyzed 60 individual experience narrations of major organizational changes in eight different organizations and industries. These narrations appeared to map in six prototypical stories (i.e. the 'Warrior Story') that are proposed to explicate yet uncharted temporal pathways of change followership. We highlight several similarities and differences between those stories and interpret them as reflections of Implicit Followership Theories in change context. By adding to the understanding of interpretive processes grounded in mental schemas, this study could help leaders of change to anticipate their followers' diverse responses to supposedly similar experiences.

Connectivity and Cohesion in the Networked World: A Durkheimian Perspective

Designated as a “Best Paper” for OCIS

Author: **Yasmin Merali**; U. of Hull

This paper addresses the challenge of maintaining social cohesion through waves of potentially disruptive technological innovations. It develops concepts from Durkheim’s Division of Labour to advance our theoretical understanding of the relationship between individual connectivity and the emergence of a coherent network economy. Advances in ICTs present opportunities for innovative ways of organising work, and AI presents unprecedented possibilities to augment human intellectual and physical capabilities. These changes pose novel legal, ethical and societal challenges: requisite legislation and social norms to deal with their consequences have not yet been established, raising the risk that irresponsible exploitation of new capabilities may undermine social stability. We use Durkheim’s concepts to examine how that risk can be mitigated by maintaining social cohesion in the absence of established norms. We identify two distinct mechanisms underpinning the emergence of social cohesion, predicated on the existence of a “lumpy” societal network that supports the evolution of multiple diverse capabilities, with tightly connected clusters (embodying mechanical solidarity) alongside more loosely connected, possibly transient constellations (embodying organic solidarity). This type of network organization is consistent with the pattern that confers resilience and transformational capability in biological systems, resonating with Durkheim’s use of the biological organism as a metaphor for a cohesive society. Conversely, the Gig economy decouples workers from the collaborative network, rendering them vulnerable to anomie. The main contribution of this paper lies in establishing the criticality of attending to the design of work and elucidating the requisite network mechanisms underpinning societal cohesion in dynamic contexts.

How Robots and Automation Change Human Work (session 1045)

Robots and other types of automated technologies are increasingly taking over the tasks that were previously done by humans. Therefore, it is important to understand the diversity of the practices and the ways in which organizations and their members deal with technological change in different industries and contexts. Our symposium highlights how robots and automation change human work and what consequences this has on people and organizations. The symposium consists of four empirically grounded papers that focus on the burning theoretical questions in this field: how reliable performance is ensured in work with robots; how high reliability organizing principles may be adapted to robot-human interface; how robotization affects organizational performance and workforce structure in different types of organizations; and how humans negotiate work design and share social space with robots. By integrating diverse theoretical and methodological approaches into our symposium, we enrich our scholarly understanding of the impact of robotization and encourage discussion of the phenomenon from different angles.

Institutional Complexity and Opportunity (session 1041)

The Interplay between Institutional and Individual Determinants of Organizational Transparency

Author: Pavel Kral; U. of Economics, Prague

This paper develops organizational transparency theory by exploring the determinants of transparency. A typology-based model explores the interplay between the institutional and the individual determinants of organizational transparency. The typology explains the mechanisms and outcomes of different combinations of the determinants of transparency, which lead to four archetypes of transparency: Complete transparency, Symbolic transparency, Illusory transparency, and Residual transparency. This multilevel approach provides a new perspective, which helps to interpret the conflicting results of past studies of the determinants of transparency. It reveals the conditions under which the unintended consequences of transparency initiatives—such as information decoupling or the transparency paradox—may occur. The practical implications of ways of making organizations more transparent are considered with a view to avoiding the negative consequences of transparency initiatives.

sustain hybridity over time. We identify two contextual variables - maturity and strategic focus - that influence how these hybrid organizations organize for high strategic performance. We find that successful responses of organizations facing institutional complexity are multifaceted, dynamic, and change over time as strategy and stakeholder demands vary. We contribute to institutional theory by introducing the concept of buffering and bridging to explain how successful hybrid organizations distance themselves from the institutional logic they originate when they become more mature (buffering). At the same time, they increase their efforts to maintain connections to representatives of the logic they stem from (bridging).

Configuration of Institutional Entrepreneurial Opportunities

Author: **Lasandahasi Ranmuthumalie De Silva**; Birkbeck, U. of London

Author: **Robin Gustafsson**; Aalto U.

The paper develops a middle-range theory - rooted in the 'configuration' principles of sociology and organization theory - to explain how the different configurations of macro institutional and micro individual conditions trigger different actions that begin distinct IEO creation processes. It is theorized that during the opportunity creation process, micro and macro conditions may change, giving rise to new configurations. Our conceptualization of multiple types of configurations that trigger individual actions in parallel and in sequence that, when successful, together lead to the creation of the demand and/or solution(s) for institutional change advances a granular understanding of the triggering of the moving forward of institutional change. In particular, this theorization provides a framework to fulfill our knowledge gap to systematically study the heterogeneity in the triggering of actions and their evolution in the institutional entrepreneurial opportunity creation process.

Inception point: Combining institutional complexity and strategy-as-practice for strategizing

Author: **Kathryn Louise Hartwell**; London School of Economics and Political Science

Author: **Gerardo Patriotta**; U. of Warwick

Author: **Simona Spedale**; Nottingham U. Business School

This paper examines the intersection between institutional theory and strategy, and more specifically, institutional complexity and strategy-as-practice, to further our understanding of how organizations can effectively respond to multiple, and often conflicting, institutional pressures. We present an in-depth case study of a UK-headquartered commercial law firm, documenting how the firm has navigated the ongoing shift from a once traditional legal field dominated by the professional logic, to a more fluid situation, characterized by the increasing encroachment of the market logic. Our study brings together the macro approach of institutional complexity and the micro processes of strategy to offer multiple contributions. In particular, we further current literature on organizational strategic responses by showing that multiple strategies can co-exist within one firm at a given time, and we highlight the potential of talk as a medium through which organizational response strategies are initially brought into being.

Author: **Thorbjørn Knudsen**; U. of Southern

not able, or not willing, to endow them with the resources they need to be developed. In this symposium, we seek to shed light on the evaluative processes that lead to the acceptance (or rejection) of novelty broadly conceived, the intra-audience dynamics that shape individuals' judgment, as well as the consequences of such processes for innovators themselves. The four papers in this symposium explore the motivations that lead individuals to abandon (or not) their novel ideas as a consequence of the feedback they receive from key stakeholders, the way evaluations are affected by the presentation sequence of novel ideas, and the intra-audience factors that lead individuals to evaluate novel ideas in different ways. Our goal is to encourage future research to further explore the relationships between novel ideas and their target audiences, with particular attention to the microfoundations of evaluators' judgment.

Denmark

Many organizations employ algorithms that learn from their members and then shape the way these individuals learn. Nevertheless, decades of research on organizational learning suggests that imperfect learning algorithms could sustain suboptimal beliefs that trap organizations indefinitely. To study potential algorithmic learning traps, we solve the underexplored theoretical properties of the March 1991 mutual learning model and demonstrate the conditions under which individuals should trust learning algorithms' recommendations. Our results show that the received wisdom regarding the benefit of slow learning and diversity does not hold when algorithms cannot identify accurate beliefs but follow the majority. The presence of non-discerning or even manipulated algorithms suggests that individuals should learn fast instead of slow to reduce the chance that algorithms learn the wrong, misleading lessons that would otherwise diffuse and contaminate everyone. Our exploitation of the March model generates novel insights that are increasingly relevant, thus promoting the model's generalization and making its beauty more robust.

Falling Down or Bouncing Back: A Two-Stage, Dual-Path Organizational Learning Process After Failure

Author: Hao Gong; Rutgers U.

Author: Jian Han; China Europe International Business School (CEIBS)

Author: Yan Pan; Rutgers U., School of Management and Labor Relations

Research demonstrates that experiences of failure can have positive and negative effects on a firm's subsequent behavior and performance. This contradictory finding necessitates in-depth exploration on the mechanisms behind failure-related performance change. The purpose of this study is to fill this gap by disaggregating the postfailure learning process into "falling down" and "bouncing back" paths and addressing their relative effects on organizational performance in an integrated framework. We test our arguments in the context of a computer-based strategic business simulation. We repeatedly collect survey data from

144 teams in an executive education program during 2016-2018. Our study contributes to the literature on organizational learning from failure in three dimensions. First, we develop a comprehensive model by integrating macro and micro perspectives. Specifically, we advance our understanding of a firm's subsequent reactions to failure through its micro-foundation rooted in top management team (TMT) dynamics. Second, our findings indicate that organizational learning from failure involves two stages, namely chaos stage and reassembly stages. Finally, we reveal that the severity of failure amplifies both falling down and bouncing back effects on organizational performance change. From our findings, we draw implications for organizations to facilitate effective learning from failure.

Learning What They Think vs. Learning What They Do: Two Mechanisms of Vicarious Learning

Author: Sanghyun Park; INSEAD

Vicarious learning is a vital component of organizational learning. However, as new technologies emerge that have the potential to improve vicarious learning among individuals and between humans and algorithms, our lack of conceptual clarity about its underlying mechanisms may impede our ability to benefit from them. We theorize and model two fundamental processes underlying vicarious learning: observation of actions (learning what they do) vs. belief sharing (learning what they think). The analysis of our model points to two key insights. First, vicarious learning through belief sharing is not universally better than simple mutual observation of actions and outcomes. Specifically, enabling mutual observability of actions and outcomes is superior to sharing of beliefs when the task environment features few alternatives with large differences in their value and there are no time pressures. Second, the superiority of vicarious learning through belief sharing in more complex task environments with time constraints does not require any differential wisdom ex ante among the learners. Both results are shown to be the consequence of a key mechanism – how vicarious learning affects self-confirming biases.

Wait Before You Learn - How Organizational Structure Shapes Learning Paths

Author: Felix Meissner; U. of Zurich

Hierarchical structures -- here understood as the intra-organizational arrangement of lines of authority, information flows and roles of organizational members -- have been traditionally assumed to inhibit organizational learning and impede an organization's adaptability. We revisit this assumption, which is based on the logic that hierarchies may hinder the accurate processing and delay the internal forwarding of performance feedback, thereby foregoing the opportunity to learn and quickly adapt behavior in a way that increases performance. We argue that this logic is incomplete. A delay in feedback forwarding may also influence the characteristics of the learning process, in particular the search paths and focus of exploratory activities. Employing a simulation model, we examine how organizations search and experiment with new solutions when performance feedback on past actions is delayed and ambiguous. Contrary to conventional wisdom, our analysis uncovers mechanisms of deeper exploration by which hierarchical structures may improve, rather than impede learning and performance improvements in the long run. Our model shows that hierarchies both influence the speed of interpreting and learning from performance feedback as well as the search paths taken to explore alternatives.

Stigma and Morality: Sanctions, Change, and Acceptance (session 1042)

Surviving Bad Business Behavior: Network Structure and Trust Penalty

Author: **Sonja Opper**; Lund U.

Author: **Na Zou**; Goethe U. Frankfurt

Sanctions against bad behavior vary greatly. Some wrongdoers are regarded as no longer trustworthy; others face only modest consequences. This study investigates how this difference can be explained. Using data on 384 people cited as being “difficult” contacts (“wrongdoers”) within networks of Chinese entrepreneurs who deemed them such (“accusers”), this study shows how social structure influences variation in the penalty in lost trust that wrongdoers pay. Controlling for personal attributes and the substance of the incident that led to the wrongdoer being deemed difficult, we find that trust in the wrongdoer decreases with network closure around the accuser. We also find that highly embedded wrongdoers “survive” the incident with smaller trust penalties. The counterintuitive conclusion is that whereas closed networks have ideal structural properties to detect and sanction malfeasance, closure around the wrongdoer protects the wrongdoer from severe consequences of bad behavior.

Orchestrating Interstitial Networks: Dynamics of High-Potential, Low- Expectation Collaboration

Author: **Leona Henry**; Tilburg U.

Author: **Guido Moellering**; U. of Witten/Herdecke

Network orchestrators try to mobilize value for and from networks by recruiting network members and purposefully shaping their interactions to foster collaborative outcomes. While the activities of such actors have been assessed in dynamic settings in which network members participate on a full-time basis, orchestrators may find themselves in networks where members are engaged as a low-commitment side activity, which, nevertheless, might turn out to be highly important for them. We introduce the concept of interstitial networks to denote such settings and explore how orchestrators in these networks perform their role. We find specific dilemmas orchestrators face in these settings, as well as three orchestrating practices for

Unpacking Stigmatization: Labeling, Audience Heterogeneity, and Market-Based Sanctioning

Author: **Mohamad Hasan Sadri Karami**; IE Business School

Author: **Wesley Helms**; Brock U.

Author: **Kam Phung**; York U., Canada

Author: **Alessandro Piazza**; Rice U.

Existing research on organizational stigma has predominantly focused on its origins, as well as for the consequences of stigma for the organizations that are subjected to it. By contrast, the stigmatization process has remained relatively unexplored from an empirical standpoint. In this paper, therefore, we theorize about the stigmatization process and we suggest that its effectiveness in eliciting market-based sanctions will be a function of: 1) the labels used in framing stigmatizing judgments; 2) the audiences using those labels; 3) the “fit” between vilifying labels and the audiences using them. Through an analysis of cumulative abnormal returns (CAR) in the wake of stigmatizing judgments formulated by various audiences and targeting firms active in the defense industry between 1998 and 2016, we find broad support for our arguments.

Queens of Drag: A Multidimensional Perspective on Core Stigma

Author: **Mario Campana**; Goldsmiths, U. of London

Author: **Katherine Duffy**; Adam Smith Business School, U. of Glasgow

Author: **Maria Rita Micheli**; IESEG

This paper critically assesses RuPaul’s Drag Race as a stigmatized organization which has built its success on the active spectacularization of its core stigma, through the showcasing of specific organizational discourses and transgressions. Drag Race is an interesting case as the organization does not conceal stigma; on the contrary, it leverages the transgressions associated with the social deviance of drag queens, enhancing success and acceptance with wider audiences over time. We focus on how audiences generate discourses that trigger this acceptance and how the organization fuels these discourses, using them as strategic resources for

navigating them: 1) probing themes and partners, 2) adapting orchestration timelines and activities, and 3) experimenting with interaction formats. Our findings highlight the mutually reinforcing relationship between orchestrating practices and the manifestation of interstitial elements in networks. Moreover, we show the experimental and collective character of orchestrating interstitial networks.

Tertius Dominans and the Persistence of Structural Holes Among K-Pop Songwriters

Author: **Yonghoon Lee**; Hong Kong U. of Science and Technology

This paper explores how inequality between successful artists—who can access to a wealth of opportunities—and unsuccessful artists—who face daunting challenges even to survive in their career—provides unique insight into the persistence of structural holes in collaboration networks. The author proposes that when two unsuccessful artists who never collaborated before share a tertius dominans, that is, a common collaborator who is more successful, the unsuccessful artists are less likely to initiate a new collaboration that excludes the tertius dominans. This allows structural holes of the successful artists to persist. Studying the careers and collaboration network of K-Pop (Korean popular music) songwriters, the author argues that daunting career challenges make unsuccessful artists yield brokerage opportunities to their successful collaborator who can bring them better career prospects. Using several empirical designs, including case-control design, songwriter fixed effects, and difference-in-differences, the author estimates the hazard of exclusive closure, where the disconnected collaborators initiate a new collaboration without the broker, and finds supporting evidence. Implications to studies on the instability of structural holes, inequality and networks, and the careers of cultural production are discussed.

The Role of Confucian Moral Virtues in Transforming the Stigma-inducing Moral System

Author: **Grace Hong Fan**; U. of British Columbia
Author: **Maxim Voronov**; Schulich School of Business

This study builds theory on the role of traditional moral virtues in enabling actors to transform the stigma-inducing dominant moral system. Drawing on a longitudinal, qualitative study of early private entrepreneurship in China, the findings suggest that stigmatized actors' continuous moral work involving both rhetoric and enactment of moral virtues can be effective in influencing the dominant moral system, which has been utilized to stigmatize them. Further, the moral work generates feeling of solidarity amongst stigmatized and elicits positive sentiments from the stigmatizers, deepening existing knowledge of audience dynamics in the stigma literature. We discuss the implication of connecting morality with stigma for the study of stigma and social progress. Key words: stigma, morality, moral virtues, qualitative research

Saying Hello and Waving Goodbye: Intra-Organizational Tie Formation when Brokers Leave

Author: **Tracy Anderson**; Department of Management and Technology, Bocconi U.

Brokers, who serve as indirect ties between others, can play an important role in the formation of new collaborative relationships. Yet we know little about how the mobility of such individuals changes the role that they play. In this paper, I explore the how the organizational exit of individuals in brokerage positions influences tie formation between previously unconnected workers. Whereas these exiting individuals may be expected to play a lesser role in the formation of new collaborative relationships, I argue that they may in fact play a greater role as their exit will both stimulate demand for such helpful brokering among the workers they will leave behind and alter the costs of this type of brokering. I explore the impact of brokers on tie formation using data on employees engaged in scientific research within a single organization. Using journal article co-authorship to identify collaborative ties, I find support for my argument. Furthermore, I show how the role of exiting brokers varies depending upon the nature of their exit, tie strength, and the relative status of the brokers. In so doing, this paper illuminates how new tie formation is shaped by the mobility of brokers, extending our understanding of the dynamics of collaborative networks within organizational settings, brokerage, and the effects of employee mobility.

Stand Up or Stand By: The Effects of Network Positions on Whistle-Blowing

Author: **Azusa Nakamura**; Bocconi U.
Author: **Giuseppe Soda**; Bocconi U.

This paper examines which network positions enable individuals to engage in whistle-blowing in a context of sexual harassment in Hollywood movie industry. We hypothesize that individuals who are in an open network are more likely to engage in whistle-blowing. This is because they can get access to variety of information regarding the level of retaliation by sexual harasser and supporters of their whistle-blowing. We also hypothesize that high-

an example from a nursing home, where a depressed resident is invited on a motorcycle trip to give her a positive and energizing experience. It illustrates an initiative to prioritize moral agency aiming to benefit another person over moral agency geared towards avoidance of harm. Informants to this study have indicated that moral agency of this kind is rare, since it involves a risk of causing harm, and a risk of professional repercussions if the outcome is negative. Moral paralysis occurs when decision-makers are reluctant to engage in prescriptive moral agency, due to a perceived lack of protection against negative consequences. We argue that previous theories have conflated prescriptive and proscriptive moral agency on the one hand, with action and inaction on the other, and propose a model that combines these two dimensions of moral agency. We also apply the concept of moral luck to explain the emergence of moral paralysis.

Unpacking the Moral Dimensions of Crowd-Based Organizing

Author: **Emmanouil Gkeredakis**; IESE Business School

New forms of crowd-based organizations (CBOs) are puzzling for organizational scholars. On one hand, they enable unbounded participation – any individual from the crowd can join – creating the conditions for generative interactions and ongoing change. On the other hand, for an organization to sustain itself, the contributions of multiple actors need to be steered toward a certain direction to tame change and achieve stability. Extant literature insights suggest that CBOs may influence and guide crowd behavior through architectural and governance mechanisms, such as rules of participation and structure of incentives. In this paper, we aim to unpack the moral dimensions of CBOs. We develop the argument that discursive resources, in particular, orders of worth, play a crucial role in soliciting and maintaining the commitment of the crowd. Empirically, we study two CBOs, Quirky and Kickstarter, which mobilized orders of worth to convince crowds to contribute to a greater good through their platforms. We found that through raising and materializing moral claims,

status individuals are more likely to engage in whistle-blowing. This is because they can control relevant resources such as information and connections. Also, they can ask low-status actors to support their whistle-blowing when they form a tie with low-status ones. We test our hypotheses on the Hollywood film industry and find support for our hypotheses that different network positions determine whistle-blowing.

CBOs solicited the commitment of the crowd and managed to scale their activities. Yet, despite the early success, the actions of an increasingly diverse crowd put a strain on the process of materialization. Hotly debated controversies reflected deep moral tensions that rendered the commitment of the crowd fragile. By unpacking these controversies and the responses of Quirky and Kickstarter to deal with them, this paper offers new insights into the moral dimensions of crowd-based organizational forms.

Resilience (session 1046)

[Beyond Chaos, Anger, Grief, and Remorse Through Organizing After a Nuclear Disaster in Fukushima](#)

Author: Nobuyuki Chikudate; Hiroshima U.

This study reports qualitative research to investigate the nature of the organizing that played a significant role in harnessing resilience among survivors and refugees, who suffered during and after the catastrophic events of March 2011, in the northeastern region of Japan, especially Fukushima. The author conducted an eight-year in-depth qualitative study to reveal the nature of organizing among those who suffered from those events.

Humanitarian Operations and Supply Chain Management (session 1047)

[Role and Importance of Coordination in Disaster Logistics: The Case of Earthquakes in India](#)

Author: Reda M Lebcir; Hertfordshire U.

Author: Priyanka Roy; U. of Hertfordshire

Purpose: The world has witnessed an increasing number of natural disasters in recent years affecting large populations. The logistical operations to deliver relief to these populations are complex requiring careful planning and execution especially during the Last Mile Relief Distribution (LMRD), the ultimate phase in these operations. LMRD is the phase where the disaster logistics chain directly connects with the affected communities and whose performance is affected by many factors. Among these is the level of coordination between the organisations involved in relief operations. The aim of this paper is to evaluate the impact of coordination on LMRD performance in the context of India, the most affected country in the world by natural disasters. Methodology/ Design: The research was conducted into two phases. First, qualitative interviews were conducted with Indian government, national, and international NGOs involved in disaster relief operations in the country to determine the factors affecting LMRD operations.

initiatives within a US higher education institution where repeated efforts by actors led to nominal change. We focus on understanding how perceived change makers – administrators, faculty, staff, and students – intentionally sought over time to enact sustainable development initiatives in the face of strong pressures for the status quo, or a business-as-usual mentality. We show how an actor’s journey in attempting to embed sustainable development practices into the university was a dynamic process, where he/she experienced periods of persistence and periods of suspension in their work. Our theorizing reveals three key coping strategies that actors utilized in periods of persistence: connecting with others, being resourceful, and envisioning for the future. Our study contributes to the sustainability literature by addressing the underexplored concept of place-based sustainability, and relating this to resistance to change and individual coping mechanisms. In doing so, we explicate how actors persist in their efforts to pursue sustainable development initiatives despite strong pressures for the status quo.

Socio-Ecological Resilience and Environmental Sustainability of Avocado in Michoacán State

Author: **Nadeem Khan**; Henley Business School, U. of Reading

Author: **Nada Kakabadse**; Henley Business School, U. of Reading

Author: **Antonis Skouloudis**; Henley Business School, U. of Reading

Natural science impact assessments of sustainability evidence more closely than social and business studies frameworks that the interdependent planetary boundaries limits are being breached. This brings to attention environmental ecological assessments are better placed as the starting point to inform how human action or inaction as socio-economic behaviours can influence environmental resilience – rather than the other way around. This study identifies food security as a grand challenge. A socio-ecological cosmopolitan resilience framework is conceptualised and applied to the commodity case of the avocado in Michoacán, Mexico. A range of multi-level issues are identified and captured

Second, an Agent-Based Simulation Model (ABM) was developed to represent the Indian LMRD system to evaluate the impact of coordination on its operational performance and ability to satisfy the needs of the affected people. Several scenarios reflecting different coordination policies were evaluated on the ABM. Findings: The qualitative phase findings identified coordination as the most significant factor affecting LMRD operations performance in India. The ABM simulation results provided empirical evidence that better coordination during LMRD reduce the level of inventory, hence costs, to satisfy disaster relief demand by approximately 16% and improve responsiveness by 13%. Originality: This research identifies coordination as a major driver of LMRD operations in India. Its impact is evaluated through the development of an innovative ABM model, which provided empirical evidence of the magnitude of LMRD performance improvement by adopting new coordination policies. The research provides suggestions for new ways on how to achieve better coordination and implement these successfully in Indian LMRD operations.

Understanding Organizational Risk-Taking Behavior during Disaster Relief Operations

Author: **Iana Lukina**; U. of South Florida

Author: **Samuel Roscoe**; U. of Sussex Business School

Author: **Arash Azadegan**; Rutgers Business School

Risk taking is commonplace during disaster relief operations. However, little attention is paid to how different types of organizations manage risks during the immediate response and short-term recovery period of a natural disaster. Following extant models in disaster management, this paper examines how two different organizational types, namely expanding and extending, manage risks associated with responding to Hurricanes Irma and Maria. Data are gathered from 27 interviews with individuals involved in disaster response activities across two organizational types. We find that expanding and extending organizations will perceive risks differently based on structural rigidities, the expectations of the public as well as safety concerns.

together, as impacting biodiversity, land usage and fresh water sustainability at the individual, firm and governmental levels. At each level, a variety of recommended simultaneous changes that may advance system-wide sustainability are considered as cultural, moral and governance dimensions towards ameliorating negative sustainability effects and promoting multi-level improvements for enhanced resilience. Our cosmopolitan framework is important as natural science and social norms must inform business practice at all levels for environmental sustainability.

Sadism in Foreign Lands: The Burn Pit Atrocity

Author: **R. Duncan M. Pelly**; McMurry U.

This paper explores one of the forgotten tragedies of the modern era – that of the burn pits. Burn pits were large holes dug directly into the ground in Iraq and Afghanistan during the war on terror where government contractors burned hazardous materials in direct proximity to human habitation. The result is not only air pollution and contamination of water tables, but also countless illnesses and death for soldiers and civilians exposed to these toxins. This paper supports the American courts' opinion that military contractors were not to blame for these tragedies. Instead, this autoethnography uses the theories of Marquis de Sade to explore why senior military officials ignored the dangers of burn pit exposure deliberately to provide an illusion of normalcy during military deployments and to benefit from harming their subordinates. This paper is of use to academics who explore organization dysfunctions; it is one of a small number of papers that explores issues involving the burn pits; and, most importantly, it represents activism to use scholarly research for greater good and to expose evil.

Adaptability in Humanitarian Operations: Role of Prosocial Motivation and Authoritarian Leadership

Author: **Mojtaba Salem**; Kühne Logistics U.

Author: **Niels Van Quaquebeke**; Kühne Logistics U.

Author: **Maria Besiou**; Kühne Logistics U.

Many field office leaders contend that humanitarian aid operations call for authoritarian leadership in order for aid workers to more quickly adapt to changes and thus deliver a better job performance. However, given that field reports highlight leadership as a serious operational failure, is it really effective to lead aid workers with an authoritarian style? We draw on human motivation theorizing to address this question because many aid workers join humanitarian aid operations primarily to help beneficiaries. We test our hypotheses with a sample of 299 aid workers from the field. Contrary to the common view, we find that, when leaders are less authoritarian, aid workers who are prosocially motivated are better capable of adapting to changes and thus performing because leaders would not undermine the autonomy that they require to stay motivated. However, under less authoritarian leaders, the adaptability and job performance of aid workers with lower prosocial motivation continue to suffer. The theoretical and managerial implications of these findings for humanitarian aid operations are discussed.

Hopkins U.

According to the Federal Emergency Management Agency (FEMA), around 40% of small businesses never reopen following a disaster and around 90% of firms that do reopen, fail within a year unless they can resume operations within 5 days. Nonetheless, firms can hasten their recovery and increase their survival chances by implementing resilience actions or tactics after a disaster begins. Given that business interruption losses are usually not eligible for public assistance programs, the type of action to be implemented is a strategic decision and will likely depend on some particularities of each business and the market in which it operates. This paper examines one of these resilience tactics – resource sharing – from the perspective of Resource Dependence Theory. By using a unique dataset collected from responses of businesses affected by Superstorm Sandy and Hurricane Harvey and by specifying a sample selection model, this study provides novel conclusions indicating that there is unobserved heterogeneity that explains the strategic decision-making of firms in the post-disaster and that those firms that are more likely to resource share are also the ones that exhibit higher economic resilience. Implications of these findings, complications and future research are discussed.

Multi-Criteria Decision Analysis to Prioritize Locations of Labor Exploitation for Intervention

Author: **Ioannis Kougkoulos**; U. of Nottingham

Author: **Selim Cakir**; U. of Nottingham

Author: **Doreen S Boyd**; U. of Nottingham

Author: **Alexander Trautrimis**; U. of Nottingham

Author: **Kornilia Hatzinikolaou**; Aristotle U. of Thessaloniki

Author: **Stefan Gold**; U. of Kassel

Recent estimates suggest that there are currently more than 40 million people worldwide in modern slavery and other forms of labor exploitation. UN Sustainable Development Goal 8.7 addresses this problem and urges stakeholders to take effective measures to end all forms of labor exploitation by 2030. Presently, there are no risk assessment tools available to enable decisions of resource allocation for humanitarian operations that compare the risk of labor exploitation among different alternatives systematically. In this paper, we argue that multi-criteria decision analysis (MCDA) can overcome barriers associated with quantitative examination of labor exploitation risk if it is informed by a combination of data sources in order to capture the issue's complex and multidimensional nature. Combining satellite-based, interview, and questionnaire data, we apply the proposed MCDA tool in a case study, which evaluates labor exploitation risks in Greek strawberry fields. Through satellite monitoring, approximately 50 settlements hosting about 6000 workers have been identified. MCDA performed on a subset of six settlements from this sample yielded a complete ranking of settlements based on the risk of labor exploitation. Our paper advances research on humanitarian operations, sustainable production, and not-for-profit operations management by elucidating how MCDA can be an effective methodology for data-driven prioritization of interventions against labor exploitation.

Up the Chain: Career Climate and Mentoring in the U.S. Army

Author: **Shannon Portillo**; U. of Kansas

Author: **Amy E. Smith**; U. of Massachusetts, Boston

Author: **Alesha Doan**; U. of Kansas

For careers in public service, meritocracy is espoused and idealized with formal structures for advancement – civil service laws, the general schedule classification, and the senior executive service among others. However, career development is also relational. Mentoring, social networks, and role models also influence advancement. In this paper we examine how espoused career paths and the relational dimensions of career advancement interact to produce career climates in the public sector workforce. Using data from a mixed method study of the U.S. Army, including survey data from approximately 1,200 Army personnel and analysis of 27 focus groups with 198 participants, we find that mentoring quality matters for all employees, but it matters more for women in male-dominated professions. Our findings have implications for how scholars and practitioners discuss the role of mentoring in in public organizations, and specifically how mentoring shapes employees' career advancement and ascension to leadership positions.

Social Entrepreneurs' Motives, Role Stress, Work Competence, and Passion

Author: **Young-joo Lee**; U. of Central Florida

Author: **Hyunseok Hwang**; Texas A&M U., College Station

This study examines how social entrepreneurs' motives and role stress affect their passion and how these relationships are mediated by their perception of own work competence. The analysis of the data from a survey of 264 self-identified social entrepreneurs working in different types of organizations show that other-oriented motives are strongly associated with passion while self-oriented motives are generally not. The results also reveal that perceived work competence mediates these relationships, reinforcing the relationships between other-oriented motives and passion and between role stress and passion. In particular, when social entrepreneurs perceive a high level of competence, role stress positively affects social entrepreneurs' passion, suggesting that the multitude and ambiguity of roles can boost passion, rather than decreasing it. This paper concludes with suggestions for social entrepreneurship education programs and curricula.

How Do Organizational Sustainable Practices Foster Public Service Motivation and Job Satisfaction?

Author: **Saskia Crucke**; Ghent U.

Author: **Tom Kluijtmans**; Ghent U.

Author: **Kenn Meyfroodt**; Ghent U.

Author: **Sebastian Desmidt**; Ghent U.

Insights on how managerial practices influence PSM and job satisfaction of employees are limited and inconclusive. This study answers the calls made to study potential organizational drivers of PSM and job satisfaction. Specifically, we focus on organizational sustainability practices, encompassing the social and environmental impact of public service organizations. As local governments provide a unique setting, offering a direct impact on sustainability through broad

reach top leadership positions rather than trying to understand how, or why, some do. By contrast, this study examines how men and women engage in identity work to attain a top leadership role. This paper presents a preliminary analysis of confirmation hearing transcripts for 67 women and men who held top-level leadership positions in 12 U.S. federal regulatory agencies between 1983 and 2013. We use a grounded theory and narrative inquiry approach to examine how these nominees express their identity and signal their legitimacy in order to claim these leadership positions. Our preliminary analysis finds that while both men and women assert personal and professional qualifications to legitimize their claims to top leadership positions, they do so in different, possibly gendered, ways.

Governing for Whom? Representative Governance and Segregation in North Carolina's Charter Schools

Author: **Jessica Sherrod Hale**; Indiana U. Bloomington

Author: **Emily A. Finchum**; Daniel J. Evans School of Public Policy & Governance

Market-based reforms have altered accountability structures in the public sector, raising questions about whether markets effectively hold organizations accountable to the public. Research on market models in education has revealed that these reforms can sometimes have perverse results, such as segregation, that contradict the public interests typically linked to public education. This study offers an empirical examination of one policy-relevant mechanism for understanding public accountability in market-based reforms that employ nonprofit service providers. Using Guo and Musso's (2007) theory of representative governance in nonprofit management, we examine how representation and participation in the governance of nonprofit charter schools contribute to public accountability. We find that few charter schools in our sample employ mechanisms to increase organizational capacity to represent the public at large. Moreover, we find that lower descriptive representation is linked to substantive outcomes

authority, this research was carried out among 41 local governments in Flanders, Belgium, including 781 respondents. The findings indicate that internal employee-oriented sustainability practices are positively related to PSM and job satisfaction through the impact of perceived organizational justice. Additionally, external sustainability practices, directed toward the natural environment and the beneficiaries, were found to increase PSM and job satisfaction, through perceived societal impact potential. This research therefore provides new insights into managerial practices, attitudinal and behavioral concepts to influence PSM and in turn job satisfaction.

Born to Serve? Disentangling Genetic, Childhood, and Adulthood Influences on PSM Using a Twin Design

Author: **Christoffer Florczak**; Mannheim U.

Author: **Robert Klemmensen**; U. of Southern Denmark

Author: **Ulrich Jensen**; Arizona State U.

Author: **Stig Hebbelstrup Rasmussen**; Aarhus U.

Since its inception as a motivational form based "primarily or uniquely in public institutions" (Perry and Wise 1990), the antecedents of public service motivation (PSM) have been debated and explored. However, to date no investigations of a possible genetic component of PSM exist and only few attempts have been made to disentangle youth and adolescence socialization effects from adulthood socialization effects. Investigating the relative impact of these variables is important as genetic or early life influences might additionally confound established empirical relationships. Empirically, we employ a twin-design, popular in the behavioral genetics tradition, on a data set of 1,801 twins from the Danish Twin Registry. In accordance with dominant interpretations of PSM we find a sizeable effect of adulthood environment. Additionally, we find that PSM is also heavily influenced by early life socialization and not at all by genetics. This is surprising, as other "other-oriented" concepts such as empathy, pro-sociality, altruism, and agreeableness have sizeable genetic components whilst their childhood socialization components are

that contradict the public interests articulated in public law.

Linking Ability-Job Fit and Work Engagement in the Public Sector

Author: **Edel Conway**; Dublin City U.

Author: **Kathy Monks**; Dublin City U.

Author: **Yseult Freaney**; Dublin City U.

Author: **Natasha McDowell**; Dublin City U.

While work engagement has been extensively investigated in private sector research, culminating in an extensive body of knowledge and a thriving engagement “industry”, much less research has been undertaken in public sector contexts. Yet, a focus on engagement may be particularly important given the extent and nature of public sector reforms internationally. This paper draws on the job demands- resources (JDR) model to provide a more nuanced understanding of the processes underpinning work engagement in the public sector. We test a model which examines whether the fit between perceptions of ability and demands is associated with engagement and whether this relationship is mediated by perceptions of meaningful work. We also consider whether prosocial motivation moderates the relationship between ability-job fit and meaningful work. We test our model by drawing on data from two large-scale employee surveys (study 1: N = 10,401 and study 2: N = 18,926) undertaken within the civil service in Ireland. Our findings support the relationships we hypothesize. Our paper discusses our study's contribution to knowledge and its implications for practice.

Diary Studies, a Double-Edged Sword: An Experiment on Possible Distortions Due to Daily Reporting

Author: **Viktoria Gochmann**; U. of Fribourg

Author: **Sandra Ohly**; U. of Kassel

Author: **Silja Christina Kotte**; U. of Kassel

Diary studies are booming in management research because they provide samples of work situations measured immediately and in the naturalistic work setting. Yet, we suggest that due to the high demands imposed by participating in diary studies, participants tend to show deviant reporting behavior (demand effect). Additionally, repeated reflection on the variables of interest might change how they are perceived (intervention effect) – altering the benefits named above. To investigate these assumptions, 444 participants completed two questionnaires at the start and end of a two week diary writing period. Questionnaires contained constructs prone to vary due to reflection. In between, participants were randomly assigned to one of five diary conditions reporting on daily interactions at work which differed in terms of demandingness and affective valence of the required report. The control group did not fill out any diaries. We could show that deviant reporting behavior increased over time especially in more intense, negative diaries. Changes in work-related perceptions showed only for team-member-exchange (TMX) which decreased after two weeks of intense reporting on negative work situations. However, the impact on work perceptions appears to be weak as participants avoid intense reporting, diminishing the risk of intervention effects. We discuss implications for diary research.

CSR Perceptions (session 1050)

Shareholder Reaction to Corporate Philanthropy: Beyond the 'Buying Goodwill' Explanation

Author: **Kentaro Azuma**; Ritsumeikan U.

Author: **Nicolas Dahan**; California State U., Monterey Bay

Author: **Jonathan P Doh**; Villanova U.

Corporate response to natural disaster in the forms of cash and/or in-kind donations (corporate philanthropic disaster response --CPDR) has been a growing form of corporate philanthropy. Thus far, it has been empirically studied primarily in the U.S. and Chinese settings (Patten, 2008; Zhang et al., 2010), but never regarding Japan. Through an event study methodology, we analyze shareholder reaction to CPDR announcements after the Kumamoto earthquakes, a series of major earthquakes which occurred in Japan from April 14th 2016. Our main contribution resides in unpacking three possible explanations for the positive shareholder reaction to corporate philanthropy we found. Our results provide some support for the most common explanation (“buying goodwill”, i.e. building support from a variety of stakeholders) in terms: of local embeddedness (positive effect of domestic stock ownership), sincerity (concurrent employee donations) and timing (greater positive effect of early donations). We find limited support for the other typical explanation (corporate governance), as only concentrated stock ownership has an impact on shareholder reaction. Most interestingly, this article provides the first empirical test of a third explanation: corporate philanthropy as a costly market signal to outside investors of the firm's financial strength. We find support as firms with a higher Price-to-Book ratio and firms making a costlier donation (in terms of donation amount relative to their annual profits and relative to their total assets) receive a more positive shareholder reaction.

How Do Firms Manage Hypocrisy in Response to Auto Recalls? Balancing Purposeful Hypocrisy

challenging as that requires establishment of two or more causal paths as the causal chain underlying mediation. Many existing studies testing mediation utilize a single experiment that manipulates the independent variable and measures the mediator and the dependent variable, likely because it is unethical or unfeasible to manipulate the mediator. Such studies often receive critics that the causal effect of the mediator on the dependent variable is not established and thus the causal chain not complete. In this paper, we theorize and identify three remedies a single experiment can use to examine the causal chain underlying mediation. When the three remedies are not applicable, we classify parsimonious experimental designs that make experiments testing mediation more cost-efficient and feasible.

Comparing Two Approaches to Testing Within-Level Interactions Using Panel Data

Designated as a "Best Paper" for RM

Author: **Manuel J. Vaulont**; Arizona State U.

Author: **Zhen Zhang**; Southern Methodist U.

Organizational scholars are increasingly using panel data to test within-level interaction effects. However, potential confounding in the estimation of such interaction effects may arise because commonly used strategies could reintroduce between-level variability to the estimation. The present study compares two such strategies for testing within-level interactions, namely group-mean centering the predictors (i.e., remove-then-multiply or RTM approach) and employing a fixed-effect estimator after the interaction term is formed (i.e., the multiply-then-remove or MTR approach). Examining the estimation equations of these approaches, we show that whereas the RTM estimates of within-level interactions match with researchers' within-level theorization (hence are unbiased), the MTR approach can produce biased estimates because this approach creates a "forced average" among the within-level interaction effect and two cross-level interaction effects. Our Monte Carlo simulation study provides empirical evidence that the MTR approach can inflate or deflate the estimate of the true within-level interaction effect. We propose a

Author: **Miranda Welbourne Eleazar**; UT Dallas

Organizational hypocrisy has received extensive scholarly attention in the corporate social responsibility context. We extend that literature to examine how firms engage in both purposeful hypocrisy and hypocrisy avoidance, depending on the salient stakeholder at a given time. We test our model in the context of corporate political activity (CPA), particularly lobbying, in response to product recall crises. We posit that in response to the initial salient stakeholder of the government enforcing the recall, firms will engage in purposeful hypocrisy of lobbying against the very recalls they are engaged in. On the other hand, firms will utilize hypocrisy avoidance behavior when consumers and the media are the salient stakeholders, as those stakeholders would be more likely to view the lobbying as hypocritical and thus perceive the lobbying negatively. This paper contributes to the literature on organizational hypocrisy, impression management, and lobbying.

Effect Direction Between Work-Family Conflict and Psychological Strain: A Replication and Extension

Author: **Tim Manfred Goetz**; HSG U. of St. Gallen

Author: **Anna Brzykcy**; Technical U. of Munich

Author: **Stephan Alexander Boehm**; U. of St. Gallen

Research on the relationship between work-family conflict (WFC) and psychological strain provides largely inconsistent results about the direction of this effect. To identify a source of this variation, we review modeling approaches used in 15 studies derived from the only meta-analytical test of the direction of this effect (Nohe et al., 2015), and 51 newer studies not yet included in this test. We find that none of these studies accounts for the confounding effect of unmeasured, trait-like between-person differences, for example, by adding random intercepts (RIs) to the structural model. Instead, they apply approaches that combine the within-person variance and the between-person variance (e.g., Crossed-Lagged Panel Model, CLPM), thereby leading to biased effect estimates. Recent methodological reviews have thus urged scholars to apply the RI-CLPM to solve this problem. Following these calls, our study replicates and extends prior research by modeling the effect of interest using the CLPM and the RI-CLPM. We seek to examine whether Nohe et al.'s (2015) result holds once the RI-CLPM is applied. We collected three-wave survey data from 12,241 working adults living in Germany. The data are representative of the German workforce and were collected annually from 2016 until 2018. The RI-CLPM yields a significantly better model fit than the CLPM. Whereas the results from our CLPM replicate the meta-analytical finding (i.e., WFC and psychological strain affect each other reciprocally), the RI-CLPM yields a different result: WFC leads to greater psychological strain and not vice versa. Implications for theory development and practice are discussed.

Data collected on 309 consumers in India support the proposed theoretical framework. The results are discussed in terms of their implications for research and practice.

Are Corporate Environmental and Social Improvements Competing or Mutually Reinforcing?

Author: **Dasun Yoo**; Korea U.

Author: **Jon Jungbien Moon**; Korea U.

Author: **Felix Reimann**; WHU - Otto Beisheim School of Management

How do social and environmental dimensions of corporate social responsibility (CSR) coevolve within firms? Are improvements in these two dimensions competing or mutually reinforcing? Based on the attention-based view, we develop arguments for both perspectives, considering the respective concepts of selective attention and attention spillover. Further, we hypothesize that the described relationships are moderated by the firms' resource constraints, industry, and economic development level of the home country. We test the hypotheses with a large-scale dataset containing 15,917 firm-year observations from 329 industries and 38 countries from 2008 to 2017. The analysis reveals that improvements in social and environmental aspects of CSR are mutually reinforcing and verifies the moderating effects of resource constraints and industry. Our results imply that firms can improve their broader CSR performance by focusing on lighthouse (a byproduct of a signal) projects in selected areas, indicating theoretical and practical implications for CSR improvement.

Experiencing Work: Broadening our Sight Using Humanistic Management Perspectives (session 1054)

This symposium presents ongoing research on how organizational members experience work using humanistic management perspectives. Humanistic management perspectives require a broader vision, grounded in humanistic assumptions prioritizing human dignity, well-being, and flourishing (Kuhn, 2001; Medlock, 2012; Pirson, 2017; Pirson & Lawrence, 2010). While past research on work experiences has been predominantly grounded in economic management philosophies, the presentations in this symposium “broaden our sight” of organizations and organizing by grounding research and theorizing in a humanistic management paradigm. The humanistic management paradigm requires us to recognize that organizing, managing, and leading are intrinsically human experiences that support flourishing by focusing on dignity and well-being. This is offered in contrast to the economic paradigm that positions these activities as being in service of maximizing wealth, power, and profit. Each of the papers included in this symposium seek to understand the experience of work using humanistic assumptions.

Distributed Ledger Technology Affordances for Financing Sustainable Development

Author: **David Leslie**; U. of Cape Town

Author: **Stephanie Giamporcaro**; Nottingham Trent U.

Author: **George Kuk**; Nottingham Trent U.

Distributed Ledger Technology (DLT) has been heralded as one of the most significant innovations since the internet. This article explores the applicability of DLT to the issue of financing the UN Sustainable Development Goals (SDGs) by approaching the question of what opportunities DLT presents for aligning investments with SDGs-related outcomes within the financial sector through the concept of affordances. Our qualitative research inquiry combining an exhaustive analysis of practitioner literature and interviews with 15 leading sustainable and responsible investment (SRI) practitioners and 14 actors involved in DLT ventures in Sub-Saharan Africa shows that despite discourse around blockchain technology that focuses on generic perceptions of affordances relating to data transparency, actualization of these affordances within the sustainable finance field is contingent upon a number of socio-cognitive and institutional hurdles. As a result, while discourse around blockchain presents a galvanizing vision for innovation within the financial sector, its direct benefits for mobilizing additional contributions towards the SDGs by private sector investors remain ambiguous.

Author: **Natalia Yakovleva**; Newcastle U.

Author: **Diego Alfonso Vazquez**; Portsmouth Business School

Author: **Tuyara Gavrilyeva**; North-Eastern Federal U., Yakutsk, Russia

Non-governmental organisations (NGOs) often pressure governments and companies to change solutions to social problems such as environmental degradation by shaping powerful resistance and forming coalitions. There are gaps in understanding how NGOs influence managers' interpretation of the significance of social issues and social groups in stakeholder and issue salience assessments. This paper aims to explore NGO activism in the Russian Arctic region that emerged during oil pipeline construction and outcomes of resulting regional legislation on social impact assessment and compensation extended to indigenous peoples. It is based on the analysis of qualitative data collected in 2006-2019 using Salience and Institutional Analysis and Design framework, which allows to examine the role of NGOs in elevating salience of indigenous peoples as stakeholders and their concerns within the nexus of business- government-community operating at operational, collective-choice and constitutional levels. The new regulation appears to address NGO activism at the collective-choice level, but actually limits NGOs' ability to influence radical change at the constitutional level of environmental governance. As a result, active participation of NGOs adds external legitimacy to government innovations, while paradoxically reifying the exclusion of indigenous groups from critical governance functions such as distribution of benefits and participation in modification of solutions.

Cross-Sector Partnerships for Sustainable Development: Understanding Community (dis)Engagement

Designated as a "Best Paper" for SIM

Author: **Ana Dahik**; IPADE Business School

The growing complexity of grand challenges such as sustainable development has drawn attention to cross-sector social partnerships (CSSPs) as platforms to solve wicked problems. In management studies in

general, and in CSSP studies in particular the “local” and the “community” have reemerged as operational spaces and units of study, yet the lack of a clear definition and the interchangeable use of community in the literature presents an opportunity for management scholars. By using an alternative conceptualization of community, which emphasizes communities as relational systems between actors relative to the purpose of the CSSP, this paper uses a case-study approach with three embedded units CSSPs for sustainable development of the bamboo industry in an indigenous region in Mexico. I propose a typology for the different types of engagement and disengagement of actors that affect and are affected by the CSSP relational system which goes beyond the partners and beneficiaries. I look at the factors that explain these different types of engagement and disengagement and how they affect the CSSP. This study contributes to the CSSP literature by broadening the scope of how we define CSSP communities and by deepening our understanding of interactions between system context, CSSP antecedents and the different types of engagement of the CSSP community.

Land Readjustment for Sustainable Development in Challenging Contexts

Designated as a “Best Paper” for SIM

Author: **Hossein Mohammadi**; Lecturer

Author: **David Pick**; Curtin U.

Author: **Dora Marinova**; full professor

Author: **Peter Newman**; Distinguished Research Professor

Achieving sustainable development is especially challenging in nations where armed conflict is occurring. This paper examines how land readjustment can be undertaken to support sustainable development of informal urban settlements in Kabul, Afghanistan. Through developing a substantive model from this exploratory case study, the research aims to improve understanding about land readjustment in challenging contexts and its contribution to the achievement of the United Nations Sustainable Development Goals. The findings suggest sustainable development can be supported through

Customised Land Readjustment. This involves implementation of specific management, financial, legal, and technical strategies that ensure the provision of required infrastructure and land tenure security, which in turn support the improvement of quality of life while maintaining the spatial integrity of the community. Keywords: land readjustment, public policy, sustainability, sustainable development goals, stakeholder management and influence, challenging contexts, Kabul, Afghanistan.

Financial Inclusion in Emerging Markets Through Mobile Money – A Configurational Analysis (WITHDRAWN)

Author: **Christian Kabengele**; Heinrich-Heine U. of Dusseldorf

Author: **Rüdiger Hahn**; Heinrich-Heine U. of Dusseldorf

In the last decade, mobile money has financially included millions of unbanked people in emerging countries. However, neither country-level institutions nor firm-level strategies alone offer satisfactory explanations for mobile money's successful and widespread adoption. We therefore analyze which combinations of firm- and country-level factors explain the successful adoption of mobile money services? We perform a fuzzy-set Qualitative Comparative Analysis on a sample of 96 mobile money deployments in 43 emerging countries. Our findings reveal four distinct recipes for success: 'Oligopolists', two variations of 'Enabling Environments', and 'Fintechs'. Oligopolists can be successful irrespective of enabling institutions, if institutional voids are large. Two variations of enabling environments suggest that in most cases either enabling regulation or sufficient mobile and educational infrastructure are key for success. Lastly, a small group of fintechs are successful

Volunteering and Philanthropy (session 1051)

The Causal Effects of Employee Participation in Corporate Volunteering: Field Experimental Evidence

Author: **Florencio F. Portocarrero**; U. of California, Irvine

Corporate volunteering has become a central component of organizations' corporate social responsibility (CSR) strategy, with more than 90% of corporations currently supporting some form of employee volunteering with nonprofits and charities. However, it is unclear whether such initiatives are strategic from a human capital management perspective, as research to date has been unable to establish a causal effect of such initiatives on important employee outcomes, and we have limited understanding of the mechanisms through which such initiatives might benefit the firm. Implementing a field experiment on a sample of 221 new employees in a large Latin American bank, we find that employees who participated in a corporate volunteering initiative were less likely to leave the company than those randomly assigned to the control group. These employees reported lower levels of work stress; an important employee outcome unexplored in the CSR literature to date. Employees who participated in the initiative also reported higher organizational identification and

despite relatively developed financial services sector because the offer technologically sophisticated use cases. These findings provide recipes of how financial inclusion is most achievable in various combinations of firm- and country-level factors and they offer insights for policy makers regarding the necessary institutional framework. Furthermore, we contribute to theory by mobilizing institutional theory to demonstrate the ambiguous nature of institutions for firms with an inclusive business model.

Because there is no Plan(et) B: A Study of the Fossil Free Sweden Initiative and its Legitimacy

Author: **Naghmeh Nasiritousi**; U. of Stockholm

Author: **Julia Grimm**; Cambridge Judge Business School

Today the world faces a number of grand challenges that are both daunting and urgent to address. States have historically employed legislative and executive powers to direct societal actors toward common goals. Yet, the scale of the grand challenges that are to be addressed e.g. by the UN's Sustainable Development Goals include climate change and require significant changes to business as usual. The decarbonisation challenge in particular requires states to mobilise a range of actors in order to achieve structural changes in a legitimate manner. Consequently, we have seen the emergence of orchestration attempts by states, whereby they use soft or indirect forms of steering to coordinate and engage non-state actors in order to achieve policy objectives. This type of steering raises a number of pertinent questions: How can such an initiative gain legitimacy amongst the actors that it seeks to orchestrate and how can it maintain this legitimacy in the face of competing interests? Building on recent literature on legitimacy and the role of non-state actors in the fields of international relations and organisational studies, this paper uses the case of the Fossil Free Sweden initiative that the Swedish government launched ahead of the UN climate change conference in Paris in 2015 to highlight key factors and considerations in establishing and maintaining legitimacy in the orchestration of a varied set of non-state actors. Drawing on interviews

perceptions about the employer's social responsibility. Moreover, we show that these CSR perceptions mediate the effect of employee participation in corporate volunteering on employee attitudinal and behavioral outcomes. We advance the literatures on micro-CSR and corporate volunteering by shedding light on the mechanisms through which corporate volunteering can benefit firms and contributing causal evidence of these effects.

Helping Hand vs. Iron Fist: Corporate Philanthropic Disaster Response and Deregulation

Author: **Jigao Zhu**; U. of International Business and Economics

Author: **Sumita Sarma**; California State U., Bakersfield

Why and when do firms provide charitable giving in response to catastrophic events? How does it relate to firm performance? Based on the community-based corporate social-action model in a civil society, we argue that firms located in less-regulated regions engage in more philanthropic activities than firms located in more-regulated regions, which lead to improved firm performance. Based on data from Chinese firms' responses to the 2008 Sichuan earthquake, we find that firms operating in more deregulated provinces donated higher amounts than firms in less deregulated provinces following the disaster. Additionally, firms in more deregulated provinces were more likely to respond and with speed. We also examine the local community's normative pressure on corporate philanthropic disaster response and find that local donation events and amounts promote firms' donation actions. We thus suggest that managers take a preemptive attitude to this typical nonmarket social strategy to build competitive advantage for their firms.

Can High-Speed Rail Influence the Urban-Rural Income Equality in China? Social Exclusion Perspective

Author: **Yu Jia**; Wuhan U.

Author: **Yunqian Wang**; Wuhan U.

Existing studies have explored the influence of high-speed rail (HSR) on efficiency-related outcomes. However, little attention has been paid to the issues of social equity in relation with HSR. Based on social exclusion theory, we suggest that HSR could enlarge urban-rural income inequality, result in undermining social equity from the perspective of urban-rural income. Drawing on the methods of DID, PSM-DID, and the fixed effect model, we analyzed a panel data from 276 cities in China from 2006 to 2015, and found strong support for research hypothesis. The results show that the HSR would increase the urban-rural income inequality (i.e., reduced social equity in terms of economy). Furthermore, the positive effects of HSR on income inequality are highly heterogeneous depending on regional characteristics. In particular, when regional public transport accessibility is higher, the positive impact of high-speed rail on urban-rural income inequality would be weakened; when regional social security fiscal expenditure level is higher, the positive impact of high-speed rail on urban-rural income inequality would also be weakened.

Foreign Investors and Governance Quality in Extreme Institutional Environments

Author: **Geofry Nfortaw Agbor Areneke**;
Manchester Metropolitan U. Business School
Author: **Emmanuel Afolabi Adegbite**; U. of Nottingham

Author: **Gil Peleg**; Yeshiva U.

Author: **Daniel Shapira**; Ben-Gurion U.

Author: **Oded Lowengart**; Ben Gurion U. School of Management

When people act prosocially in public, they signal society about the nature of their identity. One reflection of this is by their sacrifices to help others. Using choice-based conjoint experiments, the authors evaluated the social recognition for prosocial behavior in the context of financial donations and volunteer work. The results reveal that the economic value of the donation is not the only factor in social recognition, as the benefactor's sacrifice signaling has a great impact on the social recognition although the sacrifice itself has no impact as far as the beneficiary is concerned. Moreover, the authors found that people grant higher social recognition for volunteering than monetary donations. The results also suggest that heterogeneity in the evaluator's social values and their resources yield different social recognition. Furthermore, although it seems that social recognition is mostly fixed, it can be manipulated by framing the beneficiary's needs.

How Aspiration-Relative Performance Affects Corporate Philanthropy

Author: **Li Tong**; Singapore Management U.

Author: **Ying Zhang**; Northwestern Polytechnical U.

Research on the economic slack perspective suggests that high-performing firms are able and willing to be involved in philanthropic activities, yet less attention has been given to the potential negative effects of being high performing. Drawing upon the red queen effect and the myopic loss aversion perspective, we argue that high-performing firms are saddled with large threat of declines in their future relative financial performance and then crowd out their long-term orientation, manifesting a low level of corporate philanthropy engagement. We identify the cause of such response to be the myopic loss aversion of executives. The degree of myopic loss aversion depends on the institutional environments and market conditions. We further document that firms owned by the state and

Author: **Michael Machokoto**; U. of Northampton
Author: **Abongeh Tunyi**; U. of Sheffield Management School

We draw on practice transfer theory to advance the corporate governance mobility literature by developing a framework that uncovers how foreign institutional investors (FIIs) transfer and improve on corporate governance practices of firms in challenging institutional environments. Using hand-collected data for 85 listed Nigerian firms covering 2011-2016 period, we show that FIIs bypass information disadvantage, weak governance enforcement institutions in extreme institutional environments by transferring good governance standards to firms in the host country of investment. More so, we show that the severity of FIIs transfer and enhancement of corporate governance quality of firms in challenging institutional environments is positively moderated by their legal origin. Specifically, FIIs from common law countries significantly enhance the ability of these investors to transfer and improve on the CG practices of firms in challenging emerging economies. On the other hand, high cultural distance between FIIs country of origin and the investment country negatively moderate this relationship. Our results are robust to the choice of estimation method, sample selection, and control for other factors that influence corporate governance practices. We also highlight theoretical and practical implications of the study.

Antecedents and Consequences of Scope and Sustainability (session 1056)

Is Sustainable Strategy a Thing?

Author: **Jaan-Pauli Kimpimäki**; Lappeenranta-Lahti U. of Technology LUT

Author: **Laura Albareda**; LUT U., School of Business and Management

Author: **Philipp Meyer-Doyle**; INSEAD
Author: **Amy Zhao-Ding**; INSEAD

This study examines how the prior career experiences of decision makers systematically shape their responses to performance shortfalls. We posit that while prior experiences lead managers to develop greater levels of knowledge and skills, they also shape their mental models and enhance their beliefs about their abilities, their predictions, and their strategies, which in turn makes them less responsive to negative performance feedback. We find that more experienced and more specialized fund managers are less likely to initiate changes when faced with negative performance feedback compared with their less experienced or less specialized counterparts. Further, the context within which managers gained their prior experience matters. As performance deteriorates below aspirations, managers with prior experience in high-status organizations and those who have worked previously under munificent environmental conditions are also less responsive compared with their counterparts without such experience. Overall, our paper contributes to the literature on performance feedback by showing that prior experience of decision makers is an important factor that determines an organization's propensity to initiate strategic change in response to negative performance feedback. Further, the study also contributes to the human capital literature by highlighting a potential unintended side effect of accumulated human capital, namely lower responsiveness to negative performance feedback.

Inconsistent Performance Feedback and R&D Investment

Author: **Hugo Verver**; Tilburg U.
Author: **Tine Buyl**; Tilburg U.
Author: **Marius Meeus**; Tilburg U.

In this study, we examine to what extent inconsistent performance feedback (IPF) – i.e., a situation in which an organization performs above one, but below another aspiration level – affects R&D investment. Adjusting R&D investments is an intricate remedial action for publicly traded

Author: **Ivan Montiel**; City U. of New York, Baruch College

This paper investigates the degree of integration of modern conceptions of sustainability in strategy research over time with a bibliometric network analysis based on co-citation linkages over articles intersecting strategy and sustainability research. The findings display a comprehensive retrospective of the evolution of the intellectual structure of the sustainable strategy research space from a split between environmental and social aspects focused on firm and financial performance, to an increasingly specialized but fragmented field losing focus in central strategy research. The discussion identifies potential challenges of several assumptions underlying the contemporary theoretical approaches to strategy research in view of the increasing practical relevance of sustainability and proposes a research agenda for addressing these challenges.

Narcissistic CEOs in Family Firms: How They Shape Diversification

Author: **Julia Hautz**; U. of Innsbruck
Author: **Kurt Matzler**; U. of Innsbruck
Author: **Michael Mayer**; U. of Bath
Author: **Sebastian Schneck**; U. of Innsbruck
Author: **Christian Stadler**; Warwick Business School
Author: **Andreas Strobl**; Lancaster U. Management School

This paper explores the impact of CEO narcissism on family firms' product diversification strategy. In addition, we investigate how this relationship is shaped by family influence using a dataset of publicly traded German firms from 2005 to 2009. Our results show that more narcissistic CEOs have a negative impact on diversification. We suggest that belief in their own capabilities and skills to successfully manage a focused business and their desire for recognition override motivations to reduce risk and stabilize earnings which are typically associated with CEOs and are normally assumed to lead to higher levels of diversification. However, we find that this negative relationship between CEO narcissism and diversification is less pronounced

organizations, as it implies short-term performance improvement, but potentially at the expense of long-run competitiveness. We propose that organizations will respond to IPF in distinct ways depending on the salience of the inconsistent performance signals, as expressed in the extent to which performance deviates from both aspiration levels. Using a sample of 1,290 high-tech manufacturing firms from 1990 until 2017 (11,186 year-observations), we find that organizations cut their R&D investment in response to IPF, however, only when the negative performance feedback signal was larger than the positive one. This study enriches previous work on performance relative to multiple aspirations, by offering new insights into why organizations, under certain conditions, may respond differently to IPF. Keywords: Performance Feedback, Multiple Aspirations, R&D, Behavioral Theory of the Firm.

Has the Attention-Based View Changed Research on Attention in Organizations? A Systematic Review

Author: **Rian HJ Drogendijk**; U. of Groningen

Author: **Hammad Ul Haq**; U. of Groningen

In 1997, Ocasio attempted to highlight and revive research on attention in organizations by introducing the attention-based view of the firm (ABV), which specifically emphasizes the central role of social structures in the attention allocation of decision-makers. This has resulted in an increased interest among researchers for using an attention lens to study decision-making in organizations. We identified 94 articles studying attention in organizations in 43 journals through a systematic search in ISI Web of Science. Our review of these articles allows us to map what research has been done on attention and to investigate how the introduction of ABV has influenced the direction of research on attention in organizations. We conclude, however, that Ocasio's attempt to revive an interest in social structures has only partly succeeded. We discover some notable additions to attention research, in particular the concept of quality of attention and the focus on bottom-up attentional processing, but very few researchers have actually done full justice to ABV. Most importantly, there is a

with increased family ownership. We also find that the effect of CEO narcissism is less pronounced for CEOs who are family members. Overall, we find that family influence can restrict the narcissistic tendencies of family CEOs. Our findings thereby extend the research on the impact of CEO narcissism on strategic decisions by adding a family firm perspective.

Firm Heterogeneity and the Internationalization-Firm Performance Relationship

Author: **Abu Rehan Abbasi**; Indian Institute of Management, Bangalore

Author: **Rejie George Pallathitta**; Indian Institute of Management, Bangalore

There is a paucity of research that investigates the effect of governance mechanisms on the outcomes of internationalization in emerging market contexts. This paper attempts to address the lack of research on the effect of governance mechanisms on the outcomes of internationalization in emerging market contexts and focuses on two unique attributes associated with emerging markets, namely, family ownership and business group affiliation. In order to investigate these phenomena, we utilize an eleven-year longitudinal data set of 2,138 manufacturing firms from an emerging market (India) with a combined total of 17,212 firm-year observations. Specifically, our key finding indicates that a firm that has high levels of family ownership and is affiliated with a business group can change the nature of the underlying U-shaped relationship between internationalization and performance (I-P) to an inverted 'U' relationship. We also find that the threshold at which the change in the shape of the 'U' occurs is very close to the levels at which the owners get considerable control over the firm. Therefore, by integrating corporate governance literature with strategic management and international business literatures, our study represents one of the very few that simultaneously investigate the twin effect of key governance mechanisms (family ownership and business group affiliation) on the I-P relationship by operationalizing ownership in a manner that helps bring out the influence of the institutional context as well.

lack of problematization of the concept of social structures: only a handful of articles conceptually challenge it and collect relevant data for it. The result is that we risk losing sight of ABV, particularly of its core concept of social structures, and fail to develop novel insights on attention in organizations. We point out that future research can catch up and enable theoretical development of ABV through problematizing its core concept and designing more innovative empirical studies that allow proper testing of its assumptions and propositions. Doing so will allow us to contribute to a better understanding of how decision-making is done in organizations.

Neither More nor Less: Responsiveness to Performance Feedback and Subsequent Performance

Author: **Michal Jirásek**; Masaryk U.

Despite some contradictory findings and missing details on the process of performance feedback itself, the literature on the topic can largely explain why and when the firm strategy changes. While understanding the firm behavior has an enormous value, we are still unsure of the performance consequences of responses to performance feedback. This research aims to contribute to answering the question of the relationship between responsiveness to performance feedback (intensity with which the firm reacts to a given performance feedback message) and subsequent performance. Since the responsiveness has both positive and negative consequences, the relationship is theoretically assumed to be of an inverted U shape. That means that responding either too little or too much is detrimental for subsequent firm performance. Using data from U.S. manufacturing firms, the findings support the inverted U shape relationship between responsiveness and subsequent performance. Furthermore, the research shows the moderating effects of the firm's proximity to bankruptcy and the industry's R&D intensity on the relationship. The research contributes to the performance feedback literature and points out potential avenues for prescriptive advice to firms.

Imprinting Effects of IPO Underpricing on the Future Strategic Actions of High-Tech Firms

Author: **Stefan Wuorinen**; Michigan State U.

Author: **Gerry M. McNamara**; Michigan State U.

Author: **Lingling Pan**; U. of Pittsburgh

Prior research has shown that firm founding can leave an imprint on the firm and its managers that influences choices the firm makes years after founding. We extend this literature by showing how another epochal event in the firm's lifecycle, its initial public offering, imprints the firm and influences its actions years after the completion of the IPO. Focusing on high-tech IPOs, our findings show that when evaluating risk-related decision options, firm managers act in response to feedback they received in the IPO process. Further, these responses are moderated by the degree of inertia experienced by the firm and manager, with higher levels of inertia strengthening the imprinting effects. Thus, our research contributes to the imprinting literature by providing evidence for another sensitive corporate phase which imprints an influence on corporate decisions. We also contribute to the IPO literature by going beyond short-term effects of IPO performance to examine the long-term impact of the IPO event.

Board Decision-Making, Board Strategic Involvement, and CEO Turnover (session 1059)

An Empirical Test of the Assumption that Female and Male Directors Contribute Different Perspectives

Author: **Koen van den Oever**; Radboud U. Nijmegen
Author: **Richard Franciscus Johannes Haans**;
Erasmus U. Rotterdam

There is a substantial disbalance in the number of women versus men in leadership positions. Stereotypes about how women behave in such positions permeate popular discourse, yet little is known about whether and how female leaders are actually different from their male counterparts in their behavior, perspectives, and ideas—let alone how they shape important processes in their organizations. We investigate 110,221 statements made by directors during board meetings and unearth that women focus more on processual matters and that men are distinctly outcome-focused. The extent to which a diversity of female and male topics is discussed in turn increases the degree of monitoring by the board. Women thus do shape decision-making by focusing discussions on unique topics.

Business Groups and Nonmarket Strategy (session 1060)

Investment as Bargaining Chip

Author: **Minyuan Zhao**; Washington U. in St. Louis,
Olin Business School

Institutional environments are often considered exogenous in firms' investment decisions. While the non-market strategy literature has discussed various approaches that firms may adopt to influence their interactions with institutions, such discussion is mostly absent in the analysis of market strategies. In this paper, we argue that in countries with significant government discretion, firms may obtain better treatment from the local institutions by locating R&D or manufacturing—the types of investments usually welcomed by the local governments—in the host countries. Using a sample of global patenting and litigation records of the Fortune Global 500 companies from 2007 to 2014, we find that firms tend to have a better chance at obtaining patents, or reversing unfavorable patenting decisions at patent authorities, after their increased local R&D or manufacturing presence. The results are only significant in countries with weak legal institutions, and in countries with relatively weak domestic industries. The effect of investment on firm-specific experience with local institutions thus offers an alternative explanation for location decisions that may seem suboptimal when environments are treated as exogenous.

The Half-Life of Political Capital: An Examination of the Temporal Effects of Political Connections

Author: **Debtanu Lahiri**; HEC Paris
Author: **Goncalo Pacheco-de-Almeida**; HEC Paris

to monitor the CEOs' decision making, to determine the CEOs' performance and compensation, and to retain or to fire the CEOs. Further scholarly work examines other exogenous factors (i.e., external shocks) or observable structural and individual characteristics that undermine the judgment and decision-making of the boards. However, these extant studies inevitably overlook the CEOs' anticipation and possible preemptions facing the boards intervention by resigning as part of the decision-making process in managing their career concerns. Invoking the settling-up concept of Fama (1980), this paper provides a comprehensive examination of the role of unobservable cognitive decision-making factors that account for performance-induced CEO turnovers using a sample of publicly traded U.S. firms throughout 2004 to 2018. We find a U-shaped performance-induced CEO turnover, such that there are more CEO departures at the top or bottom performance deciles versus moderate firm performance. Our evidence is consistent with the concept of "settling up," that is, given the higher risk of within-tenure compensation or ex-post career opportunity losses, CEO turnover is less likely to be induced by firm performance. Instead, prior CEO departures proxy the level of board intervention and distort the CEO's decision-making to encourage departure when it might not be warranted. We conclude that given that replacing CEO is costly, increased probability of departure can be a neglected form of agency cost that is driven by increased board intervention. Our investigation of this new sample allows us to more fully understand CEO incentives to stay or to leave stemming from the anticipated risk of board intervention.

Are Quad-Qualified Directors Effective Board Monitors? An Analysis of CEO Turnover

Author: **Nikolas Feistkorn**; Leeds U. Business School
Author: **Iain Clacher**; Leeds U. Business School
Author: **Gianluca Veronesi**; U. of Bristol

The extant board governance literature has generally examined the relationship between the characteristics of directors and their monitoring performance in isolation. To overcome the

The primary objective of this study is to examine the temporality of the effects of firms' political connections. We use two separate DVs, persistence and volatility of firm performance. Using various sources, we constructed a panel data of over 5,000 firms located in 14 different countries. Our findings suggest that the effect of political connections lasts for around 6yrs. Besides, the effect is significantly positive only for above average performers. For others, though negative, the effect remains mostly insignificant. Furthermore, we find that legislative constraint on politicians has a very strong and negative moderating effect. We also find some evidence of negative moderating effect of political stability and efficiency of factor-market institutions. Our study makes a theoretical contribution by pointing out a firm-specific determinant of persistence and volatility, besides demonstrating that firms' political connections could overcome 'institutional voids' of the business environment. For estimation of persistence, we used random coefficient modelling technique on a first order autoregressive equation AR(1). Our methodology allowed persistence estimates to vary by firm and by time, thereby removing a major limitation of prior research. Additionally, for precise causal identification, we resorted to statistical matching techniques.

In this paper we explore the extent to which transaction cost economics (TCE) generalizes across national cultures. In particular, we examine the effects of national cultural power distance, uncertainty avoidance, and masculinity on TCE's axiomatic market- favoring premise and asset specificity-driven logic of vertical integration. We adopt an experimental research design and administer a choice based conjoint survey to a sample of active app development entrepreneurs. We find that entrepreneurs in low power distance and low masculinity cultures tend to behave in ways

limitations of this approach, Hambrick, Misangyi and Park (2015, AMR) have proposed the board quad model, which combines the four individual directors' attributes of independence, expertise, bandwidth and motivation. In this paper, we investigate the validity of model in the context of CEO turnover decisions. To define whether individual directors are quad-qualified, we create composite measures of each attribute based on director-level employment, stock ownership & social network data and then construct an encompassing quad-qualification score. Using logistic regression analysis, we find that a greater presence of quad-qualified directors leads to a greater CEO turnover sensitivity to stock performance. Furthermore, we show that the turnover-performance sensitivity increases in particular for boards with three or more quad-qualified members. Implications for practice and theory are discussed.

consistent with TCE's core predictions. However, we also find that entrepreneurs behave in ways that run counter to these prediction in high power distance, high uncertainty avoidance, and high masculinity cultures, preferring to govern low asset specificity transactions hierarchically and showing a greater preference for markets as asset specificity increases. Taken together, our findings suggest that TCE is an important—but far from universal—logic of governance choice, opening the door for the development of new theories of vertical integration that can better explain and predict behavior across national cultures.

Business Group Affiliation and Firm Strategy: A Competitive Repertoire Perspective

Author: **T V Arunkumar**; Indian Institute of Management, Tiruchirappalli

Author: **Manikandan Karayambadi Srinivasan**; Indian Institute of Management, Tiruchirappalli

We bridge the business groups and competitive dynamics view (in specific, competitive repertoire research stream) to examine competitive actions of business group affiliate firms vis-à-vis standalone firms. We posit that greater access to diverse resources, information and knowledge through the network of other firms in the business group enable affiliate firms to carry out a higher number—competitive repertoire intensity—and wider variety—competitive repertoire complexity—of competitive actions. Further, we theorize that access to significant amount of resources through the business group network and the accumulated knowledge and capability of group center in conceiving and implementing strategic actions will enable affiliate firms to exhibit higher competitive repertoire significance than standalone firms. In sum, we expect competitive strategy of business group affiliate firms to differ from that of standalone firms. We test our hypotheses on a sample of Indian firms during the time period 2009-2017 and find support. While extant research on business groups focus on 'what' and 'why' of business group affiliation, we enhance our understanding of business groups by engaging with 'how' business group affiliation influences firm strategy. We also

Time to Unpack: Industry, Corporate, and Business Segment Effects on the Components of ROA

Author: **S. Trevis Certo**; Arizona State U.

Author: **Matias Kalm**; Tilburg U.

Author: **Jeffery LePine**; Arizona State U.

Organizational scholars have long been interested in the influence of industry, corporate, and business segment effects on organizational performance. Research on this important topic has used return on assets (ROA) as the indicator of organizational performance, and when this research is considered in the aggregate, there appears to be a general consensus regarding the role of these multilevel influences. However, theories of firm boundaries and value creation suggest that multilevel effects may influence the two conceptually meaningful components of ROA—income and assets—quite differently. This, together with properties of ROA that complicate statistical analyses, may obscure our understanding of the drivers of organizational performance that exist at different levels. We first examined this issue with a simulation and found that when a stable between-level (e.g., firm) effect influences both the numerator (e.g., income) and denominator (e.g., assets) to the same degree, estimates of the between-level effect dissipate almost entirely when the two components are combined as a ratio (e.g., ROA). We then used Compustat Business Segment data to assess the generalizability of our findings to organizations. Consistent with the results of our simulation, stable firm- and business-level effects on income and assets substantially exceed the corresponding

extend competitive repertoire research to a new organizational context in an emerging economy.

Institutional Ownership and Environmental Turbulence (session 1061)

Staying Out of Each Other's Way: Common Ownership and Competitive Dissimilarity in a Global Context

Author: **Judith Heigermoser**; U. of Goettingen

Author: **Jana Oehmichen**; U. of Groningen

Author: **Philip J. Steinberg**; U. of Groningen, Faculty of Economics and Business

Research on the implications of common institutional ownership (meaning that one investor owns a sizeable number of publicly traded shares in two rival firms – i.e., dyads) has recently gained traction. However, it is unclear whether the effects of common ownership on firms' strategies are transferable to the global domain, and whether national borders serve as boundary conditions. To gain a better understanding of these questions, we compiled an international dataset with 2,832 of the largest firms worldwide between 2008 and 2017, resulting in 136,410 dyad-year observations. We control for various confounding effects and confirm a positive relationship between common ownership and the competitive dissimilarity (i.e., unique competitive repertoires) of dyads. We also theorize on and test boundary conditions to that effect. First, we argue that within international dyads, firms are less likely to cannibalize each other, giving the common owner less reason to influence strategy. Second, when the majority of common owners come from a different country than the firms, owners suffer from an information disadvantage and are less able to serve as informational bridges. For both boundary conditions, we find negative

effects on ROA. Together, these results suggest that our theoretical understanding of organizational performance would be well served by research that considers income and assets separately.

A Temporal View on the Performance Effect of R&D and Advertising Expenditure

Author: **Sascha Erben**; Heinrich-Heine U. of Dusseldorf

This study discusses and empirically tests a dynamic perspective on R&D and advertising expenditure's effects on firm value. We provide theoretical reasoning for why dynamic forces at the industry level should affect how expenditures in R&D and advertising translate into firm value. Subsequently, to test these expectations, we introduce expenditure strategy measures that capture a firm's expenditure decisions relative to recent changes in industry-level dynamics in the fields of R&D and advertising, namely opportunity and expropriability. In two large panel datasets of established United States manufacturing firms, we find that firms can create value by taking recent changes in these factors in their industry into account for expenditure decisions in R&D and advertising. The value potential of doing so is substantial and hence calls for a more dynamic approach towards R&D and advertising over time.

Master of Puppets: How Common Ownership Interferes with Competitive Dynamics in Platform Markets?

Author: **Bilgehan Uzunca**; ESADE Business School / Ramon Llull U.

Author: **Kubilay Cirik**; Louisiana State U.

Author: **Umit Ozmel**; Purdue U., West Lafayette

Why does a company dominate certain markets with rigor while exiting other seemingly equally attractive ones? The answer to this question might lie in "who calls the shots at that company and the rest of the industry." We investigate the implications of "common ownership", which occurs when institutional investors simultaneously hold equity positions (i.e., minority shareholdings) in several (or all) natural competitors within a concentrated industry. We extend prior research on common ownership towards platform markets where the industry-wide value creation mechanisms significantly differ from that of the traditional markets due to the multi-sidedness. We provide a systematic explication and assessment of when and under what conditions common owners might have higher incentives to interfere with competitive dynamics toward profit maximization of the portfolio of the firms over which they have ownerships, rather than maximization of an individual firm's profit per se. We distinguish between several platform characteristics across different institutional settings and suggest that—in comparison to the baseline scenario where platforms do not have a common owner (i.e., separate ownership)—the presence of common ownership in platform markets might lead to common owner's interference, which might dramatically shape the competitive dynamics within the industry.

[view paper \(if available\)](#)

particularly popular “dynamic capabilities”. While providing relevant insights, these approaches have left some of the important theoretical and empirical challenges regarding firm survival and success unanswered. Based on recent studies of the long-term evolution of a wide range of industries, we therefore argue that it is both necessary and helpful to go beyond firms and firm heterogeneity and examine industry and location as additional “loci” of capabilities and drivers for lasting competitive advantage.

Active Slack, Balanced Capability Portfolios, and Firm Performance

Author: **Cristina Oana Vlas**; U. of Massachusetts, Amherst

Leveraging previous dynamic capabilities research, we investigate the unique role that active slack—recoverable R&D and inventories—may play for the performance of firms developing capability portfolios to renew and thrive in high-velocity environments. We see balanced capability portfolios as firms’ efforts to develop sensing and seizing capabilities simultaneously within or across internal and external modes of organization. For a sample of software firms, our findings reveal that in high-velocity environments, active slack has a direct positive effect on firm performance and a positive moderating effect for firms maintaining balanced capability portfolios within either internal or external modes. However, for firms maintaining balanced capability portfolios across internal and external modes, active slack has a negative moderating effect. Our findings advance the dynamic capabilities perspective and inform scholars and practitioners on the importance of active slack in high-velocity environments.

The Impact of Environmental Uncertainty and Leverage on Firm Restatements

Author: **Grigorios Livanis**; Ohio U.

Author: **J Michael Geringer**; Ohio U.

Author: **Aaron Wilson**; Ohio U.

This study examines the relationships of environmental uncertainty and leverage with financial restatements, using a sample of 5,454 organizations that were audited by 582 unique auditors, including 3,406 restatements. As hypothesized, we find a higher likelihood of subsequent restatement of an organization’s financial statements, both overall and for Big R restatements, for organizations with increased environmental uncertainty and higher relative levels of leverage. The interaction of environmental uncertainty and leverage was also linked to increased likelihood of restatement. Implications for theory and practice are addressed.

Facing Turbulences with Organizational Slacks in a Corporate Scandal: Firm Value and Risks

Author: **Dimitri Simonin**; UTS Business School

Author: **Jan Hohberger**; U. Ramon Llull, ESADE Business School

Corporate scandals happen not only when firms and managers deliberately commit fraud and harm the environment but also when firms have to recall malfunctioning products. Corporate scandals are more frequent than ever. Since information can be accessed easily and spread instantly, local issues quickly become global corporate scandals, which increases their strength and decreases the time for firms to implement a recovery plan. Corporate scandals bring uncertainty to the future of the firm’s financial health. Thus, they decrease expectations for returns and increase volatility of future cash-flows. Organizational slacks are resources detained by a firm to face an unexpected event. We believe they serve as a buffer in a situation of corporate scandal. Our study aims to determine the buffering role of organizational slacks can generate, when a corporate scandal hits a firm. To measure it, we use the event study methodology. We perform both short-term and long-term event study analyses. The

former is based on a sample of 362 North American listed firms regarding 1,940 corporate scandals, from 2007 to 2018, and it measures the difference between the normal stock returns of the firms and the stock returns happening on the days surrounding the corporate scandal. The latter is based on 333 North American listed firms regarding 1,719 corporate scandals, from 2007 to 2018, and it determines the fluctuations of the idiosyncratic risk in a period of 252 days following the corporate scandal. Our findings reveal key insights into the role of organizational slacks in a corporate scandal situation. Moreover, we analyze the buffering effect of organizational slacks in an unstable environment by introducing the moderating role of market turbulence. Results show that: (1) a corporate scandal has a negative impact on the firm value and firm volatility; (2) organizational slacks have a positive impact on the scandal's negative effect on the firm value and firm volatility; (3) and, detaining organizational slacks increases the negative effect of the corporate scandal on the firm value in a turbulent market environment, but mitigates firm volatility in the same environmental conditions. Our primary contribution is to the management-finance literature, in the way that we integrate research on organizational slacks and corporate scandal literature with frequent changes in fit between market and management decisions. Our second contribution is to managers, as we bring novel insights into the ways of mitigating the negative effect of a corporate scandal with organizational slacks.

has not been learning from failures? Which firm strategies and actions moderate turnover following an adverse corporate event? Prior research has focused on the antecedents of failure learning while overlooking these questions. Using a dataset of product recalls as a setting for organizational learning, I document that the likelihood of turnover substantially increases for the executives of firms that have recent recalls relative to the executives of the propensity-score matched, nonrecall control firms. Furthermore, executives become more likely to exit if the recalls are reputational shocks; less likely to exit if a firm responds to consumer complaints proactively, and is strong in CSR. The results contribute to our understanding of the managerial consequences of failure learning.

When the Truth Hurts: Performance Perception Inaccuracy and Organizational Learning

Author: **James Oldroyd**; Brigham Young U.

Author: **Peter Micah Madsen**; Brigham Young U.

Author: **Lisa Mali Jones Christensen**; Brigham Young U.

Author: **Shad S. Morris**; Brigham Young U.

Organizational learning can result from both successes and failures, but what happens when organizational actors interpret a project as a success when standards suggest it was a failure (or vice versa)? Success drives organizational members to reinforce existing knowledge and routines, while failure drives organizations to search for causes and discover new routines to correct the flaws that produced failure. While considerable research examines how experiences influence learning, research has yet to explore how perceptions of prior performance affect organizational learning. Using office-level data from all offices of a global financial services firm, we explore how the accuracy of project performance perceptions affects subsequent learning from project experience. We find that organizational learning from project experience is compromised when prior project performance is misperceived as being overly positive or overly negative. We also find that prior experience and the level of effort expended in evaluating prior projects attenuates performance perception inaccuracy.

Author: **Kimberly M Ellis**; Florida Atlantic U.

Author: **David R. King**; Florida State U.

Author: **Janice M. Gordon**; Florida State U.

M&A research suggests that advisors can help and hurt acquisition performance. However, few studies consider that these attributes may be interrelated. To capture this interrelationship, we focus on four sources of knowledge—contemporaneous capital (advisor's concurrent experience working with multiple acquirers), relational capital, the acquirer's knowledge from its prior acquisitions, and the acquirer's knowledge of the target's industry. Building on learning and agency theories, we hypothesize that the positive performance effect of contemporaneous capital is moderated by relational capital, acquisition experience, and industry similarity. Using a large sample of deals over an 18-year period, we find that advisors generally help their clients (as reflected in higher performance) but tend to exploit their clients' vulnerabilities (leading to lower performance) when they lack contemporaneous capital.

Value Drivers from Prior Alliances with Targets in Mergers and Acquisitions

Author: **Hang Nguyen**; Eli Broad School of Business, Michigan State U.

Author: **Ranjani Krishnan**; Eli Broad School of Business, Michigan State U.

Author: **Satish V. Joshi**; Michigan State U.

Acquisitions are often associated with insipid performance returns for the acquirer for many reasons, the most prominent of which is information asymmetry. Prior alliances with the target firm can attenuate losses from asymmetric information and yield higher returns for the acquirer. Using learning, network, and property rights theories, we study acquisitions of alliance targets and calibrate the extent of value enhancement as a function of three sets of moderating factors – alliance-, network-, and market. Alliance-level factors include quantity, duration, and diversity. Network-level factors include network centrality, efficiency, and reputation. Market-level factors include demand

These results imply a partial remedy such that practice, attention, and effort can reduce misperceptions about performance and enhance organizational learning. In general, our research highlights the role and importance of performance perceptions in the organizational learning process and reveals that performance misperception can sabotage experiential learning.

The Role of Organizational Learning Orientation on Corporate Political Activity

Author: **Izuchukwu Evans Mbaraonye**; U. of Nebraska, Lincoln

Author: **Varkey Titus**; U. of Nebraska, Lincoln

Author: **Mirzokhidjon Abdurakhmonov**; U. of Nebraska, Lincoln

Corporate Political Activity (CPA) is an investment spurred by strategic motivations. While research on CPA in growing, little is known about how a firm's innovative efforts may motivate its participation in CPA. We link a well-known motivation for CPA—to mitigate uncertainty—to the risky and uncertain activity of organizational learning. We build on the CPA literature with insights from the exploration-exploitation framework of organizational learning to investigate the role of a firm's learning orientation on the investment in CPA. Specifically, we propose that exploration oriented firms invest more heavily in CPA than other firms. We then argue that this relationship is attenuated by the strength of regulation in the focal firm's industry, and strengthened by the munificence of the focal firm's industry. We test our hypotheses on a sample of 926 firms, and find general support for our hypotheses.

uncertainty, competition, and technology intensity. Analysis of 1,499 acquisitions that occurred between 1990 and 2015 indicates that while alliance partner acquisitions are associated with higher stock returns for the acquiring firm, the aforementioned moderators affect the extent of returns. We find evidence of non-linear returns from alliance-level moderators, quantity and duration, and positive returns from market-level moderators. Some of the network-level benefits accrue at the time of the alliance announcement itself, leaving little residual value gains at the time of the acquisition. Our study contributes to a richer understanding of the drivers of value from prior alliances with the acquisition target.

Internationalization of R&D Through Alliances or Joint Ventures?

Author: **Shu Deng**; U. of Texas at Dallas

Author: **Jiyu WANG**; U. of Texas at Dallas

Author: **Songcui Hu**; U. of Arizona

How do firms select different forms of partnerships, i.e., non- equity-based alliances or equity-based joint ventures (JVs), in the process of internationalization of research and development (R&D)? We argue that the interplay of information processing and interorganizational learning perspectives can help better understand this decision making. The information processing perspective emphasizes information load as a mechanism of selecting different types of global R&D partnership, suggesting that a firm with high information load, as indicated by its partnership diversification, may choose R&D alliances to avoid the problem of information overload. In contrast, the interorganizational learning perspective highlights knowledge transfer as a mechanism, indicating the disadvantage of alliances in the global R&D partnership choice. Furthermore, we argue technological distance and repeated partnership are boundary conditions under which the effect of partnership diversification on the likelihood of selecting alliances is promoted or prohibited. Using a sample of cross-border R&D alliances and joint ventures in a multiple-country setting, we find supportive evidence of our theoretical predictions.

This study contributes to the literature on the R&D internationalization.

Who Gains from M&A? The Effect of Industry Life Cycle on Post-M&A Innovation Performance

Author: **Kyungsoo Kim**; Kenan-Flagler Business School, U. of North Carolina at Chapel Hill

Mergers and acquisitions (M&A) are popular strategies for firms seeking innovations, but previous studies show contradicting results about the effect of M&A on post-M&A innovation performance. I argue that the interplay between industry life cycle and firms' incentives for innovation activities plays a critical role in determining the post-M&A innovation performance of acquiring firms. In this study, using datasets of granted patents and M&A transactions between 1980 and 2000, I analyze the effect of M&A on post-M&A innovation performance of acquiring firms. In particular, I focus on industries in the declining stage in which firms are desperate for but not able to create fundamental innovation due to their rigid structure. Industries are identified based on 3-digit SIC codes, and declining industry is defined through the sales growth rate, firm entering rate, and annual stock return. The results show that M&A transactions in declining industries lead to better post-M&A innovation performance of acquiring firms. Furthermore, diversifying M&A has more positive effect on innovation performance than consolidating M&A in declining industries. However, as an industry becomes more concentrated, the positive effect of M&A in declining industry decreases significantly. The study contributes to the existing literature on M&A by clarifying the key sources of conflicting findings with regard to post-M&A performance

Channel Diversification, Conflict, and the Moderating Role of IT and Institutional Development

Author: Tingyu Lu; School of Management, Xi'an Jiaotong U.

Author: Guijun Zhuang; Xi'an Jiaotong U.

Author: Ruqi Li; School of Management, Xi'an Jiaotong U.

Using the survey and secondary data of Chinese manufacturers, this study assesses whether and how channel diversification affects hybrid channel conflict, as well as the moderating role of IT resources and institutional development. We conceptualize hybrid channel conflict as a dual-dimensional construct, comprising the inter-channel conflict and the intra-channel conflict. We find that a firm's channel diversification in an emerging economy can function to engender hybrid channel conflict. Specifically, when firm's IT resources increase, the effect of its channel diversification on inter-channel and intra-channel conflict decrease. Additionally, when a nation's institutional development increases, the effect of the firm's channel diversification on inter-channel conflict decreases, while its effect on intra-channel conflict is not significant. Our findings integrate the system-based view (open systems theory), which views a firm's multichannel system as an open system, and resource- and institutional-based view, which notes that IT resources and institutional development in emerging economies have critical influences on the relationship between channel diversification and hybrid channel conflict. Overall, this paper enriches the related literature by ascertaining whether and how hybrid channel conflict can be generated in the multichannel system.

Attention to New Product Development in Alliances

Author: Ricarda B. Bouncken; U. of Bayreuth

Author: Martin Ratzmann; U. of Bayreuth

Author: **Roman Barwinski**; U. of Bayreuth
Author: **Jeff Covin**; Indiana U.

This paper extends the attention based view to alliances between buyer and supplier firms on product innovation. Attention of both firms increases when detailed specifications regarding the product's parameters (e.g. functional principles, features, design elements) are developed and applied in the course of the alliance. Data collected from 279 European manufacturing firms reveal that moderate levels of "post-formational specifications" proposed by the buyer firm are associated with "superior" new product offerings by the supplier. Less superior products result when the specifications by the buyer are either minimal or high. Mutual knowledge creation is associated with increased attention of both partners so that they constructively work together even when the level of constraints in post-formational specifications is low or high. Thus, the attention related to mutual knowledge creation in the alliance enhances new product superiority of the supplier as well as moderates the relationship between the level of specifications and new product superiority.

Employees' Yin and Yang Mindset and Intra-Firm Coopetition in Growth Companies

Author: **David An**; EBS Business School

Author: **Markus Kreutzer**; EBS Business School

Current research lacks an understanding of how employees view the paradox of intra-firm coopetition (IFC), top management orchestration of IFC, and resulting employee behavioral strategies and actions. Based on a single case study of ALPHA Plus, a wholly owned subsidiary of ALPHA Corporation, one of the leading mobile messengers in Asia, we find organizational context and top management orchestration to influence how employees perceive the salience of IFC. How employees respond, however, largely depends on their cognitive frame, the Yin and Yang mindset (YYM). Depending on their YYM, employees either apply strategies that benefit from IFC such as balance and seize or they apply deceive and reject strategies. Our study is based on a grounded theory

approach and contributes to the understanding of cognitive foundations and behavior of employees towards the phenomenon of IFC by integrating the Asian philosophy of Yin and Yang which we define along three dimensions: ubiquity, necessity and oneness.

Organization Structure Matters: R&D Centralization and Alliance Governance

Author: **Sandip Bisui**; U. of Colorado Boulder

Author: **Kun Zhang**; Peking U. HSBC Business School

Author: **Jeffrey J. Reuer**; U. of Colorado, Boulder

Author: **Dutt Dev Harsha Tadikonda**; U. of Colorado, Boulder

We bridge current streams of corporate strategy and cooperative strategy research to investigate the potential implications of organizational structure for alliance governance in technology partnerships. We propose that in an alliance between a client firm and an R&D firm, the client firm's internal structure of R&D plays an important role in the alliance design and governance, specifically in determining the scope, interdependence, and contracting of alliance activities and the distribution of control rights. Using data from alliances in the bio-pharmaceutical industry, we find that firms with centralized R&D structure tend to engage in alliances with broader scope and higher task interdependence, and they are more likely to capture the upstream control rights through the design of R&D contracts. We therefore extend research over several decades that has examined the organization and structuring of alliances themselves to highlight the importance of parent firm organizational structure for the ways that firms set up alliances.

Author: **Tatiana Kostova**; U. of South Carolina

Author: **Marc Van Essen**; U. of South Carolina

Author: **Steve Sauerwald**; U. of Illinois at Chicago

Using resource dependence and institutional theories, we examine how minority state ownership affects firm's environmental performance across different national contexts. Minority state ownership is increasingly common globally as a form of government control over business. We propose that it makes firms more dependent on governments and responsive to home country institutional pressures and state expectations for environmental protection. We find empirical support for our model—minority state owned firms have better environmental performance, especially in countries with stronger pro-environmental regulatory and normative institutions and weaker pro-environmental cultural-cognitive institutions. Our study contributes to research on how minority state ownership affects corporate environmental behavior by developing a novel integration of resource dependence and institutional theories, and uncovering nuances in how different institutional pillars influence organizations.

More Estranged Bedfellows: Reform of State-Owned Local Partners and Ownership Realignment

Author: **Tao Wu**; National U. of Singapore

Author: **Andrew Delios**; National U. of Singapore

The establishment of the State-owned Asset Supervision and Administration Commission (SASAC) was announced in 2003. This increased the pressure of state-owned enterprises (SOEs) to improve performance. How did this influence the dynamics of ownership structure of international joint ventures (IJVs)? We contend that when SOEs are

The Strategic Dynamics of Imitation and Diffusion (session 1066)

Imitation and diffusion remain central concerns for scholars from diverse disciplines and backgrounds such as economics, organizational sociology, and strategy (see Lieberman & Asaba, 2006; Strang & Soule, 1998; Young, 2009). This research has predominantly focused on the conditions that enable or deter imitation, and to a lesser extent the performance consequences for imitators versus innovators or early entrants. The findings are mixed on the extent to which imitative efforts harm or benefit the performance of early versus later entrants. Moreover, the recent proliferation of open-source strategies calls into question the established wisdom that imitation necessarily harms the performance of innovators. It may thus be time to employ more sophisticated empirical strategies to uncover what drives the strategic dynamics of imitation and diffusion, and to reinvigorate the debate by focusing on the mechanisms that shape imitative behavior and the ensuing competitive dynamics. This symposium brings together three tightly connected papers by authors from a range of backgrounds and vintages, and two discussants who have shaped the debate, to address several questions informed by contemporary empirical research: (1) How and when can an imitative product harm (or improve) the performance of the original? (2) How does the order in which firms expand their scope affect their performance? Is it the case that early entrants benefit and laggards suffer as a result of the bandwagon effect? Relatedly, (3) even if early-mover advantage and laggard costs are found, are these driven by intrinsic benefits of moving early rather than late, or is this a matter of fit where selection drives results instead? (4) What explains an industry's low deterrence of imitation, followed by vigorous patenting? Beyond shedding light on a set of complementary questions, this symposium aims to identify important areas for future research on imitation and diffusion by distilling key lessons from this literature, from opening the debate on identification and endogeneity in assessing the impacts of early versus late imitation, to articulating the specific mechanisms that underpin firms' strategic choices in terms of imitation.

forced to compete for survival they have more incentives to appropriate valuable assets of foreign firms through IJVs. Hence, we believe that upon the rise of SASAC foreign firms have stronger motivation to exclude SOEs from joint ventures to avoid appropriation by increasing equity share while SOEs need to maintain their ownership position to enable appropriation. Overall, these two competing forces may lead to inconclusiveness in the dynamics of equity share. To tease out them and demonstrate the tension, we differentiate between sensitive and non-sensitive industries in terms of foreign ownership and argue that the results of the wrestling between these two forces vary in two types of industries. The results from analyses based on the longitudinal data of Sino-Japan joint ventures in China reveal two opposite impacts of SASAC on foreign equity of SOE-owned IJVs in sensitive and non-sensitive industries, which is also moderated by the level of administrative affiliation of SOEs (i.e., central government or local government).

Government Ownership in the Middle East and North Africa

Author: **Julia Barbar**; U. of St. Gallen

Author: **Canan Mutlu**; Kennesaw State U.

Our study investigates the impact of government ownership on firm performance in the MENA region. While extant studies have presented mixed findings with diverse samples from developed or developing countries, state-owned enterprises in the Middle East and North Africa (MENA) region have received little attention despite their substantial scale. Based on a sample of 1215 MENA firms from year 2010 to 2017, we examine the relationship between government ownership and firm performance. Furthermore, we unpack this relationship by scrutinizing the moderating roles of pyramid ownership structure and government identity (domestic vs. foreign). We find that government ownership enhances firm performance in the MENA region. However, the advantages of government ownership diminish if such state-owned enterprises have lengthy control chains or foreign identity.

Author: **Mike W. Peng**; U. of Texas at Dallas

Author: **Jingtao Yi**; Renmin U. of China

Author: **Xiuping Zhang**; The U. of International
Business and Economics

Why do some state-owned enterprises (SOEs) embrace innovations during economic transitions, when institutional logics move from state socialism to market capitalism? The rise of a market capitalism logic espousing competition and innovations challenges traditional SOEs' state socialism logic that prioritizes central planning. We posit that these challenges, stemming from the grip of the state as the ultimate owner, may be mitigated for some SOEs in corporate pyramids. A pyramid features SOEs being organized into chains of firms, creating indirect ownership and control through pyramidal layers. Such layers insulate government intervention in lower-tier SOEs, loosening the grip of the state socialism logic and facilitating the transition towards the market capitalism logic, as reflected in more SOE innovations. Leveraging a sample of SOEs in China, we find that SOEs innovate more when the number of pyramidal layers between them and the state increases. Additionally, the innovation-facilitating role of pyramids hinges on industry regulations and institutional development. Overall, this paper integrates research on institutional logics and corporate pyramids to deepen our understanding of SOE innovations.

Friends in Low Places: Status, Structure and Venture Capital Syndicate Performance

Designated as a "Best Paper" for ENT

Author: **Jiguo Qi**; The School of Economics and Management, Tsinghua U.

Author: **Steven White**; Tsinghua U.

Author: **Wei Zhang**; Tsinghua U.

This study explores the short- and long-term performance implications of different configurations of status composition (high, low) and internal structure (lead, non-lead roles) in syndicated venture capital investments. In contrast to prior work that has focused on the signaling effect of individual VC status and the relationship to investment outcomes, we argue that syndicates are more complex and that status and structure interact and have a strong impact on long-term performance. We test our hypotheses using a dataset of 2,069 syndicated VC investments in China. In line with signaling theory, we find that syndicates with a high-status lead VC have a greater likelihood of a venture receiving a subsequent round of financing. Results for long-term performance are quite different. Syndicates of two low-status VCs or a lead high-status VC with a low-status non-lead VC had significantly higher likelihoods of a successful exit than syndicates of two high-status VCs.

Irrigation Canals: Foreign Venture Capital Investment and Cross-Border Knowledge Spillovers

Author: **Roberto Santos**; U. of Massachusetts, Lowell

Author: **Yi Yang**; U. of Massachusetts, Lowell

Prior studies have documented that VC investments provide channels facilitating knowledge flows through investment relationship networks. Such knowledge diffusion, although it may help entrepreneurial companies overcome initial resource constraints, can undercut their competitive advantages by leaking their intellectual properties to competitors in domestic and international markets. The potential for unwanted spillovers may even adversely affect a nation's competitive advantage. This study examines whether and how foreign VC investments in a host country's industries are

Author: **Yuan Shi**; Cornell SC Johnson College of Business

How does equity crowdfunding affect venture capital firms' investment decisions? VCs may be attracted to the new market opportunities identified by crowdfunding investors and thus diversify their investments. VCs may also seek to differentiate from the crowd by positioning as dedicated experts, and thus become more specialized in their investments. I test these competing explanations by examining VC investments following the legalization of equity-based crowdfunding in more than twenty states during 2009-2017. I find that VCs make more specialized investments after the crowdfunding policy shocks in their home states, but the effect is attenuated when VCs and crowdfunding investors share similar investment focus. Mechanism tests show that specialization is driven by a crowding-out effect, while diversification is explained by a lead-in effect.

A Value-Based View of Crowdfunding Rewards and Crowdfunding Performance

Author: **Han Jiang**; Tulane U.

Author: **Zhiyi Wang**; U. of Colorado Boulder

Author: **Lusi Yang**; U. of Arizona

Author: **Jia Shen**; Oregon State U.

Author: **Jungpil Hahn**; National U. of Singapore

In this study, we integrate the insights of consumption value theory and the crowdfunding literature to develop a value-based view of crowdfunding rewards to systematically theorize and synthesize the underlying mechanisms through which the various rewards offered by crowdfunding projects can incentivize crowdfunders' backing decisions. Identifying three basic value dimensions carried by different crowdfunding rewards: utilitarian value, socioemotional value, and participatory value, our value-based view posits that these three values satisfy crowdfunders' different needs and thus motivate them to back a project on distinct grounds and considerations. Through this view, the performance of a crowdfunding project can thus be theorized as the joint effects of the three values delivered by all the rewards it offers.

associated with knowledge spillovers in their home countries. Using a dataset of foreign VC investments in 27 U.S. critical industries and related patenting activity between 2007-2017, we find counterintuitive evidence that increased foreign VC investment in U.S. critical industries is actually associated with knowledge spillovers in an inverted U-shaped relationship. Such a relationship is also moderated by home country intellectual property regimes and technology gaps between the home and host countries.

The Changing Resource Needs of New Ventures and Venture Capital Syndicate Expertise Diversity

Author: **Yu Liu**; U. of Texas at Dallas

Author: **Haemin Dennis Park**; U. of Texas at Dallas

Employing a dynamic view of the resource dependence perspective (RDP), we examine how changing resource needs of new ventures will drive lead venture capitalists (VCs) to reach other partners for heterogeneous resources. A greater number of partners will increase the group resource heterogeneity, but they will also dilute lead VCs' power over other partners and increase coordination costs in managing the group. Hence, we argue that the formation of a multiparty coalition is navigated by changing resource needs and leaders' power constraints concern. We test our hypotheses by examining how lead venture capital (VC) investors compose their syndicates along different ventures' life stages.

Explaining the Craze for Crowdfunding Research as an Academic Research Topic

Author: **Benjamin Le Pendeven**; Audencia Business School

Author: **Thibaut Bardon**; Audencia Nantes School of Management

Author: **Sophie Manigart**; Ghent U. and Vlerick Business School

Crowdfunding research has grown exponentially since the first academic papers on the topic in 2013

institutional environment. Using data of listed companies in the Small and Medium Enterprises Market and the Growth Enterprises Market between 2004 and 2012, we find that ownership-dominated power source mismatch in venture capital syndication enhances the growth performance of later stage ventures. On the other hand, status-dominated power source mismatch has the opposite effect. When the highest ownership power venture capital in the syndicate enters the board and when the new venture is headquartered in a province with a higher degree of marketization, the positive performance effect of ownership-dominated power source mismatch is strengthened.

Entrepreneurial Learning in Online Communities

Author: **Peter Kalum Schou**; NHH Norwegian School of Economics

Author: **Eliane Bucher**; BI Norwegian Business School

Author: **Matthias Waldkirch**; EBS Business School

How entrepreneurs learn is key for their success, and a growing body of research has investigated this issue. However, research on entrepreneurial learning primarily focuses on how individuals transform experience, paying less attention to social ways of learning. With the rise of online communities, entrepreneurs increasingly utilize digital spaces to share experiences and seek new knowledge. This could change how entrepreneurs learn. Building on the theory of coactive vicarious learning, we, therefore, investigate how online communities provide avenues for entrepreneurial learning by studying a large online community of entrepreneurs on Reddit. Here, we analyze the top-voted 100 threads from 2018-2019, encompassing 10'277 comments in total. Our findings outline five distinct learning discourses and show how

Family Firm: Micro and Macro Foundations for Research (session 986)

A Causal Mechanistic Perspective on Micro-Foundations in Family Business: The Case of CE

Author: **Attilia Ruzzene**; U. of Bergamo

Author: **Mara Brumana**; U. of Bergamo

Author: **Tommaso Minola**; U. of Bergamo

This paper is a conceptual contribution to the debate on micro- foundations in family business research. We advocate a causal- mechanistic approach to micro-foundations which is centered on the notion of causal mechanisms as responsible for the emergence of phenomena at the organizational level, such as corporate entrepreneurship in family firms. We distinguish two alternative purposes of the research process that can take advantage from it: prediction and explanation. First, we argue that knowledge of causal mechanisms can be exploited when testing hypothesis that draw on the mechanistic potential of dominant theories in family business research thus leading to better predictions. Second, we show how the mechanistic reasoning is a natural ally of major forms of explanation in the

entrepreneurial learning differs due to variations in micro-learning contexts. Doing so, our article (1) contributes to the growing research interest in how entrepreneurs learn in communities, while also (2) adding to the current debate on knowledge sharing and creation in online communities. Furthermore, we (3) provide empirical backing and nuance to the theory of coactive vicarious learning.

Effectiveness of Entrepreneurship Education Program in a Large Class

Author: **Katsufumi Matsui**; U. of Tokyo

Author: **Takaaki Umada**; U. of Tokyo

Author: **Taketo Sugawara**; U. of Tokyo

Author: **Emi Makino**; Hiroshima U.

Author: **Lui Yoshida**; U. of Tokyo

Author: **Kayoko Kurita**; U. of Tokyo

Author: **Katsuya Hasegawa**; U. of Tokyo

This study investigates the effectiveness of an entrepreneurship education program in a large classroom setting at a research university. Entrepreneurship education is typically delivered through experiential, action-based approaches in small class formats that are not easily scalable. A unique aspect of this study is that the credit-bearing course examined was conducted in a large lecture hall setting with several hundred students from diverse academic disciplines. Our quasi-experiment using difference-in-differences (DID) analysis evaluated the program's effectiveness. Outcomes of enrolled students were compared to those of a control group of students who had not taken the course. Results show that the program significantly deepened students' understanding of causation and effectuation logic, which are important elements of entrepreneurship. These results not only generally validate results of earlier studies showing the effectiveness of entrepreneurship education programs. They also demonstrate that, combining various types of content, students' entrepreneurship mindsets can indeed be fostered, even in a traditional large classroom setting. Consensus is building towards a view that entrepreneurship is important not only for entrepreneurs starting new businesses, but for everyone who might create new opportunities and value in uncertain environments.

field thus improving current explanatory accounts in terms of internal validity, completeness and accuracy. The paper concludes by summarizing the epistemic benefits of the causal-mechanistic approach and offering suggestions for future research.

Familial Microfoundations' Promise for a New Generation of Family Business Research

Author: **David Scott Jiang**; Georgia Southern U.

Author: **Timothy P. Munyon**; U. of Tennessee, Knoxville

Author: **Nastaran Simarasl**; California State Polytechnic U., Pomona

Why is more family business research not conducted across different domains of organizational scholarship (and levels of analysis)? Family business scholars routinely point out that (a) families own the majority of the world's businesses, (b) higher levels of family ownership and involvement increase family influence on various organizational phenomena, and (c) most areas of organizational scholarship fail to recognize how varying degrees of family influence in their firms often lead to different results than organizational scholars generally expect. Yet, family business scholarship has long been criticized for being too atheoretical, having too narrow of a scope, borrowing far more than it contributes back to other literatures, and generating research conversations that are only applicable to scholars within its own boundaries. Here, we reason that these shortcomings stem from approaches that identify unique family firm phenomena but generally provide little means to delineate, unpack, aggregate, or explain how they contribute to what other organizational scholars value and find theoretically useful. Proposing a familial microfoundations perspective, we provide a way to connect family business research with elements of existing organizational theories. Altogether, we hope to provide new paths to challenge family business and other areas of organizational scholarship as well.

Music Education During Adolescence – A Pathway to Entrepreneurial Identity?

Author: **Arturs Jefremovs**; Stockholm School of Economics in Riga

Author: **Inna Kozlinska**; U. of Groningen Centre for Entrepreneurship, The Netherlands

This paper examines the relationship of music education (ME) and entrepreneurship education (EE) received during adolescence with entrepreneurial identity of university students. The current identity research provides solid understanding of the relationship of identity with antecedents of planned entrepreneurial behaviour, depicting identity as an explanatory variable. Researching adolescent ME alongside EE as a potential enabler of entrepreneurial identity is crucial to understand complementarities between ME and EE, have a more complete knowledge of what kinds of education may contribute to entrepreneurial identity formation, and consider the identity insights when developing educational interventions for adolescents. Our analysis is based on a sample of 203 Bachelor-level students from different study backgrounds (arts and humanities, business, etc.). We find that both ME and EE received in adolescent period are related to entrepreneurial identity in adulthood. Simultaneously, ME acts as a moderator of the relationship between EE and identity; ME is also a likely predictor of the specific type of founder identity oriented towards serving a community. These new findings contribute to expanding the identity development discourse in entrepreneurship literature, and bring novel insights to the EE research, e.g. highlighting ME as an alternative pathway to entrepreneurial identity development.

Sociological Methodologies to Problematize Family Business Research

Author: **Eric Kushins**; Berry College-Campbell Sch. of Bus

In order to discover a more thorough and nuanced picture of what makes family businesses a unique phenomenon, scholars need to engage qualitative methods that produce data of organizational and relational processes. Recommendations are made for the use of sociological methodologies to problematize and challenge our current understanding of family firms. We provide descriptions, examples, and practical ways to carry out three underutilized methodologies for investigating questions of heterogeneity of families: diary studies, ethnography and autoethnography. The groundwork presented here provides scholars important rigorous and practical methodological suggestions to help launch transformative research to move the field of family business forward.

Activities of Compassion: How Owner Entrepreneurs Develop a Sustainable Organization

Author: **Naveed Akhter**; Jonkoping International Business School

Author: **Ethel Brundin**; Jonkoping International Business School

What series of activities do entrepreneurs engage in that lead to a compassionate organization? And What role does spirituality have for the activities of compassion? Drawing on spirituality and compassion as a conceptual lenses and a single case study from Pakistan, we find that through activities of compassion, grounded in the spiritual beliefs, owner entrepreneurs can develop a sustainable organization. Besides, we identify a set of activities and build an activity model of a sustainable organization. This study contributes to the literature on compassion, spirituality, and sustainable entrepreneurship.

On a more general level, the study provides an input to adolescent education literature and learning transfer in education research, in particular relating to the discussion on Eriksonian theory on identity development throughout lifetime.

Peer Effects in Entrepreneurship Education Field Experimental Evidence on the Role of Gender and Team Emotional Intelligence

Designated as a "Best Paper" for ENT

Author: **Laura Aline Bechthold**; FIF@Zeppelin U.

Author: **Laura Rosendahl Huber**; Rotterdam School of Management, Erasmus U.

This study builds on the assumption that the common experiential design of entrepreneurship education stimulates entrepreneurial learning via social interaction with peers. We present data from a field experiment in higher entrepreneurship education with 498 valid observations, including 314 female and 184 male students across 174 randomly assigned teams. We investigate peer effects in two ways. First and to the best of our knowledge, we present the first attempt to explore gendered peer effects at the pre-nascent stage of the entrepreneurial process. We theorize that having same-gender entrepreneurial peers in the team positively influences the development of entrepreneurial intentions, attitudes, as well as entrepreneurial self-efficacy. Second, we explore the role of team emotional intelligence in the context of entrepreneurship education. Our analysis provides some indications for positive same-gender peer effects, especially when it comes to the development of entrepreneurial self-efficacy among female students. Further, we find support that team emotional intelligence is not only an antecedent of entrepreneurial propensity, but also being assigned to a team with emotionally intelligent peers positively influences entrepreneurial learning and may even mitigate same-gender effects.

History and the Temporality of Entrepreneurial Opportunities (session 994)

There is a growing interest in the ways in which entrepreneurship is embedded within, and explained by, the passage of time. Thus, in entrepreneurship, "Broadening our Sight" means, among other things, expanding our temporal horizons to increase the historical and temporal sensitivity with which we explain entrepreneurial processes. Unfortunately, however, such historical and temporal sensitivity is not common in the existing research on entrepreneurial opportunities which tends to focus on the nexus between individuals and more-or-less synchronic situations. This lack of emphasis on history and temporality is surprising because opportunities are manifestly about the contrast between the status quo (i.e. the past) and an imagined future which may be realized through present action. In the proposed symposium we adopt the view that entrepreneurial opportunities are best understood in relation to evolving accounts of the past, present, and future. Accordingly, on the one hand, opportunities can be viewed as specific features of broader socio-historical contexts which may be discovered, created, or otherwise actualized by entrepreneurs with consequences for subsequent entrepreneurial activities. On the other hand, entrepreneurs' own prospective and retrospective accounts involving entrepreneurial opportunities may serve a symbolic or rhetorical function which may facilitate subsequent stakeholder enrollment and resource acquisition. The proposed symposium is intended to foster temporal-historical approaches for explaining and studying entrepreneurial opportunities. To do so, we bring together leading scholars with demonstrated expertise on entrepreneurial opportunities, entrepreneurial processes, and the history of entrepreneurship to present their ideas and respond to audience questions.

Incubators and Accelerators (session 990)

What is an Accelerator? The Case for a Pluralist Conceptualization

Author: **Benjamin Webster Walker**; Victoria U. of Wellington

Author: **Stephen Cummings**; Victoria U. of Wellington

Author: **Rebecca Downes**; Victoria U. of Wellington

Author: **Ruth Fischer-Smith**; Land Information New Zealand

Author: **Jesse Pirini**; Victoria U. of Wellington

The past decade has seen a marked rise in research on entrepreneurial accelerators. Efforts to develop a conceptual definition of the accelerator initially lagged behind this surge, but have recently begun to emerge in published articles. We explore this conceptual evolution as a case study of how scholars respond to new entrepreneurial phenomena. By first analyzing 48 academic definitions of the accelerator, we demonstrate an increasing convergence on Cohen and Hochberg's (2014) definition. By then analyzing practitioner understandings of the accelerator phenomenon using textual data from the websites of 73 accelerators, we find that practitioner understandings exhibit similarities to — but also some important differences from — the emerging academic conceptualization. We discuss the significance of this finding in light of the apparent convergence on a single academic definition of the accelerator, which, while conducive to efficient theory generation, might come at the expense of deep insight into the phenomenon. Mindful of this risk, and informed by our research findings, we make the case for a pluralist conceptualization by outlining four ways of viewing what accelerators can be: facilitators of new venture growth, vehicles for personal development, communities of practice, and strategic symbols. In light of the novel and continuously evolving nature of many entrepreneurial phenomena, we conclude by discussing the theoretical benefits of pluralist conceptualizations for the field of entrepreneurship

as a whole.

An Anchor or a Lifebuoy? Incubators as Spaces of Learning and Identity Building

Author: **Yuliya Shymko**; Audencia Business School

Author: **Theodore Andrew Khoury**; Portland State U.

Author: **Stephen Mezias**; INSEAD Abu Dhabi

Using a sample of participants from a business incubator in Quito, Ecuador, we conducted a narrative study of the process of entrepreneurial identity building. Our review of prior research suggested that the emerging market context would likely have significant effects in several ways. First, it would affect how they would articulate the early stages of their identity formation — that is, the reasons they would claim that they decided to attend an incubator. Second, it would affect how they articulate how and what they learned during the incubator experience. Third, it would affect how they rationalized their experience of the incubator in terms of what they learned and how their identities were transformed. Despite a sizable sample of entrepreneurs with ventures in a variety of fields, our findings revealed some clear consistencies and sequencing in the process of building an entrepreneurial identity. We label these phases as entrepreneurial identity conception, entrepreneurial identity inculcation, and entrepreneurial identity calibration.

Exploring the Treatment Effect of Startup Accelerators on Venture Emergence

Author: **Romi Kher**; City U. of New York, Baruch College

Author: **Shu Yang**; Hofstra U.

Author: **Scott L. Newbert**; City U. of New York, Baruch College

While startup accelerators are routinely touted in the popular press, research has yet to empirically establish their effect on emerging ventures. In order

to confirm whether such a causal treatment effect exists, we adopt a quasi-experimental design to examine whether and how accelerators actually help new ventures emerge. Our sample consists of 4,294 startups that applied to 119 accelerators worldwide from 2013 to 2017. Using propensity score matching with the nearest neighbor matching algorithm, we find that accelerators do facilitate firm emergence. However, by stratifying our sample on the basis of the progress each startup had already made toward emergence prior to entering the accelerator, we also find that this acceleration effect is conditional on a startup's stage of development. These results not only demonstrate the value accelerators can provide emerging ventures, but more importantly, how accounting for sample heterogeneity by reducing censoring bias can provide a clearer picture of the benefits of acceleration.

Beyond the Coping Threshold: How External Pressure impacts Entrepreneurial Orientation in SMEs

Author: **Chris Williams**; Durham U. Business School

Author: **Jacqueline Jing You**; Durham U. Business School

Author: **Nathalie Spielmann**; NEOMA Business School

We examine the relationship between the intensity of external pressure and entrepreneurial orientation (EO) in small-medium sized enterprises (SMEs). Blending insights from the fields of EO, organizational resilience and entrepreneurial action we argue there will be a U-shaped relationship between the overall intensity of external pressures on decision making in the SME and the degree of EO adopted by the SME. Our theory asserts there will be a 'coping threshold' after which a negative relationship between external pressure and EO will turn positive. Using data from small-sized wineries in France we find strong support for our theory. Results suggest that external pressures have a pivotal role to play in explaining EO in small firms over and above performance levels and resource endowments under the firm's ownership. We discuss implications for theory of EO as well as practical implications for leaders of SMEs.

Frugal Entrepreneurship at the Grassroots Level: An Emerging Phenomenon

Author: **Mokter Hossain**; Qatar U.

Frugal enterprises are recognized as change agents who serve less fortunate customers in emerging markets. The extant literature lacks knowledge about the early stage struggle of these enterprises. This study extends the existing entrepreneurship research by empirically examining the frugal entrepreneurship phenomenon. Using inductive, theory building approach across multiple cases, we investigate how frugal enterprises by using bricolage approach develop frugal innovations, successfully commercialize them, and make an impact in a society with resources constraints and institutional constraints. Findings show that frugal entrepreneurs face unusual challenges. Financial and institutional supports at the early stage of the ventures provide a significant value for them. Despite numerous

prolonged stress. Although knowing more about “entrepreneurial stress” promises to better prepare aspiring entrepreneurs and advise current ones, systematic theoretical and empirical work is scarce. Our paper aims to stimulate research by focusing on a facet of entrepreneurial stress that is related to the resources deemed crucial for entrepreneurial activities. Specifically, we develop propositions regarding the stress-inducing potential of what does (e.g., resource loss or threat thereof) or does not happen (e.g., failure to gain) to such resources and the psychological implications for entrepreneurs (e.g., strain). We do so by integrating principles of conservation of resources (COR) stress theory with key postulations from the resource-based view (RBV) of the firm while also drawing from research in organizational behavior, strategic management, entrepreneurship, and particularly the input-process- output model of strategic entrepreneurship.

The Simultaneous Impacts of Firm Birth Versus Death on Regional Employment: The Case of the U.S. (WITHDRAWN)

Author: **Eunsuk Hong**; SOAS U. of London

Author: **In Hyeock Ian Lee**; Loyola U. Chicago

The relationship between entrepreneurship and domestic employment has not been clear cut due to the interconnected but contradictory effects of firm birth versus death from entrepreneurship. Using a geographic panel of 1,850 state-year observations of firm birth, death, and regional employment across the U.S. from 1978 to 2014, we investigate whether and how firm birth and death affect the levels of domestic employment in a region. Our main findings are threefold. First, firm birth and death in a state exert contrasting effects on regional employment within the same state (i.e., intra-regional effects): firm birth affects the regional employment in an inverted U-shaped fashion whereas firm death shows an opposite U-shaped pattern. Second, firm birth and death in a state exert the same contrasting effects on the regional employment across its neighboring states (i.e., inter-regional effects): however, the intra-regional effects are stronger than the inter-regional counterparts. Third, when a state is equipped with strong innovative capabilities, they mitigate the negative effects of firm death on the regional employment both intra- and inter-regionally. We discuss theoretical, empirical, and practical contributions of these findings to the previous literature.

How and When Can HR Actions, Behaviours, and Capabilities Transform Start-Ups into Scale-Ups?

Author: **Graeme Martin**; U. of Dundee

Author: **Norin Arshed**; U. of Dundee

Factors influencing the transition of knowledge-

Author: **Jukka Pekka Partanen**; U. of Vaasa

When addressing the issues of entrepreneurial well-being, scholars tend to investigate the interrelationships between two variables: work environment and entrepreneur. However, such a quantitative approach to the issue ignores the fact that stress is a rather complex and multiyear phenomenon. Thus, novel ways are required to overcome the oversimplification of the stress process. This study addresses the phenomenon of entrepreneurial stress through the perspective of personal accounts and asks the question of what the entrepreneur's actions can lead to stress. The study applies narrative analysis to gain a deeper insight into the phenomenon of entrepreneur stress since stories are known to bear the account of one's acts and behaviours. The findings reveal the complex nature of stress by illuminating how personal beliefs and behaviour can subject entrepreneurs to stress, strain, and overwork. The results of the paper contribute to the literature on entrepreneurial stress and well-being by casting a more nuanced light on life pressures experienced among entrepreneurs.

PAPER SESSION

ASYNCHRONOUS

intensive SME start-ups scale-up have become a major area of interest to academics in entrepreneurship, policy-makers and practitioners. Yet we know little about the specific HR actions, behaviours and capabilities needed to surmount the management challenges faced by scale-up firms. Thus we ask: how and when can HR actions, behaviours and capabilities transform start-ups into scale-ups? Our findings are based on longitudinal, 'engaged' research with a high-tech scale-up. Drawing on this research, we develop a process theory that provides insights into how start-ups can transform organically into scale-ups by valuing people, creating sustainable working conditions and co-evolving with their entrepreneurial ecosystems. We elaborate on the presence of three stages in this process that are potentially generalizable to other SMEs scaling-up: laying the human capital foundations; achieving scale through bridging and bonding social capital; and re-defining the entrepreneurial eco-system through enhanced reputational capital. Finally, we discuss the contributions of our research to theory and practice in entrepreneurship and HRM.

ENT

Opportunity Recognition and Evaluation (ORE) 2 (session 992)

Time, Sleep, and Alertness

Designated as a "Best Paper" for ENT

Author: **Ludvig Levasseur**; Indiana U., Bloomington

Author: **Jintong Tang**; Saint Louis U.

Author: **Masoud Karami**; U. of Otago

Author: **Lowell Busenitz**; U. of Oklahoma

An individual's time perspective has important effects on behavior and decision making. We herein argue that time perspective may be particularly relevant among entrepreneurs. Although rarely addressed, we argue that bringing a time perspective into entrepreneurship is important because of its significant impact on the processing of information surrounding potential opportunities.

ENT

Uncertainty 1 (session 993)

Innovating Frugally: The Role of Risk-Taking, Proactivity, and External Sources of Knowledge

Author: **Mir Dost**; Department of Management Sciences, Lasbela U., Uthal-Pakistan

Author: **Maria Claudia Angel Ferrero**; IAE Montpellier - U. of Montpellier

Growing changes in global environment is compelling firms to seek and exploit opportunities for market growth. Innovation that is cost effective, functional and sustainable (frugal) is considered to be one of the most important factors for such growth. For this study, we investigate the effects of risk-taking and proactivity dimensions of entrepreneurial orientation on frugal innovation (FI);

This study examines the effects of present-hedonistic and future-positive time perspectives on entrepreneurial alertness as well as the moderating role of entrepreneurs' insomnia in these focal relationships. Using two sets of data collected in the U.S. and Iran, we find support for the majority of our hypotheses. Our research paves the way for a better understanding of entrepreneurs' psychological time and how it influences the development of new opportunities.

The Role of Evolutionary Psychology in New Venture Success

Author: **Xueru Yang**; South China Agricultural U.

Author: **Frederik Riar**; Karlsruhe Institute of Technology

Author: **Franz Kellermanns**; U. of North Carolina, Charlotte

Author: **Max Leitterstorf**; Hochschule Bonn-Rhein-Sieg

Family relationships play an important role in entrepreneurial teams of new ventures. We examine two different types of family relationships in entrepreneurial teams: (1) close kinship ties and (2) distant kinship ties. Specifically, integrating insight from research on evolutionary psychology theory with research on socioemotional wealth, we analyze the impact of these family ties on the success of new ventures. Our empirical results, based on a sample of 317 new ventures, suggest that while close kinship ties in entrepreneurial teams have a negative effect on new venture success, distant kinship ties have a positive effect. Both of these effects are less pronounced in case of high founder ownership or in case of high initial financial resources. We contribute to the entrepreneurship literature by providing a broader but yet more precise understanding of the construct "family" as well as new insight for the varying effects of different family relationships on firm success. Moreover, we introduce new original theoretical frameworks on which future entrepreneurship theorizing can take place.

[view paper \(if available\)](#)

and moderation of external sources of knowledge. Using hierarchical regression analysis on data nested from 385 SMEs of Pakistan, we find partially support for hypothesized relationships. The data revealed positive influence of risk-taking and proactivity on FI. However, external sources of knowledge strengthens the impact of risk-taking while weakens the effects of proactivity on FI. In addition, data also revealed a positive influence of external sources of knowledge on FI. The findings offer some theoretical and managerial implications.

Creation, Risk, and Uncertainty: Towards a Theoretical Framework for Entrepreneurial Strategy

Author: **Jarrold Humphrey**; U. of Florida

Author: **David Gaddis Ross**; U. of Florida

Author: **Michael J. Leiblein**; Ohio State U.

Despite the critical importance and growing interest among academics, students, and practitioners of entrepreneurship, the smorgasbord of conflicting definitions and ongoing debates concerning what does or does not constitute entrepreneurial activity hinders progress in this critical area of research. In this paper, we adopt a different approach: Rather than provide a binary definition of what is and is not entrepreneurship, we highlight three aspects of the decision-making environment that have been associated with entrepreneurship: creativity, risk, and uncertainty (CRU). Specifically, we claim that actions are more entrepreneurial when they (a) create something new, (b) subject stakeholders to risk, and (c) require decision-making under a form of uncertainty that makes quantifying risk difficult. The CRU framework contributes to the entrepreneurial literature by identifying claims in the existing entrepreneurship literature, developing a framework for reconciling them, and proposing a structure to promote more consistent empirical definitions and construct measurement.

The Effect of Previous Experience on the Opportunity Elaboration Process: A Cognitive Perspective

Author: **Josue Reynoso**; Michigan Technological U.

Author: **Gina O'Connor**; Babson College

Despite accumulated evidence on the influence of experience on opportunity elaboration, the process through which this relationship unfolds is still underdeveloped. In this work, we use a prospective grounded-theory approach to analyze how entrepreneurial experience and domain-specific experience shape the cognitive process used to search for new knowledge during the opportunity elaboration process. We selected a polar sample of 12 entrepreneurs elaborating on an opportunity in the U.S. Northeast region and conducted over 40 interviews during a six-month period. Consistent with existing literature, experienced entrepreneurs explored more opportunity dimensions than novice entrepreneurs. In contrast, while domain-specific experience displayed little influence on the entrepreneurial search process, novice entrepreneurs spent more time working on familiar domains. Diverging from previous empirical findings, search intensity is not dictated by entrepreneurial experience. Instead, it is influenced by the entrepreneurs' goals and time constraints. More importantly, novice entrepreneurs focus their attention on one dimension for extended periods, while experienced ones display rich mental frameworks, which include multiple opportunity dimensions. Despite the cognitive costs to switch their attention, experienced entrepreneurs switch frequently to maintain their rich mental frameworks updated. This process is mediated by venture complexity. Our study contributes towards the entrepreneurial cognition gap identifying the mechanisms through which previous experience influences entrepreneurial search processes. The practical implications will help entrepreneurs to leverage the strengths and biases that their previous experience brings.

The Role of the Board of Directors for Opportunity Development in Early-Stage High-Tech Ventures (WITHDRAWN)

Author: **Jolien Roelandt**; Ghent U.

Bounding Uncertainty: The Uses of Analogical Abduction in Entrepreneurship (WITHDRAWN)

Author: **Anastasia Sergeeva**; Rotterdam School of Management, Erasmus U.

Author: **Akhil Bhardwaj**; Tilburg U.

Conceptualizing entrepreneurship as problem-solving has shed light on how problems are solved through entrepreneurial ventures. This approach presupposes that problems objectively exist, an assumption that is valid for the world of Knightian risk, in which categorization is possible. In the current study, we adopt the ontological stance of Knightian uncertainty, in which a priori categories cannot be assumed, and therefore problems do not objectively exist. We posit that in the world of Knightian uncertainty entrepreneurs who perceive certain situations as unsatisfactory but remediable engage in problematization that yields problem statements. These problem statements are operationalized to form the basis of entrepreneurial action aimed at remedying dissatisfaction. We submit that to problematize, entrepreneurs engage in analogical abduction, which allows them to develop problem statements by treating target domains replete with Knightian uncertainty as if they were similar to familiar source domains. Such conjectures are selected based on the likeness of relevant attributes between the source and target domains, aid entrepreneurs in bounding uncertainty, and guide entrepreneurial action. Entrepreneurs adopt positive feedback of entrepreneurial action as a rule to guide future action under similar circumstances, while negative feedback leads them to recalibrate problem statements and modify further action. We illustrate this process using the empirical vignette of Starbucks.

Venturing into the Unknown: A Meta-Analytic Assessment of Uncertainty in Entrepreneurship Research

Author: **David Matthew Townsend**; Virginia Tech

Author: **Richard Hunt**; Virginia Tech

Author: **Daniel Judson Beal**; Virginia Tech

Author: **Ju Hyeong Jin**; Virginia Tech

Author: **Petra Andries**; Ghent U.

This study investigates the role of the board of directors for the opportunity development process in early-stage high-tech firms. Based on a board capital perspective, we argue that boards with more experience will contribute more to the development of opportunities. Furthermore, building on the attention-based view, we argue that this effect will be moderated by situational and structural factors that affect board members' attention to the venture's opportunity development process. Using hand-collected data on 183 early-stage high-tech firms in Belgium, we find that board experience has a stronger relationship with the board's contribution to opportunity development when board size decreases, when board tenure increases and when the firm underperforms. These findings offer a contribution to the literature on opportunity development in new ventures and to research on the role of boards of directors in new ventures. They also have important implications for entrepreneurs who are trying to develop opportunities and their stakeholders.

ASYNCHRONOUS

PAPER SESSION

Uncertainty exists within a small constellation of core constructs that are central to the study of entrepreneurship. And yet, despite the common agreement and consensus that uncertainty plays a central role in entrepreneurship theory and research, there are important unresolved debates around several key questions including conflicting views on the nature of uncertainty (i.e., objective versus subjective uncertainty), the relationship between uncertainty and different types of entrepreneurial action (i.e., innovation, adaptation, and uncertainty bearing), and the complex relationships among uncertainty, entrepreneurial action, and organizational performance. The purpose of this study is to examine the body of empirical evidence in the field of entrepreneurship through the use of meta-analysis and meta-structural equation modeling in order to take steps towards disentangling the multilevel and multidimensional relationship among uncertainty, entrepreneurial action, and the fate of entrepreneurial ventures, thereby contributing to future theory development in the field of entrepreneurship.

New Insights on Career Calling and the Pathways to its Positive and Negative Outcomes (session 318)

Careers Division Best Symposium Award Nominee

The recent decade has seen a growing interest in the concept of career calling that can be broadly understood as purposeful, meaningful, and passion-driven engagement in a career that one feels drawn to pursue and that contributes to a greater good. Although debates continue taking place about how to define this concept, research increasingly shows that career calling has important implications for individuals (e.g., job satisfaction, well-being, etc.) and organizations (e.g., job performance, turnover intentions, etc.; Thompson & Bunderson, 2019). The majority of research shows positive outcomes of calling, but there is also evidence that calling has a “dark side” and it is related with negative outcomes (e.g. burnout, workaholism, and organizational exploitation; Bunderson & Thompson, 2009; Duffy, Dik, Douglass, England, & Velez, 2018). Nevertheless, we still know little about the mechanisms and conditions explaining when calling has positive and/or negative effects on diverse work and career-related outcomes (Lysova, Dik, Duffy, Khapova, & Arthur, 2019). To address this, the symposium brings together an internationally-diverse group of expert scholars, to share their fresh insights on the topic. By combining five methodologically-diverse papers, this symposium pursues the following important aims to: a) enrich understanding of the mechanisms and conditions explaining how and when calling has positive and/or negative effects on diverse work- and career-related outcomes; b) contribute to the further development of theory and research on calling; c) draw scholars' attention to calling as an important and promising concept for understanding individual and organizational work- and career-related outcomes.

OMT New and Returning Member Networking and Research Forum (session 297)

If you are new to the Organization and Management Theory (OMT) division, are interested in joining OMT, or are an established member who has been away for a while, then this forum is for you! This forum was created especially to help members to feel "at home" in the OMT division. We have designed the forum so that you can meet leading scholars in the OMT division, meet other new members of the division, and discuss research with other scholars who share similar interests. The forum will include a welcome and overview of the OMT Division and research discussions moderated by renowned scholars who actively conduct research in a particular area of interest. As a participant in the forum, you can self-select into several research themes of your choice. Research themes will be organized by theory, context and methodology.

Behind the Scenes of Highly Cited Organizational Ethnographies (session 325)

This PDW represents the third iteration of the highly popular 'Behind the Scenes' series, which brings together several top ethnographers in organizational studies to share their detailed experiences conducting ethnographies in organizational settings. This PDW is structured to enable participant interactions with these scholars in three different segments and formats. First, each scholar will share a brief narrative detailing a particular experience in the field (Michael Smets - Working with a team in the field; Bryant Hudson - being an undercover ethnographer in the field; Kim Elsbach - handling emotions in the field; Davide Nicolini - managing the anxieties of being in the field; Kate Kellogg - balancing participation with data collection in the field; and Juliane Reinecke - dealing with cultural differences in the field). Next, scholars will engage in a panel discussion with participant Q&A. Lastly, participants will each join a small- group roundtable in which a scholar facilitates discussion on a specific stage of the ethnographic process (from field site access through journal reviews). This PDW is right for you if you're interested in immersive research approaches, especially in organizational settings. You will get to hear what went into producing some of the most loved and cited organizational ethnographies. We are sure this PDW will inspire you and offer the much-needed boost of motivation and support for your own ethnographic or immersive work. When you register for this PDW through AOM, you will also need to complete an online form (see the link below) to help us match you with your preferred roundtable topic & facilitator. Please note that space in this PDW is limited and has always filled quickly. Registrations are accepted on a first-come, first- served basis, and while organizers will make every attempt to match you with your top choice, roundtable assignments are not guaranteed. Although roundtable participation is capped at 54 to enable a highly interactional session, more are certainly welcome to

eSports: A Natural Laboratory for Management Research? (session 324)

Big data on complex social systems can improve our ability to study longstanding management questions. This PDW aims to examine eSports — online multiplayer video games with millions of players and fanbases rivaling traditional sports — as a natural laboratory for management research. We aim to engage scholars working at the intersection of economics, psychology, and sociology in three main activities: (1) discussing exemplars of long-standing management questions that have been investigated using data on online multiplayer video games; (2) computational social science tutorials, focused on specific empirical challenges and opportunities presented by eSports data; (3) a hands- on workshop, with groups of participants developing research designs exploiting eSports data. Our goal is to offer an interactive and developmental session, fostering research collaborations between scholars at different stages of their careers and from different disciplinary and demographic backgrounds.

Pre-registration required; all are welcome to attend parts 1 and 2. An application is required ONLY for the hands-on workshop and the plenary discussion of research designs (parts 3 and 4 of the PDW). An application is NOT required for participation in the PDW. To be considered for the hands-on workshop and the plenary discussion of research designs, please submit: 1) a max 2-page structured research plan describing a current research project or new research idea; 2) your CV to e.forti@ucl.ac.uk and jclement@stanford.edu by July 15, 2020. Your submission should consist of a single PDF document including the following: 1) Research question or title of the idea/research project (e.g. if you would like to discuss a specific new research idea with the organizers and other participants at the roundtables); 2) Abstract; 3) Brief description of actual or potential data source(s) and data collection method(s); 4) Max 3 specific aspects of the idea to get feedback on; 5) CV. IMPORTANT: The filename of the single PDF document and the subject of the

Riding Populist Storms: Ways Forward for Critical Management Scholarship in Populist Times (session 320)

This symposium concerns the challenges and possibilities faced by CMS scholarship in the context of populism. This is timely, as populist movements are currently powerful and passionately contested forces behind political, economic, and organisational turbulence in many parts of the world. They stir up questions, problems and emotions that are highly pertinent to CMS and in urgent need of being addressed, with new issues arising as new populist events continue to violently shake and reshape societies. At times, it feels like we are riding a never-ending populist storm, battered by winds and waves of change whilst dangers threaten to rise at any moment from dark churning waters. To help navigate these waters, in this symposium we will use a number of key insights from our Organization 'Speaking Out' Special Paper Series on 'Populist Responses to Austerity and Cultural Change: Brexit, Trumpism and Beyond', as a springboard for a panel discussion into potential ways forward for CMS scholars. Authors from the Special Paper Series who are attending this year's AOM Meeting will form a panel to share their key insights with a CMS audience and identify questions for further development within our field in order to spark the panel and plenary debate as to the future of CMS and role of CMS scholars in these populist times.

Information Disclosure in Strategic Management (session 326)

The information that managers voluntarily disclose to outsiders can have important performance implications for the firm. Information disclosure is therefore an important decision for managers and a growing area for strategic management research. In this symposium, we examine and discuss two major topics in voluntary disclosure research: (1) environmental disclosures that aim to reveal the extent to which organizations are responsible members of society and (2) impression management tactics that utilize information disclosure as a means of influencing stakeholder perceptions of the firm. We focus not only on performance implications for the firm but also the important role of information disclosure on society. We discuss common themes, future directions, and collaborative opportunities.

Best Papers III: Social Networks and Shared Representations (session 323)

Frenemies: When Firms and Activists Collaborate

Finalist for the OMT Division Best Paper Award

Designated as a "Best Paper" for OMT

Author: **Kate Odziemkowska**; Rice U.

This paper examines how contentious targeting of firms by movements influences the formation of firm-activist collaborations. I integrate research on social movements and interorganizational collaborations to argue that the symbiosis between contention and collaboration posited by existing theory, privileges firms' incentives for collaboration and overlooks activists' risks in collaborating with movement adversaries. I test my arguments using a 25-year panel of contentious and collaborative interactions between 118 activist organizations and 500 firms in the U.S., and network data on movements. Contrary to existing theory, I find that contentious targeting of a firm by a movement reduces the firm's chances of collaborating with an activist in that movement. Instead, contention catalyzes collaboration only when a firm's reputation provides assurance it will follow-through on its collaboration commitments, and when the risk of criticism from the movement is reduced. The findings support a view of firm-activist collaborations as socially-contested, highlighting a novel precursor to contention driving collaboration: cooperative ties between contentious and collaborative activists. While intuitively we may expect activists to seek to preserve social bonds by avoiding collaborations with their friends' adversaries, it is precisely in the absence of pre-existing social bonds that activists and firms fail to transform contention into collaboration.

Working with the 'Enemy': Free Space in Facilitating Cold War Space Collaboration

Designated as a "Best Paper" for OMT

Author: **Thomas John Fewer**; PhD Candidate, Drexel U.

Author: **Dali Ma**; Drexel U.

Although collaboration between competing organizations is one of the most challenging tasks in management, our knowledge about social-cognitive mechanisms that facilitate the collaborative interaction between members of competing organizations is rather limited. We conducted an inductive, interpretive historical case study of the collaboration between the US and USSR space programs during the Cold War. Our study uncovers a process by which individuals used a "free space," i.e., social space in which organizational members cognitively severed themselves from the higher-level ideological/political tension by initiating and maintaining informal and isolated interactions with their collaborative counterparts. The concept of "free space" has profound implications for analyzing effective collaboration between competing organizations in both market and nonmarket contexts.

Deliberate vs. Spontaneous Networking Behaviors and Information Search: An Interactive Experiment

Finalist for the OMT Division Best Paper Award

Designated as a "Best Paper" for OMT

Author: **Bálint Diószegi**; Imperial College Business School

Author: **Anne L.J. Ter Wal**; Imperial College Business School

Author: **Valentina Tartari**; Copenhagen Business School

Author: **Daniella Laureiro Martinez**; ETH Zurich

While networking is frequently characterized in terms of dichotomous sets of behaviors, little is known about how individuals find a balance between them. This omission is especially striking in contexts where these dichotomies present themselves as trade-offs, forcing networking individuals to choose between opposing types of behaviors. Networking events are a prime example of such a context, as participants are concurrently searching for information and act as targets of others' search efforts. We focus on two of the dichotomies that are most relevant in such social context – deliberate versus spontaneous as well as selfish versus altruistic networking – to examine how and why individuals respond differently to these trade-offs, and to evaluate the effectiveness of the observed approaches. We do so by way of an interactive networking experiment, which includes random assignment into treatment groups of varying levels of background knowledge, as well as real-time tracking of participants' movement using sociometric badges. Our results allow us to differentiate between two routes taken by networking participants: a direct, deliberate and selfish one of information exploitation, and an indirect, spontaneous and altruistic one of information gathering, both of which may be understood as integral parts of the same cyclical process. We conclude by discussing the theoretical implications of our study.

Designing Shared Representations for Open-Ended Needs

Finalist for the OMT Division Best Student Paper Award

Designated as a "Best Paper" for OMT

Author: **Linda Mitrojorgji**; Rennes School of Business

While a vast literature examined problem-solving as part of decision making in organizations, little is known about how problems are formulated in the first place. Through an ethnographic study, in this paper, I investigate problem formulation by looking at how architects in an architectural practice handled the early phase of their clients' projects. This phase required them to operate in an uncertain environment, in the presence of ambiguity and heterogeneity of interests and needs, and lack of clarity about constraints. My findings show that problem formulation was driven by two distinct interrelated sub-processes: expanding and contracting problem-space boundaries while simultaneously structuring participation within those boundaries. Through six different activities – canvassing, expanding cognitive frames, envisioning future self, pillaring, scaffolding alternative futures, and reframing – architects managed the process iteratively by continuously altering the problem space boundaries and structuring participation, thus allowing a shared representation of the problem to emerge. My findings challenge the way we think about problems and extend our understanding of problem-solving process beyond the prevalent problem-solution dichotomy. This study contributes to the growing literature that sees problems as catalysts for future value creation by offering empirical evidence and new theoretical insights on how problems are formulated.

The Dance of Leaders and Followers (session 330)

Implicit Motives as Missing Link Between Transformational Leadership Behaviors and Follower Outcomes

Designated as a "Best Paper" for OB

Author: **Hugo M. Kehr**; TUM School of Management, Technical U. of MunichAuthor: **Dorena Graff**; TUM School of Management, Technische U. MünchenAuthor: **Cafer Bakaç**; TUM School of Management, Technical U. of Munich

Transformational leadership (TL) theory is, in essence, a theory of follower motivation. The present paper reports three studies that were based on the proposition that TL behaviors arouse followers' implicit motives. In Study 1, we systematically analyzed the TL literature (N = 139 papers) for motive content. Consistent with predictions, the TL behaviors individual consideration and intellectual stimulation were systematically associated with the affiliation and power motives, respectively. Intellectual stimulation was associated with both the achievement and power motives. In Study 2, an online vignette study (N = 113), we confirmed the hypothesis that participants' implicit power, achievement, and affiliation motives determined their preferences for inspirational motivation, intellectual stimulation, and individual consideration, respectively. In Study 3, a lab experiment (N = 116), we found that the implicit affiliation motive moderated the effects of individual consideration and that the implicit power motive moderated the effects of inspirational motivation on leader's influence and followers' productivity. Mixed results were found for the moderating effect of the implicit achievement motive on the relationship between intellectual stimulation and leader effectiveness. Findings are discussed with respect to their importance in establishing TL as a motivation theory and, confirming the hypothesized multidimensional nature of TL.

**Adaptive Followership in a Dynamic Context:
Examining the Effect of Entrainment to a Previous
Leader**

Designated as a "Best Paper" for OB

Author: **Marie Thommes**; Maastricht U.

Author: **Sjir Uitdewilligen**; Maastricht U.

Author: **Ramon Rico**; U. of Western Australia

Author: **Mary J. Waller**; Texas Christian U.

To enhance understanding of team adaptation and adaptive leadership, this research examines if and how followers flexibly adjust their behaviors to changes in the task situation and in the leadership style of the team leader. Specifically, we investigate the adaptive use of active follower behaviors as the underlying mechanism in explaining team adaptive performance. We used an experimental design with 90 teams that performed six team tasks in a dynamic task context (i.e. three simple and three complex tasks were randomly presented). Results revealed that in simple tasks, follower entrainment to a previous leader does not predict the frequency of active follower behavior, nor team performance. However, in complex tasks, we find that in comparison to directive entrained teams, participative entrained teams engaged significantly more often in active follower behavior and performed significantly better. Findings further suggest that active followership is beneficial for team performance in complex tasks, whereas it hinders performance in simple tasks. Results of this study draw attention to the need to include followership in the study of team adaptation and to develop follower training programs in addition to leader trainings to enhance team performance in dynamic environments.

**Reaching the Head Through the Heart: Servant
Leadership, Decision- Making, and Financial
Performance**

Designated as a "Best Paper" for OB

Author: **G. James Lemoine**; U. at Buffalo, The State
U. of New York

Author: **Daniel I. Watts**; Georgia State U.

Author: **Snehal Hora**; U. at Buffalo, The State U. of New York

Like other forms of moral leadership, research on servant leadership tends to lean on attitudinal and motivational outcomes, and raises questions as to whether a focus on morality and others is compatible with financial organizational sustainability. To examine these issues, we integrate theory on servant leadership with motivated information processing theory via their mutual reliance on the idea of other-orientation. We hypothesize that servant leadership grows follower other-orientation, which in turn impacts the framing and depth of information processing – cognitive reflection – used by followers in making decisions. We further propose that this enhanced cognitive reflection would result in greater individual contributions to the organization’s financial performance. We test this model using objective cognitive reflection scores and financial data provided by our partner organization, examining a sample of 286 project managers. We find support for our theory in a serially mediated indirect effect of servant leadership on individual financial performance, acting through other-orientation (the heart) and cognitive reflection (the head). The implications of these findings for servant leadership and motivated information processing theory are discussed.

Participant-Observation in the Modern Era of Organization Studies (session 331)

The theme of this year's Academy is "Broadening our Sight." Broadening our sight involves getting a new view on the theories and the methods we use. Firsthand experiences, as provided by participant-observation methods, are a great source of learning and a way to broaden our sight by looking at an organizational phenomenon through the "eyes" of the informants (Douglas, 1976; Pratt, Lepisto & Dane, 2018). Several scholars (see call for papers in Academy of Management Review by Haveman, Mahoney & Mannix, 2019) in the management field have stressed the importance of going into the field to get a better understanding of how people in organizations deal with current issues and thus get a fresh look at possibly outdated theories (Pratt & Rouse,

forthcoming). This symposium's purpose is to offer a new perspective on how the researcher can take actions in their work, and what participating in the contexts we study can bring to qualitative work.

Critical Management and the Undoing of Embedded Practices (session 332)

Whyte-Out: How the Creator of Groupthink Became Unseen by Management's History

Designated as a "Best Paper" for CMS

Author: **Oliver Pol**; Victoria U. of Wellington

Author: **Todd Bridgman**; Victoria U. of Wellington

Author: **Stephen Cummings**; Victoria U. of Wellington

Irving Janis' (1971) concept of 'groupthink', the idea that the desire for consensus overrides the realistic appraisals of alternatives and leads to poor decision making, is a staple of management and organizational behavior textbooks. Despite gaining little support in empirical studies, Janis' eight symptoms of groupthink remains a popular framework taught to budding managers. What has been forgotten, however, is that nearly 20 years before Janis' supposed invention, groupthink was created by William H Whyte, author of one of the 1950s' most influential and popular books on management. We investigate how Whyte's link to groupthink became invisible to management's history, why this matters, and how recovering Whyte's ideas can provide fresh, critical insights into people dynamics in contemporary organizations.

The Facade of Neoliberal Merit: Empty Work and Unethical Subjects at a Business School

Best Doctoral Student Paper is sponsored by the journal Organization

Author: **Vivek G. Nair**; Indian Institute of Management, Calcutta

Author: **Devi Vijay**; Indian Institute of Management Calcutta

In this study, we interrogate how the professional managerial class-in-making at an Indian business school reproduces neoliberal discourse of merit. Specifically, we attend to the local social and political

formations of discourse of merit and examine its consequences. Empirically, this qualitative study draws on student interviews, qualitative questionnaire responses and a student's poem titled, 'A scheduled caste girl'. We found that neoliberal merit is refracted through Indian middle-class aspirations, while responsabilizing those from disadvantaged caste and class backgrounds for educational attainment, English language fluency, and access to networks. Simultaneously, discourse of merit creates a façade which shields 'empty work' and the production of unethical subjects who discriminate on the basis of caste and English language skills, and are indifferent to public interests. We introduce the concept of 'empty work' and elucidate the implications of an empty work ethic in higher educational institutions. We contribute to critical management studies on the normalization of unethical behavior in the managerial class-in-making and shed light on the caste and post-colonial contours of merit in Indian higher education.

Between Facts and Norms: CSR Communication and the Reproduction of Power

Best Critical Ethics Paper sponsored by the Journal of Business Ethics

Author: **Kaiyu Shao**; China U. of Political Science and Law

Author: **Maddy Janssens**; KU Leuven

Whereas research generally assumes a positive role of CSR communication, this study, in line with recent critical work, investigates the power dynamics that underlie CSR communication within the public sphere. Building on Habermas' empirical conditions for public deliberation, we examine how corporate power not only settles into CSR communication but also reproduces the wrong structure of global civil society. Through critical semiotic multimodal analysis of CSR videos of reputable multinational companies, we uncovered three communicative types of CSR, CSR as Rescuing, Preaching and Facilitating, that impair, in different ways, an inclusive and responsive civil society. These findings contribute to understanding power within CSR communication in terms of 1) exclusionary

constructions of local communities and 2) non-responsiveness of the audience through colonizing the public sphere with business logic.

There is No Lean In for Men

Best Critical Paper on Gender sponsored by the Journal of Gender, Work & Organization
Designated as a "Best Paper" for CMS
Author: **Nicole Ferry**; City U. of Seattle
Author: **Eric Guthey**; Copenhagen Business School

There is no Lean In for men. That is, in the mass market leadership press, in leadership development circles, and in much of leadership research, the counterpoint to "women's leadership" is not "men's leadership," but just plain, gender-neutral "leadership." In this paper, we explore the discursive, cultural, and gender politics behind the stark divide between the popularity of women's leadership on the one hand, and the relative non-existence of men's leadership as a comparable topic of concern on the other. Toward this end, we track the rise of women's leadership discourse, we discuss the subtle (and not so subtle) gendered nature of supposedly gender-neutral leadership speak, and we analyze the differences between a best-selling women's leadership text and a popular 'gender-neutral' text. On this basis, we argue that the prominence of "women's leadership," together with the comparable lack of a "men's leadership," functions to reinforce a masculinist leadership discourse that flies under the banner of "just good leadership." We also argue that over-attention to women as a special case in leadership contexts, and often as a problem to fix, ultimately reinforces sexist and/or misogynistic attitudes that can undermine the very project of empowerment that women's leadership discourse seeks to promote.

Expatriate-Local Inequality as Epistemic Dominance in International Development Organizations

Best Critical Paper on International Business is

sponsored by the journal *Critical Perspectives on International Business*

Author: **Emily Cook-Lundgren**; U. of Edinburgh

Author: **Ishbel McWha-Hermann**; U. of Edinburgh

Author: **Thomas Stephen Calvard**; U. of Edinburgh

This paper explores the persistence of inequality between “expatriate” and “local” staff in international development organizations despite these organizations’ outward aims of equality and improving lives. We draw on 33 qualitative interviews, observation, and documents collected over a three-month period at a development organization in Nairobi, Kenya. Analyzed through the lens of coloniality, the data illustrate how unequal relations are perpetuated through the legitimization of Western epistemic perspectives, which naturalize and authorize expatriate-local difference. This difference persists through organizational practices that prioritize equality, unity, and meritocracy. By providing novel empirical insights into operations of coloniality in organization in the Global South, we show how relations of domination codified in the colonial era persist and contribute to ongoing inequality through epistemic dominance. In doing so, we illuminate the mechanisms that not only give rise to racial difference in work and organization but also facilitate its persistence, contributing to efforts to break the silence on race in organizations and development.

The Psychology of Aggression and Deception (session 1068)

Are You Really Happy to See Me? Asymmetric Perceptions of the Ethicality of Emotional Deception

Author: Polly Kang; The Wharton School, U. of Pennsylvania

Prior work has defined emotional deception as the inauthentic display of a felt emotion. We demonstrate that the directionality of an inauthentic emotional display profoundly influences perceptions of emotional deception. Specifically, we introduce the term up-display to define the exaggerated display of a felt emotion; and we introduce the term down-display to define the suppressed display of a felt emotion. We focus our investigation on emotional misrepresentation in negotiation, because both deception and emotion profoundly influence negotiation outcomes. Across five studies, we demonstrate that individuals judge up-displays of anger, sadness, and happiness to be significantly less ethical than down-displays of these same emotions, even when the intentionality and outcomes of the emotional deception are equivalent. These findings advance our understanding of emotional deception and challenge prior work that has overlooked the crucial distinction between up- and down-displays of emotion.

On the Unique Justifying Functions of Mind Ethic Ideology (WITHDRAWN)

Designated as a "Best Paper" for CM

Author: Jae Yun Kim; SUSTech

Author: Aaron Kay; Duke U.

Considerable research and theory have pointed to the system-justifying function of Meritocratic Ideology (i.e., the belief that hard work leads to success), noting how useful it can be in justifying inequalities in material well-being (e.g., wealth). We propose that a distinct form of ideology, which we

term “Mind Ethic,” has emerged to help people justify inequalities by advocating proper mental habit (e.g., thinking properly about the relevant desire) as a useful tool for goal achievement. Across four studies, we devise a measure to capture individual differences in Mind Ethic, and then demonstrate its unique predictive power. Studies 1a and 1b demonstrate that whereas both Meritocratic Ideology and Mind Ethic predict character derogation (vs. enhancement) of those who suffer (vs. those who are succeeding) in contexts of material well-being (e.g., attributing higher intelligence to a rich person), only Mind Ethic predicts such system-justifying tendencies in contexts of psychological well-being (e.g., attributing increased laziness to those who are unhappy). Studies 2 and 3 further examine Mind Ethic’s system-justifying function across two different domains (i.e., career and health) and show that Mind Ethic predicts justification of target persons’ unequal life outcomes when those are attributed to differences in the targets’ mental habits or mental effort (i.e., having negative thoughts vs. having positive thoughts in Study 2, only receiving radiation therapy vs. receiving additional meditation in Study 3), but not when the outcomes are attributed to differences in what the targets do about the relevant goals (i.e., not working hard vs. working hard in Study 2, only receiving radiation therapy vs. receiving additional chemotherapy in Study 3). This research suggests that Mind Ethic may provide a unique set of rationale for justification of unequal outcomes.

Cognitively Processing Covert Aggression
(WITHDRAWN)

Author: **Stacey Ann Marie Kent**; ACU

We explored how people cognitively process interpersonal, covert aggression, which is purposeful behavior motivated by negative intentions toward another yet subtle enough to be nonobvious. We found that people experience cognitive stages of realization, sensemaking, self-monitoring, and script development to decipher and respond to aggressors’ covert behavior. The first phase often occurs after repeated episodes due to the subtle nature of indirect aggression. In the

sensemaking phase, targets of aggression socialize the events with their peers and create narratives for why they have become targeted. In the self-monitoring phase, targets evaluate their own behavior in relation to the aggressor's behavior. In the final phase, targets create behavioral scripts of how to interact with the aggressor. The process we outline establishes a framework for advancing research in covert aggression.

Blinding Curiosity: Exploring Preferences for "Blinding" One's Own Judgment (WITHDRAWN)

Author: **Sean Barrett Fath**; ILR at Cornell

Author: **Richard Paul Larrick**; Duke U.

Author: **Jack Soll**; Duke U.

We investigate people's degree of preference for "blinding" in decision-making: purposefully restricting the information one sees in order to form a more accurate evaluation. For example, when grading her students' papers, a professor might choose to "blind" herself to students' names by anonymizing them, and thus evaluate the papers on content alone. We hypothesize that most people will consider blinding the appropriate choice in hypothetical evaluation contexts but will be less likely to choose to be blind when placed in real evaluation contexts. We find support for this hypothesis across four pre-registered studies (N = 3,273). Further, we demonstrate how choosing to see potentially biasing information (rather than to be blind to it) can make decision-makers susceptible to bias in their decisions. Finally, we present evidence that curiosity, fairness, and accuracy are competing motivations in blinding decisions and test the effectiveness of two interventions to increase people's preference for blinding.

Out of Place: Management Studies' Temporal Misplacements of Mary Parker Follett

Author: **Rebecca Bednarek**; Victoria Management School

Author: **Stephen Cummings**; Victoria U. of Wellington

Author: **Todd Bridgman**; Victoria U. of Wellington

It is hard for management studies to place Mary Parker Follett. She is a woman, and she did not focus on corporations or factories, like the so-called early management pioneers. She is not an academic or a consultant. In this article we examine a further problem contributing to her ideas failing to get the recognition they deserve. We argue that this is because it has proved difficult for our field to place her chronologically and too easy to place her spatially into different management ideas (and fads). Even when management writers have grasped aspects of her contributions, they appear out of step with the accepted chronological ordering of management thought. This contributes to Follett being forgotten and then remembered with surprise, over and over in numerous different ways. Out of step with management studies' accepted chronology, her legacy floats and is continuously clutched, but our perpetual memory loss means that it never sticks long enough to take root and be cultivated. This also contributes to her epithet: while signifying her as the 'Prophet of Management' - which may seem like a plaudit but instead further undermines Follett's insights and contribution.

Theorizing Organizational Hubris and Imagination Failures: Reflections on the Twentieth Anniversary (WITHDRAWN)

Author: **Amy L. Fraher**; Southampton Business School, U.K

This article addresses this year's AOM theme, "20/20: Broadening our Sight", by making the invisible 'visible' in a study of the causes of September 11th, 2001 (9/11). The aim is to advance the psychodynamic understanding of imagination failures by analyzing the findings of the US government's public inquiry in The 9/11 Report. In this study, I distinguish between narcissistic and hubristic organizations, theorizing that two forms of organizational hubris—America's 'hubris of empire-building' and Al Qaeda's 'hubris-nemesis complex'—amalgamated in a uniquely generative manner leading to 9/11. Previous studies of public inquiries demonstrate that inquiry reports are monological story-telling performances used to create sense-making narratives that function hegemonically to impose a simplified version of reality to assign blame, depoliticize events, and facilitate closure after shocking events. In contrast, findings here suggest that by constructing a critical narrative, The 9/11 Report may serve as a new type of public inquiry report that invites analysis of the complex factors that underpin crisis. The article concludes by identifying fruitful areas of future research and ways to theorize further about the psychodynamics of organizational hubris and the factors that contribute to imagination failures.

The Business of Language & the Language of Business: Neoliberal Performativity & Hegemonic Discourse

Author: **Jeremy Aroles**; Durham U. Business School

Author: **John S Hassard**; U. of Manchester

Author: **Paula Hyde**; U. of Manchester

administrative and judicial construal or construction in the postwar path dependent divergence of Japanese and U.S. employment relations. After noting contemporary variance on important parameters: executive compensation, income inequalities, and labor unit efficiencies, we identify the shared grounding in labor legislation passed within a decade or so during the 1930s – 1940s. We focus on the exceptional “at will” employment doctrine of the U.S., noting its origins in poor academic research and continued precedent support through “judge made” case law. Next, recalling its basis in the work of John R. Commons, our study introduces the role of Suehiro jurisprudence in postwar Japanese law, with its featured discourse of justness in the workplace evidenced in Japan’s Supreme Court decisions and administrative guidance. Japanese postwar jurisprudence lacks preoccupations with “originalism” to U.S. founders’ intent, or precedent obligations to “at will” employer prerogative. Notwithstanding, Japanese knowledge of U.S. case law and the role of precedent enabled a corrective focus on employment in justness and management participation. The persistent U.S. failure to recognize a continuing employment relationship is contrasted by the distinctive Japan path divergence, inviting remediation regardless of judicial ideology, originalist or progressive. We recognize in the work of Charles Lund Black, a U.S. constitutional law scholar, a parallel legal methodology that can effectively remediate “at will” precedent through due process (Fifth and 14th Amendments) and the unenumerated rights implied by the Ninth Amendment of the U.S. Constitution.

Organizing at High Speeds: Temporal Pathologies in the UK Artificial Intelligence Field

Author: **Chris Baird**; U. of Edinburgh Business School

Author: **Michelle O’Toole**; U. of Edinburgh Business School

This paper questions the one-sided thesis that ‘speed’ is a defining feature of successful organization. While organizations are continuously advised of the perils of slowness, much less has been written on the pathologies of speed. We report

Austerity measures and neoliberal policies have deeply affected the UK cultural sector. In particular they have been central to cementing the idea that contemporary cultural institutions should henceforth be regarded as commercial operations. As the language of business and management increasingly frames how organizations of the cultural sector are described, this paper seeks to define the main discursive practices motivating this performative repositioning. Drawing theoretically from J. L. Austin’s (1962) landmark philosophical work on performativity, and building empirically on in-depth interviews with senior staff across the UK museum sector, we argue that the incursion of business language has served to reshape the ‘reality’ of the sector. This has been achieved, primarily, by materialising what we term conceptually a new hegemonic performative discourse – one based on notions of monetisation, productivity and rebranding. In order to understand current and possibly future dilemmas facing the management and organization of museums, we assess the consequences of this new commercial discourse as it becomes framed as strategically superior to that of its historic conservational and educational counterpart.

Liberating Numbers? Statactivism Work for Tax Justice (WITHDRAWN)

Author: **Wafa Ben Khaled**; U. of Birmingham

Author: **Mattia Anesa**; U. Of Sydney

Author: **McKenzie David Arthur Lloyd-Smith**; Cass Business School, City U. London

In line with the Foucauldian governmentality narrative, prior studies of the role of calculative practices in accounting, organization and management studies mainly regard numbers as a subjugating force serving the dominant neoliberal hegemony. Moving beyond this approach, recent research on counter-accounts envisions the possibility to resist numbers by providing alternative accounts of the social reality, whereas research on ‘stat-activism’—the reliance on statistics for political purpose—see the re-appropriation of numbers as key to subvert hegemonic orders. However, little is known about the activities underlying statactivism.

these pathologies as they emerged during an extensive two-year study of the UK Artificial Intelligence (AI) field. Here, through 30 interviews, attendance at 20 AI-events, and considerable archival data, we encountered numerous AI workers facing strong tensions between imperatives for speed in AI work on the one hand, and a desire to steer AI work in a 'robust' and 'beneficial' direction on the other. While an emphasis on speed is frequently linked with performance, our analysis reveals it led to profound issues of widespread 'precarity,' 'corner cutting,' and 'temporal desynchronization.' This suggests that when ethical and responsible organizational practice is desired, speed imperatives may need to be discouraged. We develop these insights further through an engagement with two of the foremost theorists of speed—Paul Virilio and Hartmut Rosa—both of whom are relatively untapped theoretical resources for management and organizational scholars interested in speed, temporality and related issues.

Standing in the Tide - The Dynamics of Private and Public Governance in MSI Development

Author: **Johanna Jarvela**; Cass Business School

This paper explores the temporal dynamics of multi-stakeholder initiatives. While previous research has investigated the delivery, legitimacy and impacts of these voluntary governance constellations, it has for most part disregarded how they evolve overtime. By building on longitudinal empirical material on two sustainability initiatives in mining, I show how state governing, politics and issue dynamics influence the development and survival of these initiatives. This research contributes to the previous literature on the interplay between private and public governance by first, by showing how state both influence and adopt CSR; secondly, examining the evolving character of governmental engagement through adoption, orchestration, and withdrawal; and third by analysing how these governmental strategies influence the overall functioning and evolution of the initiatives.

[view paper \(if available\)](#)

In this paper, we conceptualize 'statactivism work' and investigates its deployment through a qualitative study. We analyze how activists produce a report that showcases statistics about the welfare loss induced by corporate tax minimization, ultimately triggering a four-year Senate inquiry in Australia. Relying on multiple sources of qualitative data, we analytically induced three facets of statactivism work—seizing the opportunity, producing critical numbers and campaigning. The simultaneous use and complementarity of these practices explain how these activists have exploited the emancipatory potential of existing public numbers and, in so doing, challenged corporate hegemony. As a whole our analysis updates the governmentality narrative, conceptualizes statactivism work, and advances organizational studies of calculative politics.

Visualizing Corporate Sustainability as a Heterogeneous Network: A Ventriloqual Approach (WITHDRAWN)

Author: **Wenjin Dai**; The Open U., United Kingdom

The field of Corporate Sustainability (CS) has been dominated by a human-centric view that seeing CS as a phenomenon mostly communicated by and for human beings (as well as the future human beings). Ironically, this view of CS often isolates human influence from ecological materiality and ignores the environmental foundation every organization relies on. Using the notion of ventriloquism and actor-network theory, this article challenges the human-centric view of CS, with problematic implications of how we understand sustainability. This study is conducted in a Japanese multinational corporation based in Shanghai. Participant produced drawing method is used together with interview and ethnographic methods. Through a ventriloqual approach, this article argues CS is not just produced by various human and/or nonhuman actants, but it comes alive through an interdependent, relational, and heterogeneous network. This article contributes a visual account to the communication conceptions of CS: it exemplifies the separation of human and/or nonhuman influences is problematic and calls for innovative approaches that transcending such

Broadening our Sight: New Directions in Disability Research (session 1083)

This presenter symposium features five research studies by well-known disability scholars on the inclusion and workplace experiences of persons with disabilities. Together, these studies extend the boundaries of disability research by showcasing inadvertent ways in which new workplace designs perpetuate social inequality, how managers' informal accommodation decisions are driven by social exchange lens, that hiring persons with a disability may enhance organizational reputation, that supervisors with disabilities may function as multipliers of inclusion and productivity, by offering an updated conceptualization of stigma dimensions, and by developing a new measure of stigma characteristics. Our discussants will synthesize the individual presentations to suggest future directions as well as practical suggestions for promoting inclusion within organizations.

Local Racial Diversity, Intergroup Contact, and Exclusionary Organizational Preferences Among Whites

Designated as a "Best Paper" for GDO

Author: **Eric Anicich**; U. of Southern California

Author: **Merrick Osborne**; USC Marshall School of Business

The demographic landscape of the United States is rapidly changing and by 2045 the U.S. will become a "minority White" country. We leverage several unique datasets to examine (1) how experiencing zip-code-level racial diversity affects Whites' intergroup attitudes and professional decisions and (2) whether gatekeepers to historically White institutions maintain policies that serve to perpetuate interracial barriers. Matching survey data to local Census data (N = 1,046,120), we find that Whites express more anti-Black bias in more versus less diverse communities, but that this bias is attenuated when intergroup contact is higher. Next, using data from every tennis (N = 10,542) and golf (N = 10,933) facility in the U.S., we find that local diversity is positively correlated with the maintenance of exclusionary barriers (e.g., guest policies, monetary fees, dress codes). Finally, two experiments (total N = 1,117) demonstrate that Whites avoid organizations in diverse geographical locations and organizations that espouse diversity values, further impeding intergroup contact. Importantly, this aversion is driven by Whites' anxiety (generalized and resource-based). Despite the debiasing promise of increased intergroup contact that living in a diversity community provides, Whites' reactions to diversity may serve to reduce contact instead, thus perpetuating a cycle of intergroup aversion.

Material Climate Justice: Connecting Social Equity and Climate Risk in Urban Climate Adaptation

Author: Nichole Kay Wissman Weber; U. of San Diego
Author: Nardia Haigh; U. of Massachusetts

Climate reports underscore the differential impact of climate change risks for marginalized communities— women, people of color, indigenous communities, the disabled, and socioeconomically disadvantaged populations—and the need to recognize and address inequities in climate adaptation processes. To date, scholarship on climate adaptation in organization and management scholarship focuses on firm-level and empirical work has failed to account for the complexity and materiality of socio-ecological systems, historical processes that structure inequity, and the agency of actors within adaptation processes. To address this, we develop a material climate justice framework by extending conceptual links between risk, material feminism, and justice. The material climate justice lens combines climate justice (CJ) insights about political economic processes that distribute risks and rewards in the urban context and the materiality of differentially embodied exposures to risks, resources, and political advantages. We describe the ways representatives of marginalized groups practice agency in climate adaptation processes that are primarily being driven by government agencies in consultation with business, academic, and consulting groups. Findings suggest that representatives of marginalized populations engage in sub-processes to impact climate adaptation that expand notions of climate risk to include embodied experience connected to resources, representation, histories, place and future embodied experiences.

They Got the Job but Winning is Only Half the Battle: Whiteness and Patriarchy in the Upper Echelons

Author: Samantha E. Erskine; Weatherhead School

of Management, Case Western Reserve U.

Extant scholarship inundates us with messages about the underrepresentation of people of color in executive roles and the hardships they endure when advancing in their careers yet in the nonprofit sector, there is an increasing number of people of color who hold executive roles, including the Chief Executive Officer role. What are their experiences once they reach the proverbial “mountaintop” (shattered glass ceilings, navigated labyrinths, and chipped away at concrete walls described by organizational scholars)? This qualitative study, grounded in hermeneutic phenomenology and supported by critical race feminist theory and intersectionality, explores the lived experiences of Black women, Black men, and Latina (female) CEOs of nonprofit organizations. Although they were hired to lead multi-million dollar organizations as Presidents, CEOs, and Executive Directors, they often navigate conflicts and challenges with their board members, donors, and colleague CEOs on issues of philanthropy, governance, power, and organizational identity. This study unearths stories of white supremacy, patriarchy, fragility, harassment, anger, and the paradox of power within the upper echelons where whiteness is embedded with philanthropic largesse. I also address the dualism within the nonprofit sector to champion, build, and strengthen the capacity of individuals, families, and communities to survive and thrive while perpetuating toxic workplace cultures within the upper echelons. The findings and implications brought to light in this study are informative for organizational scholars and practitioners whose work centers on attracting and supporting executives of color and/or developing board members’ capacity to govern people of color-led nonprofit organizations.

Sanctioned Radicals: Comparing Collective Organizing Around Race and Gender Inside Organizations

Best Paper Based on a Dissertation

Author: **Lumumba Seegars**; Harvard Business School

In response to ongoing race and gender inequality, racial minorities and women have often collectively organized around their identities to create more inclusive workplaces. Although both groups are marginalized, the structures of race and gender hierarchies are different. This paper explores how collective organizing around race differs from collective organizing around gender inside of organizations. Because race and gender inequality are both based on hierarchies that differentially allocate resources, I analyze the resource relationships between the subordinate and dominant members of both hierarchies (Black and White for race; women and men for gender). I pay particular attention to the dynamics of formal organizing inside of organizations and introduce the term sanctioned radicals. Sanctioned radicals are individuals who attempt to change their organization with the explicit permission and approval of their organization. They are sanctioned by being officially recognized and supported with resources, but they are also sanctioned by being controlled by that resource relationship. Thus, organizing within organizations amplifies the resource relationship already inherent within gender and race hierarchies. In a qualitative field study comparing employee resource groups (ERGs) organized for Black versus women employees in a high tech company in Silicon Valley, I found that Black and women employees' experiences of sanctioned radicalism differed with regard to their ability to access resources. I discuss how the unique traits of race and gender along with the intersections of race and gender shaped this variance. Finally, I discuss how this research can illuminate paths for reducing both race and gender inequality.

Managing Concealable Stigmas When the Online and Offline Worlds Collide

Author: **Lucas Amaral Lauriano**; King's College London

Author: **Thiago Coacci**; UFMG

Employees with concealable stigmas can opt to hide part of their lives at work. A growing number of studies have shown the antecedents and consequences of revealing stigmatised identities to peers, when the lines between work and non-work contexts are clear. The internet, however, has caused a collapse in such lines, with the possibility of interaction with multiple audiences in a single virtual space, such as Facebook and Instagram. Literature on concealable stigmas has overlooked this context collapse, leading to limited knowledge about the impact of social network sites in such cases. We then ask: how do social network sites affect the management of concealable stigmas? Drawing on ethnographic observation and semi-structured interviews with gay male employees in the Brazilian organisation, we reveal that stigmatised employees adopt a 'mirroring behaviour' to avoid disclosure dissonance between online and face-to-face behaviours. Contrary to current studies on online behaviour, we argue that segmentation of identities can do more harm than good. Peers can easily realise such 'acting', even if stigmatised employees are skilful at using social network sites. We advance concealable stigma studies by exploring changes that the internet causes in stigma management, also including peer's perceptions as an essential variable.

Highlighting Minority Identity Resources to Increase Well-Being of Marginalized Employees

Author: **Tejvir Sekhon**; Western Washington U.

Author: **Meghana Warren**; Western Washington U.

Increasing diversity and inclusion using institutional policy-based levers alone has proven to be difficult. Recent research has begun to explore more interpersonal approaches such as allyship. Allies, i.e., dominant group advocates of marginalized employees, can leverage their privileged identity(ies) as strengths to support the well-being of

The Implication of Power Dynamics in Dual-Earner Couples: A Study of Household Labor

Author: **Hyejin Yu**; Oklahoma State U.

Author: **Alexis Nicole Smith**; Oklahoma State U.

Our research studies the household labor of dual-earner couples—married or cohabiting couples where both partners are employed. Integrating power theories and gender-role perspectives, we examine how power dynamics within dual-earner couples influence each spouse's household labor. Polynomial analyses of 204 respondents in dual-earner couples revealed that relative power between spouses affects men and women differently. A focal spouse's asymmetric power over the partner spouse exerted a strong influence on men's participation in household labor, but not for women. In addition, we found a concave relationship between the couple's symmetric power and men's household labor, indicating that men increase household labor when both spouses jointly increase power but stop increasing when both spouses reach high power. Our research contributes to the literature of power, gender, and dual-earner couples by examining all possible patterns of the power structure within couples and providing a precise explanation of how relative power and joint power between spouses affect husbands' and wives' household labor.

Supervisor Role Identity Saliency and Employee Work-Family Conflict

Author: **Peng Wang**; Miami U. Ohio

Author: **Joseph Charles Rode**; Miami U. Ohio

Author: **Zhen Wang**; Ren Ming U. of China

Drawing upon role identity theory and perspective-taking research, we investigated the relationship between supervisor family identity saliency and employee work-family conflict, with supervisor work identity saliency as a moderator and perceived supervisor work-family support as a mediator. Using the leader-follower dyadic data, we confirmed the negative indirect effect of supervisor family identity saliency on employee work-family conflict through increased perceived supervisor work-family support. Moreover, supervisor work identity saliency

marginalized employees. However, effectiveness of specific allyship interventions remains unclear. We develop and test a novel theoretically-derived positive psychology-based allyship intervention, specifically, highlighting minority employees' identity-based resources in the face of a discrimination episode. Results from two experimental studies show that any intervention by an ally can boost the marginalized employee's feelings of inclusion and vitality post transgression. However, highlighting the marginalized employee's identity-based resources is more effective than communicating firm's diversity and inclusion policy or confronting the transgressor. Highlighting resources signals the ally's sincerity and makes the marginalized employee feel more included and hence, more vitalized. Among the different types of identity resources, highlighting psychological and intellectual capital of a marginalized employee is parsimonious yet as effective as highlighting all types of resources combined, because it is perceived as more sincere. This research provides allies and managers with a quick, actionable and non-confrontational intervention that can increase the well-being of marginalized employees.

From Tokens to Trailblazers: A Motive Fulfillment Approach to Minority Employee Identity

Author: **Karren Kimberly Knowlton**; The Wharton School, U. of Pennsylvania

Scholars have long been interested in how employees experience minority status as tokens, overlooking the possibility that many employees may view themselves in a different way - as trailblazers. I suggest a psychological conceptualization of what it is to be a token employee, as opposed to previous definitions based on numeric representation. I present a theoretical framework for why and how minority employees' work-related experiences lead to token and trailblazer identities. By establishing the constructs of token and trailblazer identities, I redirect literature on tokenism toward a broader consideration of minority identity at work and the foundations of that identity. Further, I argue that token and trailblazer identities are independent and

strengthens the positive effect of supervisor family identity salience on perceived supervisor work-family support. Perceived supervisor work-family support also mediates the interactive effect of supervisor family identity salience and supervisor work identity salience on employee work-family conflict. Implications and future research directions are discussed.

Linked Lives and the Gendered Household Context for Self-Employment in the UK

Author: **Shireen Kanji**; Brunel Business School
Author: **Natalia A. Vershinina**; Audencia Business School

The importance of the household context for understanding transitions to self-employment is gaining recognition. We examine the gender dimension to this theme and establish whether there is a causal effect of the transition to parenthood, marriage or cohabitation on the transition to self-employment and business ownership for men and women using eight waves of Understanding Society (n=43,674), the nationally representative UK household panel survey. In order to develop our understanding of the household context through the lens of linked lives, we focus on how one partner's long hours at work impact the other partner's transitions to self-employment, and thereby examine the gendered asymmetries in this relationship for heterosexual couples. We bring out the different social positions of self-employment better by contrasting how the household context relates to self-employment status for business owners, arguably a more advantaged group, with a less advantaged group who enter self-employment from unemployment.

Identity (In)congruence in Ethnically/Racially “Superior/Inferior” Peer Dyads

Author: **Pegah Sajadi**; HEC Montreal

Author: **Ariane Ollier-Malaterre**; UQAM U. of Quebec in Montreal, Canada

In this paper, we use social dominance theory to investigate the identity negotiation processes at play in racially/ethnically diverse dyads of peer employees. We focus on dyads in which one employee belongs to a race/ethnicity viewed as ‘superior’ and his or her peer to a race/ethnicity viewed as ‘inferior’. Building on social dominance theory, we argue that the social dominance orientations (SDO) of the members of such a dyad, that is the extent to which they accept and support the dominance of ‘inferior’ groups by ‘superior’ groups in a society, predict identity (in)congruence, i.e. (in)congruence between the way an employee sees him or herself and the way the peer sees him or her. Specifically, we theorize that conforming dyads in which both members have high SDO and mature dyads in which both members have low SDO experience identity congruence. Conversely, stormy dyads in which the ‘superior’ member has high SDO and the ‘inferior’ member has low SDO, and compassionate dyads in which the ‘superior’ member has low SDO and the ‘inferior’ member has high SDO, experience identity incongruence. Further, our theory explains the consequences of identity (in)congruence in each dyad.

A Relational Perspective of

By connecting research on managing work-family role conflict with research on role theory and relational identities, I explore the relationship between different domestic role set enactments and approaches to managing the work-family interface. Using the career narratives of 70 executive and non-executive women from the Middle East and Africa, I examine how their work-family strategies interacted with their career trajectories. At the core of my theoretical model is the process by which idiosyncratic versus ideal enactment of role sets between focal women and their multiple role senders result in distinct strategies for managing work-family role conflict. Whether women enacted an ideal or idiosyncratic version of their role was not up to them alone. It also mattered where multiple role senders were on a spectrum ranging from rejecting to cooperating. Women interacted with multiple domestic role senders and these role senders were particularly consequential because women’s roles at home (e.g., wife, daughter, sister) are rooted in relational identities. The consequences of these strategies on women’s career trajectories are discussed. This paper contributes to theories of relational elements of roles, work-family and gender in work and careers.

Leadership and Human Capital Resources in Organizations (session 1089)

Human capital resources, which originate as individual-level employee knowledge, skills, abilities, and other characteristics (KSAOs) before aggregating to a unit-level resource through the process of emergence, are the key vehicle for organizations to accomplish their work. As such, there has been an increased interest both in the KSAOs of employees, as well as how employee relationships influence a unit's capabilities, identification, embeddedness, and turnover intentions. As leaders occupy central roles within the organization, they are likely to influence the emergent enabling states necessary for the emergence of human capital resources, both directly through their own abilities, as well as through leader/subordinate relationships. In short, leaders influence how group members think, behave, and feel. However, these relationships are bound not only by the subordinates' prior perceptions of the leader, but also by the task demands of the situation, as well as cultural context. This symposium includes four papers that examine how leaders impact and are impacted by emergence enabling states that influence the emergence process. These papers use longitudinal data from US, China, and Brazil to explore the characteristics of the leader, the context in which the leader operates, and the impact leaders have on emergence and team outcomes.

Successful Aging at Work: The Role of Work Design in Growth Trajectories of Older Workers

Author: Karen Pak; Radboud U. Nijmegen

Author: Dorien Kooij; Tilburg U.

Author: Annet De Lange; U. of Applied Sciences Arnhem and Nijmegen

Author: Swenneke Van Den Heuvel; TNO

Author: Marc Van Veldhoven; Tilburg U.

In order to age successfully at work, people need to maintain or improve their work ability and motivation to work. This implies a process that develops over time and can differ substantially between individuals. Most studies fail to capture this process as they take a variable-centered approach. This study investigated whether different trajectories of perceived work ability and motivation to continue working in the current job can be distinguished between older employees over time and to what extent job demands and job resources are predictive of these different trajectories. We applied growth mixture modeling among 5,799 employees of 45 years and older at four time points. We found four distinct groups of older workers that differed in their trajectories of perceived work ability and three types of groups of older workers that differed in their trajectories of their motivation to continue working in the current job. Higher levels of physical and emotional demands were more common in trajectories that were unfavorable, whereas higher levels of mental demands, autonomy, supervisor support, and colleague support were more common in favorable trajectories. This study gives Human Resource Management practitioners insight into how jobs should be designed to stimulate successful aging at work.

status in the workgroup and organizational inclusion. Evidence also suggests that employee job dissatisfaction contributes to turnover intentions. There is a need for investigating ways to create work environments in which diverse individuals can be integrated into organizations and feel included. To address this need, in this present study, a quantitative exploratory approach was used to measure the relationship between minority status and job satisfaction for employees in higher education institutions in the U.S., and the relationship between minority employees' status and their perceptions of inclusion in their workgroups. A sample of 1,898 participants employed in the United States higher education organizations were recruited using Amazon's Mechanical Turk (MTurk). Findings illustrate there is a statistically significant positive correlation between inclusion and workplace satisfaction. The results also show there are differences in inclusion by demographic status, sexual orientation, disability status, religion, and type of workplace. One of the study's implications, if employees feel they are excluded in the workplace, they are more likely to become dissatisfied with their workplaces, which may result in voluntary turnover of high performing employees, as their feelings of being included go up, their satisfaction does. The study's results allude to the issue minority groups employed in higher education organizations have a low sense of belonging, which may result in dissatisfaction with the workplace and eventually force them to quit their jobs.

Cultural Intelligence and Establishment of Organizational Diversity Management Practices

Author: Lauren A. Turner; U. of Massachusetts, Lowell

Author: Kimberly K. Merriman; U. of Massachusetts, Lowell

Drawing from upper echelon theory, this study examines Chief Human Resource Officer (CHRO) level of cultural intelligence as a predictor of the establishment of discretionary diversity management practices during their tenure. Cultural intelligence in this case represents a psychological

and cognitive individual difference that we contend combines with functional expertise to bolster attention to diversity management. CHRO transformational leadership behaviors are modeled as an intervening process, conceived as the lateral and upward influence enacted by CHROs to impact structural-level change. This novel perspective stems from phenomenological insights and an early perspective of transformational leadership behaviors that has received little attention. We test our arguments with primary and secondary data collected from a sample of 193 CHROs and their respective institutions. Findings shed light on a largely unexplored functional role among top management ranks. We delineate contributions for research and consider the practical relevance for organizations at a time of heightened attention to diversity issues.

Ambidextrous Leaders Helping Newcomers Getting on Board: How to Achieve Adjustment and Proaction?

Author: **Wenan Hu**; Tongji U.

Author: **Jinlian Luo**; Tongji U.

Author: **Zhijun Chen**; Shanghai U. of Finance and Economics

Author: **Jing Zhong**; Tongji U.

In the modern workplace, newcomers tend to achieve both role adjustment and role innovation simultaneously. Thus, a pressing need exists for the newcomer literature to understand how organizational insiders, such as immediate supervisor, can support newcomers to accomplish both purposes simultaneously. Drawing on the social information processing perspective, this study focuses on ambidextrous leadership, which contains two seemingly opposite yet potentially complementary behaviors—opening and closing leadership—and investigates their interaction effect upon newcomer task performance and innovative behavior. A field study based on 377 newcomers and their direct supervisors revealed that opening leadership and closing leadership exhibited a mutually strengthening interaction effect on newcomer innovation by individual creative self-efficacy. Conversely, the interaction effect between opening leadership and closing leadership on individual task performance was transmitted through role clarity. Furthermore, we discussed implications from the study, accordingly.

Talent Dispersion: Core/Periphery Distinctions, Team Performance, and Individual Talent Development

Author: **Tiffany Trzebiatowski**; Colorado State U.

Author: **Rakoon Piyanontalee**; U. of Wisconsin, Madison

Author: **Charlie Trevor**; U. of Wisconsin, Madison

Talent dispersion, and the hierarchy it creates, has the potential to be both functional and dysfunctional in teams. We argue and demonstrate that an overly broad conception of talent dispersion contributes to the disagreements in the literature. Through incorporating the notion of core and peripheral team members, we are able to conceptually and empirically investigate talent dispersion associated with certain members of the team, which allows for a cleaner use of relevant theory (in particular, the functionality of hierarchy) and less noisy tests of dispersion's consequences. Specifically, we focus on talent dispersion associated with individuals' core and peripheral positions on the team to better understand dispersion's effects on team performance. We also investigate how well the core members coordinate the tasks at hand as an important explanation for when talent dispersion may be beneficial to team performance. Finally, we recognize that talent dispersion's implications for learning, opportunities to perform, and incentives may also influence the development of individuals over time. This heretofore unstudied dynamic may speak to talent dispersion effects in a new way, further illustrating our emphasis on the need to consider the individual team members to fully understand the collective talent dispersion construct in teams.

Talent Management and the Employee: Systematic Review of the Nascent Literature and Research Agenda

Author: **Karin A. King**; London School of Economics

Talent management is a strategic workforce management practice of priority interest to CEOs and argued to be a business imperative of top

perspective, we propose that newcomers with the same supervisor will develop a collective or shared perception of supervisor serial socialization tactics (SSSTs) that predicts newcomers' work engagement and job performance. Additionally, we propose that supervisor intrinsic motivation for newcomer socialization provides a boundary condition on the effects of SSSTs. Using time lagged data from 91 supervisors and their corresponding 218 newcomers, we found that peer newcomers' shared perceptions of SSSTs are positively and significantly related to newcomer work engagement and in turn, newcomer job performance, even in the presence of SSSTs individual-level effects. Further, we found that supervisor intrinsic motivation towards newcomer socialization moderated the effects of SSSTs on newcomer job performance and the relationship between work engagement and job performance. These findings extend role theory in the socialization context to include novel insights concerning both peer newcomers' shared perceptions and supervisor intrinsic motivation.

Matching for High Quality Mentoring Relationships: Do Values Matter?

Author: **Sophie Drozdowski**; Ludwig Maximilian U. of Munich (LMU)

Author: **Eva Lermer**; LMU Munich & FOM U. of Applied Sciences

Author: **Dieter Frey**; Ludwig Maximilian U. of Munich (LMU)

Formal mentoring programs have become a common human resource practice in organizations and academia to facilitate personal learning and development. However, formal mentoring relationships fall short of their informal counterparts, as they are seldom of exceptional high quality. Mentoring research emphasized the importance of deep-level matching criteria to increase relationship quality and mentoring support by creating the right chemistry between mentor and protégé. Drawing on the formal mentoring framework and the similarity-attraction paradigm, the present study examines the influence of actual value congruence on protégé perceived relationship quality and role modeling support. Moreover,

management. As the scholarly literature in talent management continues to develop and become established as a distinct topic in the literature, it continues to broaden and establish links to multiple realms of empirical enquiry including strategy, international management, mobility, and human capital. However the participation of the employee as a central actor in talent management requires further consideration in understanding how this strategic practice may access and influence the development and deployment of human capital within teams, firms and ultimately, nations. This paper presents a systematic review of the nascent talent management literature focused specifically on the stream in the literature which considers the employee as a central actor and stakeholder in talent management. In doing so, this review presents an illustrative overview of the landscape for future research on the topic of the employee within talent management, along with indicative research questions of interest.

Does Global Talent Management Help to Retain Host-Country Nationals?

Author: **Yong-Suhk Pak**; Yonsei U.

Author: **XIAOYUAN LI**; Yonsei U.

In this study, we examined how the perceived global talent management by host-country nationals affect their turnover intention. Based on survey data from 653 employees having worked for 24 foreign subsidiaries in Korea, we empirically tested the effect of global talent management on host-country national retention. Global talent management itself does not seem to be conducive in retaining host-country nationals. Our test results show that host-country nationals' perceived global talent management is not directly related to their turnover intention. Instead, host-country nationals' organizational identification fully mediates the relationships between their perceived global talent management and turnover intention. In addition, we show that the benefit of global talent management on organizational identification and retention is magnified when global talent management practices are implemented with greater internal consistency. Our findings contribute to the existing literature of

specific relational processes through which high quality relationships are established, as well as proximal outcomes of these relationships, are investigated. We tested the proposed model in a longitudinal study using polynomial regression analyses with data obtained from a sample of 149 mentor-protégé dyads. Results mainly supported the proposed theoretical model. However, the impact of actual fit in values varied depending on the value dimension, revealing self-enhancement and self-transcendence values as the key dimensions. The implications of these findings for mentoring theory and practice, especially the matching process, are discussed.

The Line Manager Factor: Explaining Employee Perceptions of Training & Development Effectiveness

Author: **Kristine Tamayo-Verleene**; IESEG School of Management

Author: **Antonio Giangreco**; IESEG

Author: **Johan Maes**; IESEG School of Management

Author: **Luc Sels**; KU Leuven

This paper studies the link between LMs' ability-motivation- opportunity (AMO) and their effective implementation of Training and Development (T&D) practices. Addressing calls for further examination of the AMO framework, this paper extends current combinative models and empirically tests the interaction effects of the AMO variables with a key moderating mechanism: employees' perceptions of leader- member exchange (ELMX), in order to assess the relational effects that potentially strengthen the link between LMs' AMO and T&D implementation effectiveness. Our multilevel analyses of matched data from a sample of 61 team leaders and 452 employees from Philippine call centers confirm that out of the AMO variables, only ability has a significant direct effect on LM's T&D implementation effectiveness. Moreover, we found that ELMX was significantly and positively associated with employee perceptions of their LM's T&D implementation. We also found that ELMX negatively moderates the relationship between ability and T&D effectiveness, and positively moderates the opportunity-T&D effectiveness relationships. Our contextual

managing local staff retention by emphasizing the importance of identity issue. Multinational enterprises need to advance the host- country national organizational identification which would in turn mediate between global talent management and their turnover intention. The conclusion and related issues are discussed at the end of the paper.

Macro Talent Management Theorizing: The Political Economy of Talent Formation in the Middle East

Author: **Beverly Dawn Metcalfe**; American U. of Beirut

Author: **Yasmeen Makarem**; American U. of Beirut

Author: **Fida Afiouni**; American U. of Beirut

Challenging dominant Global North trajectories, we critically explore the complex terrain of global TM with the aim of expanding the boundaries of the MTM model by examining the complexity of GTM through a transnational and political economy of skill formation lens. We provide a macro assessment of TM processes, at different scales (i.e. National and Transnational) and explore the myriad partners in devising TM strategy that existing scholarship has not sufficiently examined. In sum, explorations of the complexities of economic organization, and unravelling new multiple forms of TM theorising would benefit from spatialized accounts, and the politics of location in shaping TM logics and ideas and the geographies of transnational organizations. We take the AME as a case in point to highlight the inadequacy of current MTM models and proffer multiple dimensions of TM realities in the Arab Middle East, and indeed other developing regions. We are driven by a concern that TM theorization is rooted in a neoliberal ethic and rarely consider how the local becomes global, and how the global is articulated in the local. Our endeavour therefore is to move beyond dominant TM scholarship that privileges MNCs and Global North logics, and reimagine new vistas for TM organization actors, and new TM conceptualizations in multiple locales/locations, in order show Global South perspectives of MTM.

approach contributes to the current discourse on improving our understanding of the AMO framework, as well as the literature on HRM implementation, particularly in the field of T&D. Our findings also offer valuable insights about the unique work culture in Philippine call centers, and offer suggestions to organizations on how to make the most of the line manager factor in successfully implementing training and development initiatives.

Work-Nonwork Satisfaction in Work 4.0 Era (WITHDRAWN)

Author: **Farveh Farivar**; U. of Tasmania

Author: **Julia Richardson**; Curtin U.

The implication of increasing pervasive connectivity is a source of concern for an increasingly broad range of stakeholders, and particularly with respect to its impact on individual well-being and work performance. Introducing a further dimension to contemporary conversations on the topic, and drawing on a survey of 403 Australian white-collar employees this paper uses a set-theoretic approach (fsQCA) to identify how spillover media use occurs at the intersection of online enterprise networking and cyberloafing. Using boundary theory, it identifies the implications for work and nonwork satisfaction, reporting how online enterprise networking at home for work purposes and online social networking at work for personal purposes (cyberloafing) both enhance work satisfaction. Although many organizations are expanding opportunities for online enterprise networking while at the same time limiting opportunities for cyberloafing in the workplace, the paper suggests that they should be aware of the potentially damaging effects on employees' work and nonwork satisfaction more

Governance and Configuration Across Borders (session 1094)

Re-Configurative Divestments of Foreign Subsidiaries as an Organizational Process

Author: **Toshimitsu Ueta**; Copenhagen Business School

Author: **Naoki Yasuda**; Tokyo U. of Science

Multinational firms divest foreign subsidiaries to not only eliminate underperforming businesses but also reconfigure subsidiary networks. Although the importance of such re-configurative divestments has been emphasized by previous studies, our knowledge on how firms can effectively manage them is limited. Viewing re-configurative divestments as an organizational process of disentangling and recombining operations related to divested subsidiaries, this study examines factors facilitating them. Our empirical analysis of multinational manufacturers supports the argument that routinization of operations is a key condition for re-configurative divestments. Our analysis also confirms that multinational firms redeploy critical resources to other business units after re-configurative divestments, and the effect is stronger than redeployments following outright divestments. This study contributes to the literature of foreign subsidiary divestments by unpacking organizational processes of re- configurative divestments.

broadly.

Highly Accurate, but Still Discriminatory: A Fairness Evaluation of Algorithmic Video Analysis

Author: **Alina Köchling**; Heinrich-Heine U. of Dusseldorf

Author: **Shirin Riazzy**; HTW Berlin

Author: **Marius Wehner**; Heinrich-Heine U. of Dusseldorf

Author: **Katharina Simbeck**; HTW Berlin

Firms increasingly implement algorithmic decision-making to save costs and increase efficiency. Concerning the latter, algorithmic decision-making is considered to be fairer than human decisions due to social prejudices. However, the question arises as to the actual fairness of algorithmic decision making. The goal of this study is to identify whether the use of algorithmic decision-making leads to unfair (i.e., unequal) treatment of certain groups. To this end, we analyse a data set consisting of 10,000 video clips and two winning algorithms with high accuracy. Our analysis shows that the underrepresentation concerning gender and ethnicity in the training data set leads to an unpredictable overestimation and/or underestimation of the likelihood to invite representatives of these groups to a job interview. Furthermore, the algorithm replicates the existing inequalities in the data set. As we offer evidence for possible negative consequences, this study provides essential practical as well as theoretical implications.

Contraction for the Sake of Expansion - An Oxymoron?

Author: **Niron Hashai**; Arison School of Business, The Interdisciplinary Center (IDC), Israel

Author: **Netanel Drori**; The College of Law and Business

Author: **Christian Geisler Asmussen**; Copenhagen Business School

International and business diversification are two common strategies of firms. We present novel theoretical arguments and empirical evidence suggesting that contracting a given diversification path (be it in the international or business dimension), does not only allow firms to expand the other path in the short term, but also to again diversify the initially contracted path, thereby expanding both diversification paths in the long term. We argue and show that when firms contract a given diversification path, they spark two subsequent processes: They free up non-scale free resources from the contracted diversification path to invest in the other diversification path, which allows them to expand this path. In turn, this expansion creates new scale free resources that also facilitate renewed diversification along the initially contracted path.

Corporate Governance in the Middle East and North Africa: A Systematic Review

Author: **Bassam Farah**; American U. of Beirut

Author: **Rida Elias**; American U. of Beirut

Author: **Elie Abi Saad**; École des Hautes Études Commerciales de Montréal - HEC Montreal

This paper systematically reviews the literature on corporate governance (CG) in the Middle East and North Africa (MENA), organizes it into five main themes and their subthemes, and proposes several avenues for future research. Through thematically mapping the main findings contained in previous studies on CG in the MENA, we comprehensively

artificial intelligence rather than human assessors. Yet, limited research had examined applicant reactions to such novel technology or compared it to the video-conference and face-to-face interviews from the applicants' point of view. This study used a sample of job applicants and assessed their fairness reactions to these procedures. The results showed that applicant favour and perceived face-to-face interviews significantly higher than video-conference and digital interviews. Also, applicants with high procedural justice perceptions were attracted to the organizations using face-to-face and digital interviews, however, their perceptions did not increase their intentions to accept the job offer. The implication for research and practice are discussed. Applicant's high on openness to experience had a higher rating for process favorability of online interviews, whereas no significant differences were found for digital and face-to-face interviews.

Social Media and "FOMO-Work": The Perceived Prevalence of Better Work Experiences

Author: **Vanessa Shum**; Simon Fraser U.

Author: **Christopher D. Zatzick**; Simon Fraser U.

Author: **Bin Zhao**; Simon Fraser U.

Social media is commonly used by both organizations and individuals; yet, there is limited understanding of the psychological consequences of social media usage on employee attitudes and behaviors. In this paper, we examine the impact of social media intensity and its strong correlate, "fear of missing out" (FOMO), on employee work attitudes. We draw on Social Comparison Theory to understand how the unprecedented access to information about alternative work experiences on social media impacts job satisfaction and turnover intentions. We conceptualize a new construct, FOMO-work, as an individual's intense concern for better work experiences. We examine the construct validity of FOMO-work including the predictive validity with various employee work attitudes. Then, we theorize a positive relationship between social media intensity and turnover intentions through FOMO-work and job satisfaction. A serial mediation model is tested with a sample of 138 employees at a Canadian consulting firm. The findings suggest that

organize this literature. We hope this review provides a better understanding of how organizations are governed in this part of the world, establishes a solid foundation for future research directed at CG practices in the MENA, and encourages practitioners to improve CG in the region.

The Role of MNEs as Intermediates for Canadian Imports

Author: **Walid Hejazi**; U. of Toronto

Author: **Andreea Ciologariu**; Henley Business School, U. of Reading, United Kingdom

Theories of transactions costs and internalization explain the extent to which activities undertaken by the MNE will take place inside the MNE network (i.e. intra-firm) or in the marketplace (i.e. arm's length). The mode(s) undertaken by each firm would be the result of careful consideration of the costs and risks involved in the deployment of each mode. Using a unique and confidential dataset on imports into Canada at the firm-shipment-product-level, we separate trade into that which is arm's-length or intra-firm, and whether shipments come directly from the country of origin, or are first intermediated through the U.S. market. We go beyond the general conclusion that the U.S. is an important source of imports into Canada and show that the U.S. is also an important conduit for imports from the global economy. MNEs are shown to play a relatively large role in intermediating imports into Canada from more distant and difficult markets such as those in Asia, but less so from closer, more familiar and better developed markets such as those in Europe. MNEs located in the U.S. are therefore instrumental in mitigating the challenges of operating in the global economy for Canadian importers.

Innovation and Global Strategy (session 1093)

Internationalization, Incremental and Radical Innovation, and Firm Performance

Author: **Joan Freixanet**; Graduate School of Management, Saint Petersburg U.

Author: **Josep Rialp**; Autonomous U. of Barcelona

This study examines the degree and scope of internationalization as antecedents of incremental and radical product innovation, and the effects of these innovation facets on sales growth. We argue that more internationalized firms may benefit from the access to new knowledge, and to external and internal stimuli from the new competitive context, which trigger a process of learning and development of new organizational capabilities. Firms may leverage this combination of dynamic capabilities and technological knowledge from abroad to increase their innovation output, either in the form of incrementally or radically new products. In turn, we posit that incremental product innovation may be beneficial for performance leaders, but useless for a turnaround of performance laggards. Conversely, radical innovation may be useful for performance laggards, but may disrupt the current position of performance leaders and lead to reduced sales growth. Drawing on a sample of 1,064 firms for the period 2008–2014 we produce results that provide overall support for our arguments, and hold theoretical and managerial relevance.

International Entry and Exit Strategies (session 1091)

Contract Enforcement Institutions and Integrative Strategies: Implications for MNE Exit

Author: **Yamlaksira Getachew**; Loyola Marymount U.

Author: **Paul Beamish**; U. of Western Ontario

We examined whether and how host-country contract enforcement institutions and multinational enterprise (MNE) integrative strategies interact to influence foreign subsidiary exit from the least-developed countries. In doing so, we first unbundled contract enforcement institutions into those which are market (i.e., enforcing contracts with local firms) versus non-market (i.e., enforcing contracts with host-government). We then examined their implications for the exit of MNE subsidiaries using alternative forms of integrative strategies: horizontal or vertical. We find that weak market contract enforcement institutions undermine the viability of the horizontal integration strategy, whereas weak non-market contract enforcement institutions are detrimental to the vertical integration strategy. Further, we examined the roles of several response mechanisms in mitigating the hazards of weak contract enforcement institutions. By advancing a more fine-grained understanding of contract enforcement institutions and MNE integrative strategy as well as examining potential interactions, this study contributes to theoretical development on the interplay between economic institutions and firm strategy, and generates fresh insights regarding responses to weak contract enforcement institutions.

Location Choice of Product Development and Product Innovation: The Moderator Effect of Embeddedness

Author: **Defeng Sun**; Nihon U.

In this study, based on both the location choice perspective and the local embeddedness perspective, we investigate how the location choice of product development activities at parent companies or at foreign subsidiaries, local embeddedness, and the interaction term of location choice and local embeddedness affect product innovation. We test the effects by using data derived from a questionnaire survey of 397 Japanese subsidiaries in East Asia and South-East Asia. Through this analysis, we confirmed that the location of product development activities at foreign subsidiaries instead of parent companies and the local embeddedness are found to promote product innovation. On the other hand, the interaction term of the location choice of product development and the local embeddedness is negatively related to product innovation. This means that the location of new product development at foreign subsidiaries is found to drive down product innovation when foreign subsidiaries are more deeply embedded in local environment.

Economic Integration and Innovation

Author: **Luis Alfonso Dau**; Northeastern U.

Author: **Elizabeth Marie Moore**; Northeastern U.

Author: **Santiago Mingo**; U. Adolfo Ibanez

Despite the enumerable studies on innovation, scant empirical inquiry exists on the impact of economic integration and political connectedness on innovation. Building on traditional assumptions of new institutional economics, we utilize new regionalism theories of economic and political integration to analyze the effect of economic integration, as measured by trade agreements, on a country's innovation output. We argue that higher levels of economic integration increase innovation output. However, it is also important to distinguish between two common types of trade agreements: service agreements and goods agreements. Given the increased depth of integration associated with

Is Internationalization a Boon or a Bane? An Assessment of the I-P Relationship.

Author: **Abu Rehan Abbasi**; Indian Institute of Management, Bangalore

Author: **Rejie George Pallathitta**; Indian Institute of Management, Bangalore

The debate on whether and how internationalization affects firm performance, despite decades of research remains ambiguous. While some internationalization-performance (I-P) relationship studies have also found the absence of a significant relationship or that firms are better off operating in their domestic markets, the focus of these studies is largely limited to developed markets. In contrast, we conduct our analysis in an important emerging market using an extensive data set of 173,665 observations from 27,388 Indian manufacturing and services firms during the period 1996-2018. We find that depending on the mode of internationalization chosen and the industry context, the internationalization effect on firm performance results in a relationship that is either an 'S'/cubic model or a 'U'/quadratic model. For the entire sample of firms, as well as for a sample exclusively of manufacturing firms, the relationship is an 'S' when firms internationalize through exports and is a 'U' when the mode is foreign investments. For manufacturing firms, we find that the performance during internationalization exceeds prior performance when the mode is exports. For the services industry, the relationship is a 'U' for both exports and foreign investments, implying that services firms are yet to achieve their optimal level of internationalization. We check for the robustness of our results by conducting state of the art statistical tests recommended in the literature for both the cubic model and the quadratic model.

Entry Mode Still Matters: A Replication and Extension of Shaver's (1998) Endogeneity Thesis

Author: **Bei He**; Waseda U.

service agreements, we argue that they have a more positive effect on innovation output than goods agreements do. Finally, we posit that, while economic integration is generally positive for innovation, this positive effect weakens as the level of economic integration increases—the effect can even turn negative at the highest levels of economic integration. Our empirical study, based on 461 observations from 76 countries across 11 years, provides robust support to our theoretical arguments.

Keeping Options Alive: Evidence from the Flat Panel Industry

Author: **Changhyun Kim**; China Europe International Business School (CEIBS)

Author: **Yong H. Kim**; HKUST

Author: **Ziyi Chen**; HKUST

In this paper, we reexamine the efficacy of redundant investment strategy and late entrance as a risk-hedging mechanism at the context of technological uncertainty, competition for an industry-wide dominance. Unlike recent findings against the effectiveness of such risk-hedging mechanisms, we identified a positive impact of dual investments by late entrants. In an early stage of a nascent industry when multiple (e.g. four or five) technologies competes, a dual investment strategy might not work. Later when the competition for dominance becomes a competition between two technologies, however, dual investments into the two technologies turns out effective. We also found that a business group structure contributes to managing complexity caused by dual investments. A semi-market structure institutionalized within a business group is effective in striking an optimal balance between internal competition and cooperation within the boundary of the firm.

PAPER SESSION

ASYNCHRONOUS

Author: **Jesper Edman**; Waseda U.

Author: **Junichi Yamanoi**; Waseda U.

This paper seeks to replicate and extend Myles Shaver's (1998) seminal findings that endogenous strategy selection explains the relationship between entry-mode and subsidiary performance. Expanding Shaver's (1998) original single-country, single-year study to a multi-country, multi-year sample of Japanese subsidiaries' foreign market entries, we employ a multinomial endogenous treatment effects model to test for differences in the effect of four entry modes – greenfield, joint venture, acquisition and alliance – on subsidiary performance growth. Our findings show that while endogeneity strategy selection does explain some portion of subsidiary performance, entry mode remains a significant predictor of survival and growth. These results hold even after splitting the sample based on host country cultural distance from Japan. We discuss reasons for the discrepancy in findings, as well as their implications for future research.

The Influence of National Institutions on Multimarket Contact in the Global Mobile Phone Industry

Author: **Claudio Giachetti**; U. Ca' Foscari of Venice

Author: **Joseph Lampel**; U. of Manchester

Author: **Ergun Onoz**; Ozyegin U.

We argue that multinational enterprises (MNEs) that use multimarket contact (MMC) to coordinate strategy with rivals in host countries must contend with the institutional quality of host countries. Drawing on signaling theory and institution-based view, we propose that institutional quality can influence the observability of actions by an MNE's rivals in a host country, thereby affecting the MNE's ability to use MMC to establish mutual forbearance with host country rivals. We test our hypotheses using a sample of 85 mobile phone vendors in 46 countries.

International Location Choices (session 1092)

Manufacturing Location Decisions and Organizational Agility

Author: **Gregory Theyel**; California State U.

Author: **Kay Hofmann**; Hochschule Osnabrück

The location of manufacturing is operationally and strategically important for multinational companies. The spatial dispersion of manufacturing is determined by firm-specific as well as external factors, both of which are subject to constant change. After decades of offshoring production, the paper uses interview data from UK high value manufacturing companies to explore the recent phenomenon of reshoring and the strategic and operational effects of manufacturing location. The analyses show that concentrating manufacturing in home countries enables firms to increase organizational agility and stimulate innovation. However, under certain conditions, firms also continue benefiting from the known advantages of offshoring. This underlines that there is no universal recommendation for improving competitiveness by a certain spatial configuration of manufacturing. Instead, firms need to consider their specific markets, competitive context, and capabilities when strategizing manufacturing location.

Author: **Roberto Santos**; U. of Massachusetts, Lowell

We examine the foreign direct investment (FDI) activities of firms from both developed and emerging markets (EM) in a highly developed science and technology cluster, the bio-pharmaceutical industry. We create a unique dataset that allows us to analyze the collocation patterns and configurations of 19,843 offices, including 3,261 foreign offices from 61 foreign

Rethinking Migration and Multicultural Interactions: Implications for Work Outcomes (session 1090)

The purpose of this symposium is to review the different perspectives on multiculturalism and migration and to provide an agenda for future research with the intent of improving work outcomes in modern day organizations. In this symposium, we are particularly interested in understanding the current diverse views on multiculturalism at both macro and micro levels. We also wish to investigate the role of migrants in understanding the consequences of multiculturalism with the view of understanding the various identities that become salient during multicultural interactions and how identities are negotiated across different contexts.

countries operating in the United States (U.S.) over the past four decades up until 2018. Using a mix-methods approach, we find there is no one-size-fits-all optimal set of characteristics for attracting foreign investments. We developed a four-tiered ranking scheme to differentiate collocation nuances ranging from established (tier one) to least established (tier four) clusters. Our results show that while foreign companies from emerging markets have a stronger preference to collocate in more established clusters and in clusters with a larger proportion of other foreign firms, they also have preferred collocation patterns and are more likely to collocate in clusters with specific resource configurations. Thus, depending upon the type of firm and where they come from, foreign firms have either more or less collocation choices. Our results have important theoretical and managerial implications.

Digital Internationalization: The Role of Ownership and Location Advantages

Author: **Noman Ahmed Shaheer Siddiqui**; U. of Sydney Business School

Author: **Richard L. Priem**; Texas Christian U.

Internationalizing firms usually prefer countries offering location advantages such as innovation clusters and alliance partners in order to improve their competitive positions in current and new markets. Yet, it is unclear whether a focus on certain locations is still important for digital firms that can instantly release digital technologies worldwide. Analyzing internationalization of digital technologies across 57 countries, we show that digital firms may reap critical location advantages from lead markets to facilitate internationalization of their digital technologies. In particular, lead markets with higher within-country demand heterogeneity and preference overlaps with other countries may help digital firms improve the global appeal of their digital technologies. However, identifying preferred lead markets is not enough; the digital firm needs adequate ownership advantages, particularly technological and marketing capabilities, to fully benefit from the lead market. Thus we link demand-side characteristics of lead markets and supply-side

50 Years of Research on Regional Headquarters: An Analysis and Future Agenda

Author: **Perttu Kahari**; Aalto U. School of Business

Author: **Eva Alfoldi**; U. of Delaware

Author: **Iiris Saittakari**; Aalto U. School of Business

The purpose of this paper is to review the literature on regional headquarters (RHQ) in order to provide a framework for an enhanced understanding of the RHQ phenomenon and to suggest a future research agenda for RHQ research. Using a systematic literature review, 56 academic journal articles and book chapters were analyzed, covering a period of over 50 years from 1967 to 2019. The key contribution is an analytical framework that constructs RHQ as a combination of role and geographic scope. It suggests four characteristic attributes to distinguish RHQ from other organizational units, namely intermediacy, terminability, triple-embeddedness, and sensitivity to change. Another main contribution to international business research is a future RHQ research agenda, with topics including the geographic scope of RHQ, the intermediate and performance outcomes of RHQ, intermediacy and triple embeddedness, and RHQ dynamism.

The Relevance of Goal Activities in Workplace Coaching: A Systematic Literature Review

Author: **Alessa Antonia Müller**; U. of Kassel

Author: **Silja Christina Kotte**; U. of Kassel

The relevance of goal theory for coaching has been emphasized by both scholars and coaching practitioners. Yet concerns have been raised about possibly overestimating positive effects on outcomes and neglecting potential pitfalls of goal-focused coaching practice. Synthesizing findings of 24 (quantitative and qualitative) studies, this systematic literature review investigates the occurrence of goal activities in workplace coaching and the relationship between goal activities and coaching outcomes. Reported goal activities include goal setting/clarification, setting action plans, and a goal-focused coach-coachee relationship. Results indicate that coaches report applying goal setting rather frequently during coaching engagements, while coachees report them to occur less. Study findings suggest a positive relationship between goal activities and coaching outcomes (e.g. goal attainment). However, several studies also report no significant associations. The lack of significant associations seems to relate to both study design and chosen outcome measures. In addition, initial findings point to possible moderating variables (e.g. initiator of goal activity) and potential challenges of organizational stakeholders impacting upon goal activities. We discuss findings, assess the risk of bias of included studies and conclude by considering implications for practice and future research.

Understanding What Drives the Coaching Working Alliance: A Systematic Literature Review

Designated as a "Best Paper" for MED

Author: **Carolin Graßmann**; SRH Berlin U. of Applied Sciences

Author: **Carsten Christoph Schermuly**; SRH U. Berlin

A recent meta-analysis showed that the working alliance between clients and coaches is a key factor for coaching outcomes such as clients' goal attainment and preventing negative effects. However, surprisingly little is known about which factors contribute to establishing working alliances. We conducted a systematic literature review to investigate which factors influence the working alliance between clients and coaches. Wherever

possible, we also analysed relationships by meta-analytical means. We identified 21 samples in 18 studies in our literature review. As suggested by social exchange theory, we identified factors that focus on clients, coaches, and the client-coach dyad. Clients' motivation and coaches' perceived competence rank among the most promising antecedents for establishing a working alliance in coaching. The number of studies allowed us to examine them by meta-analytical means, which revealed medium-sized effect sizes (for change motivation: $r = .37$, $p < .001$, $k = 8$; perceived competence: $r = .42$, $p < .001$, $k = 4$). Coaches' experience was not significantly related to working alliance ($r = .10$, $p = .22$, $k = 4$). Personality and personality similarity appear unrelated to working alliance, whereas behavioural similarity was identified as an antecedent. Several coach behaviours have been suggested in relation to working alliance. These results contribute to a better understanding of the factors that are related to the working alliance in coaching, which may also help coaches to reflect on and improve in their practice. In particular, more behaviour-oriented studies are needed in pursuing the driving factors in coaching working alliances.

Can You Hear Me Now? The Influence of Perceived Media Richness on Executive Coaching Relationships

Designated as a "Best Paper" for MED

Author: **Angela Passarelli**; College of Charleston

Author: **Mai P. Trinh**; Arizona State U.

Author: **Ellen B. Van Oosten**; Case Western Reserve U.

Author: **Mandy Varley**; Case Western Reserve U.

The leadership development industry has drawn scrutiny for being simultaneously costly and ineffective at developing effective leaders. Executive coaching has been demonstrated as one method of effective leadership development, yet it can be expensive for organizations to employ. Given the availability of new technologies, many organizations have experimented with a shift in the delivery modality from face-to-face coaching to distance coaching without exploring how changing

technology affects the coaching relationship, one of the most important factors in predicting successful coaching outcomes. A time-lagged field experiment examined the effects of modality (face-to-face, video-conference, and telephone) and perceived media richness on coaching relationships. Results demonstrated that modality did not have a direct effect on the coachee's perceptions of relationship quality nor the coach's sense of being trusted. However, significant indirect effects existed, mediated by perceived media richness. As expected, participants viewed face-to-face meetings to be significantly richer than video-conferencing and telephone. Coachee teleconferencing self-efficacy moderated this relationship, such that those with greater efficacy perceived telephone and video-conferencing to be similar in richness to face-to-face sessions. Greater perceived media richness was then associated with higher quality relationships for the coachee and a greater sense of being trusted for the coach. Although we expected emotional expressivity to moderate the relationship between perceived richness and relational outcomes, we did not find statistical support for this hypothesis. Theoretical and practical implications are discussed.

Mindfulness and Study Engagement: Mediating Role of Psychological Capital and Intrinsic Motivation

Author: **MUHAMMAD ALI**; School of Economics & Management, Tongji U.

Author: **Jiaqi Yan**; School of Economics & Management, Tongji U.

Author: **Mohsin Raza Khan**; Bahria U., Business School, Islamabad, Pakistan

The purpose of this study is to examine the relationship between mindfulness and study engagement with a focus on exploring the mediating mechanism between the proposed relationships. Based on the conservation of resources (COR) theory, we examine whether psychological capital (PsyCap) and intrinsic motivation mediate the relationship between mindfulness traits and study engagement. Path analysis was conducted to test the hypothesized relationships among a sample of 428 foreign students studying in Chinese

universities from Shanghai. The results support the hypothesized relationships and imply mindfulness is an important antecedent of study engagement that is, more mindful students are more engaged at study. Further, PsyCap and intrinsic motivation mediates the relationship between self-rated mindfulness and study engagement. These findings are important for universities, especially with reference to developing specific educational strategies to address study engagement issues. This study has several theoretical and practical implications.

Faculty Advisors: A Piece of the Management Student Well-Being Puzzle

Author: **Nicholas Anthony Smith**; Oregon Health & Science U. and Quinnipiac U.

Author: **Julia M. Fullick-Jagiela**; Quinnipiac U.

Author: **Patricia Kelly**; Quinnipiac U.

Academic advising theory and research has documented the importance of advising for student well-being and important university outcomes. However, the effectiveness of academic advisors in improving such outcomes for management students with a mental illness has yet to be examined. In our study of 280 management students, we found that having a supportive academic faculty advisor was related to higher university satisfaction and lower quitting intentions through reduced burnout for students without a mental illness. These relations, however, did not hold for students with a mental illness, who experienced relatively high levels of burnout regardless of advising support perceptions. We then explored the relative importance of predictors of student mental well-being, and found that mental health self-efficacy was strongest predictor of mental well-being, followed by resilience, but that mental illness knowledge and perceived workload were not significantly related to mental well-being. Our results suggest that faculty advisors may be under-prepared to meet the needs of students with a mental illness, and we recommend that faculty advisors focus on gaining skills to improve student mental health self-efficacy and resilience.

What Do Management Students Expect After Graduation? A Qualitative Study of Pre-Entry Expectations

Author: **Ceren Erdem**; Henley Business School, U. of Reading

Author: **Chris Woodrow**; Henley Business School, U. of Reading

The aim of this study is to explore the pre-entry work expectations of students studying for management degrees in the UK. Analysis of interviews conducted with a diverse group of graduating students reveals that they hold a limited set of expectations prior to employment that is focussed upon five key domains. This set of expectations is narrower than those examined in previous studies and includes expectations relating to issues that have received limited prior attention, including non-tangible rewards and workplace fairness. This exploratory study adds to the small body of research that has examined pre-entry work expectations in current graduate newcomers, which is largely based upon deductive survey methods, and suggests various routes to the management of inexperienced graduate newcomers to organizations.

History and Management Theory (session 1099)

This session presents theoretical and empirical analyses of the ways in which history has informed management theory. The papers demonstrate how history and historical reasoning have formed a powerful influence in management theory, from its origins in early organizational theory up to and including postmodern management thought

History and Organizational Theorizing Blended: A Review of an Interdisciplinary Dialogue

Author: **Christian Stutz**; U. of Jyväskylä School of Business

The “historic turn” in management and organizational research (MOS) called organizational theorists and historians to engage in discussions on how to best combine organizational theorizing and historical reasoning, methods, and evidence. Arguably, the collective effort of an emergent academic movement has recently resulted in an interdisciplinary integration, that is, a new paradigm called historical organization studies. However, history remains a marginal epistemic lens and mode of inquiry in the various research fields of MOS. Drawing from insights of studies of interdisciplinarity, this article reviews and takes stock of the movement’s activities of more than 25 years to advance the collective project of blending history and MOS. My findings specify the challenges, accomplishments, and prospects by explicitly considering the projects’ interdisciplinary nature. More generally viewed, this article illuminates the pitfalls, benefits, and the collective efforts needed to establish a new interdisciplinary space in MOS.

[view paper \(if available\)](#)

design their career trajectories and re-design them as circumstances change. Departing from traditional one-on-one coaching sessions, we investigate the effectiveness of a collaborative life design method based on Design Thinking and conducted in large groups. Through a quasi-experiment we find that students who attended the life design workshop significantly increased their Positive Psychological Capital (specifically self-efficacy, resilience and hope), their self-esteem and the presence of meaning in life. The qualitative data analysis revealed that the intervention allowed students to broaden their sight on life, discover authenticity by reframing their measures of success. Business schools could consider offering courses on career design with a collaborative design thinking approach to support students in learning a methodology which could better equip them to navigate the future of work.

Strive or Avoid: A Motivational Perspective of Growth and Independence- Oriented Intentions

Author: **Michela Loi**; U. of Cagliari

Author: **Barbara Barbieri**; -

Author: **Emanuele Castriotta**; U. of Cagliari

Author: **Maria Chiara Di Guardo**; U. of Cagliari

This paper aims at shedding light on the motivational and self-regulatory components lying at the bottom of growth and independence-oriented intentions as conceptualized by Douglas (2013). In a sample of 209 undergraduates, we administered a structured questionnaire at the beginning of an elective entrepreneurship education program. We investigated how the different types of intention are related to different approaches to achievement goal motivation (Mastery, Performance, and Avoidance approaches) and self-regulatory modes (Locomotion and Assessment). Findings show that growth-oriented and independence-oriented intentions have different motivational and self-regulatory patterns of correlations. Growth intentions relate to a performance approach and locomotion. Independence intentions relate to an avoidance approach. Implications for entrepreneurship education are examined.

Similarity of Management Books Published in the First Half of the Twentieth Century

Author: **Thomas A. Stetz**; Hawaii Pacific U.

The first half of the twentieth century saw the emergence of a variety of management ideas and various schools of thought that occurred during this time. While there are commonalities, these schools are far from absolute. They often intertwine and use different terminology making distinctions difficult. To better understand how management thought developed, 27 digitized management books from well-known authors published between 1903 and 1949 were analyzed using quantitative techniques and a plot showing the semantic similarity among the books was produced. Inspection of the plot showed seven unique groups of books: Scientific Management I, Scientific Management II, Psychology, Labor Relations and Personnel, Human Relations, Social Organization, and Administration. The plot also showed a progression over time with the earliest authors taking a mechanistic task and worker-level perspective. Later authors expanded this to consider group-dynamics, psychology, sociology, structural aspects of organization, and the functions of management and general management as a whole. Each book and author is described providing an understanding of its location in the plot and the relationship with other books and authors. This is the first study to apply quantitative text analysis techniques to early management writings and to simultaneously examine so many books and authors.

**'What They Think vs. What They Know' Students':
Employers' Perceptions of Job Applicant
Screenings**

Author: **Delonia Minor-Cooley**; Academy of Management

Author: **Rochelle Parks-Yancy**; Texas Southern U.

The employment outlook for recent college graduates is positive. However, processes by which employers screen applicants and students' perspectives of those processes remains a worthy study. This is particularly salient for first generation college students (FGCS). This study examines the perspectives of the employment screening process from both employers and FGCS. The study results seek to improve the effectiveness of professional development knowledge that university career counselors provide to FGCS populations.

**Peer Coaching: A Tool for Affectively-Driven
Experiential Learning in Undergraduate Education**

Designated as a "Best Paper" for MED

Author: **Ioanna Iordanou**; Oxford Brookes U.

Author: **Ashley Roberts**; Warwick Business School

Contemporary Business School education is increasingly being scrutinized for its functionalist knowledge generation. In consequence, critics have proposed several ways that can better prepare graduates for their future, including Experiential Learning. While the place of emotion has been thoughtfully considered in the workplace, we lack systematic, empirically-grounded studies on affective capability generation in undergraduate Business School programmes. With data drawn from 16 semi-structured undergraduate student interviews and 30 student reflective essays, we contribute to this shortcoming in existing literature by empirically exploring the study of coaching and practice of peer coaching in an interdisciplinary, undergraduate Business School module. We propose a peer coaching model of relational,

approaches to historical research. The reorientationalist agenda of the historic turn has led to sharp debate between seemingly divergent communities of history researchers. Controversy of its supposed philosophy, namely postmodernism, has caused the ire of some and celebration of others within the broad church of historical research on business and organizations. This paper seeks to destabilize the characterization of the historic turn as being wholly taken up by postmodernism by historicizing the conditions of its possibility. Throughout the process we unravel the constituent elements of the popularized historic turn and attempt to make sense of its ethic as a vehicle of critique.

affectively-driven experiential learning, where both cognition and emotion impact knowledge generation equally. This paper therefore stands to make three central contributions to the management learning literature: Firstly, that the study and practice of peer coaching amongst students can enhance learning by raising emotional awareness and is, thus, a privileged site for affectively-driven experiential learning; secondly, that peer coaching has the potential to foster affectively-driven managerial mindsets for students in their future careers; and thirdly, we offer a reconceptualization of Kolb's experiential learning model that incorporates the affective and relational components of learning through experience.

Author: **Pablo Zoghbi-Manrique-de-Lara**; U. of Las Palmas de Gran Canaria

Author: **Adnane Maalaoui**; IPAG

Author: **Hervé Colas**; groupechd

Prior research suggests that employees aware of their peers' mistreatment by management and who themselves are target to such mistreatment help their peers more than employees who have been exposed only to peers' mistreatment. However, reasons why this help is amplified are unclear. In this study we suggest that such help is performed out of compassion and, hence, that personal and peers' unjust treatment, empathic-concern, and acts of kindness follow Kanov et al. (2004) compassion process: noticing, feeling, and responding. It is

Harmonizing Work: Meaning and Meaning Making in Christian Hymnody

Author: **Monty L. Lynn**; Abilene Christian U.

Author: **Sarah Easter**; Abilene Christian U.

Author: **Ryan Jessup**; Abilene Christian U.

Author: **Greg Straughn**; Abilene Christian U.

Viewing life through a spiritual lens has been shown to enhance resilience and meaningfulness in work. But exactly what messages do spiritual and religious systems communicate regarding labor? To better understand how religion frames work, we analyze 315 Christian hymns containing work-related phrases. We identify eight themes which address a worker's self, role, and job and we estimate the relative prominence of these themes from 1750 to 2000. We discuss the findings' relevance for meaning making and workplace spirituality research.

hypothesized that interactions between personal and peers' mistreatment amplify kindness through empathic-concern and, hence, that kindness is compassionately performed. Results supported empathic-concern as a mediator and, hence, kindness as a compassionate behavior. Unexpectedly, however, staff reduced (rather than increased) empathic-concern and kindness. Tragedy-of-the-commons is invoked to explain these unexpected results. Simultaneous mistreatment could lead staff to perceive justice as a scarce common resource that is ultimately a source of dispute and leads to uncooperativeness.

"It is Those People": Religious Scripts Organizing for Compassion

Author: **Gry Espedal**; VID Specialized U.

Drawing from an ethnographic and longitudinal qualitative case study in a faith-based institution, this paper analyzes how religious scripts encode and enact organizational compassion. The organizational script is often described as acquired through institutional orders, practice or observation. However, how religious behavior is triggered not only by cognitive schemata but also by emotions, values and personal experiences, are less described. In this article, a process of acknowledging the religious history, noticing pain and living ethical spirituality is identified as forming compassionate behavior. The experience of pain, suffering and inequality can be a pervasive aspect of organizational spiritual life and frame organizational activities to reproduces and replicate organizational religious scripts and moral engagement of reaching out to sick and marginalized.

The Lived Experience of Meaningful and Meaningless Work in a Stigmatized Occupation

Designated as a "Best Paper" for MSR

Author: **Zachary A. Mercurio**; Colorado State U.

Experiencing meaningful work is linked to positive outcomes such as increased engagement, job satisfaction, motivation, positive work behaviors, performance, and an overall sense of well-being (e.g. Lysova, Allan, Dik, Duffy, & Steger, 2019; Rosso, Dekas, & Wrzesniewski, 2010). However, direct empirical inquiry into the lived experience of meaningful work remains limited. Moreover, the lived experience of meaningful work in stigmatized occupations - jobs relegated by society as physically, socially, or morally undesirable due to the nature of the work - remain understudied. I used a qualitative approach enacted through a descriptive phenomenological method to uncover what the experience of meaningful (and meaningless) work was like for a group of university custodians. I found that experiencing meaningful work is readily accessible in a stigmatized occupation and revealed several defining features of the experiences of meaningful work and meaningless work in a stigmatized occupational context.

The Role of Universal Values in Cultures of Migration? The Case of Lithuania

Author: **Vilmante Kumpikaite-Valiuniene**; Kaunas U. of Technology, School of Economics and Business

Author: **Jurga Duobiene**; Kaunas U. of Technology

Author: **Vilmante Liubiniene**; Kaunas U. of Technology

Author: **Ineta Zickute**; Kaunas U. of Technology

Author: **Ashly Hervey Pinnington**; British U. in Dubai

Contemporary migration is characterized by increasing numbers of people deciding to leave their countries seeking better opportunities abroad. In some countries, a culture of migration is said to arise where, a specific set of values appear considering migration as the final goal to be

Organizational behavior researchers concur that the ever-rising growth of workplace incivility paralyzes the well-being of the organization, but how the occurrence of incivility can be scaled-down is yet to be known. To address this gap, we proposed and tested the effect of workplace spirituality on two types of workplace incivilities (experienced incivility and instigated incivility), based on the insights drawn from the conservation of resources theory and transactional model of stress. Taking intuition from the social exchange theory, we also investigated the mediating role of prosociality on the relationship between workplace spirituality and two forms of workplace incivilities. Using a time-lagged study design, we tested and replicated our model in two different field studies. Findings of both the studies revealed that workplace spirituality reduces the occurrence of experienced and instigated incivility at work. Prosociality partially mediated the relationship between spirituality and two forms of workplace incivility. Our study advances the literature on low intensity negative work behaviors and provides a solution to them in the form of workplace spirituality.

The Compassion Process and Cognitive Appraisals (WITHDRAWN)

Author: **Regina Michelle Taylor**; Creighton U.

Research on compassion in organizations has grown over the last decade, however, there is still a need for empirical work on the topic before we truly understand compassion and the various factors that influence it in everyday organizational life (Atkins & Parker, 2012; Dutton, Workman & Hardin, 2014). An important question from this literature that still remains is what leads someone who witnesses another's suffering to respond with compassionate action? This paper explores this question by investigating the occurrence of cognitive appraisals as moderators of the relationship between compassionate feelings and compassionate responses. Results from two experimental studies and one field study provide empirical support for the role of cognitive appraisals in the compassionate feeling compassionate responding relationship. Theoretical and practical implications of compassion in organizations are discussed, and areas for future

attained (Massey et al. 1998), then over time migration becomes a common pattern of behavior, where the majority of people become captivated by the same intent (White, 2016). This paper aims to contribute to knowledge on individuals' values, based on Schwartz's (1992) universal values theory, and focuses on identification of value differences of immobile locals compared with mobile locals, emigrants and returnees. In total 5,390 Lithuanian respondents participated in the survey, which was conducted in Lithuania and abroad. We conclude that in the case of Lithuanians, security, benevolence and self-direction are the main three values of immobile locals and self-direction, benevolence and security are the main three values of emigrants contributing to a culture of migration.

Assessing Work Meaningfulness: The Positive Work Meaning Scale (PWMS)

Author: **Jing Hu**; UNSW Business School, Australia

Researchers and practitioners alike are interested in knowing where one's positive work meanings come from. Research on positive work meanings has been flourishing, accompanied by the development of a selection of assessment tools on this important concept. Most measures on this topic are theory-driven uni-dimensional scales. To further advance research in this field, combining data-driven and theory-driven approaches, the author proposed a seven-dimensional model describing the work aspects that are meaningful to employees who came from a diverse range of industries in two cultures. The seven dimensions are "Making social significance", "Having good workplace relationship", "Getting instrumental benefits", "Gaining self-development", "Feeling achieved at work", "Feeling interested in work", "Nurturing others at work", and "Seeing a fit between self and work". Based on the model, the author further developed a multi-dimensional scale to capture the seven dimensions. The newly developed scale, the Positive Work Meaning Scale (PWMS), showed good psychometric characteristics; it had good dimensionality, internal reliability, test-retest reliability, divergent and convergent validity, and criterion validity.

research are identified.

Hospital Integration and Relational Coordination: Workplace Spirituality and Work Engagement

Author: **Isabel Albuquerque**; Nova School of Business and Economics, U. Nova de Lisboa

Author: **Rita Campos Cunha**; NOVA School of Business and Economics

Hospital organizational integration and relational coordination are associated with positive organizational outcomes in health care organizations, in what concerns both quality and efficiency (Gillies et al., 2006; Mattke et al., 2007; Gittel, 2011). This study analyses the relationship of hospital organizational integration and relational coordination with objective organizational performance outcomes, which measure efficiency, and with perceived organizational performance outcomes, which measure service quality. The double mediating role of workplace spirituality and work engagement on these relationships is also analysed. The study is a survey with 395 health care professionals of a large public hospital. Results revealed the significant role of hospital organizational integration in the promotion of efficiency and quality in health care services and, on the other hand, highlighted the role of relational coordination in fostering the quality of the health care service provision, but not in achieving operational efficiency. Additionally, workplace spirituality and work engagement are performance predictors and mediating variables, in what concerns service quality of hospital performance.

Supervisor's Bottom Line Mentality, Work Meaninglessness, and Employee Outcomes

Author: **Salar Mesdaghinia**; Eastern Michigan U.

Author: **Shiva Nadavulakere**; Saginaw Valley State U.

Author: **Anushri Rawat**; Eastern Michigan U.

This study theorizes that supervisor bottom-line mentality (BLM, i.e., a narrow focus on bottom-line outcomes while ignoring other priorities) can paint a picture of work that ignores true caring for important organizational stakeholders (e.g., employees, customers, and the community) and is, therefore, associated with employees' engagement in fewer affiliative organizational citizenship behaviors, greater job neglect, and lower job satisfaction. We also theorize that job meaningfulness mediates these relationships. Furthermore, we theorize that these relationships are stronger for employees with stronger moral identities who have a greater desire for meaningful work (e.g., serving others). We tested our hypotheses in two field studies. Study 1, involving time-separated surveys from employees and supervisors working in India, demonstrated that working with a high BLM supervisor was associated with performing less affiliative citizenship behaviors, greater job neglect, and lower job satisfaction. Study 2, involving time-separated surveys from employees working in the United States, further showed that work meaningfulness mediated these relationships. In addition, in Study 2, we found that the negative impacts of supervisor BLM on work meaningfulness, and subsequently the outcomes, were stronger for employees with stronger moral identities. Our results suggest that not only to keep employees satisfied, but also for the sake of business success, supervisors should broaden their sights to see beyond the narrow confines of bottom-line objectives.

Abstract Thinking, Perspective Taking, and Meaning (session 1108)

Beliefs About Abstraction: How Abstract Thinking Signals Motivation and Influences Employability

Author: Marie Crouzevialle; Eidgenössische Technische Hochschule Zürich
Author: Yaacov Trope; New York U.
Author: Petra C. Schmid; ETH Zurich

Construal level theory (Liberman & Trope, 2008) identifies abstraction as the key process that allows forming representations of distal objects such as goals, ambitions, and plans (Fujita, Trope, & Liberman, 2015). Abstract thinking expands our mental horizons and allows “taking a step back”, while concrete thinking helps us to immerse in the immediate environment and focus on its local features. Across five experiments, we test whether people perceive abstraction as signaling a drive to progress and project one’s competences in the future—a trait we expect to be desirable in most education and job settings. In particular, we hypothesize that abstraction should signal long-term vision, motivation and willingness to seize opportunities for growth and professional development. Results across one field study and four online experiments confirm that people do recognize abstract thinking as signaling motivation to improve, and associate it with action flexibility and room for improvement. Study 5 further demonstrate that abstract thinking can selectively boost a candidate’s employability when the hiring company is described as placing a strong emphasis on growth opportunities. Overall, this research suggests that abstract thinking can be used as a self-presentation tool that signals motivation and goal-orientation.

Although the self-monitoring construct has been studied for almost half a century, there is considerable lack of clarity about its definition and that of its related constructs, i.e., high self-monitors (HSMs) and low self-monitors (LSMs). The understanding of the latter is particularly unclear and incomplete. We dissect the construct definitions and also review a high-quality sample of empirical articles to show that LSMs have been relatively neglected and poorly understood. They have been considered merely as opposites of HSMs, whereas in fact, they are more varied. We conceptualize five different types of LSMs that we derive from a 6-cell (2 x 3) conceptual framework, which encompasses two levels of motivation (low, high), and three levels of ability (low, moderate, high), to self-monitor. We illustrate this conceptual development by populating all six cells with characters from the popular American sitcom, *The Big Bang Theory*. We also develop propositions involving the five new types of LSMs to highlight the usefulness of our framework. Finally, we discuss the implications of our theorizing for research and practice.

Do High Performers Always Receive More Supervisory Career Mentoring? The Role of Perspective-Taking

Author: **Xiaoyu Wang**; School of Economics & Management, Tongji U.

Author: **Xiaotong Zheng**; Durham U.

Integrating social exchange theory and socioanalytic theory, this study examines the roles of employee performance and perspective taking in the supervisory career mentoring (SCM) employees receive, which is vital for their career development. We propose that perspective taking captures an important relational factor in the process of protégé selection, a factor which will not only have an incremental effect in predicting SCM above and beyond the contribution of employee performance but will also strengthen the positive effect of employee performance. The results from a multi-source multi-wave field study and an experimental study indicate a positive effect of perspective taking,

and a positive moderating effect on the relationship between employee performance and SCM. In addition, from a social exchange perspective, the study finds that cost-benefit analysis mediates the main effects and the interactive effects on SCM. Thus, the paper highlights the importance of combining employee 'getting ahead' and 'getting along' attitudes in understanding the protégé selection process. The paper concludes with theoretical and practical implications.

Does Trait Mindfulness Help Working College Students? The Mediating Role of Meaning and Enrichment

Author: **Laurel McNall**; State U. of New York, College at Brockport

Author: **Matthew Bennett**; State U. of New York, College at Brockport

Author: **Melissa Brown**; State U. of New York, College at Brockport

As more evidence accumulates on the benefits of mindfulness, research is needed to understand how and why mindfulness results in positive change. Drawing on Mindfulness-to-Meaning Theory, we explored the underlying mechanisms that may explain the relationship between mindfulness and important outcomes for working college students. Using a sample of 265 employed college students, we found evidence for a serial multiple mediation model of work meaning and work-school enrichment in the relationship between mindfulness and outcomes (i.e., job satisfaction, school satisfaction, emotional exhaustion). These results lend initial support for mindfulness as a personal resource that helps working college students experience better outcomes through higher work meaning and work-school enrichment. Practically speaking, this research suggests that mindful working college students may be better equipped to experience work meaning and work-school enrichment, and in turn, positive outcomes. As such, universities and organizations may want to consider not only offering mindfulness interventions, but also helping students find greater meaning in their employment experiences.

Emotional Labor and Conservation of Resources Theory (session 1107)

Climate of Service Priority & Service Performance: The Role of Emotional Labor and Workload Pressure

Author: **Dana Rachel Vashdi**; U. of Haifa
Author: **Tal Katz-Navon**; Arison School of Business, The Interdisciplinary Center (IDC), Israel
Author: **Marianna Delegach**; Sapir Academic College

Service employees face a complex organizational environment that constantly poses multiple demands in order for them to achieve organizational goals. Hence, there is a persistent tradeoff between service as a key element of the organization's strategy and other competing or even conflicting demands. Using the Job Demands-Resources model as an overarching theoretical framework, we investigated why and when shared perceptions of the relative priority assigned to service are related to service performance. Specifically, we examined employee's use of deep acting emotional labor strategies as a mechanism that explains this relationship and workload pressure, as a bounding condition of this relationship. A sample of 245 hospitality employees nested within 39 departments in thirteen hotels participated in the study. Results demonstrated that when service was perceived as a relative priority compared to other competing goals, employees reported using a higher level of deep acting emotional labor strategies, which in turn led to better service performance. Yet, this was apparent only under specific circumstances or contexts, i.e., when workload pressure was low.

Exploring New Approaches to Leader Identity Development (session 1112)

Leaders offer the game-changing competitive advantage for organizations via providing multiple positive flow-on effects that improve performance and organizational culture (Day & Dragoni, 2015; Salas, Kraiger, Smith-Jentsch, 2012; Silzer & Dowell, 2010). Unsurprisingly, there is intensifying focus from both academic and practitioner domains on how to acquire and develop more of this prized resource. Currently, the leader development field has a clear understanding of the important role that leader identity plays in leader development (Epitropaki, Kark, Mainemelis & Lord, 2017; Ibarra, Wittman, Petriglieri, & Day, 2014). However, there still remain fundamental gaps in our understanding of what causes leader identities to develop over time and what organizations can do to support this process (Martin, Hughes, Epitropaki & Thomas, 2019). This symposium answers the call to the big question that the leader development field is grappling with. It includes five ambitious projects that each offer new approaches to developing the identity of leaders.

Effect of Customer Mistreatment on After-Work Impulsive Behaviors Through Self-Control Depletion

Author: **Hui Zhang**; School of Sociology, Huazhong U. of Science and Technology

Author: **Zhiqing Zhou**; Baruch College & The Graduate Center, CUNY

Author: **Yanwei Shi**; Department of Human Resource Management, Shanghai Normal U., Shanghai

Author: **Yanjun Liu**; School of Labor and Human Resources, Renmin U. of China

Drawing on the ego-depletion theory, the current study examined the effect of daily experience of customer mistreatment at work on employees' impulsive behaviors after work (impulsive buying, mobile phone overuse, and overeating behaviors) through self-control depletion. Further, we investigated the moderating roles of two resource-gaining activities at work (taking time for relaxation and learning something new at work) on the relationship between customer mistreatment and self-control depletion. With daily diary data collected from 57 fulltime employees across 5 working days, our results revealed that daily experience of customer mistreatment at work was negatively related to employees' impulsive buying and mobile phone overuse after work (but not overacting behaviors) via self-control depletion. Besides, relaxation, but not learning, buffered the positive relationship between customer mistreatment and self-control depletion. These findings shed light on further understanding the underlying mechanisms between customer mistreatment and employee impulsive behaviors and resource-gaining strategies at work that might mitigate the negative effects of customer mistreatment.

and challenging to gain acceptance and thrive in organizations. We posit that feigning agreement with prevalent organizational values through facades of conformity helps to achieve these goals. Specifically, we investigate why and how the perceived organizational support moderates the effect of supervisory support employees experience on their adoption of facades of conformity. In doing so, we invoke conservation of resources theory based arguments that perceived organizational and supervisory support are valuable resources to individuals and that the level of access to them influences the use of facades of conformity. We argue that, while facades of conformity are negatively associated with organizational and supervisory support, the intertwined effect of these two types of resources on facades of conformity is mixed. Through two studies, we found that the relationship between supervisory support and facades of conformity was predominantly negative when perceived organizational support was low. We also found an inverted U-shaped relationship between supervisory support and facades of conformity when perceived organizational support was high.

When a Leader has to Put on an Act: A Test of Dual-Process Model of Leaders' Emotional Labor

Author: **Tsung-yu Wu**; Department of Psychology, National Taiwan U.

Author: **Shi-Ju Tung**; National Taiwan U. of Science and Technology

Author: **Hao-Cheng Lo**; Department of Psychology, National Taiwan U.

Drawing on Gardner et al.'s (2009) model of leader's emotional labor and authenticity and Côté's (2005) social interaction model of emotion regulation and work strain, we explore how leader's surface and deep acting is associated with leader's felt authenticity, which is further related to leader's emotional exhaustion (intrapersonal process). We also explore how leader's surface and deep acting is associated with follower's perceived leader authenticity, which is further related to follower's affective trust in leader (interpersonal process). Moreover, we investigate whether follower's

affective trust in leader affects leader's emotional exhaustion. Using survey research, we obtained 166 pairs of leader-follower dyad data in organizations at Taiwan. The results showed that, regarding intrapersonal process, leader's surface (deep) acting is negatively (positively) related to felt authenticity, which serves as a mediator and is further related to emotional exhaustion. Regarding interpersonal process, leader's surface acting is negatively related to follower's perceived leader authenticity, which serves as a mediator and further related to trust in leader. In addition, follower's trust in leader is associated with leader's emotional exhaustion. Our study contributes to existing literature by demonstrating that leader's deep acting may be a compromise between emotional labor and authenticity, and that Gardner et al.'s (2009) model can be integrated with Côté's (2005) model.

How Does Coaching Leadership Promote Employees' Constructive Deviance? Affective Events Perspective

Author: Zhisong Cui; Jilin U.
Author: Hongyu Wang; Jilin U.
Author: Chilombo N Nanyangwe; School of Management, Jilin U.

Adopting an affective events perspective, this study proposed and tested a moderated-mediation model linking coaching leadership, positive emotion at work, proactive personality and constructive deviance. Analysis of survey data collected from 225 supervisor-subordinate dyads in a large manufacturing enterprise indicated that: (1) coaching leadership is positively associated with employee constructive deviance; (2) employee

these limitations, we collected a sample of 590 observations from 60 employees working in diverse occupations over 10 consecutive working days. Based on the conservation of resources theory, we expected presenteeism to be perceived as an active, problem-focused coping strategy that health-impaired employees use to get through tough times. More importantly, we considered presenteeism to be an effective way for employees to craft their jobs to balance physical and work demands. Our findings revealed that presenteeism mediated the relationship between episodic physical pain and job crafting. Moreover, interpersonal mistreatment (ostracism in our study) negatively moderated the relationship between episodic physical pain, presenteeism, and job crafting. The findings suggest that resource allocation and investment underlie presenteeism. Consistent with the resource-based view of stress, our findings emphasize the need to replenish employees' resource pool to help both employees and organizations cope with stress.

Drawing on sports injury literature, we examined why and how people persist after injury via interviews with 37 individuals who were and/or are injured. Based on their post-injury level of effort in comparison to their pre-injury level, we categorized participants into three groups (i.e., Below, Same, and Above). Through 42 injury episodes derived from the interviews, we identified different reasons of persistence and effort levels for each group of participants. We further identified 10 behavioral and 8 emotional/cognitive strategies that participants used to cope with injuries and compared differences among the three effort-level groups. Theoretical and practical implications are discussed.

The Effects of Leader Communication Indirectness on Subordinate Task Performance and Job Creativity

Author: **Ye Zhang**; Peking U.

Author: **Jack Ting-Ju Chiang**; Peking U.

Author: **Jiang XU**; Ph.D Candidate in Organizational Behavior

Author: **Yating Gao**; Peking U. Guanghua School of Management

The general consensus in leadership and communication research advocates direct communication in the workplace because it reduces uncertainty and increases efficiency. Our research indicates however that indirect communication can offer unique benefits that cannot be obtained through direct communication. Drawing from the situational strength theory and regulatory focus theory, we develop a comprehensive model to simultaneously examine the constraining and enabling effects of leader communication indirectness on subordinate task performance and job creativity. A multi-source, time-lagged survey data of 224 leader-subordinate dyads reveal that leader communication indirectness is positively associated with subordinates' perceived job autonomy, and this association is strengthened by their promotion focus. Meanwhile, leader communication indirectness is negatively related to subordinates' perceived goal clarity, and this relationship is. In addition, subordinate promotion focus strengthens the positive relationship between leader communication indirectness and subordinate

Influence of Workplace Safety Climate on Presenteeism from the Perspective of Affect and Cognition

Author: **Beini Liu**; Beijing Technology and Business U.

Author: **Qiang Lu**; Beijing Technology and Business U.

Based on the stimulus-organism-response theory and cognitive-affective personality system theory, this paper explores how the theoretical model of the workplace safety climate (WSC) influences presenteeism. Affect-based trust and cognition-based trust are assessed, and the situational role of organization formalization in this process is examined. Using a time-lagged research design, data from 396 healthcare employees were gathered and multiple regression and bootstrapping were used to test each hypothesis. The results show that: (1) WSC significantly reduces presenteeism. (2) Both affect-based trust and cognition-based trust mediate the relationship between WSC and presenteeism. Affect-based trust exerts a complete mediating role, while cognition-based trust exerts a partial mediating role. (3) Cognitive psychological path influences affective psychological path. Cognition-based trust completely mediates the relationship between affect-based trust and presenteeism. (4) Organization formalization exerts a positive moderating effect on the relationship between WSC and affect-based trust. However, it exerts no significant moderating effect on the relationship between WSC and cognition-based trust. This study overcame the single research perspective. Combined with organizational, work-related, and person-related factors the internal logic of the impact of WSC on the decision-making process in presenteeism was identified. The research results provide practical information for enterprises to create a sustainable organizational environment, reduce risks related to human resources, and effectively manage organizational health.

Linking Visionary Leadership and Creativity: A Multi-Level Investigation from the Goal Perspective

Author: **Wenjing Cai**; Vrije U. Amsterdam

Author: **Xueling Fan**; School of Business, Nanjing U.

Prior research mainly examined visionary leadership at either the individual level or the team level separately, which overlooks the integration of individual-level processes with team-level processes although it is acknowledged that leadership functions inherently multilevel. In the current study, we aim to fill this research gap by incorporating goal theories into multilevel leadership theories to further understand the effectiveness of visionary leadership. Specifically, we conceptualized visionary leadership as a multilevel phenomenon which manifests the dual-focused (i.e., team-level, and the individual perception of) visionary leadership in the team setting, and explored how it influences multilevel creativity—a core but neglected outcome-through multilevel goal processes. Using a two-wave data collected from 272 employees and their 75 corresponding supervisors in China, we found that visionary leadership affected creativity through multilevel pathways. Specifically, team-level visionary leadership influenced team creativity via its influences on team goal commitment, while individual-level visionary leadership influenced employee creativity by fostering leader-follower goal congruency. Besides, team goal commitment exerted a cross-level effect on employee creativity. Our study sets the stage for further research in theorizing dual-focused visionary leadership and

understanding how it can function at multiple levels to increase creativity in organizations.

The Creativity Bias: Investors Respond Negatively to Executives' Creative Expression

Author: **Michael Haselhuhn**; U. of California, Riverside

Author: **Elaine M. Wong**; U. of California, Riverside

Author: **Margaret Ormiston**; George Washington U.

Creativity and innovation are often considered to be essential characteristics of effective organizations. However, recent experimental research suggests that individual-level creativity in the workplace is not always perceived positively because of the uncertainty inherent in creative ideas. Although this research has advanced our understanding of perceptions of individual creativity in organizations, less is known about whether this creativity bias holds in real world contexts and, if so, whether there are organizational consequences. In this paper, we examine the organizational implications of creative expression in Fortune 1000 firms as captured in executives' discussions of their firms' creativity in quarterly earning calls. We predict that due to the association between creativity and uncertainty, market reactions to executives' expressions of creativity will be negative. We find that greater expression of creativity-related constructs is negatively related to stock market returns, but positively related to firm financial performance, suggesting the bias may not be rational. Our study has a number of theoretical implications for the study of leadership, creativity and firm performance as well as managerial implications.

When it Pays to be Less than Perfect: Entrepreneurs Sharing Flaws with Investors can Attract Funding

Author: **Lauren Christine Howe**; U. of Zurich

A key challenge for entrepreneurs is to raise investments into their business, and a common narrative in literatures on entrepreneurship and social influence more broadly is that such investments are more likely forthcoming for those who possess outstanding qualities (e.g., self-confidence, passion) as opposed to those who suffer from personal flaws (e.g., insecurity, arrogance). Drawing on theories of similarity-attraction, social comparison, and identification, we suggest that flaws can benefit entrepreneurs to the extent that they increase investors' perceived closeness to them. Specifically, we theorize that "bridging flaws" that highlight a deficit in a desirable trait (i.e., a lack of self-confidence) will increase identification with an entrepreneur and increase investments, while "distancing flaws" that indicate an excess of a desirable trait (i.e., inflated self-confidence) will decrease identification and investments. Further, we propose that bridging flaws prompt greater identification and investment from investors who feel that they share these flaws, and that distancing flaws most repel these investors. Evidence across three studies including both archival data analyses and experiments provide general support for our conceptual model. Challenging the prevailing narrative on the benefits of exceptionalism, we provide a nuanced understanding of when and how entrepreneurs benefit from the exposure of flaws.

More Human Than Machine? The Effects of Depicting the Future of Work as Relational or Technological

Author: **Lauren Christine Howe**; U. of Zurich
Author: **Leonie Jolanthe Hentrup**; U. of Zurich
Author: **Jochen I. Menges**; U. of Zurich

Technological advancements are changing the world of work and sparking widespread interest in the future of work. Research suggests that both

The Role of Shared Future Selves and Self-Continuity in Promoting the Presence of Meaning in Life

Author: **Charles Chu**; Stanford GSB
Author: **Brian Lowery**; Stanford U.

Modern work life is increasingly lacking in structure, which poses challenges to workers' ability to maintain a sense of meaning in life (MIL). In the current research, we examine the role of perceiving a shared future self and the feeling that who we are is permanent and persists into the future (i.e., temporal persistence) in facilitating the experience of MIL. Across four experimental studies, we find consistent evidence that people who envision a future self that they perceive as shared and verified by those around them leads to the feeling that who they are will persist into the future. This sense of temporal persistence in turn leads to the experience of MIL. We conclude with implications for fields examining questions pertaining to meaning in life, the self-concept, and modern careers.

Linking Job Autonomy to Work Engagement: The Mediating Role of Challenge Demands

Author: **Simeon Muecke**; Technische Hochschule Ostwestfalen-Lippe
Author: **Kathleen Linderman-Hill**; St. Ambrose U.
Author: **Jessica Marie Greenwald**; St. Ambrose U.

We theorize that job autonomy leads to higher work engagement because it makes employees' jobs more challenging. Results of a study of 267 employees supported our hypotheses that challenge demands (felt responsibility and cognitive demands) mediate the relationship between job autonomy and work engagement. We differentiated three dimensions of job autonomy (decision-making, scheduling, and method autonomy) and showed that work engagement is affected by decision-making and method autonomy, but not by scheduling autonomy. Moreover, mediating mechanisms varied depending on the type of autonomy. Decision-making autonomy led to work engagement through feelings of responsibility,

technological skills (e.g., programming) and relational skills (e.g., empathy) will be valuable for future employment opportunities, but it is unclear what the future workforce believes about this. Psychological theories suggest that the extent to which people focus on the role of technological versus relational skills in the future of work would shape their emotional and behavioral responses. We predicted that, given the prominent role of technology in discussions about the future of work, people would under-recognize the future need for relational skills. Drawing on theories of socio-relational motivation and goal congruity, we further predicted that depicting the future of work as relational would prompt people, especially women, to feel more positively about it. However, we also predicted that people would prioritize the development of technological skills, even when the future of work was depicted as relational. We find general support for our ideas in two experiments. By understanding people's beliefs about the future of work and how reactions differ among social groups, researchers and practitioners will be better able to help the future workforce prepare for a changing world.

Exploring Grey Zone Behaviours Between Corruption and Whistleblowing

Author: **Andrea Tomo**; U. of Napoli Federico II, Italy

Author: **Ernesto De Nito**; U. of Salerno

Author: **Paolo Canonico**; U. degli Studi di Napoli Federico II

Author: **Gianluigi Mangia**; U. degli Studi di Napoli Federico II

Author: **Stefano Consiglio**; U. of Naples Federico II

Literature on corruption and whistleblowing is increasing over the last years. However, we contend that individual reactions to a corrupt proposal could differ from the mentioned behaviours. In more detail, we contend that a 'grey zone' between accepting corruption and whistleblowing does exist. This paper aims at exploring what are the behaviours defining this 'grey zone' as nuanced behaviours adopted to react to a corrupt proposal. We draw from Miceli and Near's process of whistleblowing to open the scope for the

whereas method autonomy led to work engagement through cognitive demands. Our study offers a new perspective on the challenging potential of job autonomy, thereby advancing our understanding of whether and why job autonomy is linked to work engagement. Implications for future research and professional practice on job autonomy are discussed.

Reflecting on Work Design for Improving Quality of Work: An Experiential Learning-Based Field Study

Author: **Yukun Liu**; Curtin U.

Author: **Maria Tims**; Vrije U. Amsterdam

Author: **Sharon Parker**; -

Author: **Bin Wang**; Curtin U., Perth

Author: **Jing Qian**; Beijing Normal U.

Over a century's research on work design has consistently demonstrated the quality of work as a crucial factor that significantly influences both employees' work effectiveness and their well-being. Yet poor quality of work is still prevalent in today's workplace, suggesting that the application of work design theories into practice is insufficient or ineffective. In this research, building on the theory of experiential learning, we contend that the reflection of work characteristics, combined with the transformation of work design knowledge into experience, are two crucial processes that lead to the successful application of work design concepts (specifically, job crafting). We develop a work design reflection intervention and propose that the intervention helps employees to craft their work and thereby improve the quality of their work designs. Using a between-individual field experiment involving 117 full-time employees, we found that reflecting on work design indeed motivated employees to craft their structural job resources, which further improved their job autonomy. We also found that the reflection intervention was only effective in enhancing crafting for employees with lower levels of work centrality; while those employees with higher work centrality crafted their structural resources regardless of the reflection intervention. We discuss the implications of this research.

comprehension of grey behaviours in the decision-making process following to a triggering event. Making a case from the Italian public administration through interviews and storytelling, we explore what kind of behaviours might define the grey zone. Findings unveil nuanced behaviours configuring neither as corruption nor whistleblowing, ranging from ignoring the corrupt proposal to explicit contraposition. Also, they reveal different social and individual outcomes affecting future relationships in organizations. The findings allow to extend Miceli and Near's process to a wider spectrum of response behaviours to triggering events such as receiving, or assisting to, a corrupt proposal. Although recognizing that some limitations might be in that the situations detected could be only a part of a possible wider 'grey zone', findings provide interesting implications under theoretical, practical, social, and policy making perspectives, advancing a debate on nuanced behaviours between corruption and whistleblowing. This provides a support both for organizations and policy makers for a better understanding of individual behaviours and improving actions and policies to prevent corruption and encourage whistleblowing.

Supervisor Feedback and Employee Feedback Seeking Behaviors: Testing a Mediated Moderation Model

Author: **Shuhua Sun**; Tulane U.

Author: **Angelo DeNisi**; Tulane U.

In this three-wave field study, we investigate how supervisor feedback affects employees' subsequent feedback inquiry and monitoring behaviors. Drawing from Feedback Intervention Theory, we identify positive and negative feedback and perceived feedback quality as critical cues of supervisor feedback. Further, we propose that these feedback cues interact in shaping employee psychological empowerment and perceptions of supervisor abusiveness, which in turn affect employee future feedback inquiry and monitoring behaviors differently. Consistent with our expectations, perceived feedback quality moderates the relationship between positive supervisor feedback and employee psychological empowerment, which

Well-Designed Work Helps Individuals to Mature Over Time: Evidence from a 20-Year Longitudinal Study

Author: **Yukun Liu**; Curtin U.

Author: **Liangting Zhang**; Hainan U.

Existing research in the field of personality development has long established participation in work or employment as an important contributor for individuals' personality change or development. It remains relatively understudied as to what specific features or characteristics of one's work or job could influence the changes of people's personalities over time and what could be the underlying psychological mechanisms. Building upon the existing personality development research and drawing on the extant research on work design, we propose job autonomy and social support as two important work characteristics that could positively influence the development of individuals' conscientiousness and emotional stability, two personalities reflecting individuals' maturity. Using publicly available data from a 20-year longitudinal study, our analyses demonstrated that, within individuals and over 20 years' time, individuals' job autonomy was positively associated with conscientiousness (mediated through sense of control) whilst their social support at work was negatively associated with neuroticism (mediated through positive and negative affect), suggesting that well-designed work could help working adults to mature over time. We also found that the beneficial effects of well-designed work on the development of maturity were only observed for individuals with lower (vs. higher) levels of education. We discuss the implications of this study.

in turn relates to feedback inquiry but not monitoring. Specifically, only when perceived feedback quality is high, there is positive effect of positive supervisor feedback on subsequent feedback inquiry via psychological empowerment. Further, as expected, perceived feedback quality moderates the relationship between negative supervisor feedback and employees' perceptions of supervisor abusiveness, which in turn relates to feedback monitoring but not inquiry. Specifically, only when perceived feedback quality is high, negative supervisor feedback has an indirect effect on feedback monitoring via perceptions of supervisor abusiveness. We discuss the theoretical and practical implications of the findings.

Identity in Online Environments (session 1118)

The Role of Identity in Supporting a Shared Reality On Cross-Functional Project Teams

Author: **Susan Leigh Johnson**; Weatherhead School of Management, Case Western Reserve U.

Author: **Richard J. Boland**; Case Western Reserve U.

Author: **David Aron**; Weatherhead School of Management, Case Western Reserve U.

Author: **Yunmei Wang**; Case Western Reserve U.

Project structures have become a dominating form to organize and accomplish work in firms today. This study focused on firms that source the functional expertise needed to support project implementations on a temporary basis from their organizational hierarchy. In this matrixed structure, individuals reside in two social worlds, that of the project team and that of their functional team. The purpose of this quantitative study was to understand the effect of social identity on cross-functional project teams' communication and their ability to develop a shared reality with other project team members. In this study, we surveyed 212 members of cross-functional project teams in the

Leadership in a Technology-Mediated World (session 1119)

"Move Fast and Break Things": Silicon Valley and the Language of Entrepreneurial Leadership

Author: **Susan Stryker**; U. of San Francisco

Author: **James Stryker**; Holy Names U.

Entrepreneurs have long been recognized for their critical role in the development of a vibrant and growing economy. As key "agents of innovation and creative destruction" researchers have differentiated between entrepreneurs and managers predominantly in terms of two factors: (1) personality and (2) social cognitive processes or the way they think. In this study, we explore a new way of looking at the differences between entrepreneurs and managers that may be more useful for practicing managers: their language usage or the way they talk. Using text analysis software, we compare the language from interviews with Silicon Valley entrepreneurs (n = 65 entrepreneurs) with the language from interviews with senior managers (n = 65 managers). As hypothesized, entrepreneurs used significantly more words that were focused on the importance of time, money, and teamwork than

financial services sector. We found that a strong functional identity was positively related to the ability of an individual to understand what is being communicated from another discipline. The ability to understand someone from another discipline was positively related to a successful project outcome. This study contributes to the literature on team social identity by demonstrating how it is mediated by effective communication across functional boundaries to create successful project outcomes.

Effect of Identity Disclosure on User Participation in Online Communities: A Natural Experiment

Author: **Bingjie Qian**; Hong Kong U. of Science and Technology

Author: **Tat Koon Koh**; Hong Kong U. of Science and Technology

Author: **Xiaoquan (Michael) Zhang**; The Chinese U. of Hong Kong

In this paper, we empirically study the motivations of user participation in online communities. We focus on a specific form of user participation, i.e., “liking” the content posted by others. Our identification strategy relies on an exogenous policy change of a Chinese online community. Users who have “liked” an article were anonymous before the change; the identities of such users were publicly disclosed after the change. We identify three motivations from prior literature that are relevant in our context: intrinsic utility motivation, relational motivation and image motivation. We leverage the fact that these three motivations predict different user reactions to the policy change to identify the dominating motivation. We find that users gave significantly fewer “likes” after the policy change, which is consistent with the prediction of image motivation. The analyses of the content and user characteristics provide additional support for the dominating role of image motivation. This paper provides insights into user behaviour in online communities and has practical implications for both platforms and content creators.

[view paper \(if available\)](#)

managers. Contrary to expectations, managers used more positive emotion words compared with entrepreneurs. We conclude with a discussion of the limitations and implications of our findings for management practice and future research with a particular focus on lessons learned for managers wishing to act like entrepreneurs within their own organizations as entrepreneurs.

Would You Like a Humorous Email from Your Manager? Impression Management and Behavioral Intentions

Author: **Yael Brender-Ilan**; Ariel U.

Author: **Abira Reizer**; Department of Social Sciences and Psychology, Ariel U.

Humor is a form of communication that is intended to be amusing and produce positive cognitive and affective responses from receivers. Nonetheless, humor in the workplace is a complicated matter. It has been recognized as a valuable tool for managers because it can activate various favorable outcomes and alter employees' perception of the manager's warmth and competence (impression management), but not always to the benefit of the manager. In this age of globalization, current technology coupled with the stipulation of immediate communication and quick reactions directs workplaces to use computer-mediated communication (CMC) for day-to-day professional activity. Therefore, this study was set to examine the use of humor in managerial emails. Across our studies, the use of humor showed altered beliefs about a manager's warmth and competence, and eventually influenced the employee's behavioral intentions. In Study 1, we tested the use of managerial humor in two consecutive directive emails. The humorous manager was perceived as warm, but not competent. Impression management mediated the employee's willingness to work with the manager. In Study 2, we tested the use of managerial humor with one introductory email. In this study, in addition to checking employees' perception of the manager, we also monitored the gender of both the manager and employee. Once again, the humorous manager was perceived as warm and humor mediated employees' behavioral intentions. As for

Who is in Charge of Digital Transformation? The Birth and Rise of the Chief Digital Officer

Author: **Arne Buchwald**; Vlerick Business School

Author: **Felix Lorenz**; EBS Business School

With the increasing pressure for organizations to digitalize, many companies are complementing their top management teams (TMT) with new members, chief informational and digital officers (CIOs and CDOs). As members of top management teams, CIOs and CDOs are expected to fulfill essential roles in the digital transformation strategy and its implementation. By making decisions on digitalization, they also influence business model development, innovation, and business strategy. While research on digital transformation is growing steadily, we lack a coherent understanding of the extent and nature of these top management roles and their relationships and the specific tasks involved. Based on the literature on management, information systems, and related fields, this paper discusses the evolving CIO and CDO roles and their interrelationships. Our key contribution is to conceptualize the role split, the emergence of the CDO, the nature of organizational roles and relationships by drawing on concepts of organizational ambidexterity, transactive memory systems (TMS), and shared understanding. We find that despite the separation of roles and potentially overlapping responsibilities, a collaborative relationship can be beneficial due to the complementary nature of the roles particularly to drive the digital transformation. We conclude with a future research agenda.

Leadership Competencies for Digital Transformation - Skills and Traits Sought by Practitioners

Author: **Katharina Gilli**; Free U. Bozen, Bolzano

Author: **Michael Nippa**; Free U. Bozen, Bolzano

Author: **Michael Knappstein**; ISM International School of Management

One of the greatest challenges organizations face today is taking advantage of the opportunities offered by advanced information and communication technology. In order to successfully master this digital transformation, organizations need change leaders capable of envisioning, planning, implementing, and managing new business models. Apart from conceptual and practice-oriented contributions, however, there are no empirical studies that analyze what kind of leadership competencies are considered necessary by practitioners. Hence, in order to draw conclusions for research and practice, job requirements outlined in 274 job advertisements explicitly targeting digital transformation experts were identified and categorized applying the leadership skills strataplex taxonomy. Our results reveal a higher importance of managerial and leadership skills compared to technical skills, and thus are similar to the requirements of earlier strategic change processes. This can be interpreted in different ways. Either practitioners overlook important specific leadership competencies or researchers and other experts wrongly overemphasize the technological novelty of digital transformation.

[view paper \(if available\)](#)

interdependent at both individual and collective levels. Drawing data from a massive multiplayer online game (MMOG), this paper models the interaction of the two forms of social identity on performance by examining 207,633 individuals affiliated to 5,797 groups. The findings show that groups fragmented into clusters have higher survival rate and better performance when category boundaries are clear, and individuals with influential within-group network positions have more outstanding performance when their category identities are unfocused. Theoretical and practical implications of findings are discussed.

How Doctors' and Nurses' Motivations Shape Perceptions of System Benefits and Resistance to CPOE

Author: **Hyoungyong Choi**; U. of North Carolina at Greensboro

Author: **Mark Keil**; Georgia State U.

Author: **Arun Rai**; Georgia State U.

Author: **Likoebe Maruping**; Georgia State U.

To explain users' resistance to Information Systems (IS), previous research studies focused on the changes triggered by new IS (i.e., in routines, power, autonomy, etc.) and how such changes affect users' perceptions (i.e., inequity, threat, etc.). Missing from extant views of resistance to IS is an understanding of the role of work-related motivations in shaping users' resistance to newly implemented systems. Drawing on the motivational affordance lens, we propose a new resistance mechanism that explains how healthcare professionals' motivations influence resistance to Computerized Provider Order Entry (CPOE). Specifically, using a longitudinal research design in which we surveyed both doctors and nurses, we demonstrate that system benefit mediates the effect of motivation for efficiency on resistance to CPOE both for doctors and nurses but that it mediates the effect of motivation for quality on resistance to CPOE only for nurses. Also, we demonstrate two countervailing mechanisms for the effect of motivation for efficiency on resistance to CPOE (i.e., positive direct effect and negative indirect effect via system benefit). This study makes a theoretical contribution by identifying a new

Leadership Emergence in OSS Communities: Evidence from the Linux Kernel Development Project

Author: **Marvin Hanisch**; U. of Groningen

Author: **Thomas Bock**; Saarland U.

Author: **Claus Hunsen**; U. of Passau

Author: **Carolin Haeussler**; U. of Passau

Author: **Sven Apel**; Saarland U.

In open-source software (OSS) communities, core developers—e.g., maintainers for a specific subcomponent—play a crucial role in community governance. Previous research has mainly described the characteristics and functional roles of core developers, but few have examined the drivers of progression from peripheral roles to core roles. Our theoretical model deviates from previous research by emphasizing the moderating role of developers' span of contributions. Specifically, we suggest that the positive effect of code contributions on developers' progression is weakened, due to productivity losses and higher marginal costs of learning, when their technical span is broader. By contrast, the positive effect of communication with community members on progression is amplified when developers' communicative span is broader, given the benefits of cross-functional thinking and community integration. Our theory is supported in a longitudinal study of 29,818 developers in the Linux kernel development project. Our paper introduces a novel mechanism for explaining the emergence of lateral governance mechanisms in OSS communities and contributes to the more general debate on the benefits of specialization in the context of organizational governance.

Behavioral Theory of the Firm: New Research (session 1126)

Organizational Response to Shortfalls: The Role of Decision Makers' Self-Confidence and Time Slack

Author: **Xavier Sobrepere**; U. of Zurich

The behavioral theory of the firm (BTOF) states that performance shortfalls trigger organizational responses seeking to restore performance above the aspiration level. However, previous research has shown weak support for this proposition. One explanation for this lack of support is optimistic performance assessments: Performance shortfalls might not be perceived as problematic by decision makers, which leads them to underestimate the need for a response. In this paper, I argue that decision makers' self-confidence promotes

social media platform Twitter. It builds theory on the genesis of an open online community as a process of spinning and twisting of discourses that coalesce the interests of the members. This study contributes to scholarship on online communities by theorizing the process by which they come to exist as well as the literature on organizational dialog by elaborating on how dialog leads to self-organization in open communities.

Punctuating Time: Temporal Structuring as a Resource for Sustained Engagement in Online Communities (WITHDRAWN)

Author: **Anne-Laure Fayard**; New York U.

With online communities increasingly viewed as potential sources of innovation, organizations are exploring possible partnerships with them or, in some cases, trying to design such communities themselves. Organizations are often faced with challenges when collaborating with online communities—particularly with managing governance and sustaining engagement. Drawing on a forty-month ethnographic study of OpenIDEO, an open innovation platform for social innovation, I examine how an organization created a diverse, global community and invited its members, via sponsored challenges, to collaboratively generate ideas for tackling complex social issues. Through inductive analysis, I identify the important role played by time—more specifically, temporal structuring (i.e., visually mapping activities to time and online / offline cycles). The OpenIDEO team used temporal structuring as a punctuating device that became a resource for both themselves and community members. They also used time as a complementary mechanism for governance. This study contributes to the literature on open innovation, collaboration between organizations and online communities, and time.

Digital Organizing and Emergent Collaboration on Twitter in Pursuit of Social Action

Author: **Daniel Lundgaard**; Copenhagen Business School

optimistic interpretations of performance assessments when performance is ambiguous enough. However, when performance shortfalls are unambiguous, I predict that decision makers' self-confidence leads to the opposite consequence, strong organizational responses, due to risk-seeking behavior. In addition, in this paper I propose that organizational slack is a source of ambiguity in performance assessments allowing for favorable interpretations. Particularly, I propose that decision makers prone to make optimistic performance assessments overestimate the value they can extract from slack, which leads them to underestimate the need for a response to performance shortfalls. I find support for my hypotheses by analyzing 101,146 first down decisions from the National Football League (NFL) between seasons 2009 and 2016.

Temporal Distinction of Multiple Goals and Effects on Strategic Risk-Taking

Author: **Renfei Gao**; U. of Manchester

Author: **Cyndi Man Zhang**; Singapore Management U.

Author: **Xiaogang He**; Shanghai U. of Finance and Economics

Author: **Zhengyu Li**; Shanghai U. of Finance and Economics

Organizational goals play a central role in driving firm decision making. The behavioral theory of the firm conceptualizes goals as situational aspirations that guide organizational adaptation through performance feedback. However, this aspiration-directed logic implicitly assumes the short-term orientation of decision makers, while the effect of long-term strategic goals on firm decision making is less explored. Our study focuses on long-term strategic goals, which, we argue, influence firm decision making through decision makers' commitment. Borrowing insights from strategic communication research, we conceptualize strategy specificity to capture decision makers' commitment to strategic goals and theorize its implications for firm strategic risk-taking. Additionally, we examine the interactive effects of strategy specificity and performance feedback on strategic risk-taking, with

Author: **Liana Razmerita**; Copenhagen Business School

Author: **Chee-wee Tan**; Copenhagen Business School

On the basis of a comparative case study of three social movements, #IceBucketChallenge, #BlackLivesMatter and #YesAllWomen, this paper explores how collaboration emerges online on Twitter. The study draws on organizing logics literature, research on online collaboration and online social network theories, combined with the analysis of tweets collected from days where the movements had high levels of activity. Drawing on the literature review, we derive a framework consisting of three organizing elements, structure, engagement and communicative content. These are used to analyze the distinctive characteristics of collaboration across the different cases. The article also identifies the distinctive features of the three online social movements at different levels of mobilization: the propagating movement, the coordinated movement and the co-creating movement. The study contributes to the understanding of distinctive features and organizing elements that lead to emergent collaboration in online social networks at different levels of mobilization.

Invisible Cages: How Opaque Control Tactics Influence Worker Behavior

Author: **Hatim A. Rahman**; Northwestern Kellogg School of Management

Most studies of control focus on how organizations' visible control tactics impact worker behavior, as exemplified by the metaphor of the "iron cage." Drawing on interviews, archival data, and observations as a registered user on an online labor market, I studied how such a market's opaque control tactics affected freelancers' work practices. Specifically, my findings show that the market's implementation of an opaque algorithmic evaluation led workers' experiences to resemble less of an iron cage and more of an "invisible cage." That is, freelancers were never able to understand whether and how their actions contributed to changes in their rating evaluation. The results suggest that by

contingencies of managerial discretion and board shareholding. Using panel data on 1,074 Chinese listed firms in manufacturing industries, we find that firms with higher strategy specificity engage in more strategic risk-taking. However, this behavioral tendency is weakened when firms receive strong negative or positive performance feedback. Moreover, we find that the moderating effect of performance feedback on strategy specificity is enhanced by managerial discretion but mitigated by board shareholding.

Managerial Interpretations of Performance Feedback (WITHDRAWN)

Author: **Hugo Verver**; Tilburg U.

Organizational performance feedback theory, derived from the Behavioral Theory of the Firm, is one of the most utilized theories to explain strategic behavior of organizations. This theory argues that when performance relative to aspiration levels decreases, problemistic search increases. However, empirical evidence is not as unequivocal. We propose that one way to resolve the contradicting empirical evidence is to identify and study in-depth factors that explain the coalescence between the process of performance-aspiration comparison and managers' interpretations of performance feedback. In this conceptual paper, we extend the performance assessment component of performance feedback theory. We do so by arguing for a more refined and elaborated behavioral model of responses to performance feedback, based not only on whether performance surpasses the aspiration level or not, but also accounting for managers' assessment of reliability and for their level of satisfaction. To facilitate future research on responsiveness to performance feedback we provide testable propositions.

[view paper \(if available\)](#)

Influences of Top Managers' Pay Dispersions on Organizational Responses to Performance Shortfalls

leveraging significant power and information asymmetries over workers, an invisible cage inverts how control operates because the organization can change the criteria for success and rate at which changes occur without notice or recourse, rendering the control tactics opaque to workers. I found that even highly rated workers, among the primary intended beneficiaries of the opaque algorithmic evaluation, exhibited paranoia and wariness, taking steps to withdraw from the platform. I discuss the implications and boundary conditions these findings have as related to the literature on control and evaluations in the emerging economy.

The Role of Workgroups on User Participation on Enterprise Social Media

Designated as a "Best Paper" for OCIS

Author: **Christina Yong Jeong**; U. of Minnesota

Author: **Jason Chan**; -

Author: **Yue Guo**; southern U. of science and technology

Increasing number of firms are adopting enterprise social media (ESMs), however it is unclear whether and how it enables better communication. In this paper, we focus on the workgroups feature that allows firms to segment users by relevance. While companies create workgroups under the expectation that users would be more willing to participate, overall effects of workgroups on ESM participation unclear. Online groups help to frame the online discussions around relevant work content to their users, however it is also true that the rigid communication structure of workgroups works against casual, personal style of communication that social media sites have. The analysis shows that users participate more after workgroups are instituted, and especially managers are the main group of users who stand to benefit from the feature of workgroups. Our study addresses a theoretical paradox revolving around the ambiguous impact of workgroup features on user participation on ESMs.

[view paper \(if available\)](#)

Author: **Elizabeth Lim**; Georgia State U.

The behavioral theory of the firm has been tested across various organizational change settings. This literature shows that firms pursue change when performance drops below aspirations, but relatively scarce research examines how pay dispersions of the dominant coalition influence this process. Integrating insights from behavioral theory and pay dispersion research and applying them to the business divestiture context, we propose that top executives facing total pay dispersions likely experience team conflicts and dissatisfaction, attenuating divestiture rate in response to performance shortfalls. Managers with distinct time horizons, however, exhibit varying behaviors whereby unexercisable option pay dispersion weakens divestiture rate due to widening pay gap over the long-term whereas exercisable options and stock pay dispersions foster divestiture tendencies to improve short-term performance and close the pay gap.

Conflict, Authenticity, and Silence: Organizations in Transition (session 1120)

Breaking Organizational Silence

Author: **Irina Liuberté**; ISM U. of Management and Economics

It is a common practice in organizations for employees to withhold or distort—"sugarcoat"—some of their opinions, especially when these opinions concern unpleasant news that needs to be communicated to managers. However, sometimes such withholding of information grows into the pervasive silencing of issues and this may have detrimental effects on the business as well as the well-being of organizational members. Therefore, it is important for both practitioners and scholars to understand how organizations might reverse the negative dynamics around such silenced issues. With this paper, we describe one of the ways in which organizations may break the silence and contribute to the theoretical understanding of the process. We draw on a unique ethnographic study dataset, in which, at the time of the observation, employees collaborated with their managers, and attempted to break the silence surrounding a particularly problematic organizational issue. We trace the process of how anxiety around the silenced issue built up in the organization, and how attempts to break the silence culminated in a metaphorical, humorous, and hyperbolized public revelation. These findings show the importance of courage, strategic use of humor and adaptive planning, and contribute to the understanding of socio-organizational practices around the complex issues embedded in organizational cultures.

Imprinting Effects on Strategy and Entrepreneurship (session 1122)

Contested Ideological Imprinting: State, Family Reading, and Entrepreneurship in Post-Mao China

Author: **Hongwei Xu**; U. of Windsor

Author: **Litao Zhao**; National U. of Singapore

We theorize the contested process of ideological imprinting. We argue that ideological imprinting tends to be both hierarchical and sequential, and whether organizational imprinters can effectively buffer against the penetration of societal imprinters depends on the temporal order of the latter. Empirically, we study how family books reading at adolescence buffers the pre-Mao cohort and Mao cohort against the communist ideological imprinting during the Mao China (1949-1978), and subsequently shapes their entry into private entrepreneurship in the post-1978 reform era. We find that family reading atmosphere at adolescence was more effective in mitigating the negative effect of the communist state ideology on the pre-Mao cohort's than the Mao cohort's post-1978 entrepreneurial entry. Our study shows that incongruent alternative values of individuals—once successfully imprinted—mitigate the effect of a dominant societal ideology, generating heterogeneous effects on organizational behavior. Implications for research on imprinting analysis, values and entrepreneurship, and entrepreneurship in post-communist societies are outlined.

Firms of Endearment: Organizational Imprinting in Business Ecosystems

Author: **Andrew Joseph Foley**; Cornell SC Johnson College of Business

Business ecosystems have been advanced as an analytical lens for studying multilateral arrangements of firms that span industries and in which the boundaries between competition and

Access to formal financial products like savings and checking accounts constitutes a hallmark feature of economic development. Across the globe, governments and other organizations promote 'financial inclusion' among lower-income citizens. Seeking to understand why individuals embrace or resist financial services, scholars focus on institutional, cultural, and material explanations, but pay less attention to organizations and small groups. In this study, we argue that such factors are crucial to understanding the development of financial preferences. We investigate a government-sponsored microsavings program in Colombia and find that participants became less interested in banking services over the course of the program, even as they gained access to appropriate accounts and their savings increased. Turning to qualitative data to understand this curious finding, we show that organizational efforts to disseminate abstract information about banking triggered a process of information 'elaboration' among group members, leading many to develop financial preferences at odds with those promoted by the government. This paper integrates insights from economic sociology, organizational theory, and microsociology to advance theories of financial preference. In doing so, it reveals how organizational efforts to compress information, followed by group efforts to personalize and expand upon it, can shape preferences and potentially undermine organizational goals.

Integration of Competing Logics Through Anchoring and Recontextualization

Author: **Kurt Norder**; U. of Delaware

Author: **Sudheer Gupta**; Simon Fraser U.

Author: **Jai Ganesh**; Mphasis NEXT Labs

Integration of organizational elements from competing institutional logic archetypes can provide tremendous value for society through the hybrid organization. Despite these potential benefits, most work on hybrid integration stops at inclusion of elements within the organization with subsequent isolation or leaves the relationships within and between organizational elements under-explored.

collaboration are unclear. A key construct in the ecosystem literature is the complementor. These are firms that, while not formally connected to a focal firm, provide services that are necessary for the focal firm's value to be realized by consumers. While the literature has emphasized the tensions faced by a focal firm as it attempts to align the efforts of its complementors to its value proposition, however, these studies have tended to take a static view of this phenomenon: they haven't considered how a focal firm's past decisions of which complementor firms to engage impact their ability to engage with successive complementors in the future. Moreover, the literature on ecosystems has viewed complementors as fungible. As a result, we still lack an understanding of how a focal firm's choices of complementors over time impact the evolution of an ecosystem. This paper contributes to the ecosystems literature by building theory that foregrounds the role of complementors in the development of business ecosystems and by responding to calls for an inter-temporal perspective on ecosystem evolution.

Toward a Dynamic Perspective on Organizational Authenticity

Author: **Carlotta Benedetti**; Free U. of Bozen, Bozen

Author: **Emanuela Rondi**; Free U. Bozen, Bolzano

Author: **Josip Kotlar**; Politecnico di Milano School of Management

Author: **Alfredo De Massis**; Free U. Bozen, Bolzano and Lancaster U.

Prior research has investigated organizational authenticity by considering the underlying consistency between internal values and external expressions as persistent and static, thus neglecting its temporal dimension. In this study, we provide a richer consideration of the processual nature of organizational authenticity, through an empirical investigation of how it evolves over time. We do so by conducting an in-depth qualitative case study of Masi Agricola, a seventh-generation family-owned Italian wine producer. Our analysis revealed that, when facing episodes of authenticity struggle, the organization experienced a first phase of authenticity drifting, including those actions that underpinned the perception of inconsistency between values and practices and the organization displaying such discrepancy. This was critical to facilitate the organizational reaction, ensuing a new phase of authenticity grafting to establish new links of consistency. Our findings and theoretical insights advance the current understanding of the temporal dimension of organizational authenticity, challenging the prevailing view of a linear process of

authenticity restoration, and providing new insights on the dichotomy between consistency and inconsistency as an instrumental dynamic in connecting values with practices.

Institutional Change, Disruption, and Reproduction (session 1123)

Collective Rage, Power, and Institutions: Examining Institutional Disruption, Defense, and Reaction

Author: **Bryant A. Hudson**; IÉSEG School of Management

Author: **Lee Charles Jarvis**; U. of Queensland

Author: **Elizabeth Goodrick**; Florida Atlantic U.

Abstract: In this paper we explore the role of the collective emotion rage in institutional disruption and change. While rage is considered a form of anger, the unique and intense experience of collective rage and potential for disruption deserves focused attention. We argue that rage can be experienced collectively as well as can be collectively suppressed or can be expressed in a number of ways. When such collective rage is expressed, various forms of collective institutional disruption may occur. We also argue that institutional guardians are likely to resist that disruption and engage in defensive and reactionary behaviors to defend existing institutional structures.

Lonely at the Top? CEO Sensemaking in the Boardroom

Author: **Andromachi Athanasopoulou**; Queen Mary U. of London

Author: **Michael Smets**; U. of Oxford

Author: **David Risi**; U. of St. Gallen

Author: **Tim J Morris**; U. of Oxford

Amidst the uncertainty and ambiguity characterizing CEO's role, issues or events that are "novel, ambiguous, confusing, or in some other way violate expectations" (Maitlis & Christianson, 2014: 57) mobilize CEOs to seek information and to challenge their - and others' - understanding. Drawing on in-depth qualitative interviews with 146 global CEOs, we conduct a micro-level analysis of how CEOs seek, process and make sense of information via their interactions with the TMT and others as part of their decision-making process. We explore the interchangeable and power-charged process of sensedemanding and sensemaking through which meaning-making and eventually decision-making occur. The process involves CEOs (nominally) conceding some of their power and voice to others, before retaining them prior to making a decision. CEOs invite dissension and hence, also invite multivocality (and as a result also equivocality) from their environment and seek to test or validate sensemaking and crystalize it into decisions. Our findings unpack the micro-dynamics of CEO decision-making drawing on the CEO-TMT interface,

demands can sustain organizational conformity. Studying the exemplary case of a highly acclaimed innovation project in a leading legacy newspaper, my findings suggest that, even in conditions of decreasing organizational efficiency and apparent institutional failure, the transposition of new ideas can reproduce existing institutional arrangements. The process model I propose explains how this happens in a process of empty translation that removes diverging meaning from imported ideas, decoupling the transposed policy from actual practice. The suggested theoretical model provides insights to translation and decoupling micro-level dynamics and their effect on isomorphism.

Imprinting Risky Behavior: The Institutional Origins of Bank CEO Risk-Taking

Author: **Jiwook Jung**; U. of Illinois at Urbana-Champaign

Author: **Kim Pernell**; U. of Toronto

Author: **Taekjin Shin**; San Diego State U.

Commercial banks in the United States have taken on more risk since the 1980s, in line with a shift in the dominant business model in the field, from one emphasizing financial stability to one promoting greater risk-taking to maximize shareholder value. But why did certain banks embrace risky strategies more actively than others? Combining insights from the upper echelons perspective and imprinting theory, we argue that bank CEOs who absorbed the principles of shareholder value maximization through MBA education and started their banking career in the post-deregulation era pursued risk-taking more aggressively than other CEOs. We test this argument using data on 194 large commercial banks from 1993 to 2015. Our analysis shows that CEOs with an MBA who entered banking after the mid-1980s were heavier users of brokered deposits—a riskier funding source that contributed to bank instability during the 2007-2009 credit crisis. They also contributed to the use of brokered deposits indirectly by promoting shareholder-value prescriptions known to boost incentives for managerial risk-taking. By highlighting the role that organizational decision-makers—and their institutionally-embedded cognitive orientations—

managerial cognition and decision-making literatures.

Everything Must Change so that Everything Can Stay the Same: Open Access in UK Academic Publishing

Author: **Sara Marquez**; De Montfort U.

Author: **Santi Furnari**; Cass Business School, City U. London

Author: **Anders Dahl Krabbe**; Stanford U.

In this paper, we explore the question of how incumbents can respond to disruptive, existential threats in a way that reinforces their privileged position within a field. We draw on the case of the transition towards open access in the field of academic publishing in the UK. The findings of this study reveal that in spite of the change - from academic production and distribution as 'closed access' to 'open access' - incumbents respond to the threat of disruption by using socio symbolic strategies. Strategies that incumbents utilized to first influence the institutional pressures they faced and secondly to implement open access practices of distribution in a way that enhanced rather than disrupted their ability to capture value. Therefore, the threat of disruption ends up being an opportunity for the incumbents. Our findings contribute to current theories on organizational theorizing. By identifying the strategies that incumbents used to manage the transition to open access by showing how incumbents not only can maintain their privileged position, but even reinforce it when confronting disruptive institutional pressures, we contribute to conversations of institutional maintenance. We also contribute to theories on technology and institutions: we find that technological discontinuities trigger institutional change as they open up a plethora of potential paths of institutional change which opens up a discursive power struggle amongst field participants in driving the path most aligned with their interests.

[view paper \(if available\)](#)

ethnographic study of peripheral Environmental Health and Safety professionals to show how these professionals constructed and enacted their own narratives to push back against dominant narratives of value. First, these functions minimized the disruptions caused by compliance, reversing negative perceptions of these functions as overseers or regulatory police, promoting instead a client service relationship. Second, these functions moved beyond compliance to highlight the important issues underlying regulations. These issues directly connected to how the organization generated value. In this way, these peripheral professionals established themselves as collaborators in core work, showing that their work was part of core work, not peripheral to it. This narrative approach to displaying value addresses the issues driving the divide between peripheral and core functions, thereby providing a more general strategy and platform for peripheral functions to address the challenges they face in organizations. This approach also enables organizations to better recognize and capture the value offered by peripheral functions.

Maintaining a Mandate of Meaningfulness: The Occupation of Career Advisers in Business Schools

Author: **Curtis Kwinyen Chan**; Boston College

Author: **Luke Hedden**; Boston College

Every occupation requires an occupational mandate to uphold its legitimacy. The mandates literature focuses on nascent occupations constructing mandates through the enactment of occupational values. However, even for mature occupations, mandates require maintenance, and this maintenance might be challenged when the occupation exists in an organization whose values misalign with occupational values. We examine career advisers in undergraduate business schools, a mature occupation whose values around helping students achieve purpose and fit in careers misalign with organizational values held among business school students around wealth or prestige and conformity. We conduct an ethnography of career advisers at an undergraduate business school, combined with an interview study of such advisers throughout the U.S. We find that advisers maintain

Asynchronous

PAPER SESSION

ASYNCHRONOUS

their mandate through several practices, differentiated by interactional setting and audience. In one-on-one advising sessions, career advisers discerned the alignment between the student's ambitions and advisers' values. Advisers enacted value-moderating practices when they perceived student misalignment with advisers' values, and they engaged in value-magnifying practices when they perceived alignment or openness. In group settings where assessing value congruence was infeasible, advisers engaged in value-masking practices, where they obfuscated values that could conflict with values of students, students' parents, or business school administrators. Overall, this study shows how members of a mature occupation—whose values misalign with organizational values—actively maintain their mandate by discerning between audiences and occasionally concealing rather than revealing their values.

Truly Trustworthy or Simply Strategic? An Examination of Strategic Generosity in the Trust Game

Author: David Kingsley; U. of Massachusetts Lowell

Author: Michael P. Ciuchta; U. of Massachusetts, Lowell

The importance of trust and reciprocity in facilitating mutually beneficial exchange has long been recognized. However, research suggests that the development of trust and reciprocity may be challenging if the actions are considered to be strategically rather than intrinsically motivated. This paper investigates whether initial acts of generosity impact the emergence of trust and reciprocity across strategic and non-strategic settings. Results suggest that when generosity can be perceived as being strategic it induces less trust. As a result, our research suggests that strategic considerations can

redesign and change. The results indicate that both cohesion and diversity of personal advice networks significantly affect the propensity of organizational participants to access knowledge across boundaries after a change in internal organizational structures and processes. In line with our hypotheses, the results also suggest that cohesion and diversity have opposite effects on the propensity of organizational participants to access knowledge across boundaries after the change depending on their dominant network role (sender or recipient) in the network of informal advice relations before the change. We discuss the implications of these findings for research on organizational change, knowledge transfer, and intra-organizational networks.

Your Secrets are Safe with Me? Audience Response to the Exit of Partners with Brokerage Advantage

Author: **Lakshmi Ganesh Yermal**; Amrita School of Business, Amrita Vishwa Vidyapeetham

Author: **Rajiv Krishnan Kozhikode**; Simon Fraser U.

Author: **Balasubramanian Palanisamy**; Amrita School of Business

The choice of a firm's exchange partner is an important decision that affects the quality of resources a firm gets. These partners generate social capital by acting as conduits of information flow between a firm and the market. The position where these exchange partners are situated within the organizational network enables access to valuable proprietary information about firms. Hence, the exit of such an exchange partner holding information advantage is expected to invoke a response from the market participants. We tested this by exploiting a unique natural experiment in India where the government made it mandatory for firms to change their auditors at least once every 10 years. We observe a positive response when firms lose an exchange partner holding diverse network positions. However, the response to losing the same is negative when firms associated with the partner are tainted with earnings management or corporate illegality. It is observed that the market is keen to let go of exchange partners with an informational advantage. However, if an exchange partner with information advantage is exiting a tainted entity

have a detrimental effect on welfare: earnings within equivalent trust games are lower in the strategic than in the non-strategic condition. Importantly, the observed generosity does not appear to have been strategic. Rather, it appears that simply the perception of strategic motivation is enough to reduce subsequent trust. On the other hand, we also observe that those subjects who acted more selfishly display significantly more reciprocity in the non-strategic relative to the strategic setting. This behavior appears consistent with moral balancing.

With Frenemies Like These: Social Networks Ties and Interpersonal Citizenship Behaviors

Author: **Kristie Joy Neff Moergen**; U. of Arkansas

Author: **Jonathan Johnson**; U. of Arkansas

This study examines the relationship between the type of social network tie shared between two individuals—positive, negative, or ambivalent multiplex (both positive and negative tie components)—and the performance of interpersonal citizenship behavior (ICB), a form of individually-targeted organizational citizenship behavior. Drawing from ego depletion theory, social exchange theory, and the social functions of emotions perspective, we argue that dyadic relational qualities influence the individual's decision to perform ICBs. Further, based on social categorization theory and social information processing theory, we posit that the number of positive alters a dyad shares increases the probability of ICB. We test the theoretical model in a study including 48 employees of a supplier organization for large retailers and food service companies using exponential random graph models (ERGMs). Results offer support for the hypothesized relationships, and the practical implications, as well as future research questions, are addressed.

Beyond Vision Clarity: It Takes Trust to Listen to the Team

Author: **Ipek Kocoglu**; Kean U.

Author: **Gary S. Lynn**; Stevens Institute of Technology

Author: **Zvi Aronson**; Stevens Institute of Technology

Author: **Peter G Dominick**; Stevens Institute of Technology

Author: **Pamela Burke**; Stevens Institute of Technology

At the heart of effective team communication there lies the clarity of team vision. It allows team members to listen with the expectation to move the team forward towards its goal. However, the mechanisms through which vision clarity translates into team listening are largely uncharted. In this study we developed a model that investigates the role of team trust and commitment in the relationship between team vision clarity and team action listening. Using the data collected from 474 members of 100 teams throughout a five-year quantitative study we show that the clarity of team vision is not enough in establishing effective team listening. It requires team members to have relational bonds such as trust to be receptive to the clarity of the team vision and demonstrate that they actually listen to what is being discussed in the team. We argue that this is because team listening extends beyond commonly researched practices of active listening, transcending the traditional verbal and non-verbal feedback. It relies on the actions

Competitive Advantage and Environmental Strategy (session 1128)

Untangling the Relationship Between Corporate Environmental Performance and Financial Performance

Author: **Yuanyuan Zhang**; U. of Science and Technology of China

Author: **Zhe Ouyang**; Nanjing U. of Finance and Economics

The inconclusive quest on the relationship between corporate environmental performance (CEP) and financial performance (CFP) necessitates this research. We apply fixed-effects analysis on a longitudinal dataset of 8364 firm-year observations from 1455 individual firms. The results suggest that the effect of CEP on CFP is positive at first to a certain level of CEP then becomes negative which indicating an inverse U-shaped CEP-CFP link. Also, the environmental uncertainty in terms of dynamism, munificence, and complexity strengthens the positive (negative) effect of CEP on CFP at the left (right) side of the inverse U-shaped curve. Our findings reconcile the long-standing debate on the CEP-CFP link and provide a comprehensive representation for CEP-CFP relationship by demonstrating the double-edged contingent role of environmental uncertainty.

This paper explores the extent to which risk and materiality are integrated in organisations and their reports. Risk and materiality are key concepts underpinning sustainability reporting and integrated reporting. They share similar objectives – to identify material issues that affect an organisation's ability to create value – yet they appear to exist in parallel in many organisations. The ongoing attempt to identify material issues and risks leads to multiple discourses about what are the most important issues to deal with, which can adversely affect an organisation's value-creation outcome. From interviews with board members, risk managers and sustainability managers, we found that there is an ongoing discursive struggle between the sustainability managers, who primarily engage in a stakeholder discourse in their attempt to give meaning to the concept of materiality, and the Board and risk managers who interpret materiality through a risk and financial lens. It is clear that the sustainability managers have not built support for their concept of materiality, as it does not resonate with other actors, particularly the Board members who have more power and legitimacy than the sustainability managers. The sustainability managers have failed to convey their meaning of materiality and their discursive practices have not taken hold within the organisations. In this context,

The Trappings of Collective Reputation: The Challenge to Capture the Rewards when Belonging to a Bad

Author: **Seonghoon Kim**; U. of California, Santa Barbara

Author: **Ann Terlaak**; U. of Wisconsin, Madison

Author: **Matthew Potoski**; U. of California, Santa Barbara

Capital markets value better firm environmental performance in part because investors use a firm's environmental performance to infer about other desirable but difficult-to-observe firm attributes such as the firm's trustworthiness. Building on this notion, we theorize that the market discounts the reward for improved environmental performance when the firm belongs to an organizational form that has a collective reputation of being unethical. This is because affiliation with a poorly reputed group calls into question the existence of underlying valued firm attributes, leading to downward adjustments in the reward that is otherwise granted. We argue that additional firm-level signals that further (mis)align the individual firm with its organizational form further affect this discount. Using longitudinal data on South Korean firms, we find that for business group firms—an organizational form widely seen as corrupt—the market reward for improved environmental performance is smaller than for non-business group firms. Additional signals that further reinforce a company's belonging to the business group community reduce the reward even more, whereas signals that distance the company from this poorly reputed community do not have symmetrical positive effects on rewards. These findings contribute, one, by elaborating how markets consider a firm's environmental performance to be indicative of more than just its environmental footprint, and, two, by illuminating just how deep the trappings of collective reputation can be.

Hybrid Legitimation Strategies for Managing the Same Legitimacy Gap in the Coffee Industry

Author: **Josh Morton**; U. of Leeds

Organizations in controversial industries face growing institutional pressures that challenge their organizational legitimacy. They typically respond to these pressures through implementing legitimation strategies to gain, maintain, or repair legitimacy. A developing challenge to legitimacy in the coffee industry is the issue of using non-reusable and -recyclable materials, particularly as stakeholders are becoming more aware of plastic wastage that results from distribution of single-use cups. This legitimacy challenge in the coffee industry has been observed within this study, by investigating how organizations in the industry are managing their legitimacy in response to societal concerns relating to their contribution on waste and pollution. To address this a qualitative study was conducted, through empirical work with both independent coffee vendors in the United Kingdom (UK) and large-multinational coffee chains. The findings indicate a hybridization of different legitimation strategies used in response to the issues relating to disposable coffee cup use. The findings contribute to existing legitimacy literature by highlighting a potential hybridization of different legitimation strategies, in this case contributing to our understanding of the legitimacy management of both independent businesses and larger corporates in response to the same legitimacy gap.

Environmental Opportunities, Risks, and Analyst Recommendations: Evidence from Twitter Accounts (WITHDRAWN)

Author: **Eun-Hee Kim**; Fordham U.

Author: **Yoo Na Youm**; Loyola U. Chicago

Author: **Rachel McCullagh Balven**; Arizona State U.
Author: **Glenn Hoetker**; Melbourne Business School,
U. of Melbourne

Green products refer to products that use less polluting materials, emit less pollution during usage, and are more recyclable upon disposal. Although green product strategy has gained attention from both scholars and business practitioners as a source of competitive advantage and environmental sustainability in recent years, empirical evidence for the relationship between green products and financial performance remains inconsistent. Drawing on the Natural Resource Based View (NRBV) and Resource Based View (RBV), we explore crucial contextual contingencies that can help resolve this inconsistency. In particular, we examine three country-level contingencies: i.e., the impact of regulatory, economic and political conditions of a country in which rarity and imitability of green product resources and capabilities may vary. Our meta-analysis of 18 studies published over 40-year period reveals the importance of considering country-level differences for the green products-financial performance link. Our results indicate that green products positively relate to financial performance only in countries with lax environmental regulation (vs. stringent environmental regulation), developing economy (vs. developed economy), and authoritarian regime (vs. democracy).

Unpacking the Dynamics of Climate Change Strategizing

Author: **Kirti Mishra**; Indian Institute of Management, Udaipur

Human-induced climate change is one of the most daunting grand challenges of the 21st century. Due to its impacts of organizations, it is considered a key strategic issue for organizations. Current scholarship on organizational climate change strategizing is at a descriptive level and has overlooked how climate change strategizing is carried out, who is involved in the strategy work and what resources are used for carrying out this work. Drawing on an embedded study of an Australian energy company's climate

We examine whether securities analysts differently view corporate environmental initiatives depending on whether they leverage environmental opportunities or address environmental risks. Building on stakeholder theory, specifically emerging work on the two-sidedness of firm-stakeholder relationships, we explore the question in the context of corporate Twitter accounts. By analyzing corporate environmental initiatives as mentioned in tweets and the validation they receive via retweets, we find that securities analysts favor environmental opportunity initiatives, while penalizing unnecessary investments to mitigate environmental risks. We further find that the results are amplified by analysts' priors.

Organizational Learning, Social Ties, and Environmental Strategies: A Resource Dependence Perspective

Author: **Adnan Ali**; Xi'an Jiaotong U.

Author: **Afzaal Ali**; International Islamic U., Islamabad, Pakistan

Author: **Muhammad Muneeb Farhan**; Xi'an Jiaotong U.

Anchored to resource dependence theory, our study focuses on organizational learning (both exploitative and explorative) and social ties (both political and business) and investigates how they independently and interactively affect the adoption of environmental strategies. Using a dataset of 272 Chinese firms, we find that firms that engage in exploitative learning tend to adopt mandatory rather than voluntary environmental strategies, whereas firms with explorative learning are more likely to adopt voluntary as opposed to mandatory environmental strategies. Furthermore, firms that involve in exploitative learning benefit to a greater extent from political ties than from business ties as a means of adopting mandatory environmental strategies, whereas firms that engage in explorative learning benefit to a greater extent from business ties than from political ties to adopt voluntary environmental strategies. Overall, our study offers novel insights into the environmental management literature by clarifying the underlying mechanisms through which firms adopt distinct environmental

change responses this paper examines climate change strategizing by adopting a strategy as practice perspective. By presenting a repertoire of activities enacted during climate change strategizing this paper presents a dynamic and embedded view of organizational climate change responses.

Resource Orchestration Chains in Corporate Sustainability: The Case of Swiss Retail

Author: **Johannes Meuer**; ETH Zurich

Author: **Julija Belec Gergek**; ETH Zurich

Author: **Bastien Girod**; ETH Zurich

How firms can effectively address grand challenges in sustainability such as poverty, climate change, and plastic pollution, has become a key issue of our times. Recent research has shown that sustainable firms differ significantly in their organizational structure and respective resource base from non sustainable firms, suggesting important differences in how firms allocate resources when engaging in sustainability practices. It is unclear, however, how various sustainability practices impact firms' resource allocation decisions, and how these decisions impact the competitiveness of firms over time. Drawing on a rich archival dataset from the Swiss retail industry between 2001 and 2019, we explore specific sequences of resource allocation decisions. We contribute empirically to corporate sustainability literature by identifying five successful resource orchestration chains: simple, dynamic, transformational, transactional, and systemic. Further, we combine a process approach with orchestration theory to suggest that resource orchestration chains are manifested differently among firms. In addition, our findings conceptually contribute to resource orchestration theory by advancing the idea of resource orchestration chains.

What are the Returns of Sustainability Reporting? An Empirical Investigation in US Manufacturers

Author: **Mingze Xu**; Hong Kong Polytechnic U.

Author: **Christina Wong**; Hong Kong Polytechnic U.

Author: **Chee Yew Wong**; Leeds U. Business School

Author: **Sakun Boon-itt**; Thammasat U.

This paper examines the long-run effects of sustainability reporting on manufacturing firms' productivity based on a signaling perspective. Using data collected from Global Reporting Initiative (GRI), Factiva and Compustat, this study investigates the performance impacts and moderating effects of sustainability reporting for 243 US manufacturing firms in the period of 1999-2016. Through conducting event studies, our findings reveal that sustainability reporting leads to not only positive abnormal return on assets (ROA) but also labor productivity (LP). Our results suggest three moderators including sustainability-related media exposure, reporting continuity and first-time reporting. This study provides insights into implementing sustainability reporting as an effective sustainability information disclosure strategy for manufacturers.

Supply Networks (session 1130)

To See from Where You Stand: Supply Chain Network Positions and Merger and Acquisition Likelihood

Author: **Wenjin Hu**; Zhejiang U.

Author: **Yongyi Shou**; Zhejiang U.

Author: **Yan Dong**; Darla Moore School of Business, U. of South Carolina

Drawing on the proverb that says “where you stand determines what you see and how you do”, this study examines the effect of a firm’s supply chain network position on its M&As decisions and further examines the moderating effects of financial slack and innovational slack on the relationship between a firm’s supply chain network centrality and its M&As likelihood. Secondary data from different sources spanning from 2010 to 2017 are collected and analyzed to test our hypotheses. We find that there is U-shaped relationship between a firm’s supply chain network betweenness centrality and its M&As likelihood. Moreover, we also find significant evidence that the financial slack and innovational slack of a firm will positively moderate the effect of a firm’s supply chain network position on its M&As likelihood. This study advances extant literature on the antecedents of M&As by identifying supply chain network as a critical antecedent of a firm’s M&As. In addition, this study extends organizational slacks and M&As literature by identifying financial slack and innovational slack as contingencies to a firm’s M&As decision, which is different from conventional literature on slacks and M&As.

The Opioid Overdose Epidemic and Indirect Contagion in Supply Networks

Author: **Paul Skilton**; Washington State U.

Author: **Ednilson Santos Bernardes**; West Virginia U.

This study develops and tests theory about social contagion processes in supply chains. In contrast to conventional social contagion theory, which is based on exposure through proximity and homophily, we argue that supply chain participants can be exposed indirectly to peers through shared suppliers. We

Sustainable Operations and Supply Chains (session 1129)

Resource Management in BOP contexts: Toward a Social Resource Orchestration Theory (SROT)

Author: **Eugenia Rosca**; Tilburg U.

Author: **Lydia Bals**; Mainz U. of Applied Sciences

Author: **Wendy Tate**; U. of Tennessee

Author: **Feigao Huang**; U. of Tennessee, Knoxville

Research in global supply chains increasingly covers the highly resource constrained, poverty-stricken, bottom of the pyramid (BOP) context as a potential market for revenue growth opportunities. Still, how firms can design and manage material and support flows across the global supply chain to overcome the constrained resources and enable social, environmental and economic value creation for stakeholders, remains a challenge. Qualitative data was collected via expert interviews and field visits with representatives of key stakeholders serving the BOP. Preliminary findings imply that companies need to dynamically engage and manage capabilities both internally and externally in order to be successful in BOP contexts. This research identifies intermediaries as a key stakeholder group who either engage in physical material flows or support flows. These intermediaries show specific stakeholder management and context shaping capabilities that focal firms can leverage in the BOP context. The emergent integrated framework suggests a move toward a social resource orchestration theory (SROT).

This paper considers the link between productivity

further argue that some suppliers are better positioned to reduce the uncertainty associated with adopting new practice because they have experience on the supply side of the practice. This takes on a social contagion aspect when we theorize that the number of indirect ties to peers who engage in a practice drives both increase behavior and adoption of extreme practice. Using data on the opioid supply chain we find support for our theory while controlling for alternative explanations like contagion from nearby peers and location in susceptible markets. Using generalized linear mixed models we show that ties to experienced suppliers and indirect ties to peers engaged in extreme opioid retailing are associated with increased retailer purchases and achievement of extreme retailer status.

A Meta-Analysis of Supply Chain Complexity and Firm Performance

Author: **Melek Akin Ates**; Sabanci U.

Author: **Robert Suurmond**; Maastricht U., School of Business & Economics

Author: **Davide Luzzini**; EADA Business School

Author: **Dan Krause**; Portland State U.

Increased globalization, pressure to meet varying customer needs and requirements, extended product lines, uncertainty in supplier deliveries and a myriad of related factors make supply chains utterly complex. Extant literature shows that Supply Chain Complexity (SCC) plays an important role in explaining several performance outcomes. However, the accumulating evidence is ambiguous. To better understand SCC and its consequences under specific boundary conditions, we conducted a meta-analytical synthesis of the extant literature. Meta-analytic results from 23,810 observations across 85 independent samples from 103 empirical studies indicated that rather than an aggregate analysis of SCC's effect on performance, a finer-grained analysis of the relationships between sub-components of both SCC and performance is required. While the majority of previous studies seem to advocate that complexity in supply chains is detrimental to firm performance, our results demonstrate that SCC only has a negative effect on operational performance,

and well-being in the context of SMEs. We formulate the Business-Wellbeing-Productivity framework, which connects business size and organizational structure with well being parameter, which, in turn, is correlated with productivity. Using country-level dataset of the OECD countries, we show that prevalence of SMEs in a country's business sector is associated with the decrease in productivity of this country through the SMEs' negative impact on the workforce well being. Implications of this result for theory and practice are discussed.

Unpacking Base-of-the-Pyramid Sourcing Process: Moving Beyond Institutional Factors

Author: **Maryam Zomorodi**; U. of Melbourne

Author: **Sajad Fayezi**; La Trobe U.

Studies on supply chain and sustainability suggest that sourcing from BoP markets and involving the poor in the value chain can improve sustainability performance and contribute to alleviating global poverty. Nevertheless, BoP sourcing also gives rise to a multitude of new issues that must be addressed and managed effectively. While the literature is more concerned about the challenges faced by firms selling to the BoP (BoP 1 approach), much less is known regarding the challenges when sourcing from the BoP (BoP 2 approach). Moreover, the great focus of the BoP literature has concentrated on institutional factors as the main drivers of these challenges regardless of the type of BoP business. Based on the findings from within and cross-case analysis of five case-studies in the agribusiness sector and an integration of agency theory, our study explores and unpacks the challenges and drivers related to sourcing from the poor. We categorise BoP sourcing challenges in terms of supplier-, product- and market-related challenges, and characterise the manifestation of these challenges in the form of macro- and micro-contextual drivers (institutional voids and agency problems, respectively) and the relationship between these drivers. Keywords: base-of-the-pyramid (BoP); purchasing and supply management; BoP sourcing; institutional voids; Agency

view paper (if available)

but an overall positive effect on innovation performance and financial performance. We further decompose SCC into sub-dimensions (i.e. upstream/downstream/internal) illustrating how exactly complexity in the supply chain of a firm affects its performance across a range of relevant outcomes. Our findings also reveal moderating effects of construct operationalization and study characteristics. We discuss the implications of the findings for theory and practice.

Inter-Dependence and Network Position as Predictors of Supplier Disclosure

Author: **William Diebel**; Ivey Business School
Author: **Jury Gualandris**; Ivey Business School
Author: **Robert D Klassen**; U. of Western Ontario

As corporate customers (buyers) are facing increasing pressure to disclose environmental data, stakeholders are increasingly extending their expectations for transparency to the entire supply chain. Though the outcomes of disclosure have been reasonably well-documented by scholars, such as improved reputation and financial performance, the antecedents of disclosure output have received relatively little attention. To develop a richer understanding of the drivers of disclosure, we investigate how four supply chain related constructs (power asymmetry, joint dependence, betweenness centrality, and closeness centrality), in conjunction with buyer disclosure practices, are related to those of first-tier suppliers. We provide evidence that suggests a complex relationship exists between relational inter-dependencies, network position, and disclosure; suppliers will be more likely to mimic the disclosure behaviour of exemplary buyers when inter-dependency is high and less likely to do so when supplier centrality is high. At the same time, competing informational needs counterbalance the effects of mimetic behaviour. These findings provoke a need for more supply chain studies to better understand how inter-dependencies may inhibit widespread disclosure and identify how suppliers identify buyers to model their behaviour after.

The Institutional Isomorphism of Environmental Sustainability in Developing Economies - Ecosystem

Author: **Narain Gupta**; Management Development Institute, Gurgaon

Author: **Amit Kumar Gupta**; management development institute Gurgaon

Coercive pressure has forced the firms to take up environmental measures in the last two decades in emerging economies. Under normative pressure, large firms, whose focus is far more than mere survival, have started appreciating and realizing the long-run benefits of environmental sustainability. Purpose: In a little mature emerging economy, such as India, where environmental awareness is growing. The government facilitates to build an environmental sustainability ecosystem. We investigate how do environmental compliance and environmental practices influence the overall performance? Design/Methodology/Approach: The firm performance was measured in terms of financial, customer, internal business process, and learning and growth performance. A survey instrument was designed using well-established scales and administered to the middle to top corporate management executives to gather 240 data from the Indian firms. A rigorous validity, diagnostics, and SEM were used to test the hypotheses. Findings: The full mediation of environmental practices on the effect of environmental compliance was supported besides the direct impact of environmental sustainability and its dimensions on performance. The results of this study established the institutional isomorphism of the industry ecosystem in developing countries for environmental sustainability. The results have academic and managerial implications discussed in detail. Originality/Value: The examination of mediation relationships in an environmental sustainability context is limited. This paper is among the initial works which deal with complicated mediation relationship drawn from the propositions of institutional theory. The study established and argued that the ecosystem of environmental practices would turn firms towards improved environmental compliance, and eventually enjoy long term performance. Workers' Participation in Social Sustainability Initiatives in Global Supply Chains

Author: **Ahmad Hassan**; MGMT, BSS, Aarhus U.

In the context of globally dispersed production facilities, research has highlighted workers' involvement as an important determinant of effective social sustainability initiatives in global supply chains. However, prior research offers limited insights into how social sustainability initiatives enable workers to participate in these initiatives. To address this gap, this article builds on self-determination theory and a rich empirical study of the Better Cotton Initiative in Pakistan. The article argues that workers' willingness to get involved in social sustainability initiatives depends on how they can realize autonomy, competence, relatedness, and dignity. In addition, the article finds four challenges that social sustainability initiatives encounter when trying to enable workers' participation, namely no freedom of association, poor health and safety, overworked women workers, and underprivileged working conditions. Through these findings, the article makes three contributions to research on social sustainability initiatives in global supply chains and applies a yet under-utilised theory in management, namely the self-determination theory.

Unpaid Work? Emotional Labor Assessments and Episodic Recall Bias in Public Engagement

Author: **Rick Vogel**; U. of Hamburg
Author: **Laura Werkmeister**; U. of Hamburg

While scholarship on public leadership has recently gained momentum in public administration, it is unclear whether, and if so how, researchers should account for the 'public' in public leadership. We shed new light on this issue by introducing the approach of Implicit Leadership Theories (ILTs) to the field of public administration. This socio-cognitive approach suggests that people's everyday (rather than scholarly) theories about the characteristics of leaders provide important explanations of how they respond to leadership situations. We ask if people hold Implicit Public Leadership Theories (IPLTs) and explore how these images of public leaders contrast with generic ILTs. We extract these taxonomies from data gathered in a survey experiment in Germany (n = 1,072). Results show that IPLTs have overlaps with generic ILTs but are unique in terms of rule-abiding and innovation-orientation. In contrast, charismatic aspects of leadership only figure in generic ILTs. The structure of ILTs – both generic and public – is surprisingly stable across the subsamples of public and non-public employees. We discuss how the findings may assist public management scholars in the development of explicit theories of public leadership and derive an agenda of how to proceed in a socio-cognitive approach.

Bringing Beneficiaries More Centrally into Nonprofit Education and Research

Author: **Lehn Marie Benjamin**; Indiana U. / Purdue U., Indianapolis

This paper makes the case for bringing beneficiaries more centrally into nonprofit research and education. First, the paper provides a historical overview of how scholars in three fields came to recognize beneficiaries as central organizational actors. Tracing these early observations, and the related concepts of coproduction, value cocreation and comembership, this paper considers why these ideas have not been more central to nonprofit education and research. Second, the offers three likely explanations based on a review of early discussions in the field of nonprofit management

Author: **William Resh**; U. of Southern California
Author: **Cynthia Wilkes**; U. of Southern California

We test individual-level job-related assessments as a function of a public employee's induced recall of discrete citizen engagement and one's intrinsic prosocial motivation. We are interested in whether tangible retentions of public service influence the relationship between stated, but abstract, self-concepts—such as reported prosociality. Little is known as to the impact of citizen consultation on local government employees or the outcomes that engagement might induce. We find that the relationship between self-reports of prosociality and pay satisfaction are contingent upon those concepts being decontextualized, whereas discrete recall bias appears not to affect emotional burnout. Meanwhile, when induced recall is positively valenced, it has a positive direct effect on subjects' willingness toward future citizen engagement. In other words, subjects seem to accept the emotional labor of engagement as part of their jobs. However, contextualizing engagement may make them more cognizant of its unremunerated dimensions; and, positive reinforcement of engagement provides encouragement to further engagement.

Giving Less or Leaving: Examining Disengagement among Long-Term Volunteers

Author: **Alexander Henderson**; Marist College
Author: **Jessica Elizabeth Sowa**; U. of Baltimore

Attention to volunteer satisfaction is crucial, especially for public and nonprofit organizations that rely on the use of regular volunteers who volunteer on an ongoing basis for a prolonged period of time. While scholars have examined what fosters volunteer satisfaction and volunteer engagement, less attention has been focused on what may lead volunteers to slowly disengage from their organizations—situations in which volunteers remain with an organization, but give less time, reduce their level of effort, or adopt perspectives consistent with departure but do not leave. Drawing on a survey of volunteer firefighters, we examine disengagement in terms of considering leaving the volunteer role and cutting back on volunteer time.

education. Third, the paper turns to current research about nonprofits and their beneficiaries published in three major nonprofit journals between 1998-2018 (Nonprofit and Voluntary Sector Quarterly, Nonprofit Management & Leadership and Voluntas) to show that although most researchers are not using these concepts directly, their detailed empirical findings provide evidence of the relevance of these ideas for nonprofits. The final section suggests next steps for bringing beneficiaries into nonprofit research and education.

Understanding Executive Director Turnover in the Debate of Corporatization and Professionalism

Author: **Ulf Papenfuß**; Zeppelin U.

Author: **Christian Arno Schmidt**; Zeppelin U.

Through corporatization processes, governments worldwide strive to enhance managerial professionalism and performance for public service provision. The turnover of executive directors (EDs) of public corporations reflects one of the most important governance mechanisms and is a major key variable for managerial professionalism, performance, and political control. Regarding demands in the literature, this article uses resource dependence theory (RDT) and human capital theory (HCT) and enhances the understanding on ED turnover with an analysis of the tenure of 447 EDs employed in 263 German public corporations between 2006 and 2016 using Cox regression. Linked to the debates on political interference in public corporations, we find that politicized EDs have a significant lower likelihood of turnover—demonstrating a functional effect in the conceptual debate on politicization as governance mechanism for personnel stability. Furthermore, internally hired EDs are less likely to exit their position. This is important for the conceptual debate and decision-makers because attracting highly qualified personnel from outside is time- and cost-consuming and is associated with a higher likelihood of turnover. We also shed light on the governance mechanism of “ED pay” and can show—contrary to the anecdotally stressed steady increase of ED pay—a strongly up- and downward fluctuating pay development which is not associated with turnover.

We find that organizational support, planning practices, and participation efficacy are negatively related to considering leaving one’s volunteer role. Contrary to expectations, volunteers with high public service motivation (PSM) are more likely to consider leaving their volunteer position. In terms of cutting back volunteer time, organizational support and the age of the volunteer are negatively related to cutting back on time. Contrary to expectations, volunteers who see themselves as giving more effort in their volunteering are less likely to cut back on time. Implications for theory and practice are explored.

A Moderated Mediation Model Linking perceived Organizational Support to Volunteer Outcomes

Author: **Charlotte Traeger**; ESCP Business School

Author: **Kerstin Alfes**; ESCP Business School

Author: **Nils Fürstenberg**; ESCP Business School

Volunteers play a crucial role in tackling grand challenges such as climate change, the refugee crisis, and inequalities. However, little is known about the organizational practices that can be implemented to influence volunteers’ involvement in their role. In the present study, we fill this gap by exploring how and when volunteers’ perception of organizational support is associated with volunteer engagement and intention to leave. Data from 1,542 volunteers of a German environmental nonprofit organization revealed that the relationship between perceived organizational support and the volunteer outcomes is mediated by organizational identification, and that the relationship between perceived organizational support and organizational identification is moderated by organizational vision acceptance. We extend existing research on volunteer management by using an identity-based perspective to highlight the identification mechanism underpinning the relationship between perceived organizational support and positive attitudinal responses in the volunteering context. These findings have practical implications for a professional management of volunteers, as NPOs should provide volunteers with support, as well as facilitate their understanding and approval of collective goals and aspirations.

Finally, we conceptually and empirically show that performance is a significant determinant for turnover in profit-making public corporations but not in loss-making corporations. This implies that future empirical research in the field of the corporatization of public services should differentiate between profit-making and loss-making public corporations. Overall the finding broadens our knowledge in the conceptual debate and could contribute to enhance corporatization, managerial professionalism, performance and political control.

Public Sector Reforms as Catalysts for Diffusion of Management Concepts

Author: **Sarah Krøtel**; Aarhus U.

Author: **Kasper Elmholdt**; Aalborg U.

Author: **Jeppe Agger Nielsen**; Aalborg U.

Within the last decades, there has been an increased interest in examining the diffusion of management concepts in the public sector. Yet, we know little about how the diffusion of management concepts are affected by public sector reforms. In this paper, we engage this puzzle by investigating the widespread diffusion of the Leadership Pipeline model across the Danish municipalities from 2010 to 2017, which took place in the aftermath of a major structural reform. Utilizing a strong mixed-methods design our findings show that amalgamated municipalities adopted the Leadership Pipeline model more frequently, and also sooner than then non amalgamated municipalities. In addition, we analyze how municipalities and consultancies adapted the concept to fit the reform demands and how the reform animated public sector employees in this endeavor. By implication, we argue that reforms are creating a market for management concepts and consultancy work. We conclude by discussing implications for research into public administration.

How Volunteer Involvement Affects Professionals' Basic Needs Satisfaction and Intrinsic Motivation

Author: **Ulrich Jensen**; Arizona State U.

Author: **Alexander Nielsen**; Danish Government Central Administration

As governments around the world seek to increase the capacity of public organizations to deliver high-quality services to its citizenry, volunteers are increasingly seen as a critical resource. While volunteers can bring a number of positive resources to public organizations and help increase cost-efficiency, service quality and impact, research has largely overlooked how professionals respond to volunteer involvement. We contribute to the nascent literature on how volunteers are perceived by individuals with a professional identity by integrate insights from studies on coproduction and volunteering with the established social psychology theory of self-determination to propose how that characteristic of the tasks allocated to volunteers affect professionals' work motivation through the satisfaction of basic psychological needs for feeling autonomous, competent and related to others. Using structural equation modeling and an instrumental variables estimation approach, our results show that intrinsic motivation is negatively impacted when volunteers solve tasks that are core-in contrast to complementary-to the profession, and the identity of professionals. Moreover, these negative effects are transmitted through the needs for feeling competent and related to others, while results are more mixed for satisfaction of the basic need for feeling autonomous.

It Takes Courage! How Corporate Activism Inspires Political Participation

Author: Moritz Appels; Chair of Corporate Social Responsibility, U. of Mannheim
Author: Laura Marie Schons; U. of Mannheim / Germany
Author: Daniel Korschun; Drexel U.

Climate change represents complexity in that events resulting from climatic changes can be concurrently abrupt and persistent. They can be simultaneously short-lived and decades long. Such complexity can push organisations beyond their coping range. Leveraging the sensemaking literature, our study explores how dairy farmers in New Zealand coped with drought conditions to the decade ending in 2014. By relying on interviews and thematic analysis, contrary to many previous studies, our findings suggest that actors relied on heterogeneous forms of sensemaking to cope: 1) coping through immersion; 2) coping through detachment; and 3) and coping through deliberate action. We also discovered that sensemaking was not limited to individual actors, but rather sensegiving was received from macro, external actors; namely, other farmers. Important external actors such as climatologists, meteorologists and scientists were discounted. The findings offer new insights into how organisations cope with climate change and we describe opportunities for future research.

Relational Practices for Boundary Work:

Complexity, Liminality, and Knowledge Arbitrage

Author: **Vinayak Tripathi**; Institute of Management Technology Ghaziabad, India

Author: **Winston Kwon**; U. of Edinburgh business school

In this article, we investigate to role of frontline workers who are responsible for enabling the delivery of primary care within a marginalized tribal community in Northwestern India. Our ethnographic study of these frontline medic counsellors helps to illuminate how these entrepreneurial agents actively create, negotiate and manage activities between multiple boundary conditions including those of primary healthcare facilities and the local community, social and gender boundaries within the community, and professional boundaries within the clinical domain. Our findings reveal how this female corps of medic counsellors have engaged configurational boundary work to improve the efficacy of a community health initiative. In so doing, they have also gained significant influence within the professional clinical domain and also within their

Individual political participation is a fundamental ingredient for democracy. Yet, research indicates a global increase in the number of people who are disengaged in the political process. Our research asks whether companies, through their own public statements on contentious social or political issues, can encourage consumers to participate politically. In two experiments, we provide evidence that such corporate activism can encourage political participation to the extent that it is perceived by the consumer to be morally courageous. This mediating effect is stronger when the consumer shares the view of the company engaged in the activism (what we call low political ideology distance). Moreover, delving deeper, we find that perceived moral courage can be heightened when the company takes a leadership position in its corporate activism by announcing their stand before industry peers. Broadly speaking, the research portrays consumers as potentially emulating companies that they believe act on principle despite the apparent risk of doing so.

Beyond “Do No Harm:” Corporations, Human Rights, and Activism

Author: **Rita Mota**; Oxford U., Saïd Business School

Author: **Alan D. Morrison**; Oxford U., Saïd Business School

Any analysis of non-legal business human rights obligations requires an appropriate theoretical framework. We present a theory that employs a Deliberative View of the Firm, which explicitly acknowledges that firms are capable of deliberating over non-economic propositions. Because firms are able to marshal sufficient resources significantly to affect human rights, we claim that firms should be held to account as agents of justice. In some situations, “do no harm” is insufficient: a firm that has deep roots in a community and the ability to advance human rights in that community has a Kantian obligation seriously to consider doing so. Our argument therefore identifies a path dependency in corporate human rights: positive corporate obligations arise as a result of past corporate engagement. When a corporation has

respective communities. This configurational boundary work can be understood as a set of relational practices by which boundary of the community is drawn into the highly institutionalized domain of the clinic, and the boundary of the clinic is drawn into the social and cultural domain of the community. These relational practices identified through our analysis are: a) empathizing, b) buffering, c) facilitating, d) co-opting and e) improvising. Our resulting conceptual model contributes to extant knowledge across a number of dimensions, particularly research on: i) the practices of agents working within and across multiple intersectional conditions; ii) research on how configurational (as opposed to competitive or collaborative) boundary work can be used towards common goals, and iii) middle-status groups can expand jurisdictional authority and enhance legitimacy and status by drawing upon and leveraging knowledge from different domains.

Seeing Beyond the Taken for Granted: Generating Practices of Reflexivity Through Shodh Yatra

Author: **Rajshree Prakash**; John Molson School of Business, Concordia U.

Author: **Winston Kwon**; U. of Edinburgh business school

Author: **Raymond L. Paquin**; Concordia U.

Reflexivity has received increasing attention in recent studies as a prerequisite for understanding social change. It has a strong presence within sociology and has received more attention from organizational scholars. In this article, we focus on practices of reflexivity by studying the work of an NGO, the Honey Bee Network, whose purpose is to create awareness about the existing resources and capabilities within remote communities in India by engaging directly with those communities. We find reflexivity is developed through a combination of practices: upending one's taken for granted expectations (displacement), actively engaging in exploring incongruities resulting from contradictions between one's expectations and one's experience (transposition), and sharing and questioning those contradictions in a way which is supporting of developing new, more reflexive insights

deep roots in a local community, "doing no harm" in that circumstance is tantamount to disavowing those obligations. A firm that identifies human rights violations in its supply chain may acquire moral obligations that go beyond those identified in current business and human rights initiatives. In particular, we suggest that it may in some circumstances have a positive obligation to be a human rights activist.

Investor Reaction to Corporate Activism

Author: **Cory Maks-Solomon**; American Political Science Association

In two analyses, this paper evaluates whether investors incentivize corporate activism. Exploiting an event study of large firms' stock prices, the first analysis finds no evidence of abnormal returns following corporate activism on LGBT rights and immigration, indicating that investors do not believe that activism helps or hurts a company's value. However, the second analysis finds modest evidence that corporations that receive higher returns after engaging in activism are more likely to engage in activism again in the future. These results suggest that while the average corporation does not appear to face a stock market incentive to engage in social activism, corporations that perceive that they do are more likely to continue their social advocacy. In a profound interaction of economics with cultural politics, businesses' positions on social issues can be explained by the perceived preferences of their shareholders.

Strategizing for a Base-of-the-Pyramid Market: The Case of Grundfos LIFELINK

Author: **Poul Houman Andersen**; Aalborg U.

Author: **Lars Esbjerg**; Aarhus U.

Abstract: Multi-national corporations (MNCs) are important for achieving the UN Sustainable Development Goals (SDGs), but they often struggle to align SDGs with their current strategies and business operations. This article explores how Grundfos, a Danish MNC and leading supplier of circulation pumps, entered a Base-of-the-Pyramid (BoP) market with a solution for providing fresh potable water to rural villages in Kenya. Linking to the issue raised in the call for papers, we use the case of Grundfos LIFELINK to explore how MNCs can successfully develop and implement strategies for BoP markets that help meet the SDG. We show how the original LIFELINK strategy was modified because of the practical experience gained from operating in the BoP task environment. Drawing on contrasting ideas of strategy as navigation or wayfaring, we highlight the dangers of drawing on existing strategic beliefs to replicate strategies and business practices in BoP market contexts. We believe that the concept of wayfaring offers important insights to the existing discussion of how strategizing and business practices in BoP markets interact, as it is useful for reflecting on how prior organisational knowledge in the form of existing standard operation procedures create trajectories that also influence the ability to generate insights that challenge existing strategic thought.

CEO Power and Influence (session 1140)

comparative case examination of four recent examples at Microsoft, Google, Wayfair, and Amazon, our analysis focuses on three important aspects of employee activism – opportunity structures, tactics and mobilization, and outcomes. We find that activists who exploited multiple opportunity structures were more effective and that when managers provided a positive yet unsatisfactory response to initial activist demands, activists shifted from persuasive to more confrontational tactics. In addition, although none of these examples can be categorized as comprehensive victories for activists, we find that activists were successful in mobilizing large numbers of employees, generating significant media attention, and forcing employers to engage in some types of substantive organizational change. Taken together, our findings reveal that scholars of social movements and organizations can gain analytical leverage by expanding their views of opportunity structures; focusing on employee activism as more of a dynamic, negotiated process; and defining activist success along multiple dimensions in the context of corporations.

Membership Overlaps in Board Committees, CEO Power, and Cost of Debt

Author: **Redhwan AL-Dhamari**; U. Utara Malaysia
Author: **Abdulsalam Alquhaif**; U. of Hail
Author: **Bakr Al-Gamrh**; Rennes School of Business

This study examines how debtholders perceive accounting information quality of firms with audit committee members who are also on the compensation committee, and whether strong CEO power enhances or undermines the governance role of overlapping committees. We find that firms with overlapping audit and compensation committees are perceived by debtholders to be transparent and of lower operating risk and, consequently, be associated with lower cost of debt. We also find that the beneficial effect of the presence of overlapping committees is weakened by the level of CEO power. Our results are robust to concerns of endogeneity and alternative proxies of the key variables. This study is timely in light of recently increasing call for the broadening of audit committee members' understanding of business strategies, risks and incentives provided by firms' executive compensation structures.

Pursuing Greater Good by Reducing Power: CEO Humility, TMT Decentralization, and Ethical Culture

Designated as a "Best Paper" for SIM
Author: **Sebastian Cortes-Mejia**; Iowa State U.
Author: **Andres Felipe Cortes**; Sacred Heart U.
Author: **Pol Herrmann**; Iowa State U.

Humility is increasingly recognized as a highly important attribute for strategic leaders to build successful organizations. However, research on CEO humility has focused on how humble CEOs shape collective perceptions through their interactions and behaviors with other organizational members while ignoring CEOs' critical role in strategic decision-making processes. We address this unexplored aspect of CEO humility by developing a process theory that explains how humble CEOs influence power decentralization at the TMT and subsequently

Social Innovation by For-Profit Organizations in Developing Countries (WITHDRAWN)

Author: **Ayse Saka-Helmhout**; Radboud U. Nijmegen
Author: **Maryse Chappin**; Utrecht U.
Author: **Suzana Braga Rodrigues**; FUMEC U., Brazil

This study explores the conditions that explain the successful realization of social innovation projects by for-profit organizations in developing economies. Drawing on the strategic alliance literature, we suggest that firm specific resources and governance of partnerships, and the specific institutional context in which they are embedded, play a significant role in achieving social goals. We adopt a crisp-set qualitative comparative analysis of 46 social innovation projects performed by joint ventures of Dutch SMEs and their local partners in 26 developing countries. We find that the organizational resources or capabilities of legitimate for-profit organizations complement strong institutions in these countries. This can be realized regardless of the market viability of social innovation projects. We also show that social innovation can be facilitated by the relational and governance capabilities of legitimate for-profit organizations that substitute weak institutions in these economies. Our findings highlight multiple paths that for-profit organizations can take to be socially innovative.

Me First? Behavioral Agency and CEO Opportunism in Faulty Product Recalls

Author: **Sumeet Malik**; IE Business School

Author: **Taiyuan Wang**; China Europe International Business School (CEIBS)

Author: **Geoffrey Martin**; Melbourne Business School

Author: **Luis R. Gomez-Mejia**; Arizona State U.

Stock options have been widely used to align the interests of executives and shareholders. By integrating theories of attention with the behavioral agency model, we offer a framework that predicts opportunistic CEO responses to option incentives that affect firm customers. We argue that CEOs will preserve their option wealth through their timing of product recalls. Specifically, during a fiscal year, CEOs announce product recalls during periods of market inattention to reduce loss or, during high attention fiscal year-end period, may postpone product recalls to delay loss. Such delays and evasions can harm customers both financially and physically. Using a sample from U.S. public medical device producers that made product recalls during 2004–2017, we confirm our hypotheses. Our findings give boards of medical device firms behavioral levers to protect users and the firm's future.

CEO Risk and Stakeholder Relations: The Moderating Role of Managerial Discretion

Author: **Jegoo Lee**; U. of Rhode Island

Using the managerial discretion literature, this paper examines a link between CEO risk and stakeholder relationship. We first propose the

actually does – and not-for-profit organizations usually speak up against greenwashing. Yet, the picture is not always so dark and in some circumstances, fruitful dialogues exist. Indeed, little has been said on CSR and SD involvement of small and medium enterprises, nor on their spontaneous, conversational speeches. We collected data during a focus-group which gathered company managers as well as not-for-profit representatives. A qualitative discourse analysis shows that partnerships usually starts on a transactional mode. Business entities start partnerships by contracting with not-for-profit, which they perceive as service providers. However, once socioeconomical resources are exchanged, they become significantly stronger and long lasting. In such a context, business entity managers increase their commitment in CSR, irrespective of audited indicators of reports; in turn, not-for-profit organizations highly value this involvement.

Let Your Light Shine: The Effect of Stakeholder Orientation on Strategic Alliance Formation

Author: **Stefano Romito**; Bocconi U.; U. of Milan

Author: **Clodia Vurro**; U. of Milan

Author: **Angeloantonio Russo**; LUM U.

In this article, we study how a firm's stakeholder orientation affect strategic alliance formation. Building on and extending existing literature on the determinants of alliance formation, we suggest that stakeholder orientation, defined as the degree to which a firm decides to focus its attention on stakeholder and integrate their interests and knowledge in its decision making, facilitates the selection process. In fact, a stakeholder-oriented firm improves its attractiveness as an alliance partner because it can leverage on broader relational resources for value creation, reduces the risk of adverse selection, improves its trustworthiness as a prospective partner, and develops relational capabilities that make it more comfortable in collaborating. In addition, we test the boundary conditions under which the positive effect of stakeholder orientation on alliance formation is mitigated. Accordingly, we focus on the moderating impact of (i) firm expected value creation; (ii) analyst coverage; (iii) diversification; (iv) environmental

necessity of modifying the risk management approach to stakeholder relationship. This paper then develops the theoretical argument that CEO risk is not directly associated with a firm's improvement of stakeholder relationship. Rather, the present study explores the contingent conditions of CEO risk effects and how these relationships are moderated by managerial discretion available to CEO. We test proposed hypotheses with a longitudinal dataset of over 17,000 observations of the large U.S. corporations for the period 1996-2016. The empirical results show that the relationship between CEO risk and stakeholder relationship is improved when managerial discretion is favorable, such as when CEO has a long tenure, and when the product differentiability becomes high. However, when the board monitoring is intense, the impact of CEO risk on stakeholder relationship is worsened. The implications of our findings for the risk-management theory for stakeholder relationship and managerial discretion are discussed.

Co-Constructing Decoupling and Recoupling: A Process Perspective on the IAS DETOX

Designated as a "Best Paper" for SIM

Author: **Jordis Grimm**; U. of Hamburg

Author: **Maximilian Schormair**; Trinity Business School, Trinity College Dublin

Author: **Dirk Ulrich Gilbert**; U. of Hamburg

The widespread phenomenon of policy-practice decoupling represents a crucial reason for the rather modest efficacy of many international accountability standards (IAS) in improving the sustainability performance of multinational corporations. This paper examines the phenomena of de- and recoupling in the context of IAS through a process perspective on a case where a sports fashion company is confronted with a new chemical management standard called DETOX, set by a global environmental non-governmental organization. Based on the qualitative-inductive analysis of interview and archival data, we show that the size of the gap between policies and practices not only depends on the actual practices of the standard-taker, but also on the evaluative criteria employed by the standard-setter. Policies and practices of the standard-taker and expectations of the standard-setter evolve over time shaping the interpretation and evolution of the de- or recoupling status. This paper contributes to the literature by developing a process model showing that de- and recoupling are co-constructed over time through dynamic interactions between standard-setter and -taker. Hence, de- and recoupling are more dynamic and political than previously theorized.

Ethical Leadership (session 1139)

Four Studies on the Social-Exchange Implications of Ethical Leadership Needed and Received

Author: Kai Christian Bormann; Bielefeld U.

Social-exchange theory predicts beneficial outcomes of ethical leadership as followers perceive an obligation to return the favorable treatment. Drawing from theories of threat responses and need satisfaction, I propose a qualification of this well-established perspective. In particular, I differentiate between ethical leadership needed (i.e. the extent followers need ethical leadership from their leader) and ethical leadership received (i.e. the extent leaders show ethical leadership) to predict that in certain situations low (and not high) ethical leadership received may facilitate beneficial social-exchange outcomes in the form of increased follower responsibility taking. I develop a model in which an unsatisfied need for ethical leadership (i.e. ethical leadership is highly needed but only little is received) may strengthen followers' felt obligation towards the team which then also translates into higher levels of helping behavior. I test my predictions across four different studies diverse in design including within-person, between-person, and team-level settings. Findings are in line with propositions and highlight an assumption in the ethical leadership literature in need of revision. This opens the door to further inquiry about the ethical means that stimulate followers to show normatively appropriate conduct.

SIM

Impact Investing (session 1138)

Impact Investing in Social Enterprises: A Systematic Literature Review (WITHDRAWN)

Author: Lena Schätzlein; Heinrich-Heine U. of Dusseldorf

Author: Deike Schluetter; Heinrich-Heine U. of Dusseldorf

Author: Rüdiger Hahn; Heinrich-Heine U. of Dusseldorf

Social enterprises are hybrids between non-profit organizations and for-profit firms and as such they often struggle in the acquisition of funding. Impact investment aims at achieving a social impact next to a financial return. Hence, impact investment and social enterprises seem to be a perfect match. Research in both fields is growing, however it is anchored in a wide variety of disciplines with only limited cross-referencing. To bridge knowledge in the disciplines, we systematically review 80 academic articles from 2001 to 2019 coming from a wide range of disciplines like general management, non-profit, sustainability/CSR, entrepreneurship, finance/accounting, and politics. We show research trends, link those trends across the diverse disciplines, and identify gaps as well as opportunities for future research. Overall, we find that researchers from different disciplines address similar general obstacles in the market especially in terms of market growth as well as challenges for investors and investees in the pre-investment and investment phase. Only few areas receive adequate empirical attention to draw reasonable conclusions while the field is still largely a-theoretical. Therefore, we emphasize critical shortcomings in research methods and lacking research focus on the investee perspective among other underexposed topics.

Reasons and Motives in Impact Investing: Ethical Sensemaking in the Chinese Renewable Energy

the notion of Perceived Managerial Exemplarity (PME). PME is based on Virtue ethics (Aristotle, 350 BCE; Plato, 375 BCE), Social learning theory (Bandura, 1977) and Authentic leadership (George, 2003; Luthans & Avolio, 2003). Empirical exploration of PME consists of a theme analysis of 17 middle manager interviews, resulting in a processual model including a) Behaviors perceived by employees as exemplary, as independent variable, b) Process of attraction, identification and projection, as moderating variable, and c) the effects of perceiving exemplarity with two dependent variables: a) long term impact on individual transformation, b) short term team performance and well-being. Applying the Churchill (1979) paradigm, themes and items are built into a survey sent to 1400 employees of a multinational corporation. An 80% response rate provides 1172 records from 28 countries, processed through regressions, exploratory factor analysis and structural equation modeling (SEM). The analysis of 700+ verbatim enriches the final model. Results suggest the perception of managerial exemplarity concerns managers' being rather than their doing or knowing, pointing towards attitudes, underlying intentions and motives rather than skills or rank. Virtuous self-development is proposed here as a managerial opportunity and foundation for leadership and workplace effectiveness.

How Ethical Leadership Relates to Conflict and Turnover Intentions: A Relational Systems Approach

Author: **Dennis John Marquardt**; Abilene Christian U.

Author: **Jennifer Grace Manegold**; Florida Gulf Coast U.

Author: **Lee Warren Brown**; Texas Woman's U.

In this paper, we develop and test a theoretical model that supports a relational systems theory approach (Kahn, 1998) to ethical leadership and its relationship with employee turnover intentions. We find support for our model across two different studies with unique employee samples. Specifically, when employees perceive their leader to be highly ethical, they are less likely to desire to leave their

Sector

Author: **Tongyu Meng**; U. of Auckland Business School

Author: **Christine Woods**; U. of Auckland

Author: **Jamie Newth**; U. of Auckland Business School

Author: **Basil Sharp**; U. of Auckland Business School

This paper explores Impact Investing (II) within the renewable energy sector drawing on ethical decision-making and Behaviour Reasoning Theory (BRT) to achieve an enhanced understanding of the complex ethical sensemaking process of impact investors. Addressing the ethical tensions faced by impact investors with mixed motives, this paper investigates how leaders use context-specific reasons to make sense and shape the renewable energy investment (REI) process. This study represents an initial attempt to understand the novel field of II made within the RE sector based on ethical sensemaking and BRT with a multi-stakeholder approach. Our findings show that prosocial, personal, reputational, and economic motives are the main drivers of REI, where three different modes of ethical sensemaking allowed for the construction of these motives from context-specific reasons by decision-makers in II. The research context is set in China, enabling us to shed light on the issues concerning decision-makers in face of complex situations and uncertainties within one relatively homogeneous social-economic environment. This paper utilises an abductive research approach with thematic analysis of secondary literature, in-depth interviews, and analysis of government documents and media reports to support the key findings. This paper develops three modes of ethical sensemaking – pragmatic, retrospective, and forecasting – to explain the motives of impact investors made in the RE sector. This paper contributes to the academic discourse on ethical sensemaking and BRT.

I Should Not Do This: Incongruence Between Role and Personal Morality

Author: **Jigyasu Shukla**; U. of Central Florida

Author: **Christopher M. Stein**; U. of Central Florida

We integrate the socio-cognitive theory and deontology to draw out the possible mechanisms resulting from the incongruence of personal moral values and expectations of morality in a professional role. The current theoretical article aims to delineate the possible psychological mechanisms when the role expectations clash with personal moral principles. We propose that two possible psychological mechanisms of moral disengagement and deontic moral outrage lead to the detrimental consequences of withdrawal behaviors or expected unethical role behavior. We conclude that the voice of the individuals, who suffer from the mismatch of personal moral principles and role morality, should be heard and acted upon, in order to avoid the detrimental consequences of the mismatch between personal moral values and role expectations.

RESEARCH

PAPER SESSION

ASYNCHRONOUS

We investigate the investment criteria of 179 impact investors using an experimental conjoint analysis. Our findings reveal that the three most important investment criteria of impact investors are the authenticity of the founding team, the importance of the social problem targeted by the venture, and the venture's financial sustainability. In contrast, the degree of innovation, founding team characteristics, and a first proof of concept are less important. We then compare these investment criteria across different types of impact investors (i.e., donors, equity investors, and debt investors). We find that donors pay more attention to the importance of the social problem and less to financial sustainability than equity and debt investors. Also, equity investors place a higher value on scalability than debt investors. We contribute to nascent literature on impact investing by documenting how impact investors make investment decisions and by providing a nuanced view of different investor types active in this novel market. Practical implications exist for both impact investors and social enterprises that seek financing.

A Community-Based Theoretical Framework for Impact Investment Research

Author: **Yi Zhao**; U. of Arizona

Impact investment has quickly emerged to become the new frontier for social entrepreneurial finance over the past two decades. Impact investment creates both financial and social returns by supporting hybrid form of organizations that pursue financial and social goals simultaneously. The proliferation of impact investments, however, is not matched by the production of relevant theoretical knowledge. To advance the understanding about impact investing from a theoretical perspective, I first review the existing literature on impact investing through the lens of two commonly used theoretical frameworks—institutional logics and organizational categories. Although these two frameworks have produced useful insights, they tend to ignore the social embeddedness of impact investment in the context of local communities where investment opportunities are located. Next, I

develop a community-based framework for impact investment research. Specifically, I draw upon the literature in sociology of community and organization theory to develop theoretical propositions about how the allocation of impact investment capital is influenced by the ecological, institutional and social contexts of local communities where investee organizations are embedded. The community-based framework offers research on impact investment a new theoretical perspective and opens up a new direction for empirical investigation.

Sustainability: Concepts, Impact, and Measurement (session 1137)

Corporate Sustainability and Business Ethics: Towards A Normative Research Agenda

Author: Kai N. Hockerts; Copenhagen Business School

Author: Cory Searcy; Ryerson U.

Research at the intersection of corporate sustainability and business ethics has grown over the past years. As associate editors we have seen many such papers pass our desks that unfortunately have failed to make a convincing contribution to the field and that eventually have ended up being rejected. In this paper we highlight two areas of concern. Firstly, many papers conflate corporate sustainability with other constructs such as CSR or environmental management. Secondly, many papers purporting to connect corporate sustainability with business ethics actually fail to do so. We outline several exemplary research areas that we feel would be promising fields of enquiry and call for more normative research in relation to constructs such as multiple objective functions, carrying capacity, and generational sustainability.

Adjustment Costs and Real Options, A Dynamic View (session 1147)

How Well Do U Know Dynamic Capabilities? Real Effects of Product Portfolio Reconfiguration Routines

Author: Christopher Jung; WWU Münster

In this study, we question prior work which assumes that dynamic capabilities are automatically conducive to competitive advantage, and we document negative consequences of dynamic capabilities on competitive advantage. We build on the concepts of exploitation and exploration and argue that dynamic capabilities can sometimes weaken competitive advantage, as their exercise can disturb the alignment between a firm and its environment. We theorize that the exercise of dynamic capabilities can create substantial dynamic adaptation costs and coordination costs that can outweigh adaptation benefits, suggesting a U-shaped functional form between dynamic capabilities and competitive advantage. We revisit the role of environmental dynamism to theorize that it can shape the benefits of dynamic capabilities. In dynamic environments, companies need to exercise dynamic capabilities in order to realize explorative activities. In stable environments, though, companies need to exercise operational capabilities,

The Tyranny of Tensions: The Myth that is Corporate Sustainability

Author: **Gerard F. Farias**; Fairleigh Dickinson U.

Author: **Christine Farias**; Borough of Manhattan Community College

Author: **Isabella M. Krysa**; Fairleigh Dickinson U.

The notion of tensions in corporate sustainability has for long served as an excuse to limit action and therefore further exacerbate the sustainability issues we face. While concepts like the Triple Bottom Line, and the approaches to managing tensions, ostensibly seek to balance financial, social and environmental outcomes, they, in reality, prioritize financial outcomes and serve to preserve the existing business paradigm. They create the delusion of responsible corporations while serving to preserve the status quo. We argue that true and strong sustainability calls for a rejection of the balance or Both/And approach; it calls for a hierarchical approach, where social good, the elimination of environmental harm and the restoration of the environment are prioritized over economic/financial outcomes. We do not discount the importance of financial sustainability; we simply argue that it cannot be obtained at the cost of a reasonable quality of life for all current and future generations of all species.

Firm-Level Experimentation: Joining Dynamic Adjustment Costs, Real Options, and Dynamic Capabilities

Author: **Hyeonsuh Lee**; U. of Illinois at Urbana-Champaign

Author: **Joseph T. Mahoney**; U. of Illinois at Urbana-Champaign

This paper suggests that cognitive, organizational, political, and economic factors can contribute to low (dynamic) adjustment costs. These low adjustment costs lead to low firm-level costs of experimentation, which enables high-accumulated firm-level experimentation, such as (internal and/or collaborative) market context, product/technology, and business model experimentation. Such accumulated experience can lead to an increase in a firm's real options, which can enable it to realize dynamic capabilities. The sequencing of lower adjustment costs, higher experimentation, greater awareness of subsequent real options, and realized dynamic capabilities can become a virtuous circle. That is, a firm's dynamic capabilities can further lower its dynamic adjustment costs in a positive feedback loop. We provide a theoretical framework in which experimentation in an uncertain environment is a core construct to bridge dynamic adjustment costs, real options theory, and a dynamic capabilities approach for the purpose of better explaining and predicting the firm's sustainable competitive advantage.

2018 between 1970 and 2018. Following a bibliometric review of 1455 abstracts we map where the discipline conversations on sustainability impact are occurring. We present an Impact-Issue typology which shows that three distinct patterns emerge in terms of how the term 'impact' is deployed within and across 22 ABS sub- disciplines: 1) Sustain-centric impact conversations; 2) Corporate- centric impact conversations, and 3) The 'quiet' sub-disciplines. We find distinct leaders in terms of sub-disciplines and journals who are shaping and influencing the conversation, however we find "strong" disciplines" are notably absent. The evidence suggests that epistemic bubbles exist at the discipline level, leading to a persistent disconnect between corporate and system level literatures. Epistemic bubbles reinforce single disciplinary approaches to corporate sustainability impact which can be problematic in the development of theories of impact, This we argue is due to the epistemic landscape of disciplines. We argue that these bubbles need to be bridged, rather than burst, as disciplines play an important role. Bridging argue is through the creation of conversations to create "common ground" to enable collaboration and interdisciplinary impact research to emerge to bridge the divide.

Commoditizing the Market for Sustainability Standards: An Analysis of Meta-Governance Models

Author: **Jose Carlos Marques**; Telfer School of Management, U. of Ottawa

Continued proliferation and competition amongst sustainability standard-setting organizations in most global industries and issue areas has generated considerable interest in understanding the mechanisms that may lead to standards harmonization. Drawing on the collective action and meta-organization literatures, this study sheds light on the organization of sustainability meta-governance, underscoring differences in objectives, organizational structures and mechanisms for dealing with collective action dilemmas. By means of 41 interviews and 439 archival documents, we employ a comparative case study approach to

Resolutions to the Information Disclosure Dilemma: Evidence from Divested Spin-Offs

Author: **Donald D Bergh**; U. of Denver

Author: **Tracy Xu**; U. of Denver

Author: **Ronan Powell**; U. College Dublin

Author: **Lisa Victoravich**; U. of Denver

Managers face contradictory pressures of increasing the information opaqueness of their firms for competitive purposes while analysts and investors call for information transparency so they can understand and value the firm. We conceive, develop and test alternative resolutions to this "information disclosure dilemma" and its relationship to firm performance. One view posits that a mid-range point of opaqueness and transparency will be associated with the highest performance outcomes while the other view suggests that pursuing either independently is better. Data from a sample of 405 divested spin-offs and a matched control sample of new firms show that transparency or opaqueness is associated to higher performance than a mid-range of the two. Implications for information disclosure management, the boundaries of the opaqueness and transparency literatures, and divested spin-offs are offered.

Together We Stand, Divided We Fall: Real Options in Conflict-Prone Countries

Author: **Hyungjin Lee**; Korea U.

Author: **Changwha Chung**; Korea U.

Despite the proliferation of real options reasoning as a strategic tool to navigate uncertainties, we still know little about the mechanisms through which different types of options interact to determine the value of one another. To address this shortcoming, we examine how the availability of switching options determine the value of exercising an option to alter scale. We employ this concept in the context of multinational enterprises (MNEs) with foreign subsidiaries facing violent conflict risks—settings where firms often exercise contracting options to minimize their exposure to risks while preserving the opportunity to re-expand. We investigate how the value of contracting an option, as a subsidiary

examine how eight different industry meta-governors deal with these key issues and how these differ from NGO-based approaches. Findings reveal that NGO and industry-based meta-regulators hold opposing conceptions of harmonization and develop considerably dissimilar mechanisms for bringing these about. While NGO meta-governors' pluralistic, legitimacy-based approaches have been referred to as "creating a market for standards", we suggest that industry meta-governors' centralized approach, characterized by industry concentration and supply chain governance, is best described as "standards commoditization".

survival strategy, is determined by the availability of two conditions that enable the exercise of switching options: the structural configuration of the subsidiary's MNE network and the operational overlap between the focal subsidiary and the same-parent subsidiaries. Our analysis of 1,147 Japanese foreign subsidiaries operating in 12 countries from 1991 to 2014 suggests that contraction alone may not be a sufficient strategy but its use in conjunction with extensive MNE network structure and operational overlap with same-parent subsidiaries may serve as an effective means to mitigate negative exposure and enhance survivability in conflict-prone countries.

Business Model Innovation (session 1143)

The Sources of Innovativeness in Business Model Innovation

Author: **Carlos M. DaSilva**; HEG School of Management Fribourg / HES-SO // U. of Applied Sciences Wes

We develop a multi-level theory of business model innovation (BMI) that explains business model dynamics within established firms, integrating the processes happening at the individual, collective and organizational levels. Existing organizational level approaches portray BMIs as a firm-level phenomenon, but do not specify how they emerge and evolve over time, while micro-foundational approaches illuminate actors' contributions but reduce BMI to a cognitive process at the level of individual managers. Our framework integrates these contrasting approaches, conceptualizing BMI as a complex process happening at three interrelated levels (micro-, meso- and macro-), and provides a set of propositions delineating the mechanisms and conditions where individual cognitive models (managerial schemata) are

Competitive Effects of CSR and Certification (session 1148)

How do Analyst Recommendations Affect Firm Competitive Actions? A Rival-Centric View

Author: **Wan-Chien Lien**; U. of New Hampshire
Author: **Tianxu Chen**; West Virginia U.
Author: **Jianhong Chen**; U. of New Hampshire
Author: **Jeffrey Edward Sohl**; U. of New Hampshire

Drawing on the research of competitive dynamics and financial analysts, we link analysts' stock recommendation to firms' competitive behaviors and investigate how analyst recommendations on the focal firm's stock and analysts recommendation on the rivaling firms' stock individually and interactively shape the firm's competitive behaviors. Based on a longitudinal analysis of 2,319 public firms from 2000 to 2015, we show that both analyst stock recommendations of the focal firms and of rivaling firms can enhance the focal firms' strategic repertoire intensity and complexity. Moreover, analyst recommendations of the focal firms' stocks can weaken the positive effect of analyst stock recommendations of the rivals on the focal firms' strategic repertoire intensity. Our study contributes

translated into organizational changes (routine reconfiguration). A set of theoretical propositions derived from this view offers a new ground for understanding how BMIs can lead to firm-level value creation and capture.

Disentangling the Complex Relationships Between Business Model Innovation and Firm Performance

Author: **Matthias Menter**; Friedrich Schiller U. Jena

Author: **Lutz Göcke**; FH Nordhausen

Author: **Christopher Zeeb**; Friedrich Schiller U. Jena

Author: **Thomas Clauß**; U. of Witten/Herdecke

Despite the increasing interest in business model innovation, literature still lacks solid empirical evidence about the consequences of business model innovation over time. Recent research called for more profound empirical investigations that assess the performance outcomes of business model innovation through longitudinal research designs. The purpose of our paper is to address this gap. Building on the business model classifications from previous scholars, differentiating three core dimensions (value creation, value proposition, value capturing), we collect cross- industry data based on more than 35,000 press releases capturing over 2,500 events of business model innovation from 60 German stock- market-listed corporations over an eleven-year period (2007-2017). We regress those against firm performance measures. Our findings show that business model innovation has a positive yet lagged effect on performance. We further find complementary, yet also substitutive effects of the different dimensions. Whereas value creation and value proposition innovation are substitutive in their relationship on firm performance, value capture innovation complements both other dimensions. The combination of all three dimensions is also substitutive. Our nuanced longitudinal findings on the performance consequences contribute to the business model innovation literature by clearly showing the need to carefully plan business model innovation activities at the level of strategic management.

Enhancing Profits & Reducing Losses by Managing Material Environmental, Social & Governance Factors

Author: **James McGlinch**; The Wharton School, U. of Pennsylvania

Author: **Witold Jerzy Henisz**; U. of Pennsylvania

In this study, we extend the academic debate on the materiality of corporate social performance from the question of whether a relationship exists between corporate social performance and corporate financial performance to how and where the relationship obtains. Specifically, by drawing on the recent shift characterizing corporate social performance as a firm's response to environmental, social, and governance (ESG) issues deemed to be material to a firm or industry, we show five pathways through which the strategic management of these material issues can enhance reported profits and reduce incidence of losses. Using a large sample of publicly traded US firms over a 12 year period from 2007-2018, we show that firms which are better able to manage ESG issues financially material to their industry are more likely to report unexpected increases in revenue, favorable reductions in operating costs, fewer legal or regulatory interventions, gains in employee productivity, and interest in increasing both organic and inorganic business investment. Taken together, these results suggest the mechanisms linking ESG performance to firm value extend beyond the risk-based perspective of contemporary literature, creating further value-additive opportunities for the integration of ESG issues into corporate strategy.

Barriers to Imitation in Strategic CSR: Organizational Authenticity and the Resource-

The Effects of Contextual Factors on the Quality of Business Model Ideas

Author: **Fatemeh Masihkhah**; Amsterdam Business School, U. of Amsterdam

Author: **Anna Plotnikova**; Vrije U. Amsterdam

In the face of technological disruption, incumbent firms need to adapt their business models to be able to survive and prosper. The first step in developing a new business model is to generate business model ideas. The knowledge and ideas related to new opportunities for value creation and capture are dispersed across the organization. Thus, Companies are highly interested in inspiring employees to contribute to new business model ideas and to create an environment to facilitate the creation of higher quality ideas. Using an experimental setting in a large multinational telecommunication company, with 319 participants, we found that the quality of business model ideas (considering their novelty, usability, and workability) developed under disruptive technological settings are affected, in a way that they have higher novelty and workability and lower usefulness. Moreover, we tested whether the quality of a generated idea for such complex concepts like a business model that needs different expertise from different players in the organization and collaboration of individuals under disruption will be moderated by social settings. However, our data did not support this effect. This study has important implications for our understanding of the quality of business model ideas under technological disruptions.

Reaching for the Stars: How Firms Organize to Radically Renew their Business Models

Author: **Karolin Frankenberger**; U. of St. Gallen

Author: **Christoph Zott**; IESE Business School

Business model innovation as a phenomenon lies at the intersection of strategy and entrepreneurship fields of study. Faced with the threat of nimble new entrants with powerful new business models, managers of established firms need to find ways to

Based View

Author: **Steve Kofford**; U. of Utah

Author: **Adam Clark**; U. of Utah, David Eccles School of Business

Author: **Lisa Mali Jones Christensen**; Brigham Young U.

This paper examines models of value creation in CSR and explores the existence of barriers to imitation in strategic CSR. We focus on two prominent models of value creation in the CSR literature: CSR as a means to greater legitimacy, and CSR as a signal of internal norms and values. We associate each with attributions of conformity and consistency, respectively. We argue that conformity and consistency serve as important mediators between CSR investments and value creation in these models. Drawing on the organizational authenticity literature, we explore conditions where attributions of type authenticity (i.e. conformity) and moral authenticity (i.e. consistency) may act as barriers to imitation in CSR investment. We also identify the resources that allow firms to gain attributions of authenticity while establishing barriers to imitation for rivals. We conclude by discussing how organizational authenticity may allow sustainable competitive advantage from CSR investments.

renew their own business models whilst their existing business model is still in place. However, how can they achieve this? In particular, how should they organize to ensure a high degree of novelty in the new business model? This question is of high practical as well as theoretical relevance. Drawing on theories of ambidexterity and corporate entrepreneurship we develop and test a model that explains how the degree of novelty in the resulting new business model depends on the alignment among an initiative's differentiation from the core business, its social integration with the core business, and relevant control mechanisms at the initiative level. We test our model using data from a unique hand-collected set of 141 business model innovation initiatives in large established firms. The study represents one of the rare large-scale empirical research efforts on business model innovation in established firms. Its main theoretical contribution is to explain how organizational control choices on the initiative level can serve as a crucial mechanism to unlock the power of combining differentiation with social integration – two seemingly opposing forces – in business model innovation initiatives.

Does the Stock Market Appreciate Management Speak? (WITHDRAWN)

Author: **Joao Cotter Salvado**; Catolica Lisbon School of Business and Economics

Author: **Freek Vermeulen**; London Business School

CEOs and other actors often use business jargon – “management speak” – when communicating their firm’s strategy. We examine the use of management speak in the context of acquisition announcements. Rather than providing legitimacy and impress others, we argue that the use of such terminology is likely to make an audience, including analysts and fund managers, suspicious of the value-creation potential of the deal. Consequently, the financial market will respond negatively to it. An event-study on 1,371 large acquisitions confirms our prediction. Importantly, analyzing the longer term impact of the acquisitions in our sample, our findings confirm that the financial market’s dislike of management speak is not necessarily because its use is more ubiquitous among deals with lower ex ante potential for value creation; investors just trust them less. We also show that the results are different for new CEOs, whose use of it is met with more leniency, although this changes significantly in the immediate aftermath of the 2008 crisis. Our results are robust for a battery of control variables and alternative specifications. We discuss implications for insights into the communication of firm strategy.

Some but Not Too Much: The Impact of Diversification on Corporate Payout Policy

Author: **Zhuo Chen**; American U., Kogod School of Business

This paper examines the relationship between diversification and corporate payout policy. Given the ambiguous link between diversification and firm performance, I propose that managers could use their corporate payout policies to convey positive

emerging as a particular setting for value creation, designed and controlled by the host firm. Recent research in strategic management show that the more value-in-use is created for customers through core value propositions, the more economic value can be captured by firms. However, value creation within FHOcs mostly lies in ancillary value propositions, which enhance interactions between firms and customers outside the purchase of goods or services. Our research seeks to understand how this specific value creation within FHOcs can be channeled by firms into value capture. Through a multiple case study we show that the value created within FHOcs can undergo two processes in order to be channeled into value capture: up- and downcycling. These processes are simultaneously used and combined to enhance firms’ performance through value capture. We thus show that value capture with new means of communication is a nonlinear process on which firms can regain control by creating FHOc.

How Incumbent Firms Respond to a Change in the Market Information Regime

Author: **Paola Zanella**; IE Business School

Author: **Paola Cillo**; Bocconi U.

Author: **Gianmario Verona**; Bocconi U.

Digitization poses new challenges to incumbents in many industries by changing the market information regime. Thanks to two unique datasets, we investigate both the demand- and supply-side 48 weeks before and 48 weeks after the regime change in Billboard chart. On the demand side, we find that the new market information regime reveals more diversified consumer tastes in terms of higher preferences for emerging artists and non-mainstream genres. On the supply side, we use production data to analyze how generalists and specialists modify their portfolio strategies after the regime change. We find that the two strategic groups adopt different strategies to compete in the new regime. Also, we find that, after the regime change, generalists and specialists benefit from pursuing different exploration strategies. We comment these findings for literature on technical change, market information and dynamic

information to external market and alleviate investors' concern about the "cost" of diversification. Using a matched sample between 1977 and 2014, I find that while diversified firms are more likely to pay dividends and make stock repurchases, the amount of dividend payments and stock repurchases by diversified firms is lower than that by their focused counterparts. Furthermore, using change in industry growth opportunities as an external shock, I identify a causal relationship between diversification and corporate payouts.

Competitive (dis)Advantage from Learning in Multisided Platforms: Opening Different Platform Side

Author: **Jeffrey A. Martin**; U. of Alabama, Tuscaloosa

Author: **Gorkem Turgut Ozer**; U. of Maryland, College Park

Author: **Edward Anderson**; U. of Texas at Austin

The strength of network effects is critical for the performance of multisided platforms. Platform operators invite different sides (e.g., application developers in smartphones) for their contributions to value creation. Even though platform operators impose limitations and control on who gets to participate on each side of the market, the constant pursuit of growth due to competitive pressures usually leads to policies that encourage open participation. An interesting, and sometimes unintended consequence of opening a platform is that rival platform operators can also participate as sides, or complementors. Acting as a complementor, rival platform operators can learn beyond what they could learn as outsiders, and use this learning to gain competitive edge over the platforms in which they participate as complementors. We examine the effects of this learning as a source of competitive advantage for a platform operator that is participating in a rival (host) platform as a complementor. Using an agent-based simulation model, we develop insights including one on the moderation effect of market dynamism. We find that learning leads to competitive edge in markets with low to moderate levels of dynamism (as measured by the rate and magnitude of change), but not in those with high levels of dynamism, with an exception in markets with both high dynamism and switching costs. This is true even if competitive advantage from learning diminishes as switching and learning costs increase.

Rethinking Platform Strategies in the Age of Distributed Trust

Author: **Christopher Rowell**; U. of British Columbia

Author: **Marc-David Seidel**; U. of British Columbia

The current overwhelming focus on proprietary platform ecosystems unnecessarily limits current platform literature. The introduction of distributed trust technologies such as blockchain enables new business models and strategic possibilities. Adopting a platform lens, we reveal how distributed trust technologies can replace proprietary platform sponsors at the center of platform-based markets, and afford new roles and opportunities for third-party complementors. In this paper we review the key assumptions of the platform literature which are now being violated. We then update the theory for this new reality, in light of recent technological advances. To elucidate the new theory we present the illustrative case of Cryptokitties, the first successful distributed application (“dApp”) built atop a permissionless blockchain platform.

Organizational Leaders Shaping Reality and Organizational Outcomes (session 1152)

Talking about Strategy: Leaders' Use of Adaptation Frames

Author: **Sze Sze Wong**; Nanyang Technological U.

Author: **Heather Li**; Nanyang Technological U.

Author: **Shen Rui**; The Chinese U. of Hong Kong, Shenzhen

Strategic leaders package information in ways to elicit external audiences’ positive assessment of the firm. Focusing on the simplification and condensation function in the framing perspective, we offer a new model to explain why and how leaders construct coherent adaptation frames for corporate growth and corporate restructuring that resonate with investors. Using 36,077 quarterly conference call transcripts across 2,034 firms, we

development in a resource-scarce setting, the Brazilian favelas (i.e., urban slums). To this end, I use mixed-methods, combining a randomized controlled trial (RCT) and a computation textual analysis. My results show that the PPP improves favela dwellers both labor market outcomes, such as entrepreneurship and income; and socio-psychological outcomes, such as self-efficacy and optimism/positivity. Surprisingly, however, the partnership hurts perceptions of social stigma, which increase among participants. Qualitative evidence points to what I call the “getting out of the ghetto” effect, in which participants feel more stigmatized after the partnership program because they are more likely to engage in social interactions with people from outside the favela. This paper seeks to advance the recent call for more management research focusing on the United Nations Sustainable Development Goals.

MNE Approaches to CSR in Sub-Saharan Africa: A Multi-Theoretic Study

Author: **Amy Joy Guerber**; Texas A&M U.

Author: **Scott D Julian**; Wayne State U.

Author: **Kun Liu**; -

This study provides a comparative test of three distinct theories of MNE behavior in host nations using data on the CSR activities of foreign and domestic firms in the sub-Saharan nation of Ghana. Studying the philanthropic spending and expressed CSR commitments of MNEs and domestic firms in SSA provides a direct comparison between a locally normative form of CSR (philanthropy) with one that is normative in the global context (expressed social commitments). Compared to domestic firms, MNEs express more social commitments but invest significantly less on philanthropy. Results also show a significant positive interaction between foreignness and visibility in predicting expressed social commitments, but not philanthropic spending. Taken together, these results show that TNF theory provides the clearest insight into MNEs' CSR engagement in sub-Saharan Africa.

view paper (if available)

demonstrate that strategic leaders selectively emphasize and de-emphasize different categories of information to invoke either an exploration or exploitation frame. More importantly, the invoking of these frames is consequential on investor reactions. Our findings contribute to the impression management and framing literature by offering a new framing model that articulates why and how coherence in framing in strategy discourse matters to trigger investor reactions.

Fighting with the Fourth Estate: A Framework of Organization-Media Rivalry for Narrative Control

Author: **Matt C. Hersel**; College of Business, Clemson U.

In this article, I develop a theoretical framework to explain rivalry for narrative control between transgressing organizations and media outlets. I do so by integrating and advancing key insights from competitive dynamics and crisis management research. The first part of this framework conceptualizes the unique tensions, actions, and reactions that characterize rivalry for narrative control following organizational transgressions and distinguishes it from other forms of rivalry. The second part of the framework conceptualizes the role of both journalists' and organizational leaders' perceptions in shaping actions and reactions during rivalry for narrative control. This framework expands competitive dynamics research to account for a unique form of rivalry between dissimilar actors and, in doing so, broadens research on crisis management following transgressions to account for such rivalry.

What Determines Firm Investments? The Role of Local Institutional Quality

Author: **Riccardo Savio**; Luiss Guido Carli U.

Author: **Francesco Castellaneta**; SKEMA Business School

Author: **Alessandro Zattoni**; Luiss Guido Carli U.

The influence of the environment on firms' investments has been largely investigated. Literature underlines that the national institutional quality is one of the key driver of firms' investment strategies. It is instead, relatively unexplored, if local institutional quality may affect firms' investments, that is if difference in institutional quality within the same country may influence firm investments. To this purpose, we collected data about a large sample of limited companies in Italy, a country characterized by significant variation of institutional quality within it. Our results show that higher local institutional quality positively influences firms' total investments. Moreover, our results highlight that regulated industry and state-ownership moderate this relationship. In particular, we find that, when local institutional quality decreases, regulated and state-owned firms invest more than non-regulated and non-state-owned firms; the opposite is true when local institutional quality increases. These findings underline the importance of local institutional quality and the heterogeneous reaction of regulated and state-owned firms to changes in the institutional environment.

Political Risk Reversal: Strategic Holdup of Firms by Government

Author: **Srividya Jandhyala**; ESSEC Business School

Author: **Himanshu Bhatt**; ESSEC Business School

A central idea in the literature on political risk is that governments can opportunistically appropriate returns from firms' investments. Contrary to this view, we highlight political risk reversal, where firms can also opportunistically interact with the state. Firms take strategically disadvantageous position initially vis-à-vis the host government, with the

an organizational crisis. Drawing on upper echelon theory and crisis management, we explain how certain personality traits from the five-factor model are relevant to the job demands a CEO faces in situations of crisis from a shareholder perspective. We build a multi-source dataset of 184 large scale data breaches and apply a novel open language approach to measure personality which we apply to the Question and Answer (Q&A) sections of investor calls. Our findings indicate that a CEO's level of conscientiousness, openness to experience and neuroticism positively moderates the relationship between media attention after a crisis and stock market reaction (cumulative abnormal returns), whereas agreeableness negatively influences it. These results have useful theoretical and practical implications for the role of the CEO and for crisis management in general.

Exploitation and Exploration in the Presence of Interorganizational Information Sharing

Author: **Yimei Hu**; Aalborg U., Department of Business and Management

Author: **Yuchen Gao**; School of Economics and Management, Tsinghua U.

Author: **Huanren Zhang**; U. of Southern Denmark, Odense, Denmark

Author: **Qiu Shumin**; SEM Tsinghua

When involved in an uncertain and competitive business environment, firms are faced with two contradictory pressures: differentiate from competitors for competitive advantages vs. conform to industrial norms to gain legitimacy. Building on and extending James G. March's work on exploitation/exploration and organizational learning, this study enriches our understandings of this differentiation-conformance dilemma. Using a mixed-method design, we investigate how interorganizational information sharing influences firms' performance using both a computational model and an illustrative case study. The computational model helps unfold the underlying dynamic and adaptive learning mechanism. Our results suggest that information sharing within an industry can significantly improve the performance of the whole industry. This positive effect of information sharing is especially salient in the presence of learning cost, because it helps a firm overcome the success trap. Our case study on the Chinese photovoltaic industry supports and lends external validity to these findings. When engaged in a highly uncertain new area, firms need to pay attention to the industrial norms by imitating and updating timely to the leading experiences and legitimate technological trajectories. Lead firms and industrial associations play a key role in spreading information and shaping legitimate technologies, which greatly improves the performance of the whole industry.

Strategy-Structure Fit in the Shadow of Exploration-Exploitation

Author: **Mu-Jeung Yang**; U. of Utah, David Eccles School of Business

Author: **Bryan Hong**; New York U.

Author: **Lorenz Kueng**; -

This study provides the first large-sample test of Chandler's famous strategy-structure hypothesis in the context of the exploration-exploitation trade-off. To this end, we construct measures of the degree to which strategies and organizational structure are oriented towards exploration as opposed to exploitation for a representative panel dataset of all Canadian business firms. We obtain three main results. First, high intensity of exploration strategies is negatively related to high intensity of exploitation strategies, as implied by a strategic exploration-exploitation trade-off. Second, higher relative importance of exploration (exploitation) in strategy is systematically correlated with more adoption of organizational practices that support exploration (exploitation). We show that this pattern holds dynamically as well, as strategic repositioning towards exploration is systematically correlated with restructuring towards exploration-supporting practices. Additionally, this strategy-structure relationship continues to hold if we instrument strategic positioning using firm peers. Third, intensifying low-cost competition, which reduces the benefits of exploitation strategies leads to a systematic shift towards more exploration strategies, while increasing misalignment between strategy and structure.

Publicly-listed companies increasingly face pressures from the public equity market. Recently these market pressures have arisen from activist hedge funds who buy blocks of shares in a firm's

Configuring and Governing a Nested Entrepreneurial Ecosystem for Interorganizational Ambidexterity (WITHDRAWN)

Author: **Amadou Lô**; Toulouse Business School

Author: **Christina Theodoraki**; Toulouse Business School

This paper examines the mechanisms through which corporations can achieve ambidexterity based on entrepreneurial ecosystems. The emergence of entrepreneurial ecosystems provides an alternative approach for large corporations to capture and co-create value across institutional boundaries. This paper explores this perspective by connecting the interorganizational ambidexterity literature with the emerging concept of entrepreneurial ecosystems through a case study. Specifically, we examine a space dedicated to collaboration with external actors initiated by a large industrial corporation in collaboration with 22 other selected organizations and start-ups stemming from the Parisian entrepreneurial ecosystem. Our results reveal the necessary configuration (spatio-material and sociocultural attributes) for supporting explorative activities and the balanced management (democratic governance combined with leadership) of a nested entrepreneurial ecosystem for ensuring ambidexterity for large corporations. Our findings shed new light on the ambidexterity and entrepreneurial ecosystem research streams and provide guidance for managers and future research.

The Emergence of Digital Platform Ecosystems: A Problem-Solving Perspective

Author: **Ramya Krishna Murthy**; Schulich School of Business

Author: **Anoop Madhok**; Schulich School of Business

In digital platforms value is co-created by platform sponsors and complementors and fundamental to such co-creation is a shared understanding of the scope of activities of the respective actors. The platform sponsors' choice of scope is critical at the initial stage to attract participation of the autonomous complementors although neither the complementors nor the complements are known ex- ante. In this paper, we address how a platform

stock with the intent to intervene in the firm's management. Despite the growing presence of activist investors, the nature of strategies that garner attention from these investors is not well known. This study uses the theoretical lens of a lemons problem in strategies, arising from information asymmetry and adverse selection issues in public equity markets, to argue that as companies' strategies are incongruent with the expectations of market participants and therefore more difficult to understand, they are prone to public market dissent and likely to garner more attention from investors seeking involvement in management. Using a hand-collected proprietary database of SEC 13D filings and proxy statements, we find that companies' increasing levels of strategic incongruence tend to be positively associated with attracting proactive investor attention.

Community-Based (Dis)Advantage?: An RBV View of Community Driven Performance Gains and Latent Hazard

Author: **David G. Sirmon**; U. of Washington

Author: **Greg Fisher**; Indiana U.

Author: **Alex Michael Murray**; U. of Oregon

Community is often excluded from stakeholder-focused research. However, some scholarly work identifies community as a driver of firm advantage, while other work suggests that communities can be turn antagonistic towards previously supported firms. We draw on Resource-based View and Resource Dependence Theory to address the complicated nature of community and its effects on engaged firms. First, we argue that when proximal (contributing to the firm's co-specialized resource bundle) community, indeed, is a central stakeholder. However, because proximal community holds a utility function that is different from other proximal stakeholders (community seeks to strengthen community identify as opposed to help ensure the firm is profitable in order to share in those profits) it simultaneously drive performance gains as well as produces a latent hazard; a hazard that if triggered leads the community to swiftly enact antagonistic actions against a previously supported firm. More specifically, we argue that community size,

sponsor's choice of scope can attract complementors and facilitate the emergence of an ecosystem. Using the problem-solving perspective, we demonstrate that for successful emergence of de novo ecosystems the platform sponsors' choice of activity scope should be aligned with the problem they seek to solve. We test our arguments, using fuzzy-set qualitative comparative analysis on a dataset of crowdfunding campaigns of aspiring platform sponsors, and identify multiple pathways, representing distinct configurations of problem dimensions and scope, for successful emergence of ecosystem around incipient platforms.

commitment and resource provision simultaneously drive performance gains characterized with diminishing returns as well as a community-based latent hazard. However, not all community-engaged firms face the same threat in terms of the latent hazard being triggered. We identify contingencies that increase mutual dependence between the community and firm, thereby desensitizing the triggering of said latent hazard. In total, our research extends RBV and captures the complexity of navigating a community-centric strategy.

Social Comparisons and Multiple Aspirations in Performance Feedback (session 1151)

Different Types of Performance Feedback and their Distinct Influence on CSR Engagement

Author: **Sofia Angelidou**; U. of Liverpool Management School

Author: **Charalampos Saridakis**; Leeds U. Business School

Drawing on the behavioral theory of the firm, and particularly on performance feedback, we tested the influence of discrepancies between corporate financial performance and aspirations on the decision to engage in corporate social responsibility. Our findings highlight the importance of performance feedback in stimulating varying firm decisions when setting the level of their social engagement. Our empirical evidence shows that as financial performance rises above historical or falls below social aspiration, the firm's engagement in CSR activities decreases, whereas as financial performance rises above social or falls below historical aspiration, the firm's engagement in CSR activities increases. Our findings shed light on the underlying mechanisms that lead to opposing interpretations of achievement and variations in the perception of risk- an issue that has received very

Author: **Johann Peter Murmann**; U. of St. Gallen

Author: **Ji-Ye Mao**; School of Business, Renmin U. of China

Author: **Chaoyuan Deng**; U. of St. Gallen

There is a widespread perception that Chinese companies, compared to their Western counterparts, are not good at creating novel products and services. But in the arenas of e-commerce and other digital businesses, Chinese companies such as Alibaba and Tencent have become highly successful. This has led some observers to hypothesize that while Chinese firms may not excel at developing new-to-the-world products and services, they may be very good in inventing new-to-the-world business models (BMs). To explore this phenomenon, we analyzed 137 suggested innovative BMs in detail to investigate

little attention in prior empirical research.

Strategic Social Comparisons: How Historical Performance Influences Reference Group Selection

Author: **Jingyi Wang**; UNSW Sydney

Author: **George A. Shinkle**; UNSW Sydney

Author: **Lingli Luo**; Zhejiang GongShang U.

This paper examines organizational heterogeneity in social comparison related to organizational aspirations. Organizational social comparison is the process wherein an organization compares performance with its reference group. Combining the organizational aspiration literature and the social comparison literature, we investigate the immediate and deferred influences from organizational self-comparative performance (difference between organizational performance and aspiration) on social reference group selection. Our theorizing is based on the activation of different social comparison motives. We hypothesize that an organization progressively narrows the performance range of its social reference group when performance increases, while first narrows and then broadens the industry range of the group as performance increases from below to above aspiration. We also hypothesize that higher variance of self-comparative performance across time weakens the effect from positive self-comparative performance; while it strengthens the effect from negative self-comparative performance. We utilize one-step system GMM estimations on a secondary dataset of 1,127 North American listed firms from 2006 to 2015. The results partially support our hypotheses. Our research advances the knowledge on organizational heterogeneity in social reference group selection by expanding the role of historical performance, adding the self-improvement motive of social comparison, and highlighting the time dimension when investigating relevant antecedents.

Global Networks, Local Specialisation and Regional Patterns of Innovation

Author: **Andrea Ascani**; Gran Sasso Science Institute

Author: **Luca Bettarelli**; -

Author: **Laura Resmini**; -

Author: **Pierre-Alexandre Balland**; Utrecht U.

A large academic consensus exists on the idea that successful innovative processes are geographically bounded within regions. Nevertheless, the ability of regions to capture and re-use external knowledge is also regarded as a fundamental element to sustain and refine the local profile of specialisation and competitiveness. The present article combines these views to investigate the sources of the regional innovation process, by analysing data on Italian regions over the period 2007-2012. We define regional external networks based on all the foreign subsidiaries of local multinational enterprises identifiable as global ultimate owners. Our main results suggest that both the internal specialisation and the outward networks can generate indigenous innovation, but the role of the networks varies substantially according to its density, its degree of complementarity with the specialisation profile, its geographical spread and the specific location of the foreign subsidiaries. Our results, then, support a view of the regional innovation as an interactive process whereby valuable knowledge resources are not only generated within the reach of the local economy, but they are also integrated with external inputs. This contrasts with recent anti-globalisation views according to which the increase in the foreign operations of national companies impoverishes the local economy.

Aspiration Adaptation to Multiple Performance Comparisons: Generic Strategy as Information Filter

Author: **Karen Ruckman**; Simon Fraser U.

Author: **Daniela Blettner**; Simon Fraser U.

When adapting aspirations, managers compare their firm's performance to their own past aspirations and to performances of social reference groups. In this paper, we explore how firms adapt their aspirations in response to comparison with three social reference groups and argue that generic strategy functions as a filter in the process of interpreting performance feedback. In a longitudinal sample of U.S. airline companies, we show that low cost or differentiation strategy moderates the performance feedback process in that firms with a well-defined generic strategy are heavily influenced by their own performance feedback when underperforming and the social reference groups that most closely align with themselves when overperforming.

Self-Evaluation Bias and Social Comparison Motives: A Field Experiment on Social Aspirations

Author: **Yun Hou**; National U. of Singapore

Based on a field experiment at Singapore hawker centres, I examined the effect of social comparison information on levels of social aspirations. I built my theoretical argument by integrating self-evaluation bias into the process of forming aspiration levels under the influence of social comparison information. I argue that social comparison information triggers a self-improvement motive for managers underestimating their relative performance, and this motive leads to higher social aspiration levels. However, if managers display overconfident self-evaluations, social comparison information negatively affects social aspirations for them as they are prone to self-enhancement motive. I test my hypothesis in a field experiment setting. I recruited food stall managers from hawker centres in Singapore and randomize them into treatment and control, so I can empirically show the existence of self-evaluation bias held by real business managers and gauge the causal effect of social

A Wave-Type of Real-Time Translation Work: Shifting the High-Speed-Rail Scientific Frontier in China

Author: **Kun Zhang**; U. of Queensland

Author: **Yunxia Zhu**; U. of Queensland

Author: **Peter W. Liesch**; U. of Queensland

Author: **Alexandra Kriz**; U. of Queensland

Author: **Hao Jiao**; Beijing Normal U.

This paper uses data from a qualitative study and a range of secondary sources to explore both the micro-level practices of real-time translation work and the macro context in which they occur. The aim of this paper is to explicate the nature of the translation work undertaken by a collective of actors to translate high-tech knowledge in multiple practical settings in responding to social and legitimacy pressures. In examining how the knowledge of constructing High-Speed-Rail (HSR) lines was translated into the Chinese context I draw a qualitative analysis to reveal the intricacies of the dynamic and ongoing translation work of high-tech knowledge and identify the patterns of the translation work as it develops. As such I contribute to the literature of Scandinavian institutionalist translation by first theorising the micro-practices actors undertaken, identifying the macro-level social entities, and secondly by relating them to a wave-type translation work - an evolving phenomenon. In doing so I argue that translation work in this distinctive socio-political context is dynamic in nature as the directions and outcomes of real-time translation work is a function of the ongoing energy - the collective interests which correspond with macro-level social entities.

IP Strategy: IP and Novel Value Appropriation (session 1156)

That's Mine! Employee Side Projects, Intellectual Property Ownership, and Innovation

Author: **Xi Wu**; Fox School of Business, Temple U.

Author: **Min-Seok Pang**; Fox School of Business, Temple U.

Author: **Charlotte Ren**; Fox School of Business, Temple U.

Working on side projects outside their work hours is a growing trend for many high-skilled knowledge workers. While employees might believe that anything they create in their spare time belongs to themselves, it is not always the case. In a legal case of Alcatel v. Brown, a Texas court ruled that employers own rights to employees' intellectual property (IP), including ideas of their side projects. Relatively little is known about the effect of the legal protection of employees' IP rights on innovations. We leverage the Alcatel v. Brown case as an exogenous shock and apply a difference-in-differences model to examine how the legal case

unknown quantity to participating in their screening processes to being able to leverage intermediary support as a credibility strategy. We reveal how it is becoming common for nascent ventures to pitch to intermediaries to win their attention rather than carry out generic market actions as suggested by the literature. Through drawing on valuation studies scholarship, we identify the critical processes in these pitches that facilitated movement along the continuum. Our study extends understanding of why nascent ventures successfully pitching to analysts and receiving positive evaluations is essential in furthering their growth and development.

Dude, What Did You Get from Your Parents? Learning by Investing in Industry Incumbents' Spinouts

Author: **Yoon Jung Kwon**; Rice U.

Author: **Anthea (Yan) Zhang**; Rice U.

This paper examines how a firm's knowledge dependence on the incumbents of an industry affects its choice of corporate venture capital (CVC) investees. We argue that since spinouts, defined as entrepreneurial ventures started by prior employees of the industry's incumbent firms, inherit knowledge of their parent firms, investing in spinouts allows CVC investors to indirectly access knowledge of the spinouts' parent firms. Using a sample of CVC investments that took place in the U.S. semiconductor industry in 2006-2015, we find that a CVC investor that has a higher level of knowledge dependence on industry incumbents is more likely to invest in a spinout venture than in a non-spinout venture in the industry. We also find that a CVC investor's knowledge dependence on a specific spinout's parent increases the likelihood that the CVC investor invests in the spinout, and this effect is strengthened when multiple founders previously worked for the parent firm. Bridging the CVC literature and spinout literature, our paper demonstrates that CVC investments not only allow firms to access knowledge of the ventures in which they invest, but also access knowledge of other firms that are related to the investees.

[view paper \(if available\)](#)

affects innovation activities. We find that following *Alcatel v. Brown*, both patent counts and entrepreneurial activities decrease in counties where employees' ownership of their IP is not legally protected. We also find that this dampening effect is more pronounced in information technology industries. Our work contributes to the literature on innovation management and provides policy implications on intellectual property law.

IP Strategies and Firm Value: Do Design Rights Matter? An Exploratory Assessment at the Firm Level

Author: **Michela Laura Bergamini**; KU Leuven

Author: **Bart Van Looy**; KU Leuven

The extent to which firms engage in technological innovation has received widespread attention in the last decades, as unique technologies result in superior value creation at the firm level. More recently, a number of scholars pointed at the distinctive role of design rights as design-driven strategies might equally result in unique and valuable assets. While the premium of patent protection on firm market value has been well documented, the extent to which and under which circumstances design protection also translate in market valuation has received little attention. In this study, we examine both what drives propensity to apply for design protection and whether it pays off for firms to (additionally) consider design rights in their IP portfolios. We rely on a consolidated panel data set (2000-2014) of stock-listed firms, situated in nine manufacturing industries (Automotive, Chemical, Electrical, Engineering, Food, IT-Hardware, Pharmaceuticals, Textiles and Other Manufacturing). We expect the presence and impact (on firm value) of design rights to be more outspoken in mature industries, as well as in industries focusing on end-consumers. While our intuitions hold for the propensity to apply for design rights, we neither observe a positive premium for mature industries nor for customer industries (on average). Only in high tech consumer oriented industries a premium in terms of firm value is becoming (consistently) visible. As such, our findings inspire to rethink the distinctive role of design rights

The Timing Dilemma: Understanding the Determinants of Startups' Patents as Collateral for Loans (WITHDRAWN)

Author: **Xue Yang**; Sichuan U.

Author: **Yuandi Wang**; Sichuan U.

This paper proposes a timing dilemma in which lenders are racing with two forces from the uncertainty of patent valuation and the validity of a patent's economic/legal life. Based on a large sample which contains Chinese startups' pledged patents, we verify the lenders' trade-off between uncertainty and validity over time. We also find that the endorsements from third parties can help lenders cope with the timing dilemma by mitigating uncertainty while saving time. Thus, we further the existing literature by expanding the determinants of using patents as loan collateral from static patent-level factors to dynamic multilevel factors.

CVC, Investor Leadership, and Technological Influence of New Venture Invention

Author: **Francesco Di Lorenzo**; Copenhagen Business School

Author: **Rafael Corredoira**; The Ohio State U. Fisher College of Business

Corporate venture capital (i.e. CVC) has received increasing attention as important positive antecedent of investee ventures' innovative performance. Yet, extant literature has mostly focused on the quantity of innovation (e.g. patents count). In this article, we shift the attention towards the quality of innovation of CVC-backed innovative startups. More specifically, we look at technological influence as a novel approach to capture how a specific invention shapes future technological domains. Building on recent works exploring the mechanism underlying the CVC's effect, we propose CVC leadership (i.e. leadership position of CVCs in the venture's investors syndicate) as a driving mechanism to explain investee venture's innovative capabilities development. Analyzing the patents of semiconductor innovative startups from 1985 to 2005, our results suggest that CVC investor leading positions occur in ventures with current

and their antecedents, especially in terms of value appropriation dynamics. We conclude by addressing limitations and by advancing suggestions that imply ample opportunities for future research.

Litigating Monetization and Patent Trolls: Evidence from the Patent Market

Author: **Mingtao Xu**; Purdue U., West Lafayette

Firms' valuation of resources depends on their expected value appropriation from the resource. Being important resources, patents are used by firms to practice the technology and to exclude other firms from using the technology. However, the valuation of patents can be drastically different depending on the monetization method, especially when the firm has no interest in the product market. This paper studies patent assertion entities (PAEs) which are firms that use legal threats as the business model to monetize patents. The paper sheds light on various value appropriation mechanisms from patents by examining PAEs' patent acquisitions in the market of technology. I theorize and show that patents with stronger but older technologies are more likely to be acquired by PAEs. Also, PAEs purchase patents with medium exclusion scope. Besides, I show the dependence of litigating monetization on the legal regime by exploiting the enactment of America Invents Act (AIA).

Patent Collateralization: The Effect of Policy and Impact on Patenting

Author: **Meijun Liu**; U. of hong kong

Author: **Shuo Li Liu**; Harvard U.

Author: **Yuandi Wang**; Sichuan U.

Author: **Richard Freeman**; Harvard U.

Pledging patents as loan collateral has increased in advanced countries with the growth of intangibles in the value of firms. Despite China's less sophisticated market in intangible capital, collateralization has also increased in China. Using evidence on city-level

technological projects that have less potential for superior inventive capabilities (i.e. lower patent technological influence); yet, once in leading position, CVC investors show a nurturing effect through its leading position improving inventive capabilities of the investee startups. Descriptive evidences suggest that this could be associated to a transfer of technological capabilities. By introducing a temporal dimension to the analysis of the CVC leadership in relation to the investee ventures' technological influence, our study unfolds further both selection and nurturing effects of the complex relationship between innovative startups and CVC investors.

RESEARCH

policies to encourage collateralization in the early 2000s, we find that government efforts to encourage the practice sparked much of China's increase in patent collateralization from 2002 to 2015. Bank lenders – a group more connected to the government than non-bank financial institutions – favored older, larger, private enterprises. The most effective policies provided direct financial support to firms and lending institutions. Policies worked best in cities where intellectual property rights were better protected. By adding value to patents, patent pledge policies induced firms to make more patent applications, potentially encouraging innovation. The impact of government policy on pledging patents as loan collateral reflects the state's continuing entrepreneurial role in capitalism with Chinese characteristics.

How Competitive Intensity Affects the New Product Development Outcomes

Author: **Chong Chong Lyu**; School of Management, Xi'an Jiaotong U.

Author: **Feng Zhang**; South China U. of Technology

Author: **Thompson Teo**; National U. of Singapore

Author: **Ting Wang**; Xi'an U. of Technology

New product development (NPD) is essential for securing firms' growth and success when faced with intense competition. However, the issues of the pathways through which competitive intensity affects NPD, and how firm size can play a moderating role in achieving specific NPD outcomes in competitive markets have not been adequately examined. To fill these gaps, the study proposes a research model based on the environment-behavior-performance theoretical framework, and empirically tests relationships among competitive intensity, knowledge integration, organizational unlearning, and NPD outcomes (i.e. NPD innovativeness, NPD speed), as well as the moderating role of firm size. Survey data from 242 Chinese manufacturing firms reveal that competitive intensity is positively associated with both knowledge integration and organizational unlearning. These relationships are moderated by firm size. Specifically, firm size strengthens the relationship between competitive intensity and knowledge integration, and weakens the relationship between competitive intensity and organizational unlearning. Further, by comparing the relative effects of knowledge integration and organizational unlearning on NPD outcomes, knowledge integration is found to have a stronger

and 2016. The results showed, first, that firms relied to varying extents on different knowledge search modes in their invention design processes. Second, reviewing the technological originality of the designed inventions showed that simply absorbing new knowledge components, without major changes in knowledge base structure, was associated with low technological originality, but constituted one of the main knowledge search modes used by the analyzed firms. In contrast, major changes in knowledge base structure favored technological originality, with or without new knowledge components, but were nevertheless the least used mode. Understanding organizational learning practices associated with the phenomena described here can foster innovation performance in firms.

Innovating Across Technologies: How Systems Integrators Increase Outsourced Components' Innovations?

Author: **Jose-Mauricio Galli Geleilate**; UMass Lowell

This study addresses the question of how firms taking the role of systems integrators can increase innovativeness by adding new features to their products from outsourced components. We focus on a sample of global automotive manufacturers which have systematically outsourced production of several key components while at the same time remained active in terms of innovation efforts around these component technologies. We provide evidence that as systems integrators increase innovation efforts around outsourced components, they are able to increase new outsourced component introductions that provide important new features to their final products. Yet, we also investigate how systems integrators manage their search efforts regarding these outsourced components' technologies. We find that while increasing search from suppliers' knowledge base for innovation is beneficial to a greater deployment of new components, increasing search from competitors in this context has a detrimental effect on the frequency of new outsourced components' introductions.

relationship with NPD speed than with NPD innovativeness. In contrast, organizational unlearning has a stronger relationship with NPD innovativeness than with NPD speed. This study provides a better understanding of how firms can choose appropriate strategic behaviors to achieve the expected NPD outcomes under intense competition.

Managing Complexity: Time Pacing of Product Innovation in the Mobile App Industry

Author: **Pengxiang Zhang**; Darla Moore School of Business, U. of South Carolina

Author: **Scott F. Turner**; U. of South Carolina

Author: **Sali Li**; U. of South Carolina

Time pacing is an important, yet understudied, area of inquiry for strategy scholars interested in fast-changing settings. To date, we know little about the conditions under which time pacing is used. Integrating research on time pacing and complexity, we propose that organizations rely on time pacing to organize important strategic activities, e.g., innovation introductions. Further, we theorize how different forms of complexity challenges condition organizations' use of time pacing as a simple strategic approach. Our theoretical arguments receive significant empirical support based on analyses of generational product innovation in the mobile apps industry. We find that innovation introductions exhibit a regular temporal pattern, i.e., consistent time intervals. Moreover, different forms of complexity expose organizations to distinct challenges, such that product and action complexity facilitate, and market complexity inhibits, the use of time pacing as a simple strategic approach. This study offers important contributions for current understanding of time pacing and complexity.

Antecedents of Bricolage in Resource-Constrained Firms – Empirical Evidence from Vietnamese SMEs

Author: **Son Thi Kim Le**; U. of Littoral Côte d'Opale

Author: **Laurent SCARINGELLA**; Rennes School of Business

Resource-constrained firms are sometimes able to innovate in unconventional way. The concept of bricolage explains how such firms innovate with only limited resources at hand. Building upon the resources-based view theory, this research suggests bricolage is a strategy to mobilize scarce resources and investigate antecedents of bricolage, including the environment-level determinants and firms'

Author: **Hermann Ndofor**; Indiana U., Indianapolis

Incessant improvements in technology and fast changes in customer needs make it imperative for firms to constantly development new products. How quickly a firm can develop new products affects its competitiveness and thus performance. Prior research has explored how specific firm resources such technological resources can influence new product development (NPD) speed. However, scant research has considered how the ability to bundle and recombine different resources affects NPD speed. Based on resource management theory, this study explores the effects of stabilizing bundling, enriching bundling and pioneering bundling capabilities on NPD speed. Furthermore, it examines how strategy, captured through business model designs moderated this relationship. With a sample of 189 firms, our results show that stabilizing bundling, enriching bundling, and pioneering bundling all can increase NPD speed. Besides, NPD speed increases firm's performance. Efficiency-centered business model design (EBMD) can strengthen both the positive effects of stabilizing bundling and enriching bundling on NPD speed while weakening the positive effects of pioneering bundling. Novelty-centered business model design (NBMD) can decrease the positive effects of stabilizing bundling on NPD speed while increasing the positive effects of enriching bundling.

PAPER SESSION

ASYNCHRONOUS

internal capability that drive firms' ability of assembling and mobilizing resource. Using quantitative methodology based on a sample of 6,341 small and medium enterprises (SMEs) in Vietnam, this research found that only the lack of infrastructure is an incentive for bricolage, while the shortage of other resources such as finance and human capital are not potential triggers for bricolage. Regarding the effect of firms' capability on bricolage, the connecting and absorbing capabilities of firms appear as central factors that catalyze bricolage. Therefore, absorptive capacity and social networks are found as fundamental elements driving bricolage behavior. Absorptive capacity raises the ability to apply and recombine both internal and external resources in a novel way. Social networks are also an effective instrument in supporting resource- constrained firms to gain more access to external knowledge sources and other resources. This research, thus, contributes 1) more insightful view about antecedents of bricolage and 2) an empirical evidence of these bricolage antecedents.

Comparing Practices Across Different External Corporate Venturing Modes: A Qualitative Meta-Analysis

Author: **Alice Rettig**; Freie U. Berlin

Author: **Carolin Auschra**; Freie U. Berlin

For established corporations, external corporate venturing (CV) is an important means to stay

employee composition and R&D structure affect its absorption of foreign direct investment (FDI) spillovers. Using a unique dataset of Chinese firms in Beijing Zhongguancun (ZGC) Science Park from 2005 to 2015, we demonstrate a positive FDI spillover effect on domestic firm innovation. Our empirical results also indicate that a firm's diverse employee composition and R&D spending can improve its absorptive capacities to learn from foreign firms. By employing a seminal dynamic panel threshold model, we further show that after reaching a certain threshold, the increasing diversity of a firm's employee composition begins not to affect the relationship between FDI spillovers and its innovation, while a higher diversity of R&D structure turns into a negative moderating effect. Firms therefore need to place more attention on their diverse innovation structures.

Employee Radical Creativity: The Roles of Supervisor Support and Employee Intrinsic Work Goal

Author: **Ying Zhang**; China U. of geosciences Beijing

Author: **Jian Zhang**; U. of Science and Technology Beijing

Author: **Jun Gu**; Monash Business School

Author: **Herman Tse**; Monash U.

We aimed to investigate whether supervisor autonomy support influences employees' radical creativity through their intrinsic work goal orientation and how their willingness to take risks moderates the indirect relationship. We tested our prediction using data from a field study (Study 1: 262 supervisor-subordinate dyads) and two experimental studies (Study 2: 101 Chinese students and Study 3: 157 American working adults). The results of Study 1 showed that supervisor autonomy support was positively related to employees' intrinsic goals and radical creativity, intrinsic goals played a mediated role. The results of Studies 2 and 3 revealed that supervisor autonomy support had a positive impact on radical creativity via intrinsic goals and employees' willingness to take risks moderated the indirect relationship. The results of these three studies suggesting that supervisor autonomy support promotes radical creativity

innovative within rapidly changing environments. Corporates can choose between different external CV modes such as corporate venture capital investments, alliances, and incubators/accelerators in order to reach this goal. Despite several insights on singular external CV modes, a comparison of managerial practices to design and enact each mode is missing so far. The same is true for a process model that takes important decisions and practices within the phases of different external CV modes into account. We address these issues through a comparative analysis of external CV processes with the help of a qualitative meta-analysis. This research design allows us to synthesize, compare, and generalize findings from previously published single case studies. As a result, we propose a process model of external CV that explains commonalities and differences in the practices that enact corporate venture capital investments, alliances, and incubators/accelerators. By comparing the practices of these three external CV modes, we contribute to previous literature in the following ways: first, we develop a process perspective missing so far on external CV. And second, we compare differences and commonalities of managerial practices within three different external CV modes, thereby informing future research as well as practice.

Does Corporate Venture Capital Deliver Performance? A Meta-Analysis

Author: **Nikolaus Seitz**; LMU School of Management, Ludwigs-Maximilians-U. Munich

Author: **Erik Lehmann**; U. of Augsburg

Author: **Patrick Haslanger**; U. of Augsburg

The effect of corporate venture capital (CVC) investments is far from being conclusively discussed in literature. Although the expected benefits of CVCs for corporations and start-ups are undisputed, empirical evidence is mixed. We combine and analyze the results of 32 CVC studies, including 105,950 observations: Our results suggest that while CVC investments are positively linked to start-ups' and investors' as well as strategic performance, we find no significant relationship between CVC investments and financial outcomes. The effects are moderated by the timing of the investment, the

through employee intrinsic work goal orientation only when their willingness to take risk is high rather than low.

Relinquish or Rejuvenate? How Firms Treat Inventions after Inventor Departure (WITHDRAWN)

Author: **Yanfeng Zheng**; U. of hong kong

Author: **Qinyu Wang**; U. of hong kong

Knowledge worker mobility is often considered as detrimental to knowledge creation and retention for sourcing firms. Integrating insights from the knowledge-based view of the firm and the innovative search literature, we propose that knowledge worker mobility has a dual impact: the loss of tacit knowledge associated with mobility is both a threat to invention value and an opportunity for knowledge rejuvenation. Analyzing a matched sample of over 23,000 inventors and their patented inventions granted during a twenty-year period, we find that firms are less likely to maintain inventions if their inventors leave. However, if maintained, left-behind inventions generate more novel recombination in later development. The dual impact of inventor mobility is further contingent on inventor collaboration networks and knowledge complexity. Our findings show that the tacit knowledge possessed by inventors is a double-edged sword, with implications for research on knowledge worker mobility and knowledge management practice.

Dynamics of Technological Relationships Between Corporate Investors and their Portfolio Companies

Author: **Peiyi Jia**; U. of Massachusetts Lowell

Author: **Yi Yang**; U. of Massachusetts, Lowell

The purpose of this research is to examine the dynamic trajectories of technological relationships between corporate venture capital (CVC) investors and their portfolio companies. Specifically, we aim to find out how the technological similarity and complementarity between corporate investors and portfolio companies change over time as the relationship evolves. Based on resource dependence theory and competitive analysis, we identify the latent mechanisms that jointly shape the trajectories of the technological relationships. Our findings suggest that both technological similarity and complementarity between corporate investors and portfolio companies follow inverted U shape trajectories. We further test moderating effects and demonstrate that the shapes of trajectories are contingent on the level of technological dynamism faced by corporate investors and the same industrial affiliation between two sides of the CVC relationship. This study contributes to the CVC literature by being the first to study the dynamics of relationship evolution.

Crowdfunding Platforms and the Threat of Copycats

Author: **Susan L. Young**; Kennesaw State U.

Author: **Birton Cowden**; Kennesaw State U.

Scholarly attention on crowdfunding has primarily focused on understanding campaign success. What has yet to be understood are the implications of worldwide visibility to the ventures on these platforms, where economic actors from other institutional environments can capitalize on the entrepreneur's idea with little consequence. Using the exemplar of FinalStraw, we argue that because the entrepreneurial venture is displayed to varying economic actors across differing institutional environments, the venture must rethink its financing, marketing, and R&D practices. Our findings have implications for information asymmetry inherent in open vs. closed systems and the sense of community engendered by crowdfunding platforms.

Formal Education and Opportunity Entrepreneurship: The Contingent Role of Regulatory Efficiency

Author: **Pourya Darnihamedani**; Utrecht U.

Individuals with dissimilar levels of education do not perceive and act upon entrepreneurship in the same way since their opportunity costs, access to resources and motivations differ. While the efficiency of regulations varies substantially among countries, imposing additional costs and risks entrepreneurs, we integrate insights from institutional theory and recent literature on entrepreneurship to better understand how regulatory efficiency affects opportunity entrepreneurship among individuals with dissimilar levels of education. We look into business freedom, labor freedom, and monetary freedom using data from over 845,000 individuals in 74 countries. We find that the positive effects of monetary freedom on opportunity entrepreneurship is stronger for more highly educated individuals while negative effects of business freedom is more pronounced for less highly educated individuals. Our results show that regulatory efficiency may widen the gap between individuals with dissimilar levels of education concerning new venture quality.

The Impact of Students' Human Capital Investment on Entrepreneurial Outcomes

Author: **Thomas Hipp**; U. of Mannheim / Germany

This study examines how university courses in entrepreneurship are associated with long-term entrepreneurship outcomes. Drawing on human capital theory, I argue that entrepreneurship courses are helping to produce more entrepreneurship activity. I extend the view of

shareholder structures, namely the nominee vs. the direct shareholder structure, affect the attraction of venture capital financing. From the comparison with a control group of twin firms that did not receive any external seed financing, we find that a successful equity crowdfunding campaign accelerates the attraction of VC financing. This association is stronger for equity crowdfunding campaigns with a nominee shareholder structure, while it weakens when the direct shareholder structure is chosen. Compared to a different control sample of angel-backed firms, equity crowdfunded firms with a direct shareholder structure are slower in receiving follow-on VC financing, while receiving equity crowdfunding through the nominee structure accelerates the attraction of follow-on VC financing.

Successful Funding Through the Crowd: Towards a Research Synthesis Framework

Author: **Maren Rottler**; U. of Mannheim / Germany

Author: **Bernd Helmig**; U. of Mannheim

In the past ten years, crowdfunding has emerged as promising online fundraising tool for entrepreneurial finance and has inspired a rich body of literature. Due to the different crowdfunding types and success models, multidisciplinary findings on crowdfunding performance are fragmented and there is needs for theory building. With this paper we explain how and why crowdfunding campaigns are successful. We apply mechanism-based theorizing and develop an explanatory research synthesis framework based on fifty-seven evidence-based empirical crowdfunding studies published in the top management and business journals. We identify five social mechanisms and their boundary conditions. Crowdfunding success can be explained by relational, economical and personal impact considerations of individuals, which are formed and guided by social norms. When the context specific social norms and cognitive level aspects align and induce trust in beneficial outcomes of the own behavior, reciprocity and social sanctioning drive collective action and crowdfunding success.

[view paper \(if available\)](#)

entrepreneurship outcomes beyond just venture creation and include all professions with an entrepreneurial predisposition. By using publicly available data from the Internet and a professional social networking site I create unique dataset. Analyzing a sample of 2.531 university students between fall 2009 and spring 2018, I find evidence that entrepreneurship courses increase the probability for a participating individual to work in an entrepreneurial position or to start a business. Furthermore, while theoretical courses are higher associated with entrepreneurial job positions, practical courses increase the probability for venture creation. Interdisciplinarity in education I found also to be an influencing factor on entrepreneurship outcomes. I use a logistic regression model for my analysis. This study contributes to the understanding of the effect of entrepreneurship education at university level on long-term entrepreneurship outcomes. Given my new approach to the subject, this study should be seen as a preliminary study to investigate if the data collection method used is valid and I plan on extending in subsequent research.

Learning the Bias? How Successor Pre-Succession Firm Experience Affects Family

Author: **Baris Istipliler**; U. of Mannheim / Germany

Author: **Jan-Philipp Ahrens**; U. of Mannheim

Author: **Suleika Bort**; Chemnitz U. of Technology

Author: **Andrew Jay Isaak**; U. of Mannheim

Prior research shows that learning performance enhancing stewardship behavior in family firms is frequently achieved through the experiences gained inside the firm prior to succession. However, upper echelons research on managerial decision making shows that this experience inside the family firm may lead to cognitive biases which decrease firm performance. This study addresses these two opposing views via using a sample of 804 German family firms. Our findings reveal that the detrimental effects of cognitive biases arising from pre-succession firm experience have overall a negative impact on post-succession family firm performance. However, this relationship is moderated by different individual and firm level factors. In particular, our results show a u-shaped impact for a non-family successor and a successor with academic education. Furthermore, the overall negative effect of pre-succession firm experience is aggravated for firms introducing product innovations and firms operating in dynamic high R&D intensive industries.

Family Firm: Behavior (session 1072)

Back to the Roots: Applying the Concept of Basic Human Values to Understand Family Firm Behavior

Author: **Philipp Julian Ruf**; U. of Siegen

Author: **Sven Wolff**; U. of Siegen

Author: **Birgit Felden**; Berlin School of Economics and Law

This study examines the influence of individual owner-manager values on the different dimensions of socioemotional wealth in family firms. We theorize that values of owner-managers in family firms are one of the underlying motivators for SEW behaviors. By using structural equation modeling, we show the connection between values and SEW. Results show that different values influence different dimensions of SEW; splitting the FIBER scale into two dimensions, one focused on social interests and the other on personal interests. Our findings help to understand the importance of individual values, advance SEW research and contribute to the understanding of family firm behavior.

Integrating Professionalization and Managerialization in Family Firms

Author: **Damiano Petrolo**; U. of Rome Tor Vergata

Author: **Luca Gnan**; U. of Rome Tor Vergata

Author: **Wim Voordeckers**; Hasselt U.

Author: **Frank Lambrechts**; Professor Organizational Learning & Change

This paper aims to map the intellectual structure of professionalization and managerialization in family firms, to make explicit the implicit link between them, and to reveal the reasons why considering them jointly is important for future research. The

Numerous studies have suggested that values and empathy are likely to be important predictors of social entrepreneurship, but empirical, quantitative research on the isolated effect of each has been limited, and empathy has yet to be examined as a possible moderator of the relation between values and social entrepreneurship. Based on a stratified sample of 329 executives, including 103 founders of Benefit Corporations (BCorp), we build on Schwartz's (1992) values theory and Davis's (1983) distinctions of cognitive and affective empathy to determine whether social entrepreneurs differ from other executives in terms of empathy and values. We additionally examine whether empathy moderates the relations between values and employment choice, using our findings to build theory on entrepreneurial action and the entrepreneur as an individual.

Optimism & Overconfidence in Strategic Decision Making - Are Managers & Entrepreneurs Really Different?

Author: **Nadine Alexandra Chochoiek**; Bundeswehr U. Munich

Author: **Laura Rosendahl Huber**; Rotterdam School of Management, Erasmus U.

Author: **Randolph Sloof**; U. of Amsterdam

Empirical evidence supports the conventional wisdom that entrepreneurs are more optimistic and overconfident than others. However, the same holds true for top managers. In this lab-in-the-field experiment we directly compare the scores of entrepreneurs, managers and employees on a comprehensive set of measures of optimism and overconfidence (n = 2,404). The results show that on average entrepreneurs and managers are more optimistic than employees in their dispositional optimism and explanatory style of past events. For an incentivized measure of overconfidence we find no difference between entrepreneurs and managers, who both are more likely to overestimate their own abilities compared to employees. Finally, exploration of within-group heterogeneity shows that these observations hold true for various sub-groups of entrepreneurs and managers. We conclude that optimism and overconfidence are

authors have used both bibliometric analysis and systematic literature review methodologies to analyse scientific articles published in the last ten years. This study is built on and expands upon existing literature concerning professionalization and managerialization in family firms by considering different streams of research. Addressing one of the most contentious issues in family businesses research, the results of this review are directed towards both scholars and practitioners by highlighting the importance of professionalization and managerialization in family firms and establishing avenues for future research.

Two Sides of the Same Coin: The Effects of Overconfidence on Entrepreneurs' Ability to Innovate

Author: **Maria Claudia Angel Ferrero**; IAE Montpellier - U. of Montpellier

Author: **Véronique Bessièrè**; IAE Montpellier - U. of Montpellier

Research has pointed out that overconfidence, optimism, and risk-taking play an essential role on entrepreneurs' behavior. However, extant entrepreneurship research reveals that there is a dark side to the entrepreneur' profile and while some cognitive factors might be overall beneficial for entrepreneurship, the effects can differ depending on context as well as on the level to which these factors appear in founders. Drawing on a sample of 84 entrepreneurs, we investigate the impact of overconfidence, optimism and risk-taking on entrepreneur's creativity and ability to innovate. Our results suggest that the relationship between overconfidence and entrepreneur's decision to innovate follows an inverted "u-shape". This means that overconfidence has a beneficial effect up until a certain level, that when reached the effect on innovation becomes negative. Our findings contribute to and reconcile the different perspectives on entrepreneur's overconfidence as both boosting and threatening innovation.

Parental Emotional Support as a Driver of Next Generations' Family Business Succession

Author: **Matthew Steven Wood**; Baylor U.
Author: **Rene Bakker**; Rotterdam School of Management, Erasmus U.

Entrepreneurs are often confronted with unexpected events. Yet we know very little about the ways in which unexpected events manifest in entrepreneurial efforts. Entrepreneurship and management theory have traditionally viewed the process of individuals processing novel incoming information through the lens of “normalization”, meaning one systematically analyzes data, looks for commonalities, identifies trends and then takes isomorphic action. We argue that an explanation for how entrepreneurs deal with unexpected events does not fit this pattern and requires a different theoretical lens, one we coin “exceptionalization”. We theoretically elaborate exceptionalization as a process of embracing schema-incongruent information, inductively updating opportunity images, and acting in one of four ways: abandoning, self-deception, routinization, or improvisation. This new theory identifies entrepreneurs’ perceptions and considerations of unexpected events as an influential, yet previously overlooked lever in the genesis and pursuit of entrepreneurial endeavors.

Activity Sequencing in Startups

Designated as a “Best Paper” for ENT
Author: **Amir Sariri**; U. of Toronto, Rotman School of Management

Activity prioritization in early-stage startups is at the heart of entrepreneurial strategy. In this paper, I investigate the sequence of startup activities over time to understand the mechanisms underlying this prioritization. I develop a novel activity typology using a rich database of 371 early-stage, science-based startups. Exploiting the variation between activities proposed by founders of startups and separately by a group of exited entrepreneurs and venture investors (mentors), I report under-emphasis of search and analysis activities by founders. I also show mentors' prioritization of learning is associated with the startup's stage and is not blanket advice. By invoking a recent literature in economics, I argue that the observed misalignment

Intentions

Author: **Roisin Lyons**; Dublin City U. Business School
Author: **Colm O’Gorman**; Dublin City U.
Author: **Farhad Uddin Ahmed**; postdoctoral Research Fellow
Author: **Eric Clinton**; Dublin City U.

Parents play an important role in shaping the career intentions of their offspring. Building on social cognitive theory, we explore how cognitive factors mediate the relationship between parental emotional support and family business succession intentions. To test our hypotheses, we draw on a sample of 21,984 students from a family business background across 41 countries, derived from the 2018 Global University Entrepreneurial Spirit Students’ Survey (GUESSS). We find that parental emotional support directly influences succession intentions, and that this relationship is mediated by the next generation’s entrepreneurial self-efficacy and their affective commitment to the family business. We also find a moderating effect of birth order, with lower direct effects on succession intentions for children with older siblings. Lastly, we report a gender effect, finding that emotional support has a stronger influence among males. In addition, we contribute to a greater understanding of the nuances of next-generation succession intentions and parental influence for male and female successors.

Ready or Not? The Sequence of Nascent Entrepreneurs' Actions and External Financing

Author: **Casey J. Frid**; U. of St. Thomas, Minnesota

Author: **Jan Warhuus**; Saint Mary's College of California

Author: **William B. Gartner**; Babson College

The set of actions undertaken by nascent entrepreneurs during an organization's emergence is the basis for studying a wide variety of entrepreneurial phenomena, including outcomes such as organizational growth and survival. The act of acquiring external financing is a critical step toward achieving these outcomes, hence this then begs the question, "What actions do nascent entrepreneurs take in order to attain external funding?" In this study we apply an event history model and a framework integrating four major perspectives of entrepreneurship to examine when nascent entrepreneurs acquire external funding during the startup process. We apply this model to nationally representative panel data of nascent entrepreneurs to determine which discrete startup activities are likely to precede external financing. Nascent entrepreneurs tend to take actions that are "resource-light" early in the startup process to build their organizations to a fundable stage before completing more "resource-heavy" activities. However, we provide compelling evidence that some complete resource-heavy actions early and in anticipation of external financing rather than relying on actual use of such funds. Our findings highlight the possibilities of clarifying some of the heterogeneity of entrepreneurial actions to provide a more systematic understanding of organizational emergence and early stage financing.

cycles occur over time. An upward cycle emerges when entrepreneurs feel control over the distress situation and effectively regulate their negative emotions, which leads to fighting behavior (i.e., actions oriented toward recovery). In contrast, a low level of perceived control and a lack of emotion regulation result in freezing behavior (i.e., actions oriented toward survival) and trigger a downward cycle. Importantly, we also uncover that, following a loss (or gain) in perceived control, entrepreneurs can shift from an upward to a downward cycle (or the reverse), as such decreasing (or increasing) their resilience. Our findings provide a granular understanding of the dynamic nature of entrepreneurial resilience. We advance existing literature with important insights into the conditions under which entrepreneurs' persistence in the face of adversity can be fruitful or harmful, and the processes behind venture outcomes (i.e., exit or recovery).

Life After Death: Implications of Bereavement for the Post-Succession Process in Family Businesses

Designated as a "Best Paper" for ENT

Author: **Joyce Kox**; Tilburg U.

Author: **Astrid Kramer**; Tilburg U.

In this study, we explore how a family event - the death of a family business leader - affects the way a family business is managed by the family successor during the post-succession stage. When a family business leader passes away, the family has to deal with grief, while at the same time reorganize the business. The death of a family business leader is a stressful event. Family successors need to adapt to their new role and adjust the business to the new reality, while simultaneously dealing with the loss of a loved one. Exploratory, qualitative research among six family businesses shows how the interplay between the process of coping with bereavement and the succession process proceeds through four stages. Firstly, family successors put their grief aside and focus strongly on continuation of the business. Subsequently, they experience tension between the past and present until a turning point, after which they start reorganizing the business. The analysis also identified several boundary conditions that

Emotion and Business Exit

Author: **Bahare Afrahi**; Kingston U. London

Author: **Robert Blackburn**; U. of Liverpool

This article examines the impacts of emotional disengagement on business exit strategies. Analysing survey data of 402 entrepreneurs across the UK we find that entrepreneurs' emotional disengagement mediates the relationship between their vision for business and their exit strategies. However, the mediating effect varies according to their planned route to leave, including cessation, harvest, and stewardship. The paper makes three contributions. First, it helps explain the business exit from emotion point of view. Second, by illustrating the emotional disengagement-exit decision relationship, a link is established between research on disengagement and turnover intentions, to the field of entrepreneurship. Third, it provides evidence to help develop relevant non-financial and behavioural orientated support for those entrepreneurs seeking to exit their business.

Author: **Duygu Phillips**; Oklahoma State U.

Author: **Matthew W. Rutherford**; Oklahoma State U.

New ventures that are unable to fund expansion

of research on new forms of corporate venturing with more established streams on organizational structure and innovation. Third, we aim to provide an overview of the current state of research on corporate venturing, and provide future research avenues. We assembled four empirical papers on corporate venturing that focus on various aspects such as when firms engage in corporate venturing, how they can build the competences to do so, how internal and external corporate venturing activities can best be combined, and, finally, on how internal corporate venturing units can become formally embedded within corporate organizations. Three high-profile scholars specializing in corporate venturing (Robert Burgelman, Stanford University), corporate entrepreneurship (Jeffrey Covin, Indiana University), and corporate venture capital (Gary Dushnitsky, London Business School), will serve as discussants to provide both theoretical and practical suggestions on the presented papers as well as future research directions for the field of corporate venturing

using internal equity or prefer to maintain complete firm ownership may supplement existing cash flow by accessing external funds in the form of debt contract. To overcome liabilities of newness and smallness, these firms send signals to external stakeholders intended to represent a sufficient level of legitimacy and worthiness of investment. Stakeholders attempt to overcome information asymmetry by focusing primarily on costly signals from high-quality firms as they represent honesty, credibility and commitment. However, many new ventures are unable to send preferred costly signals because they do not possess them. This study examines specific signals that carry the preferred costly weight needed to gain a stakeholder's perception of legitimacy, however are difficult to fully verify due to the opacity of the signaling environment, which consists of high information asymmetry, information verification costs and distortion. This study also examines the decision-making strategy of the debt financier who utilizes heuristics in the form of expert-based schemas to make a probability judgment of credit worthiness based on opaque information presented by the new venture. As an extension of institutional and signaling theory, this study proposes that new venture signals that exist in an opaque environment will have a positive effect on a stakeholder's perception of legitimacy. This study also proposes that a stakeholder's signal receptivity, which is comprised of the valence of a stakeholder's expert-based schemas, will have a moderating effect on the relationship between opaque costly signals and legitimacy perceptions.

Why are they Committed? Examining the Entrepreneurial Process with Side-Bet Theory

Author: **Laëticia Gabay-Mariani**; Grenoble-Alpes U.

Along with an emerging body of literature investigating the volitional phase of the entrepreneurial process, the present research examines the determinants of entrepreneurial commitment, using Becker's (1960) side-bets theory. Originally developed in the organizational setting, side-bet theory is a relevant framework to understand what compels individuals into

consistent courses of actions. Powell and Meyer (2004) proposed seven category of side-bets and showed that they explained the development of different forms of commitment among employees, relying on Allen and Meyer (1990) multidimensional model of commitment. In this research, we propose to apply this seven-category lens to the context of emerging organizations, to further understand the development nascent entrepreneurs' commitment profiles. After a pilot study designed to adapt Powell and al (2004)'s categorization to entrepreneurial activity, we operationalized it in a quantitative study (n=177) on nascent entrepreneurs. We examined how they relate and influence Meyer and al (2006)'s two basis of commitment - value-based and exchange-based -, targeting two foci relevant to the entrepreneurial process: entrepreneurial project and profession. Our results show that each form of nascent entrepreneur's commitment is driven by a unique combination of side-bets. Therefore, it contributes to a better understand of nascent entrepreneurs' mindset during the volitional phase of the entrepreneurial process.

Discovering in the Storm: Alertness, Attention, and NPI in an Uncertain Environment

Author: **Smita Srivastava**; Wichita State U.

Using a psycholinguistic approach to measure CEO alertness and attention, we propose that a firm's rate of new product introductions (NPIs) are predicted by these two different yet complementary cognitive characteristics in interaction with environmental uncertainty. Based on a longitudinal (from 2004 to 2015) analysis of 251 firms, we show that, alert CEOs are able to achieve higher NPI in stable environment than in dynamic environment. In dynamic environments, new products are introduced faster by firms when alertness is coupled with high attention to R&D, customers and competitors. These findings demonstrate how CEOs' information acquisition abilities in terms of alertness shapes the rate of NPI in adverse and stable environmental conditions.

How Does Extreme Uncertainty Affect Entrepreneurial Processes, Actions, and Opportunities? (WITHDRAWN)

Author: **Sharif Alaydi**; Adam Smith Business School, U. of Glasgow

Author: **Trevor Buck**; U. of Glasgow

Author: **Yee Kwan Tang**; Adam Smith Business School, U. of Glasgow

Uncertainty is a cornerstone of entrepreneurship theory; however, the exact role it plays in stimulating and/or obstructing entrepreneurial processes, opportunity and action has remained a matter of debate. This study uses two case studies, an indigenous firm and an MNE, of mobile phone providers in Palestine in order to investigate whether extreme uncertainty creates and/or inhibits entrepreneurial opportunities and motivates and/or hinders entrepreneurial processes and actions. A thematic analysis of one indigenous firm case study, with 12 semi-structured interviews, and one MNE case study, with 11 semi-structured interviews, allows us to claim a contribution to the institutional and entrepreneurship literatures. Our analysis finds some evidence of the negative impact of uncertainty, i.e. extreme uncertainty as an inhibitor and disincentive for entrepreneurial processes, actions and opportunities; however, the two phone operators also perceive to some extent uncertainty as a source of opportunities and an incentive for entrepreneurial processes and actions. More importantly, our study reveals a turning point, an inverted U-shape. Beyond a maximum, the previously positive responses of firms to uncertainty may convert into passive or even negative responses. We label this phenomenon as 'uncertainty overload'. We also confirm the role that psychological factors, especially emotions, may play in determining entrepreneurial actions in this hostile business environment.

Towards an Untrepreneurial economy: The Entrepreneurship Industry and the Veblenian Entrepreneur

Finalist for the OMT Division Best Paper on Entrepreneurship Award

Designated as a "Best Paper" for OMT

Author: **Rasmus Koss Hartmann**; U. of Southern Denmark

Author: **Anders Dahl Krabbe**; Stanford U.

Author: **Andre Spicer**; City U. London

What is driving the declining quality of innovation-driven entrepreneurship? In this paper, we argue the growing entrepreneurship industry is an important yet overlooked explanation. This rapidly growing industry has transformed the nature of entrepreneurship and encouraged a particular form of low-quality entrepreneurship. It has done so by leveraging the Ide-ology of Entrepreneurialism to mass-produce and mass-market products that make possible what we term Veblenian Entrepreneurship. This is entrepreneurship pursued primarily as a form of conspicuous consumption. Aside from lowering average entrepreneurial quality, Veblenian Entrepreneurship has a range of (short-run) positive and (medium and long-run) negative effects for both individuals and society at large. We argue that the rise of the Veblenian Entrepreneur has contributed to creating an increasingly Untrepreneurial Economy. That is an economy which superficially appears innovation-driven and dynamic, but is actually rife with inefficiencies and unable to generate economically meaningful growth through innovation.

Communities of Practice as Bridges between Institutional Entrepreneurs and Frontline Practitioners

Finalist for the OMT Division Best Paper on Entrepreneurship Award

Designated as a "Best Paper" for OMT

Author: **Arthur Gautier**; ESSEC Business School

Author: **Imran Chowdhury**; Wheaton College

Author: **Marion Ligonie**; IESEG School of Management

This paper seeks to understand how new practices that challenge established norms and values become institutionalized by studying the development of corporate philanthropy in France over three decades (1979-2011). Our inductive qualitative study uncovers the processes that enable actors at both field and organizational levels to enhance a new practice's internal and external legitimacy, ultimately leading to its institutionalization. In particular, we identify the central role of a community of practice as a bridge between the field-level, purposive interventions (theorizing, influencing policy) of an institutional entrepreneur and the organizational level, emergent interventions (mobilizing, embedding) of frontline practitioners experimenting with the new divergent practice, thereby enabling its legitimation and, ultimately, its institutionalization. As such, our findings contribute to refine our understanding of institutionalization processes as inherently distributed and to uncover communities of practice as the missing link between "heroic" entrepreneurs' interventions and the hidden work of frontline practitioners implementing the new practice.

Wage Stagnation and the Rise of Merit Pay, 1974-1991

Winner of the OMT Division Best Paper Award

Designated as a "Best Paper" for OMT

Author: **Nathan Wilmers**; Massachusetts Institute of Technology

Author: **Maxim Massenkoff**; UC Berkeley

In the 1970s, US workers' wages stopped growing and steadily declined through the mid-1990s. During this time, employers experimented with employment practices, like merit pay, that seemed likely to raise pay and productivity. We argue on the contrary that the introduction of merit pay actually weakened organizational constraints that previously boosted pay. First, merit pay practices loosen pay fairness constraints justifying pay gaps on the basis of performance differences. Second, merit pay substitutes for efficiency wages, by providing an alternative mechanism through which employers can elicit worker effort. To test these ideas, we introduce new establishment-by-occupation microdata covering the critical early period of wage stagnation. We show that when establishments adopt merit pay, wages decline. These effects are concentrated on the lowest-paid workers within a job; the lower paid jobs within a workplace; and in the highest-paying blue collar workplaces. The spread of merit-based pay explains one sixth to one third of wage stagnation for low-skilled workers during this period. Organizational practices aggregate up to affect societal trends in inequality and wage growth.

Entrepreneurship as a Response to Labor Market Discrimination for Formerly Incarcerated People

Winner of the OMT Division Best Paper on Environmental and Social Practices Award

Designated as a "Best Paper" for OMT

Author: **Jiwon Hwang**; Columbia Business School

Author: **Damon J. Phillips**; Columbia Business School

This paper examines entrepreneurship as a way to overcome labor market discrimination. Specifically, we examine entrepreneurship as a career choice for formerly incarcerated individuals, a group of individuals who face substantial discrimination in the labor market. Using the United States National Longitudinal Survey of Youth 1997 data, we find that formerly incarcerated people are more likely to become entrepreneurs compared to individuals without a criminal record. We take advantage of an exogenous state and county level policy shock "Ban-the-Box" in the United States to further disentangle the underlying mechanism of how labor market discrimination affects formerly incarcerated individuals in their entrepreneurial choices. The findings suggest that entrepreneurship is a viable alternative career choice for formerly incarcerated people, yielding both higher income and lower recidivism rates. In addition to reporting robustness checks and addressing alternative explanations, we discuss theoretical, empirical, and policy implications.

Value Creation and Appropriation in Ecosystems: From Network Dynamics to Organizational Challenges (session 335)

An ecosystem is a group of independent firms linked to one another through non-generic complementarities, through which organizations combine their individual offerings into a coherent, customer-facing solution. When multiple organizations need to work together, they are faced with a familiar dilemma: when should they collaborate to create value and when should they compete to capture value? This symposium unites papers from some of the leading scholars in this emerging field that look at collaboration and competition in innovation ecosystems across multiple levels. We will begin with looking at competitive dynamics at the level of entire ecosystems, then take a graph theoretic approach to map patterns of complementarities within ecosystems so that we can link firms' ecosystem positions to their performance. Next, we will explore whether external stakeholders care about collaborations among ecosystem members and conclude with looking at how exactly senior leaders manage their companies' positions within evolving ecosystems. The (brief) presentations of the papers are followed by extensive discussion between presenters and coauthors, and also moderated Q&A with the audience. Our collective aim is to foster a discussion around developing better frameworks for thinking about value creation and appropriation within ecosystems and linking firms' position in these ecosystems to performance.

Broadening Our View of Team Resilience: Compelling Findings from Both the Field and the Laboratory (session 337)

Team resilience research has burst onto the scene in recent years, and for good reason: today's organizations are predominantly structured in teams, and these teams frequently face adversity and experience setbacks. Teams equipped to bounce back from these setbacks are at a significant advantage. It is no surprise, then, that scholars and practitioners are eager to identify the factors that distinguish resilient teams from brittle teams that crumble under pressure. Our purpose is to do just that — leverage the latest team resilience research to uncover distinguishing qualities and activities of resilient teams. Each paper offers novel and compelling discoveries that advance our understanding of this important topic. Hartmann, Weiss, Hoegl, and Stoverink demonstrate that a team's openness contributes to performance following a setback, but has no performance effects in a stable environment. Adler, Bliese, Barsade, and Sowden examine a team's emotional culture and find that shared hope and optimism help a team bounce back from a disappointing performance episode. Brykman, King, and Raver find that team resilience mediates the effect of voice climate on team learning, and they also uncover important boundary conditions by testing the moderating effects of leader goal orientation (stage 1) and team information elaboration (stage 2). Stoverink, Bradley, Johnson, Kirkman, and Maynard show that teams facing adversity, particularly those high on collective efficacy, can benefit from considering both adaptation and persistence as viable paths to bouncing back. All four papers offer unique perspectives on team resilience that move the field forward in meaningful ways.

Enabling Leadership: Whitney Young, Jr. as Dramaturgical Director of the U.S. Civil Rights Movement

Author: John Humphreys; Texas A&M U., Commerce
Author: Milorad Novicevic; U. of Mississippi
Author: Stephanie Pane; Texas A&M U., Commerce
Author: Md Kamrul Hasan; RESEARCH ASSISTANT

Uhl-Bien and Arena (2018) recently advanced a nascent complexity leadership framework of leadership for organizational adaptability. Within their integrative meta-theory, they made a compelling argument for the

recognition of the concept of enabling leadership as a critical form of leadership for adaptive organizations. Enabling leadership requires the social facilitation of ideological tensions to engender the adaptive space needed for new understandings to emerge within the rich interconnectivity of complexity. To further explore how leaders enable adaptive processes, Uhl-Bien and Arena (2018) called for future research using in-depth case studies of social actors centered on emergence in complex environments. During archival research of Whitney Young, Jr.'s largely overlooked and misunderstood leadership in the historic social drama of the 1960s U.S. civil rights movement, we discovered evidence to support and extend their theoretical arguments. Accordingly, using a relational leadership-as-practice lens, we interpret the dramaturgical performance Young directed to facilitate coherent emancipatory dialogue, affect the social construction of power relations, and enable the adaptive space needed for social transformation to emerge.

Present at the Beginning: The Origins and Evolution of "Opportunism" in Management Thought

Author: **Jeffrey Muldoon**; Emporia State U.

Author: **Furkan Amil Gur**; Northern Illinois U.

Author: **Josh Bendickson**; U. of Louisiana at Lafayette

Author: **Patrick J. Murphy**; U. of Alabama, Birmingham

Williamson's theory of opportunism within his transaction cost economics framework is one of the most controversial concepts within management. Considered bad for practice, a self-fulfilling prophecy, scholars over the years have challenged this notion citing that the managers who focus on opportunism ignore other concepts such as effectiveness and innovation. We argue that opportunism is something very central to management thought. We trace the writings of Taylor, Mayo, Fayol, Barnard, Follett, and Simon and demonstrate that early attention to opportunism have in fact considered work effectiveness and innovation as other implications of opportunism. We also argue that the critics' attempts to replace opportunism have their elements in some of the previous work namely the use of incentives to encourage individuals to work collectively in pursuit of the organizational objectives. By tracing the roots of opportunism in early management thought, this work helps answer some of the criticisms of opportunism in recent studies.

Rhetorical Typology in Organizational Disasters

Author: **Jussara Pereira**; FGV - EAESP

Author: **Amon Barros**; U. of Essex

Author: **Ana Flavia Rezende**; Federal U. of Minas Gerais

Traditionally, rhetorical history has been studied as a strategic and competitive advantage for organizations. However, the source of competitive advantage conferred by rhetorical history has neutralized tensions in the everyday practices of the organization. In contrast, we argue that in an organizational disaster the individuals can use three different rhetorical typologies to explain the event preventing sanctions, criticism as well as demobilizing and discrediting other histories. In this qualitative study, we explore the forms of discourse production in the (re)construction of histories related to the Samarco disaster . We analyze how companies can assign or even impose a specific meaning on their past, mobilizing controversy in the stakeholders' discourses. The theoretical and analytical framework includes literature from the fields of rhetorical history, memory and forgetting and critical discourse analysis. As result, we show how the context of economic development in the region contributed to Samarco occupying a privileged social and discursive position. The company, thus, has the

opportunity to strategically mobilize discourses within and outside the organizational context and to influence how the histories of the Samarco disaster are being created, reinterpreting the “Tale of Mud” and investing in discourses and language that can reinforce positions and reproduce the dominant structures.

History of Business Schools in the Global South Dependency and Americanization in the Case of Brazil

Author: **Sergio Wanderley**; Unigranrio - U. do Grande Rio

Author: **Amon Barros**; U. of Essex

Author: **Rafael Alcadipani Da Silveira**; FGV-EAESP

This paper aims to analyze the specificities of the history of Business Schools (BS) in the Global South by focusing on the case of the emergence and widespread of BS together with management education in Brazil. We suggest the notion of dependency as an analytical tool to decenter the concept of Americanization. Dependency is imbricated in the socio-economic-political reality of Latin America. Dependency studies developed in (and to) Latin America, from the late 1940s to mid-1970s, based on the search for the historical reasons underlying the underdevelopment of the region, and aimed at proposing ways to overcome it. We propose a periodization of BS creation and development in Brazil arguing that it was only from the 1960s, when the Cold War definitively hit Latin America, that Americanization took over dependency as the main driver behind the creation of BS. In this way, we explore the local context and local agents’ network that supported the creation of the first management training programs and BS. Finally, we propose a framework to investigate the history of BS in other Global South countries in order to illuminate histories from the Global North. By doing that, we want to foster a reflexive theorization of Management History that take into account not only local realities, but also local theorizations.

How Leaders Develop Trust in a High Trust Organization - Many Routes to Active Trusting

Finalist for MOC Division Best Student-Led Paper Award

Author: **Simon Daniel Schafheitle**; U. of St. Gallen

Author: **Antoinette Weibel**; U. of St. Gallen

Author: **Guido Moellering**; U. of Witten/Herdecke

Given the prominence of corporate high trust cultures in 21st-century organizations, trust development of leaders in their followers becomes an imperative of leadership and part of a leader's role expectations. Hence, this paper analyzes why leaders come to trust their followers and how they combine cues for trusting their followers by responding to and co-creating the specific contexts of their trust. Empirically, this study employs a concurrent nested mixed-methods design with a predominant explorative interview study with 33 medium- and top-level managers and a nested fsQCA analysis of the interview data to study effective configuration of the trust cues identified. As a result, we find four discernible trusting "recipes" of leaders towards their followers; hence four different ways how leaders shape the strategic trust imperative into "on the ground" trusting behavior. Our findings not only refine prior prominent, yet too generic models of trust but we also argue in favor of a more configurational, yet idiosyncratic view on leaders' trusting their followers in high trust contexts.

Underlying Tensions in Creativity: Social and Temporal Factors (session 1191)

Research at the individual level has already shown that individuals with traits that allow them wade into uncertainty leads to creative outcomes. Moving beyond tallying additional individual traits that provide the cognitive bandwidth to manage tensions in creativity, in this symposium we offer a complementary view that showcases temporal and social factors that explain new tensions in creative work or that explains new solutions to previously identified tensions. The five papers gathered here discuss how organizations, groups, and individuals balance the interplay between creativity and relationships and resources (skill sets, emergent criteria), and illustrates the consequences of managing these tensions for organizations, groups, and individuals including impacts on future success, career viability, and entrepreneurial success, among others.

Agentic and/or Communal? Pathways to Status and Leadership Outcomes for Men Versus Women Implementors

Author: **Jia Hui Lim**; Singapore Management U.

Author: **Elijah Wee**; U. of Washington

Our research explores the impact of idea implementation performance on peer-rated social status and leadership potential outcomes. Against the backdrop of an overall female penalty in the areas of creativity and innovation, we draw on social role theory and parallel-constraint-satisfaction theory to theorize that high- performing women can overcome the penalty and achieve similar outcomes as their male counterparts. However, we contend that a covert form of bias against women still exists. Double standards are placed on women such that they have to fulfill more requirements to be conferred similar levels of status and leadership potential as their male counterparts. Across two studies—an experiment and a multisource panel study—we find that men and women star implementors are indeed conferred similar levels of status and leadership potential, but the mechanisms underlying this relationship are conditional on the gender of the star implementor. Specifically, men star implementors were conferred status and leadership potential by peers because they were seen as agentic, whereas women star implementors were conferred similar outcomes because they were

Have You Heard? Examining the Relationship Between Leader Positive Gossip and Prosocial Behavior

Author: **Kenneth Tai**; Singapore Management U.

Author: **Yuchuan Liu**; Singapore Management U.

Author: **Jia Hui Lim**; Singapore Management U.

Although gossip is a natural and inevitable part of human interactions, it is typically regarded as a socially undesirable and unprofessional behavior associated with dysfunctional work outcomes. However, gossip may also be functional and positive gossip spread by leaders may have a profound impact on employees' attitudes and behaviors. Drawing on self-enhancement theory, we examine why and when leader positive gossip may influence employee prosocial behavior. Across two studies, we find that as employees hear their leaders spread positive gossip about other employees, they are more likely to engage in prosocial behavior, with this effect mediated by need for positive evaluation. Furthermore, in Study 2, core self-evaluation moderates the relationship between leader positive gossip and need for positive evaluation, such that the positive relationship is stronger for employees with low, rather than high, core self-evaluation. Our findings suggest that leader positive gossip may trigger the motivation to self-enhance and heighten employees' need for positive evaluation, which in turn prompts them to be more prosocial, with core self-evaluation serving as a key boundary condition underlying these relationships. We discuss theoretical and practical implications of our findings.

The Role of a LMX Defining Memory and Relationship Emotions in Leader-Follower Relationships

Designated as a "Best Paper" for MOC

Author: **Chandra Shekhar Rao Pathki**; U. of Illinois at Chicago

Author: **Janaki Gooty**; U. of North Carolina, Charlotte

Author: **Courtney Williams**; U. of North Carolina, Charlotte

Author: **Donald H. Kluemper**; U. of Illinois at Chicago

Author: **Laura McAndrews Little**; U. of Georgia

The leader-member exchange (LMX) literature suggests that exchange relationships between leaders and followers develop in a linear and consistent manner over time. However, research in the fields of organizational science, neuroscience, and cognitive psychology underscore the importance of significant, relationship-defining events that can occur at any point in a relationship's trajectory and thus alter the course of that relationship. In addition, these literatures suggest that the memory or current narrative of the event, termed autobiographical memory, is important for relationships as well. Drawing upon these literatures, we posit that followers build a narrative around significant events that occur in leader-follower relationships and the current memory of this significant event is important for the LMX relationship. We term the memory of such events as a LMX Defining Memory (LMX-DM), and further suggest that it is a source of emotions that either facilitate or thwart current LMX relationships. That is, emotions in response to the LMX-DM affect current LMX and follower work behaviors (e.g., task and contextual performance). We tested our theoretical ideas via multi-source data drawn from three time points and find that emotions in response to LMX-DMs predicted performance outcomes via LMX.

Workplace Bullying in Extreme Conditions: A Labour Control Process

Author: **Md Shoaib Ahmed**; U. of Essex

Previous studies on workplace bullying (WB) has been studied intensively focused on psychological and socio-psychological perspectives leading to the individual acts and actors in bullying. Consequently, WB received myopic attention and failed to provide wider explanations of its endemic existence in the workplace. Nevertheless, recent studies called for wider explanations of WB drawing on labour process perspectives (Beale and Hoel, 2011; Akella, 2016). Responding to this call, we provide empirical accounts and theoretical explanations of WB where workers are least protected by the internal state (trade union) and the state – an extreme condition. Drawing on Burawoy's work on consent and coercion, we argue coercive control strategies could take a form such as extreme bullying in the absence of state and internal state. The article aims to make a contribution to literature illustrating the workplace bullying in extreme conditions such as in a clothing factory in Bangladesh and conceptualise WB as a coercive control tool where management find it useful and normal to intensify exploitation with impunity.

Is this Workplace Bullying? How Ideas about Conflict Shape Conflict Management Strategies

Author: **Paulo Marzionna**; Fundação Getulio Vargas - EAESP

Litigation avoidance, union avoidance, and human resource strategies have been identified for a long time as drivers for the adoption of specific conflict management strategies and Alternative Dispute Resolution (ADR) methods. This paper adds an important element when determining how organizations respond to conflicts in the workplace: the way that the conflict is understood by actors involved in it. Drawing on interviews with managers from 14 different banks and leaders from 6 different unions in the Brazilian banking sector, and complemented by thorough archival research on unions' newspapers, this paper suggests that unions and banks have different understandings of

Over the last 15 years, research on identity management, the strategic choices employees make to manage others' impressions of their association with a stigmatized identity(ies) (Roberts, 2005), has grown exponentially. This research has contributed to a growing understanding of the crucial role of employment experiences for people with stigmatized identities (e.g., employees with disabilities, sexual minorities; Jones & King, 2014). The identity management literature is at a critical juncture, however, as employees with stigmatized identities are increasingly bringing new and more complex aspects of themselves to work (e.g., intersectional identities) that are not well understood in current research. As such, to aid scholars in 'Broadening our Sight' during the 80th Annual Academy of Management, we aim to spark developmental dialogue about the future of identity management research. Specifically, in this session we aim to have short insight- only presentations and a focus on discussion that will shed light on the future of identity management in the context of these new and more complex considerations around employees' identities.

workplace bullying, which are dependent on the frames of reference that they use to interpret labor relations (critical/pluralist in the case of unions, unitarist in the case of banks). Those different understandings have direct impacts on how each actor responds to workplace bullying. Unions favor collective tools that frame bullying as a structural issue, while banks favor conflict management tools that focus on individual managerial behavior.

Severe Harm Demotivates Prosocial Behavior

Author: **Polly Kang**; The Wharton School, U. of Pennsylvania

Author: **Maurice Schweitzer**; U. of Pennsylvania

Prosocial motivations and behaviors are often crucial to the success of modern organizations. Normative theories of prosocial behavior, widely accepted by social scientists and laypeople alike, assert that prosocial behavior is motivated by concerns for others' welfare and will increase when others face greater harm. This hypothesis, however, has never been tested under conditions of severe harm. We report results from a natural experiment combining a unique dataset of millions of time-stamped prosocial behaviors with the exogenous shocks of all major hurricanes that hit the U.S. in 2015-2018, including the worst natural disaster in U.S. history. We show that severe harm actually demotivates prosocial behavior, contrary to normative theories, but consistent with an alternative theory in which people avoid helping others when the situation feels like a "lost cause." Our results have important implications for prosocial organizations, who commonly request that people "think globally, act locally": if social problems feel too overwhelming, such a request might backfire and unintentionally nudge people to do nothing instead of help.

Flattery is one of the oldest and most commonly used social influence tactics. Existing research characterizes flattery as beneficial for both flatterers, who receive favorable treatment as a result of ingratiation, and recipients, who experience increases in positive affect and self-esteem. However, we suggest that flattery possesses unforeseen costs when observed by others. Across four studies (N=1,137), including a field experiment at an academic conference, we find that observers who witness managers granting favors in response to flattery perceive the managers as unaware and naïve. As a result of their perceived naivete, managers who reward flattery with favors are seen as less competent, fair, and worse overall. Observing favors granted in response to flattery also breeds cynicism from observers about the broader organizations that the managers represent. Finally, we explore the unique role that flattery plays in exacerbating the negative consequences of favor-granting, as well as the differential reputational costs experienced by low and high-power flattery targets. The discussion considers theoretical and practical implications for managers who are frequent targets of flattery and must weigh the costs and benefits of how to respond to ingratiation.

We examine the drivers of severe adolescent rule breaking, namely self-interest and impulsivity, on entrepreneurial persistence as we explore the influence of intersectionality on this relationship. Using longitudinal data from a national representative survey of US adolescents, we find impulsive rule breaking is associated with a higher likelihood of entrepreneurial persistence and this relationship is moderated by gender and socioeconomic status. The relationship between impulsive rule breaking and entrepreneurial persistence is stronger for men and adolescents from lower socioeconomic backgrounds. These findings contribute to research on entrepreneurial rule breaking behavior, the effect of impulsivity on entrepreneurial activity, and demographic intersectionality in entrepreneurship.

What Do Norwegian Leaders Claim to be Doing to Prevent Sexual Harassment in their Organizations?

Author: Elisabeth Sundgot Borgen; Profile Management

Author: Laura E. Mercer Traavik; Kristiania U. College

This study explores Norwegian leader's claims about the sexual harassment policies and approaches in their organizations. Based on twelve interviews we find that although leaders claim that their organizations have reporting procedures, most leader's lacked clear definitions of sexual harassment and presented policies that were not integrated with other organizational policies, and did not include continuous training and follow up. Using template analysis we found three themes in leader's presentation of their approaches and policies: certainty and uncertainty, clarity and ambiguity, and proactive and reactive. The leader's descriptions of what their organizations do were often characterized by uncertainty and ambiguity, yet most of the leaders had proactive approaches embedded in their policies. Implications for theory and practice are discussed.

Times Up: Does Female Leadership Reduce Workplace Sexual Harassment?

Author: **Shiu-Yik Au**; Asper School of business, U. of Manitoba

Author: **Andreeanne Tremblay**; FSA ULaval (Laval U.)

Author: **Leyuan You**; Texas State U. San Marcos

We examine the role of female leadership in reducing the incidence of workplace sexual harassment. We estimate the incidence rate of sexual harassment through textual analysis of employees' job reviews, published online during the period 2011-2017. We find that firms with a higher proportion of women on the board of directors and firms with a female CEO experience less sexual harassment. An increase of one female director is associated with an 18.2% decrease in the sexual harassment rate. The mechanism for reduced sexual harassment is linked to overall improved social policy. Compared to firms with male CEOs, firms with female CEOs experience 48.3% less sexual harassment, which translates into estimated savings of up to \$81.3 million per year for the average firm. Our results are robust to several adjustments for endogeneity concerns.

Women as Referents: Ranking Below a Woman Leads to Misconduct by Men

Author: **Michael Haselhuhn**; U. of California, Riverside

In this research, I examine how women's performance in the workplace serves as a reference point for men. Specifically, I predicted that underperforming relative to a woman would be uniquely motivating to men, leading them to engage in unethical activity as a means of closing the performance gap. In an archival study of Fortune magazine's annual rankings of the 1000 largest United States corporations, I used a regression discontinuity design to demonstrate that male-led firms that ranked just below a firm led by a female CEO were more likely to intentionally misstate their reported earnings compared to firms that did not

Big Data, HRIS, and Competitive Advantage

Author: **Victor Chen**; U. of North Texas

Author: **Nolan Gaffney**; U. of North Texas

Limited work has viewed big data through the lens of Human Resource Information Systems (HRIS). By integrating the characteristics of big data into HRIS, we explore the pathways that result in a competitive advantage. We do so by identifying four themes: (1) big data characteristics applied to HRIS; (2) big data analytics applied to HRIS; (3) the use of big data in the pursuit of better decisions; and (4) combined effect of workforce analytics and HRIS to better decisions. Our framework traces the relationships from HRIS to competitive advantage. Implications for the HR literature and practice are discussed.

Recruitment-Applicant Reactions (session 1179)

How Congruity Between the Consumer Brand and the Employer Brand Determines Job Pursuit Intentions

Author: **Sanne Ghielen**; KU Leuven

Author: **Luc Sels**; KU Leuven

Author: **Luk Warlop**; BI Norwegian Business School

To date, many organizations develop an employer brand next to their established consumer brand to distinguish themselves from their competitors on the labor market. This raises the question on whether the two brand concepts need to be coordinated or can be developed independently. Building on social cognition theory and the concept of self-brand connection, we posit that brand incongruity between consumer brand and employer brand hurts employer brand equity, particularly for potential employees experiencing a high degree of self-brand connection. We adopted an experimental vignette methodology (N=191) to test our hypotheses. Our findings illustrate that manipulated brand (in)congruity determines perceived congruity, that consequently has a positive effect on job pursuit intentions. Contrary to our expectations, self-brand connection did not moderate the relationship between perceived congruity and job pursuit intentions. However, self-brand connection appears to have a positive, direct impact on job pursuit intentions. These findings provide an enriched understanding of consumer brand-employer brand interactions and generate relevant insights in effective brand management.

technological anxiety over AI. The research also seeks to explore the moderating role of employee-level high-performance work systems (HPWS) on the relationships between employees' attitudes, their technological anxiety, and change readiness. Data were obtained from 417 human resource managers working in China to test the proposed hypotheses. The findings of the study indicate that employees' attitudes and their technological anxiety have a significant impact on their change readiness. Specifically, employees' attitudes positively influence their change readiness, while technological anxiety negatively predicts change readiness. Our results further highlight that HPWS can attenuate the negative impact of technological anxiety on employees' change readiness for AI adoption. Theoretical and practical implications, limitations of the study and directions for future research are also discussed accordingly.

Coaching with Artificial Intelligence: Concept and Capabilities

Author: **Carolin Graßmann**; SRH Berlin U. of Applied Sciences

Author: **Carsten Christoph Schermuly**; SRH U. Berlin

Artificial intelligence (AI) has brought rapid innovations in recent years, transforming both business and society. This paper offers a new perspective on whether, and how, AI can be employed in coaching as a key HRD tool. We provide a definition of the concept of AI coaching and differentiate it from related concepts. We also challenge the assumption that AI coaching is feasible by challenging its capability to lead through a systematic coaching process and to establish a working alliance to clients. Based on these evaluations, AI coaching seems to encounter the greatest difficulties in the clients' problem identification and in delivering individual feedback, which may limit its effectiveness. However, AI generally appears capable of guiding clients through many steps in the coaching process and establishing working alliances. Combined with its lower costs and wider target group, AI coaching will likely transform the coaching profession and provide a future HRD tool.

How and When Do Interviewer Characteristics Affect Organizational Attractiveness?

Author: **Yi-Ching Chen**; National Taiwan Normal U.

Author: **Chien-Cheng Chen**; National Taipei U. of Technology

Author: **Aichia Chuang**; U. of North Carolina, Greensboro

This study aims to investigate the effects of interviewer characteristics (i.e., friendliness and credibility) on organizational attractiveness, through the mediation of applicant perceived person-organization fit (P-O fit) and the moderation of applicant's personality traits (i.e., agreeableness and conscientiousness). Data were gathered from 100 applicants after a face-to-face interview. Results indicate that interviewers' friendliness and credibility lead to organizational attractiveness through perceptions of P-O fit by applicants. Additionally, applicant's conscientiousness amplifies the positive effect of interviewer's credibility on their perceptions of P-O fit. Finally, the moderated mediation test reveals a significant conditional indirect effect of interviewer's friendliness and credibility on organizational attractiveness through P-O fit for applicants with a high-level of agreeableness and conscientiousness, but not for those with a low-level of agreeableness and conscientiousness.

Personalized Human Resource Management: Theory and Implications

Author: **Xiaoyu Huang**; California State U. San Bernardino

Author: **Lihua Zhang**; Renmin U. of China

Author: **Cailing Feng**; Ludong U.

This conceptual paper attempts to theorize the emerging concept of personalized human resource management (HRM), which refers to HRM programs and practices that vary across individuals within an organization. As a subset of high-performance work practices (HPWPs), personalized HRM is implemented at individual levels. It represents the next generation of HRM, which is characterized by the adoption of advanced HR analytics and artificial intelligence (AI) to provide tailored HR solutions. We argue that personalized HRM constitutes a unique source of sustained firm competitive advantage and offers additional beneficial performance effects on top of HPWPs. Drawing on theories of individual differences and person-organization fit, we explain why personalized HRM outperforms traditional standardized HRM in terms of productivity, favorable HR climate, flexibility, return on investment of HRM, and firm financial performance. We also propose that business strategy is a moderator of the relationship between HRM and performance. Building on the AI job replacement theory, we further propose that the mechanical and analytical intelligence (intuitive and empathetic intelligence) required for personalized HRM tasks is positively (negatively) related to the adoption of AI. Lastly, we elaborate on the theoretical and managerial implications and explain how advanced HR analytics and AI facilitate the transition towards personalized HRM.

The Impact of Trustworthiness Perception on Online Recruiting Success

Author: **Viktoria Baumeister**; U. of Muenster

Author: **Carl Richard Hossiep**; U. of Muenster

Author: **Maxine Louise Wiemann**; U. of Muenster

Author: **Gerhard Schewe**; U. of Muenster

Actively searching for potential talent via direct approaches by recruiters in online networks is increasingly gaining importance. Online career networks enable recruiters to make direct contact with promising candidates for advertised positions. However, the online context always entails an increased risk for participants, especially with regard to the disclosure of personal data and sensitive information, and thus reinforces the need for trust-building mechanisms. This paper focuses on the investigation of initial trust in the context of online direct approaches via career networks. Based on the initial trust model, we examined which factors influence how much a candidate trusts an online recruiter. After these factors were incorporated into our model, the effect of initial trust on the candidate's behavioral intention to respond to the online re-cruiter's message was investigated. We conducted an online questionnaire and recruited participants via online social networks (N = 264). The hypothesized relationships were tested using structural equation modeling. Our results indicate positive relationships of the disposition to trust, trust-assuring argument and structural assurance with the candidate's initial trust in the e-recruiter.

Exchange Relationships and their Influence on the Likelihood of Poor Employee Referrals

Author: **Viktoria Wieschollek**; U. of Mannheim

Author: **Katja Dlouhy**; U. of Mannheim

Employee referral programs that encourage employees to refer individuals from their social network for positions in their organization are an increasingly important HR-practice. Previous research has provided evidence on factors that influence the likelihood of making an employee referral, like organizational commitment or bonus payments. Building on social exchange theory and on the concept of economic exchange, we extend previous studies and focus on factors that influence the likelihood of making poor employee referrals, i.e. the likelihood of referring candidates that the referrer knows are not motivated or perform poorly. We show that affective organizational commitment is negatively related to the likelihood of making a poor employee referral, while tie strength with the referred candidate and the presence of a bonus are positively related to the likelihood of making a poor employee referral. Furthermore, we investigate the influence of cultural expectations regarding social exchange. Our study offers important implications for theory and practice.

Human Resources Practices and Organizational Learning in High and Low In-Group Collectivist Cultures (WITHDRAWN)

Author: **Joseph Charles Rode**; Miami U. Ohio

Author: **Xiaowen Huang**; Miami U. Ohio

Author: **Roger Schroeder**; U. of Minnesota

This study investigated the effect of national culture on the relationships between human resource management practices and continuous improvement and learning within manufacturing organizations. Drawing on the insights from the social processes perspective of organizational learning and the in-group collectivism dimension of national culture (House, Hange, Javidan, Dorfman, & Gupta, 2004), we developed a theoretical model of relationships among human resource management practices, small group problem solving, and continuous improvement and learning. We tested our model using secondary survey data collected from a sample of 238 manufacturing plants operating across three industries and nine countries. Our results reveal that in low in-group collectivism cultures, human resource management practices affect continuous improvement and learning both directly and indirectly, mediated by the use of small group problem solving, while in high collectivism cultures, the effects of human resource management practices are completely mediated by small group problem solving.

The Ebb and Flow of Learning Motivation

Author: **Michele Rigolizzo**; Montclair State U.

Author: **Zhu Zhu**; Montclair State U.

Referral hiring wherein an employee refers their friend or family member to a job in their own organization represents a dominant way people get hired in the organizations. Our understanding of the factors that shape such type of hiring has seen decades of inquiry and scholarship and continues to grow. But past scholarship has been focused on two actors that have got majority of attention – job seeker (supply side) and job screener (demand side), with much less attention accorded to the link between these two, known as referrers. Even with a growing inquiry into referrers – the missing link – in this research, our understating is still vastly limited. To add to our understanding of the referrers' role in hiring, this study seeks to understand how the behaviors of referrers are shaped by the outcomes of prior events, how it affects the organizational outcomes for recruitment and whether this behavior occurs differently between men and women. Using longitudinal one-and-a-half-year data from a large US organization, I find - contrary to expectations – that referrers rate of referring decreases with each additional past referral. Disaggregating this past behavior into success (applicant hired) and failure (not hired) does not change the results. Finally, I find that this behavior is not gendered. These results are discussed considering the ongoing research into referral hiring and referrer behavior in organizations.

Understanding Applicant Reactions to Social Media as a Selection Tool: An Integrative Model

Author: **Laxmikant Manroop**; Eastern Michigan U.

Author: **Amina Malik**; Trent U.

Author: **Richaurd Camp**; Eastern Michigan U.

Author: **Eric Schulz**; Eastern Michigan U.

Applicant reactions to selection procedures have attracted much scholarly attention in the work and organizational psychology literature over the past three decades. While this body of literature is quite robust, scholarly research into applicant reactions to social media assessment, more specifically, is sparse. In this article, we develop a comprehensive theoretical framework to better understand applicant reactions to social media assessment. We

Motivating employees to initiate, and continue to engage in, both formal and informal learning is a key challenge within Human Resources. Research on the implicit theory of intelligence lends insight into this challenge by showing almost exclusively positive effects of having an incremental theory, wherein individuals associate ability with effort, on the motivation to learn. However, we propose that the motivation to learn may ebb and flow throughout the process of learning, and that the impact of implicit theory of intelligence may be different for different learning behaviors. This study examines the differentiated effect of the implicit theory intelligence on five key learning behaviors that are required to develop new skills. They are taking on a challenge, paying attention to new information, elaborating that information, practice with feedback, and critical reflection. Using data from an experimental study of 551 managers in the United States, and direct measures of each of the five learning behaviors, this study provides evidence that associating ability with effort can positively influence managers to set more challenging goals and practice with feedback. However, as the process of learning unfolds, it has little impact on the behaviors that provide less information on learners' progress, and can actually discourage engagement in critical reflection. These findings provide insight for how HR professionals can more purposefully construct learning interventions to account for multiple behaviors and changes in motivation.

How Social Media Can Change Recruiters' Evaluation of Job Applicants

Author: **Stefan Hattula**; U. of Stuttgart

Author: **Martin Rost**; U. of Stuttgart

Author: **Torsten Bornemann**; Goethe U. Frankfurt

Social media screening—the search for applicants' social media profiles—has become common practice in firms' recruiting decisions. Despite its wide usage, little theoretical and empirical understanding exists of how this additional information impacts recruiters' selection decisions when it is combined with more traditional resume information. To address this gap, we propose based on anchoring and adjustment theory that recruiters might examine available information in sequential and decreasing order of perceived importance. Specifically, we argue and empirically show in four experimental studies that recruiters form an initial evaluation of job candidates' aptitude based on resume information and then adjust these judgements using subsequent social media information. The adjustment, however, appears asymmetric: a downward adjustment after exposure to social media information with negative valence is more pronounced when recruiters have prior exposure to excellent resumes compared to moderate ones. Moreover, an upward adjustment after exposure to social media information with positive valence does not appear. We also show that the observed anchoring and asymmetric adjustment process is more likely during economic expansions than in recessions.

learning. Using a questionnaire survey, we collected data at two time points from 154 participants nested in 37 teams in five organizations in the UK. The results from multi-level analyses showed that proactive personality had a positive effect on employee reflective learning, yet, up to a certain point. Over and above this inflection point, this positive effect tailed off. In addition, the non-linear effect of proactive personality on employee reflective learning was much stronger under a situation of a weak than a strong team task support. These findings broaden our understanding of employee reflective learning, and the role of proactivity and team support in this regard. In particular, the concave downward curve challenges the conventional view about the relationship between proactive personality and employee workplace behavior. The cross-level moderating effect of team task support sheds light on the condition under which proactive personality can best influence employee reflective learning. Practitioners can use these findings to design effective intervention plans aimed to facilitate employee workplace learning and performance.

Collective Employee Perception on Firm-Specific Training: Moderating Effect of Managerial Rank

Author: **Eun-Ji Oh**; Sungkyunkwan U.

Author: **Youngsang Kim**; Sungkyunkwan U.

Author: **Andrea Kim**; Sungkyunkwan U.

This research investigates employees' perception on firm's internal training investments and examines how this collective perception on training practices sequentially influences their collective attitudes - collective satisfaction and commitment - towards firm. Based upon human capital literature, firm's intention to build up firm-specific human capital resources for gaining sustainable competitive advantage presents as sending a signal by investing on firm-specific training practices. Drawing upon signaling theory, this research suggest that employees perceive this signal as more effective when the signal gets intense, in result, those collective perception enhances collective attitudes. Also, this research argues managerial rank may disturb firms' signals towards employees to perceive training investment, which is why managerial rank

Employee Well-Being: The Role of Perceived Competence

Author: **Riitta Liisa Viitala**; U. of Vaasa

Author: **Susanna Kultalahti**; U. of Vaasa

Author: **Maija Hujala**; Lappeenranta U. of Technology

Author: **Pia Heilmann**; U. of Eastern Finland

Competence is a meaningful factor for coping in working life in continually changing work environments. Incompetence is not just a factor for poor performance, but also a potential threat for employee well-being. The purpose of the study is to gain more understanding of how competence might matter from the perspective of well-being at work. We explore how perceived competence is connected to perceived work-related well-being among Baby Boomer, Generation X, and Generation Y employees. The frames of reference of the study is based on literature on employee well-being (measured with work engagement and overcommitment) and competence, as well as on generational discussions. The quantitative,

Necessary Conditions in IB Research: An Introduction & Application of Necessary Condition Analysis

Author: **Nicole Richter**; U. of Southern Denmark

Author: **Sven Hauff**; Helmut Schmidt U.

The aim of this paper is to familiarize the IB community with a new analysis technique able to research into necessary conditions. We screened articles published in two key IB outlets and identify more than 50 articles that refer to necessary conditions (e.g., a determinant is a necessary condition / is required for an outcome) either in theorizing or discussing findings. The necessity logic that underlies these formulations implies that a single determinant is necessary but not sufficient for an IB outcome; if it is not in place, the IB outcome will not exist. Among the articles reviewed, only five make use of a method able to test necessities, while all other empirical studies make use of more traditional techniques that are interpreted in the form that a determinant increases / is positively associated with an outcome. Hence, there is a huge potential for improving the theory-method-fit in IB

questionnaire-based study was conducted in 88 companies in Finland the total number of respondents being 4418. The main finding was that perceived competence related to current duties are a statistically significantly connected to employee well-being. The results indicate that high competence results in high employee well-being in all generational groups. Further, Generation Y estimated their work well-being, both in terms of work engagement and overcommitment, lower than Baby Boomers or Generation X. On a practical note, developing competence of employees in organizations seems to be a mean to support work well-being among other benefits. It is especially important to pay attention to that among generation Y, who take their first steps in working life.

Patterns of Organisational Governance and Employee Well-Being in Britain

Author: **David Marsden**; London School of Economics

Organisations bring people together for a common purpose, but ownership of their key productive assets confers residual rights of control to determine that purpose. In publicly traded companies this prioritises shareholder returns which are always likely to trump employee motivational orientations and diminish their subjective well-being. However, the majority of workers in Britain are employed in organisations with different governance models in which residual control rights support other priorities. Co-ownership models are widespread, as are public purpose organisations, and those belonging to the public sector. This paper explores the impact of these various governance models on employee well-being, in terms of work satisfaction, commitment, influence and trust in management. It is argued that many employees seek jobs that provide scope for their intrinsic motivations, hedonic and pro-social, and may trade these against extrinsic rewards. However, because the right to manage gives employers control over the content of jobs after hiring, employees often require credible commitments that management will respect its side of the bargain. It is

research by using techniques able to appropriately research into the theoretical necessities outlined. NCA may be a fruitful avenue in this regard as it allows precise statements about which level of a condition is necessary for a specific level of the outcome. We demonstrate and evaluate this using an illustrative IB example on institutional environments and their relations with foreign direct investment performance.

Family Firms' and Non-Family Firms' FDI Before and After the Global Financial Crisis

Author: **Sebastian Fourne**; Wilfrid Laurier U.

Author: **Miriam Zschoche**; U. of Erfurt

Author: **Reddi R. Kotha**; Singapore Management U.

Author: **Christian Schwens**; U. of Cologne

This study examines how a macro-economic crisis influences the internationalization behavior of family firms and non-family firms. Drawing on international business and behavioral theory research, we predict that prior to an unexpected macro shock, family firms enter fewer countries and make lower international investments than non-family firms. However, we also predict that in post-shock periods family firms enter more countries and invest more. The results of matched-sample differences-in-differences estimations of foreign market entry and foreign direct investment amounts of 544 German public firms before and after the 2008 global financial crisis are consistent with our hypotheses. Our research addresses different questions, namely, when family and non-family firms change the temporal orientation of their reference points, how they respond in terms of foreign investments to a major macro crisis and changes in economic sentiment, and how external and firm vulnerability predict resource allocation.

Strategic-Asset-Seeking Foreign Direct Investment by Chinese Firms

Author: **Xinwei Shi**; Tsinghua U.

We examine the relationship between business group affiliation of Chinese firms and their foreign

argued that different models provide scope to enter into different types of commitments, and that employees are more likely to find their desires for intrinsically interesting work satisfied in these types of organisations. Inability to make such commitments may constrain organisations to greater reliance on extrinsic motivators. Linked employer-employee data from the WERS surveys are used to test this argument. The conclusion draws out implications for the current debate on improving employee influence in organisational governance.

Formal FWAs vs. Informal Flexibility I-deals and Well-Being: Examining Two Mechanisms

Author: **Argyro Avgoustaki**; ESCP Business School
Author: **Almudena Canibano**; ESCP Business School

This study investigates whether the association between flexible working and employee well-being differs according to the formal or informal nature of arrangements. Relying on the literature on HR processes and employee experiences of flexible working, we claim that informal flexibility i-deals have a stronger, more proximal connection to well-being than do formal flexible working arrangements (FWAs). We also explore the existence of two underlying mechanisms to this distinct relationship: (1) we examine how work effort mediates the connection between the two types of flexible working and well-being and (2) we investigate if the relationship between informal flexibility i-deals and well-being is relative to employee perceptions of formal FWAs. Using data from employees working at the Spanish division of an international consultancy firm, results show that there is a positive and significant association between informal flexibility i-deals and employee well-being and that informal i-deals appear to have a more proximal connection to well-being than formal FWAs. They further confirm that work effort, intensive or extensive, acts as a mediating mechanism that transmits part of the effect of informal flexibility i-deals to well-being. They also indicate that individuals take formal FWAs as a baseline to contrast their own deal

acquisitive behaviour in terms of technology and brand-oriented strategic assets. Drawing on new internalization theory and the business group literature, we assert that Chinese business group affiliated firms will more likely pursue foreign acquisitions to seek patents but less likely to pursue foreign acquisitions to seek trademarks. Patents have non-location-bounded (NLB) properties which mean they can be exploited by the business group – not just the firm – back in the domestic market, while trademarks have location bounded (LB) properties which mean they are less easy to exploit by a business group domestically. Using a sample of 779 Chinese cross-border acquisitions between 2006 and 2015, we find support for our hypothesis relating to patents but not for trademarks. Additional tests identify the importance of private-ownership and the presence of an R&D centre within the business group as determinants of member firms' patent- and trademark seeking through foreign acquisition. The findings reveal the importance of a key home country effect – business group affiliation – on how firms in emerging economies seek strategic assets abroad as part of their drive to overcome latecomer disadvantages and technological backwardness.

Rapid FDI of Emerging Market Firms The Role of Foreign Participation (WITHDRAWN)

Author: **Yuanyuan Li**; Rutgers Business School

Most literature on rapid internationalization focuses on exporting firms and leaves other parts of internationalization process such as foreign direct investment (FDI) unexplained. In this paper, we explore the determinants of rapid FDI, namely why certain firms are able to have high degree of market penetration and large market commitment even in the early stage of FDI. Based on the relational perspective, relationships with foreign multinational corporations (MNCs) in particular, we argue that interactions with foreign MNCs at home helps a local firm to leapfrog certain stages in the establishment chain. Our hypotheses are tested using 1612 first-time outward FDI projects from China between the years 2000 and 2014. The largely supported results suggest that foreign participation in an emerging market context accelerates the internationalization

Employees' Evaluations of Flexible Work Arrangements in Smaller Companies

Author: **Sarah J. Park**; Kent Business School, U. of Kent

Author: **Michael Koch**; U. of Kent

Most businesses in industrialised countries are micro, small and medium-sized enterprises (MSMEs). To attract and retain employees, these companies have to address increasing demands for flexible work. However, employee uptake of flexible work arrangements (FWAs) is stagnating, and employees using FWAs often experience negative career consequences. We investigate to which extent differences between companies in terms of size explain consequences of FWAs as they are experienced by employees. We hypothesize that, compared to employees in large companies, individuals working MSMEs perceive FWAs to increase workload and reduce employee morale as well as perceived promotion opportunities. We test our theory based on a representative sample of British employees, finding support for all of our hypotheses. The results contribute to the literature on FWAs in MSMEs, and elucidate boundary conditions for the perceived effectiveness of FWAs from an employee perspective.

MEETING

ASYNCHRONOUS

While modern firm benefits from the use of advanced digital resources, access to digital technology architectures is not enough in order to succeed in highly competitive industries. Instead of separated and independent activities, the firm's network embeddedness becomes critical for the firm's success and thus serves as an indicator of its competitive positioning in the global markets. Considering the importance of the Chinese and Taiwanese electronics industry on a global scale, this study investigates the role of their network embeddedness in the course of their international expansion. We build on the network theory and utilize data, spanning a period of two decades, to present evidence on how key business network parameters (relationship frequencies, industry network positioning, eigenvector, betweenness centrality, network sub-clusters,) explain which firms succeed in the highly competitive industry of high-technology electronics and become global leaders. We illustrate complex relationship configurations and how they develop over time. Moreover, we indicate preferred relationship modes, relationship partner preferences, and preferred global target markets of Chinese and Taiwanese high-technology firms. In addition to qualitative insights, by quantifying the data analysis, our research contributes to the operational development of the business network theory and delivers important implications for management and policymakers.

Chinese Manufacturing Suppliers' Upgrading in Global Value Chains

Author: **Weimu You**; Brunel Business School

Author: **Yan Jiang**; Middlesex U.

Author: **Yu Gong**; U. of Southampton

Author: **Yuan Virtanen**; Aalto U. School of Business

This research investigates the institutional challenges faced by Chinese manufacturing suppliers and their corresponding strategic responses through an institutional theory lens. The empirical research is based on a multiple case study involving nine case companies of three company size categories in the Chinese nonwoven fabric product industry. Data were collected over a period

of three years from 2015 to 2017. This paper identifies three categories of institutional challenges, i.e., macro-institutional challenges, meso-institutional challenges, and micro-institutional challenges, faced by Chinese suppliers. Furthermore, it identifies the strategic responses undertaken by these companies in response to the above challenges, i.e., economic upgrading, environmental upgrading, and social upgrading, which in turn are associated with the companies' size and level of maturity in upgrading practices. Finally, a maturity framework is developed with five positions that reveal a four-stage upgrading trajectory and strategic changes on the trade-off between institutional efficiency and legitimacy. As most extant research on the phenomenon of sourcing from China approaches it from the viewpoint of global buyers, this research examines the phenomenon from the viewpoint of Chinese suppliers. Through applying the theoretical lens of institutional theory to investigate GVC upgrading, this study contributes to the literature streams on both GVC and institutional theory.

Linking Global Value Chain to FDI Establishment Mode of Emerging Market Multinational Enterprises

Author: **Tianle Yang**; zhejiang U. of technology

Author: **Lei Li**; U. of Nottingham, China

Author: **Liang Wang**; Nottingham U. Business School
China

This study draws upon and extends the global value chain (GVC) perspective to examine the establishment mode of foreign direct investment (FDI) of emerging market multinational enterprises (EM MNEs). It addresses how FDI establishment mode is influenced by the value chain extension strategy of EM MNEs. The empirical analysis of 605 FDIs made by Chinese MNEs from 2007 to 2015 shows that EM MNEs are more likely to choose acquisition over greenfield investment if they pursue vertical value chain extension through FDI. Further, EM MNEs pursuing upstream extension of the value chain are more likely to choose acquisition over greenfield investment than those focusing on downstream extension. In addition, the likelihood of

EM MNEs choosing acquisition over greenfield investment is greater if they pursue vertical value chain extension in culturally more distant countries.

Modeling a Multinational Firm's Manufacturing Network as a Portfolios of Real Options

Author: **Yan Huang**; Iowa State U.

Author: **Tailan Chi**; U. of Wisconsin, Milwaukee

To fill the gaps in research on the portfolios of real options, we adopt analytical modeling and simulation that allows complex and interacting relationships in parameters. We also take a dyadic analysis to examine how a firm's strategic decision is shaped in the perspective of portfolios of options with the consideration of production cost uncertainty and how the valuation of portfolios changes with either positive or negative cost correlation, switching/coordination costs, and capacity constraint of manufacturing facilities. This study brings fruitful insights to the understanding of the effect of industry-level cost uncertainty and real exchange rate fluctuations on switch or growth and contraction options and can become the forefront of real options research.

Faultline Strength: The Contingent Value of TMT Cross-border Acquisition Experience

Author: **Liling Chen**; Huazhong U. of Science and Technology

Author: **Jianzu Wu**; School of Management, Lanzhou U.

Author: **Jing'an Tang**; Sacred Heart U.

Research has shown that the acquisition experience of top management team (TMT) matters for internationalization in terms of cross-border acquisition speed and performance. However, the question of how acquisition experience takes effects during the TMT decision-making process remains less known. To bridge this gap, this study focuses on one of the most important team structural attributes – faultlines– to investigate how faultline strength affects acquisition experience accumulating and sharing among TMT members and thus influences the speed and quality of acquisition decisions. Using a sample of cross-border acquisitions conducted by 292 Chinese MNEs during 2003-2013, we found that the effects of TMT acquisition experience on future acquisition speed and quality depend upon TMT faultline strength. On the one hand, faultline strength weakens the positive impact of acquisition experience on subsequent acquisition frequency, on the other hand, it strengthens the positive effects of experience on the performance of future acquisitions.

[view paper \(if available\)](#)

Purpose. The present paper investigates dysfunctions in two non-governmental organizations operating in the Middle East, and that exhibit blatant differences in their organizational cultures. The paper then compares the dysfunctions and relates the solutions devised by organizational actors to resolve their dysfunctions. The objective of the paper is to examine the impact of cultural differences on dysfunctions and solution provision. **Design/methodology/approach.** The methodology is one of qualitative comparison of action research/intervention research approaches conducted simultaneously in two NGOs operating in Lebanon. **Findings.** The results support that findings are largely similar despite the cultural differences in the NGOs scrutinized. Dysfunctions point mainly to lack of clarity in both strategic orientations and decision-making processes. They also point at burdening procedures, lack of proper communication, and ineffective organization of meetings. Inductively devised solutions suggest operating in synchronized decentralization and the subsequent adaptation of procedures, as stipulated by the socio-economic theory. **Originality/value.** The main contribution of the paper is in the counterintuitive findings that organizational culture might not be differential in organizational performance, thus requiring further research to scrutinize the impact of the environment on performance.

Locked-In Resources: Essential Ingredient for Coopetitive Relationship Stability

Author: **Rida Elias**; American U. of Beirut

Author: **Bassam Farah**; American U. of Beirut

This paper describes an underexplored process in coopetition research and contributes to the understanding of coopetition and its relationship with innovation performance from a resource based perspective. We conducted a review of three literatures and used examples of current and past coopetitive relationships amongst companies to develop this conceptual paper's six propositions and a conceptual model. This paper argues that locked-in resources lead to higher coopetitive relationship

Business Networks and Enclave Formation: Why Foreign Direct Investment Fails to Transfer Technology

Author: **Michael Murphree**; U. of South Carolina
Author: **Steven Samford**; U. of Michigan, Ann Arbor
Author: **Dan Breznitz**; U. of Toronto

Foreign Direct Investment (FDI) frequently fails to provide transfers of important ideas and technologies to host countries. Incorporating insights from network theory, we argue that this is a predictable outcome of foreign investment because there is a natural tendency among multinational enterprises (MNEs) toward enclave formation. MNE subsidiaries face risks associated with poor information in host countries, which they mitigate by partnering with known firms in their existing business networks. In-group dynamics and network inertia perpetuate the closed nature of foreign enclaves and prevent technology transfer to the local enterprises. Thus, rather than specific host country conditions – absorptive capacity, institutions, or culture – a general tendency toward enclaves among MNEs works against local technology transfer. We illustrate this tendency with three cases that a-priori should not be characterized by poor levels of technology transfer: the electronics clusters in Guadalajara, Mexico and Costa Rica and the automotive sector in Ontario, Canada. Recognizing the role of business networks in shaping MNE behavior has important analytical implications for scholars and underlines the importance of policymakers moving beyond FDI attraction to local network-building policy instruments.

Brand Equity of Commercial Banks - A Study from Customers' Perspective of ACB in VN

Author: **Teresa Lien Freiburghaus**; U. of Applied Sciences and Arts Northwestern Switzerland FHNW
Author: **Thi Hong Nhung Nguyen**; U. of Economics Ho Chi Minh City

In the banking sector, the brand is a strong intangible asset of a bank that makes the differences and increases the chances of success. Banking services is changing rapidly as customers becomes more demanding, and the markets more competitive. Customers' decision on banking choices is not only tangible with physical factors but also psychological and emotional factors. This paper aims to study a model of brand equity of commercial banks in Vietnam, from the perspective of customers and the proportion of its components contributed to the value of the brand equity. The findings potentially indicate that "Brand Image" is the most important component of "Brand Equity". Therefore, commercial banks should develop strategies to promote the bank's brand image, conveying the bank's intrinsic value to customers.

Student Satisfaction with Use of a Peer Feedback System

Author: **Magda M. Donia**; U. of Ottawa

Author: **Merce Mach**; U. of Barcelona

Author: **Sigalit Ronen**; California State U., Northridge

Author: **Stephane Brutus**; John Molson School of Business, Concordia U.

Author: **Thomas Alexander O'Neill**; U. of Calgary

We contribute to the growing literature on the role of repeated use of a peer feedback system in the development of student's teamwork skills by exploring individual and contextual factors underlying students' satisfaction with using a peer

literature argues that the relative adoption of innovations reflects their perceived value. In the context of experiential exercises, this suggests that it is important to design the value of the innovation in terms perceivable by management scholars. In this paper, we conduct a systematic literature review of articles introducing new management-related experiential exercises published between 2008 and 2019, in an effort to investigate the most commonly used methods through which creators of new experiential exercises assess the effectiveness of their innovations. Drawing on the concept of value proposition from the innovation literature, we posit that the type of evidence required to provide a compelling case for the adoption of new exercises may in fact depend on the degree to which they represent high or low stake endeavors to users. We then build upon this argument by illustrating how a mixed methods collection strategy may be particularly useful for articulating the value proposition of exercises perceived as reflecting “higher stakes”.

Classroom as Organization: A Review of the Literature

Author: **Stacie Chappell**; Vancouver Island U.

Author: **Debby Thomas**; George Fox U.

The purpose of this article is to explain the historical evolution of the CAO methodology and analyze the literature base. The intention is to provide a comprehensive summary of the CAO literature around this immersive, empowering, and relational teaching methodology. The paper begins with an overview of the CAO methodology and the historical context in which CAO emerged. Building on this foundation, the paper analyzes the CAO literature by delineating the emergence and expansion of CAO. As more CAO models evolved, various characteristics emerged that distinguished designs from one another: interdependent organization vs. leadered group design, external vs. internal focus, and various adaptations. Finally, the common elements of CAO are identified and analyzed: (1) leverage interdependence, (2) utilize peer assessment, (3) give students both learning and management roles, (4) delegate as a senior

feedback system alongside teamwork. Drawing on procedural justice theory, we theorized and found a positive relationship between student uncertainty avoidance orientation, and virtuality in collaborating with their satisfaction with use of a peer feedback system. Our findings provide actionable evidence to post-secondary institutions considering the adoption of such systems in their curricula: they are effective in the development of teamwork skills and students appreciate the opportunity to provide feedback to their peers in a structured and dedicated environment.

Critical Thinking about Information Credibility in the Management Classroom

Author: **Matt Theeke**; George Mason U.

The ability to evaluate the credibility of information is a fundamental part of critical thinking that students need to access knowledge and to learn using evidence. Yet, studies show that business students often fail to develop this capability and research highlights a need for new approaches to teach students how to evaluate the credibility of information sources. This paper builds on prior literature to propose a two-stage credibility evaluation model that utilizes a combination of screening factors (bias, appearance) and credence factors (reputation, assurances, verification, and endorsements) to assess the credibility of information sources. In contrast to existing approaches, which often rely on lists of questions to evaluate information credibility, this model aims to provide students with a greater conceptual understanding for how to assess the credibility of information. This study also proposes that implementing the two-stage model with an enhanced bibliography will improve students' critical evaluation skills by allowing educators to provide more process-oriented feedback and by broadening the scope of feedback to consider both gullibility errors (including information that is not credible) and incredulity errors (excluding credible information).

[view paper \(if available\)](#)

manager, and (5) balance structure and ambiguity to support learning. CAO offers a significant change to how we view classroom learning and teaching and offers a dynamic, effective way to bring true organizational learning into the classroom.

Co-Authorship Patterns in Business and Economics: A Social Network Analysis

Author: **Rene Maler**; WHU - Otto Beisheim School of Management

Author: **Markus Rudolf**; WHU - Otto Beisheim School of Management

Author: **Sebastian Seidens**; WHU - Otto Beisheim School of Management

This study reflects on the interconnectedness between academics in Business and Economics. We analyze social networks based on co-authorships from 46,238 articles, published in 29 leading journals across all Business and Economics disciplines from 1988 to 2017. The results point out that in these three decades, collaboration among researchers increased and networks became more sophisticated across all fields of research. While authors from Management are internally connected to a lesser extent, researchers from Marketing show the highest degree of interconnectedness across all disciplines and over time. In addition, our research shows that most productive authors are not necessarily most important authors for the network. Results show that most important scientists are clustered in Economics, Finance, and Marketing.

Students' Perceptions of Online Teaching: Student-Centered Success Factors

Author: **Jing Zhang**; California State U. San Bernardino

Author: **Helena Addae**; California State U. San Bernardino

Author: **Melissa Bakeman**; California State U. San Bernardino

Author: **Maggie Boyraz**; California State U. San Bernardino

Author: **Patrick Flaherty**; California State U. San Bernardino

Author: **Matthew Habich**; California State U. San Bernardino

Author: **Ann Johnson**; Calstate

Author: **Ya Ni**; California State U. San Bernardino

Author: **Anna Phillips**; California State U. San Bernardino

Author: **Cynthia Schreihans**; California State U. San Bernardino

Author: **Monty Van Wart**; California State U. San Bernardino

The perceptions of what constitutes quality learning for undergraduate business management students have been little studied despite the widespread use of online classes in business programs. Using survey data and focus group comments from undergraduate management students, the current study aims to 1) explore the factors affecting student's perception of quality online education, 2) discuss the relative importance of the factors, and 3) summarize recommendations from students' perspective. Exploratory factor analysis identifies seven distinct, coherent, and significant areas in terms of student perceptions of quality. They are: basic online modality (e.g., online gradebook), teaching presence (e.g., customized feedback), instructional design (clarity of structure and communication), cognitive presence (e.g., intellectual stimulation), social or student-to-student presence, online social comfort (comfort interacting online), and interactive online modality (e.g., videoconferencing and small groups). Out of seven factors, the factors that matter most for effective online learning are basic technological and teaching elements (i.e., basic online modality, instructional design, and teaching presence). Lastly,

teaching is conceptualized and designed. We adopt phenomenographic methods to reveal a five-level hierarchy of theory definitions ranging from simple notions of 'theory as an idea' to more sophisticated definitions with causal and practice implications. This hierarchy shapes the way management educators design their teaching. Those defining theory simply as an idea or notion tend to teach from a theoretical perspective and see theory as providing guidance for managerial action. Those with the most sophisticated definitions are the ones most likely to teach from a practice perspective and use theory to highlight different viewpoints and for critique. Although all the interviewees view theory as having an interventional purpose to shape or change managerial action, management educators are haphazard in the ways they teach students to apply theory. We conclude by discussing the implications of these findings for the essential-non-essentialist debate in management education and suggest avenues for future research.

Flow Experience in Blended Learning: Behind the Inconsistent Effects of Flexibility and Interaction

Author: **Fabian Alexander Müller**; Philipps-U.

Marburg

Author: **Torsten Wulf**; Philipps-U. Marburg

Despite the growing importance of blended learning environments in management education, the extant research provides inconsistent results. While many studies find positive effects of blended environments or their central characteristics (i.e., flexibility and interaction) on learning effectiveness, dropout rates remain high and learners prefer face-to-face encounters over online activities. As the cognitive mechanisms behind learning effectiveness have been neglected thus far, we draw on educational psychology to derive an explanation for these contradictions. We introduce flow theory, which describes a learner's complete immersion in an activity, and we propose that experiencing flow mediates the positive effects of flexibility and interaction on blended learning effectiveness. The results of an experiment with 115 graduate management students support our hypotheses. We contribute to management education research on

recommendations from students revealed that instructor training and motivation are critical to students' online learning experience. The data was collected from students at a single university; thus, the results might be affected by single source bias. The study answered the call for more comprehensive measures of student learning.

Exploring Self-Regulated Learning with BOPPPS Model and IRS Tool (WITHDRAWN)

Author: **Chung-Jen Wang**; National Pingtung U. of Science and Technology

Author: **Chin-Pin Li**; Tainan Municipal Jincheng Junior High School

This study aims to explore hospitality college students' learning and academic self-efficacy in self-regulated learning and the effectiveness of learner-centered education by integrating the bridge-in, objective, pre-assessment, participatory learning, post-assessment, and summary (BOPPPS) model and interactive response system (IRS) tool. Accordingly, learning self-efficacy includes five dimensions, namely, conceptual understanding, everyday application, practical work, higher-order cognitive skills, and science communication. Meanwhile, self-regulated learning represents six dimensions, namely, goal setting, environment structuring, task strategies, time management, help seeking, and self-evaluation. Questionnaire responses were collected from hospitality students in the university for the subject of hospitality cost control. Results showed that learners' learning self-efficacy was positively associated with academic self-efficacy, while self-regulated learning mediated the relations between learners' learning and academic self-efficacy. Moreover, results indicated that students who participate in class demonstrate substantially high learning and academic self-efficacy for integrating the BOPPPS model and IRS methods in their classroom, particularly in the post-test rather than in the pre-test. Lastly, results provide empirical evidence for learning and academic achievement of self-efficacy, self-regulated learning, and effective teaching design in the hospitality setting context.

blended learning environments by looking beyond the direct effects of format characteristics on learning outcomes. We reveal cognitive characteristics, especially flow experience, as an important mediator. Consequently, management education scholars should consider indirect effects from related disciplines when investigating blended learning environments. Furthermore, instructors should ensure that they integrate flexibility and interaction into blended learning environments, and they should account for cognitive learner characteristics.

How Does a Humble Leader Help the Team to be Reflective?

Author: **Sujin Son**; Chosun U.

Due to the significant impact on team innovation and team effectiveness, team reflexivity which is viewed as teams' self-regulatory actions, has been received great attention from scholars. The current study suggests leader humility as a key indicator for fostering team reflexivity. In addition, this study attempts to provide a deeper understanding regarding the effect of leader humility on team reflexivity through examining the mediating role of shared leadership and the moderating role of leader trust. Using survey of 313 employees in 60 teams from the IT service provider of a large telecommunications company in South Korea, the study has indicated that leader humility is positively associated with team reflexivity through increasing shared leadership among team members particularly when they have higher level of trust. Theoretical and practical implications were also addressed.

Rhetorical History (session 1189)

This session highlights recent advances in rhetorical history. Defined as the strategic use of the past as a persuasive strategy to manage key stakeholders of the firm, the papers in this section add both empirical detail and theoretical depth to the concept by elaborating its use in legitimating contested hunting practices, characterizing organizational disasters, enabling leadership, and creating authenticity.

Enchantment Through Authenticity: The Use of Rhetorical History to Project Images of Craft

Author: **Kai Lamertz**; Athabasca U.

operate. In light of these problems, a scoping review was conducted to explore financially viable alternatives to the Oxford tutorial for management education. Articles in highly ranked management education and development academic journals were collected by searching these catalogs and compiling a database of 48 articles published in four premier journals. These articles were reviewed by two independent raters in order to arrive at 8 alternatives to the Oxford tutorial that can achieve similar objectives of said tutorials while reducing costs. Guidelines are provided for the implementation of each alternative.

University Capital

Author: **Folajimi Yesir Ashiru**; Coventry Business School

Author: **Philip Warwick**; Durham U. Business School

Relying on the resource-based view and drawing on the work of Pierre Bourdieu and his key concepts of field, habitus, and capitals, we scrutinise the perceptions of first year business undergraduate students over a six year period for essential resources that give universities competitive advantage. Our findings reveal the combination of symbolic capitals that are essential to attract students to a Business School in a Russell Group University. The resource combination are critical in cementing and maintaining the position of a university. Hence, we refer to this combination as "University Capital".

Management Educator as Curator: Resetting Rationality at the Business School

Author: **Matt Statler**; New York U.

Author: **Pierre Guillet De Monthoux**; CBS

This essay reframes the role of the management educator as a curator who creates transformative learning experiences with students. We begin by tracing the evolution of the role of the curator within the institution of the museum, focusing on recent

Author: **William Foster**; U. of Alberta

Not all organizations project an image of their identity to stakeholder audiences that meets the expectations for rational management or corporate business forms. Craft organizations tend cultivate images that express an enchanted ethos of dedication to skill, creativity and community. Such images are often constructed in reference to historical materials that can be strategically used to claim the craft firm's authenticity in the present. We argue and examine evidence that craft organizations draw on pieces from the past as a way to demonstrate their authenticity and adherence to a craft ethos. We analyze the websites of craft breweries from 4 Canadian provinces and find that most breweries narrate craft as an under-specified concept. They used the generic craft label in conjunction with a variety of historical themes as a way of enchanting their images in reference to current organizational context or interests.

How to Stigmatize: Inside the Fight for the Rhetorical History of the Seal Hunt

Author: **Jordyn Hrenyk**; Beedie School of Business Simon Fraser U.

Organizational stigma is a collective, negative, moral evaluation of an organization that results in increased threats to its survival. Within the extant literature, stigma is generally conceptualized as an organizational attribute, or something that an organization inherently is. Though researchers have thoroughly interrogated the processes by which organizations manage stigma and minimize stigma transfer to resource-granting stakeholders, we know very little about how an organization actually becomes stigmatized. What turns a negative event into a debilitating organizational label that becomes difficult to shake? Where does stigma come from and how can we distinguish it from related constructs like illegitimacy and poor reputation? By delving beneath the growing typologies of organizational stigma to examine the processes by which stigma emerges, this work demonstrates that organizational stigma is a social process that lends itself to a categorization rather than just a fixed

developments in the field of contemporary art. In the interest of moving beyond a simple metaphor, we present a detailed account of Bruno Latour's recent work curating art shows designed to 'reset modernity', and we consider how this activity relates to practices in the business school classroom. We conclude by speculating about the implications for the field of management education of viewing rationality as the art of learning through a multiplicity of perspectives and transformative experiences.

Looking for the Shape of Strategic Management Field - The Numbers Do Not Lie

Author: **Oskar Kosch**; Cracow U. of Economics

Author: **Marek Szarucki**; Cracow U. of Economics

Despite numerous attempts to systematically review different aspects of knowledge in strategic management, no studies have so far explored the shape of this field of science, based on scientometric measures with a view to testing its coherence. We argue that a quantitative analysis of the essential elements comprising a discipline would be precious in this light. Descriptive statistics on productivity and dominance were examined. An analysis of Lotka's, Price's, and Bradford's Laws was conducted in their different versions and on various datasets, resulting in 35 different combinations. Compliance with theoretical Lotka's distribution was tested. High producers, as established by Price's Law, were presented jointly as ego networks (using social network analysis methods). High adherence to all laws was found. Stabilizing Lotka's exponent indicates that strategic management achieved structural maturity, with a core consisting of authors publishing eight or more articles (obtaining more than one-third of citations), and vast periphery of authors responsible for one or two papers. There are five journals every strategic management scholar should be familiar with. The shape of strategic management seems to be determined by the loose and extensive periphery, and dense – but in terms of citations and integration – core.

[view paper \(if available\)](#)

category of organizations. In other words, stigmatized organizations are stigmatized only for as long as their stigmatizers actively stigmatize them. I examine the process of stigma emergence through the case of the stigmatization of seal hunting in Canada by animal rights social movement organizations (SMOs), beginning in the 1960s.

Academic Leadership in India – Development of a Multidimensional Measure

Author: **Darshna Vaghela Banker**; Indian Institute of Technology, Delhi

Author: **Kanika Tandon Bhal**; Indian Institute of Technology, Delhi

Context-specific leadership research has its own value in the era of globalization. In this article, a multi-dimensional academic leadership measure was conceptualized and developed for an Indian context, spanned across four studies. 75 items under 12 dimensions were developed using in-depth interviews (N=12). As a result of the expert validation (N=12) study, the retained 48 items were examined using different quantitative techniques like exploratory factor analysis (N=101) and confirmatory factor analysis (N=548), in order to ascertain the four-dimensional (managing teaching-learning MTL, managing intellectuals MI, institutional stewardship IS and administrative competence AC), second-order academic leadership scale structure (ALS). These four dimensions were found to be conceptually rooted in different leadership styles like instructional, intellectual, servant and administrative styles respectively. The academic leadership scale 'ALS' was then examined for its psychometric properties on the larger data set (N = 548) that included responses from the faculty members, students, and the non-academic staff members. ALS met all the requirements for further empirical validation stage where each dimension was tested for two outcomes namely commitment and reputation. The results indicated two things: one, the newly developed ALS is the contemporary leadership model that is most suitable for the unique Indian context, second, the instructional style explained the highest variance followed by the intellectual style as compared to the administrative and servant styles.

Construction and Measurement of Contemporary Work Identities (session 1194)

Identity and identity processes are growing areas of research in management scholarship. Organizational, occupational, and role identities influence personal self-concept and impact how one makes sense of the workplace. Similarly, the processes that trigger identity formation or construction within the workplace has the potential to affect many individual and organizational outcomes. In fact, identity construction spans research in organizational behavior, human resources, and careers alike as individuals seek to understand self while navigating the workplace. This symposium explores identity processes faced by contemporary workers. Specifically, the symposium highlights the influence of identity processes in the context of gig employment and entrepreneurial pursuits. The unique context in which a gig worker performs identity construction may affect the processes available to those individuals, which could impact the formation of the identity. For entrepreneurs, their identity exploration may affect the individual's ability and willingness when it comes to discovery and pursuit of new opportunities. In addition to these unique contexts, this symposium introduces an instrument to measure identity work in an effort to expand and strengthen empirical research in this area.

Don't Forget about the Leader: Illuminating the Link Between Leader Behaviors and Leader Well-Being (session 1200)

Leaders have often been implicated as having a large influence not only on employee behavior, but also on employee well-being. However, only recently have researchers begun to examine how leader behaviors affect the leader's own well-being. Indeed, the well-being of a leader would seem to be considered something of an afterthought when it comes to behavioral leadership research, despite the fact that healthy and resilient leaders should be a priority for organizations who want to cultivate management patterns that are sustainable over time. This symposium seeks to continue a research trend toward well-being as important criterion generally, and leader well-being as an important criterion specifically, by expanding our knowledge of how leader behaviors affect a leader's well-being at work.

Followership: Managing Your Boss (session 1198)

I Believe I Can Do Better with Leader's Helping: A Cross-Level Mediated Moderation Model

Author: Yanting Zhu; Renmin U. of China

Drawing upon the theoretical lenses of social cognitive theory, this study aims to explore whether, when and how team leader's helping behavior can influence team member's individual work performance (in terms of individual task proficiency, task adaptivity, and task proactivity) via team member's self-efficacy. The consequences of different types of leader's helping are unfolded in this study. By proposing a cross-level mediated moderation model and using valid data of 303 team members from 39 work teams, I found both autonomy-oriented help and dependency-oriented help from team leaders have differential effects on team member's individual work performance via team member's self-efficacy. Moreover, the path analysis of moderation uncovered that leader-member exchange relationships at the team level engender the boundary conditions on the main effect of this model.

Leadership and Voice (session 1197)

Authoritarian Leadership and Voice Behavior: The Moderating Effect of Group Loyalty (WITHDRAWN)

Author: Jen-Wei Cheng; National Taiwan U. of Science & Technology

Author: Cheng Ze Hung; National Taiwan U. of Science and Technology

Author: Hung-Chieh Yen; National Taiwan U. of Science and Technology

Author: Kang-Min Chien; Chairman, Sunnic Technology & Merchandise Inc., Taiwan, R.O.C

This study investigated interrelationships among authoritarian leadership, prohibitive voice, saying nothing but good news, and group loyalty using questionnaire data from 140 supervisors and 603 subordinates in the Taiwanese military. Results from a cross-level moderation research design and hierarchical linear model suggest that authoritarian leadership has a negative relationship with prohibitive voice, but has a positive relationship to saying nothing but good news. Group loyalty moderated the relationships between authoritarian leadership and prohibitive voice; lower group loyalty weakened negative relationships. Implications for management and future research are discussed.

Investigating Meta-Perceptions to Advance Relationship-Based Approach to Leadership (WITHDRAWN)

Author: **Zhenyu Yuan**; U. of Illinois at Chicago
Author: **Frederick Morgeson**; Michigan State U.
Author: **Xiaoyu Wang**; School of Economics & Management, Tongji U.

Leader-Member Exchange (LMX) theory suggests that role development processes will result in leaders and followers eventually developing a shared understanding of the nature of their relationship. Yet, research has consistently found that leaders and followers demonstrate only modest levels of agreement regarding their relationship, and this lack of agreement is an important limitation of relationship-based approaches to leadership. In an attempt to better understand the dyadic nature of leader-follower relationships, we draw from social psychological theory on dyadic meta-perceptions in order to explore the components, processes, and contingencies of the leader-follower relationship. We suggest that judgments of the leader-follower relationship should be distinguished from meta-perceptions of the relationship (i.e., a person's inference of how the other person in the dyad feels about their relationship). Decomposing relationship judgments in this way allows us to investigate the accuracy and bias of dyadic LMX meta-perceptions. We found that not only did the leader and the follower have much weaker LMX agreement than past empirical research documented, they were also unaware of their discrepant relationship

leaders' technological savviness – a leader characteristic that is critical in today's technology-driven organizations – and examine how it might serve as an ambient cue to employees by providing valuable information about whether it would be safe/worthwhile to speak up with ideas and, ultimately, influence voice. Drawing on signaling theory (Spence, 1973), we posit that employees perceive leaders' technological savviness as an ambient cue that signals leaders' openness, that in turn, increases their likelihood of speaking up. Three experiments with two different samples (i.e., general population and students) supported our hypotheses. Theoretical and practical implications for voice and the future of work are discussed.

Could You Give Me Some Advice? The Workplace Outcomes of Leader Voice Solicitation

Author: **Beijing Tan**; Huazhong U. of Science and Technology
Author: **Zhiyu REN**; Zhongnan U. of Economics and Law
Author: **Fangna Wang**; Zhongnan U. of Economics and Law
Author: **Wenjun Yin**; School of Management, Huazhong U. of Science and Technology

Leader voice solicitation denotes leaders proactively seeking work related opinions and suggestions from their subordinates. Extant research has investigated the static informational outcomes, paying little attention to its potential dynamic motivational effects to employees. Drawing from work engagement theory, this study examined the dynamic positive effects of leader voice solicitation from a motivational perspective. Using a twice-day experience sampling method to collect data from 107 employees in a week, we found that, on a daily basis, leader voice solicitation had a positive effect on employees' work engagement, which in turn promoted employees' proactivity. Moreover, authoritarian leadership would weaken the positive relationship between daily leader voice solicitation and daily employees work engagement. Our findings generated some interesting implications for theory and managerial practice.

perceptions. Further, moderation analysis supported power dependence as a contingency factor that could weaken the leader's bias. Overall, our findings advance the relationship-based approach to leadership by shedding light on the various theoretical blind spots regarding the dyadic nature of LMX and offering important directions for future dyadic leadership research.

Taking the "High Road": Theoretical and Empirical Advances on Kindhearted Reactions to Wrongdoing (session 1201)

Employees engaging in wrongs is an unfortunate workplace reality that can prove costly for organizations. Although research has shown that individuals respond destructively to such behavior, emerging work has shown that some turn the other cheek and react in a kindhearted manner (e.g., forgive, reconcile). The literature is still in its infancy; we do not have a full understanding of when and why people react in a kindhearted manner, and what the consequences are of these kindhearted reactions to organizations. This symposium addresses this research agenda by: (1) examining different antecedents of kindhearted reactions, such as features of the wrongdoing (e.g., seriousness, intentionality), individual factors of individuals engaging in the kindhearted reaction (e.g., perspective taking, narcissism), situational factors (e.g., climate, power), and different types of wrongdoing (e.g., abusive supervision, misconduct) that influence kindhearted reactions; (2) identifying different types of kindhearted reactions (e.g., coworker protective behavior, forgiveness, leniency); (3) highlighting behavioral strategies and psychological mechanisms (e.g., gossip, unfairness) that explain how kindhearted reactions influence outcomes; (4) exploring distal consequences of kindhearted reactions, such as emotions,

The Effects of Context: Corporate Culture, Environment Behavior, and Age Norms (session 1199)

Implementing Corporate Culture Top-Down or Bottom-Up? Cultural Gaps Over Time and Firm Performance

Author: **Stefan Pasch**; Goethe U. Frankfurt, Germany
Author: **Daniel Ehnes**; Goethe U. Frankfurt, Germany

We conceptualize the differences between espoused cultural values of firms' top management and the enacted cultural values of their employees as cultural gaps and investigate how the breadth of these gaps relates to firm performance. Tracking these cultural gaps over time, we further examine how changes relate to firm performance and whether the direction of change, i.e. whether enacted values get closer to (or grow apart from) espoused values, or vice versa, has an effect on the culture-performance link. To test this empirically, we apply textual analysis on a set of over 800,000 employee reviews from Glassdoor.com, to measure employee culture, and a matched set of annual reports, to measure senior leaderships' espoused cultural values. We find that cultural gaps are negatively related to productivity, suggesting that cultural gaps impair coordination and goal alignment. Further, we show that changes in these cultural gaps have positive (negative) effects on productivity and profitability, if employees' enacted culture become more (less) similar to espoused

perceptions, and behaviors; and (5) uncovering moderators (i.e., offender need, gender, mindfulness) that influence the impact of kindhearted reactions on downstream outcomes.

Do Age Norm Violations Favor or Endanger Firm Innovation? The Role of Environmental Dynamism

Author: **Kim De Meulenaere**; KU Leuven

Author: **Florian Kunze**; U. of Konstanz

Due to the reduction of seniority-based promotion systems, the traditional link between employees' age and hierarchical status is getting disrupted in many organizations. In this study we use theoretical arguments from career timetables and status incongruence research to argue for an effect of these changing age-status structures on organizational innovation. In detail, we propose a moderated mediation model with age discrimination climate as mediator and the firms' environmental dynamism as moderator. Using large-scale multisource data of 69 firms with information provided by 12,869 employees, 69 top HR representatives and 230 top board members, we show that the impact of the age-status link on organizational innovation is different for firms with high and low levels of environmental dynamism. In firms with low levels of environmental dynamism, a weak age-status link harms organizational innovation through increased levels of age discrimination climate. In contrast, a weak age-status link has a direct positive effect on innovation in firms operating in highly dynamic environments. These findings suggest that the fading age-status relationships in organizations are not as unambiguously harmful as previously assumed and hold thus important practical implications as dealing with violations of the traditional career timetables will become more important for the current and future success of organizations.

Engaging the Age-Diverse Workforce: The Interplay Between Personal and Contextual Resources

Author: **Karoline Kopperud**; OsloMet - Oslo Metropolitan U.

Author: **Christina Nerstad**; OsloMet - Oslo Metropolitan U.

Author: **Robert Buch**; OsloMet - Oslo Metropolitan U.

Author: **Dominique Kost**; Oslo Metropolitan U.

The aim of this study was to increase our insight into fostering work engagement in an age-diverse workforce by examining the relationship between mastery goal orientation and work engagement across different age groups. We further tested whether a perceived motivational climate moderated the proposed relationships and whether the nature of the moderation differed depending on age group. In a cross-lagged survey of 838 employees in a Norwegian financial-sector organization, we found that both work engagement and mastery goal orientation differed across age groups and that the relationship between mastery goal orientation and work engagement was stronger for older than for younger age groups. Our results further support the moderating role of a motivational climate. Whereas a perceived mastery climate moderated the relationship between mastery goal orientation and work engagement for the older workers, a perceived performance climate moderated the suggested relationship for younger workers. Theoretical as well as practical implications of our results are discussed.

Transformational and Charismatic Leadership (session 1195)

Moderating Effects of Charismatic and Servant Leadership on Employee Wellbeing and Retention in M&As

Author: **Xuan Feng**; Nottingham U. Business School China

Author: **Armin Pircher Verdorfer**; Amsterdam Business School, U. of Amsterdam

Employee concerns with regard to job (in)security have been associated with reduced physical health and job withdrawal. Past research establishes that mergers and acquisitions fail when leaders do not address the psychological effects of transformation processes, reflected in perceived job insecurity, on employees. We argue that employees tend to look to their leaders for support and reassurance during times of transition and change and two types of leadership—charismatic leadership and servant leadership—can serve a protective function for employees and reduce the negative effects of job insecurity. Data for this study were obtained from a medium-sized high-tech consulting company during a merger process. Perceived job insecurity, leadership as well as emotional exhaustion and turnover intentions were collected at two separate time points. In addition, objective data on sickness absence and actual turnover were available. Results

argue that environmental corporate social (ir)responsibility (CSR and CSIR) may either spill over to (consistency effect) or compensate (balancing effect) for employees' own moral behavior. In an experimental study, in which we randomly assign individuals to work for a company engaging either in CSR or CSIR, we investigate participants' donation behavior. Our results indicate that individuals who work for a CSR compared to a CSIR company donate significantly more money to a charity that serves an environmental purpose, but not more money to a charity that serves a broader social mission.

A Self-Protective Perspective Exploration Between Organizational Politics and Self-Interested Voice

Author: **Jinyun Duan**; East China Normal U.

Author: **Yue Xu**; Xi'an Jiaotong-Liverpool U.

Author: **Wang Xiaotian**; Soochow U.

Author: **Chiahuei Wu**; Leeds U. Business School

Employee voice is almost exclusively thought to stem from well-intended motives, even though some scholars have argued that it may be self-interested. In this paper, we introduce a new type of employee voice—self-interested voice, and explore the impact of employees' perceived organizational politics (POP) on it from a self-protective perspective. With time-lagged survey data collected from 262 employees and their direct leaders in China, we found that POP is positively related to self-interested voice through self-serving cognition. In addition, Machiavellian personality strengthens the positive relationship between POP and self-serving cognition, as well as the indirect effect of POP on self-interested voice via self-serving cognition. Implications for theory and practice are discussed.

[view paper \(if available\)](#)

provided support for the hypothesized model, in which perceived job insecurity enhanced emotional exhaustion and turnover intentions, culminating in sickness absence and actual turnover. As expected, charismatic leadership buffered against these negative outcomes. In contrast to our prediction, servant leadership even increased the detrimental effects of perceived job insecurity. Our discussion focuses on theoretical and practical implications of these results.

Transformational Leadership and Followers' Thriving at Work: An Examination of Underlying Mechanisms

Author: **Arpana Rai**; Indian Institute of Management, Udaipur

Author: **Minseo Kim**; Griffith U., Brisbane, Australia

Author: **Darshana Hazarika**; -

The present study aims to examine the mechanisms through which transformational leadership influences followers' thriving at work. We identified two key mechanisms—perceptions of warmth and competence to examine the effects of transformational leaders on follower outcomes. Using a serial mediation model, we proposed that transformational leaders are perceived by their followers as both warm and competent, and these perceptions foster followers' trust in leader (affective and cognitive trust respectively), which subsequently promote their thriving at work. Based on data collected from 286 managerial employees working across a wide range of Indian organizations, we found support for our hypotheses. Implications for theory and research are discussed.

More Depletion, Less Voice? The Role of Implicit Voice Theories and Voice Efficacy

Author: **Xiaofei Hu**; Hong Kong Polytechnic U.

To reconcile prior mixed findings on the relationship between ego depletion and voice, this study introduces self-protective implicit voice beliefs as the key between-level boundary condition that determines whether ego depletion reduces voice. Based on the Quad process model, this study proposes a mediated moderation model and simultaneously considers the effect of implicit voice beliefs and ego depletion when predicting voice behavior. Data was collected from 128 employees across ten work days using an experience sampling methodology. The results indicated that self-protective implicit voice beliefs (SIVBs) moderated the relationship between daily ego depletion and daily voice such that the relationship was more negative when SIVBs were high, but turned insignificant when SIVBs were low. In addition, daily voice efficacy mediated the interaction effect of ego depletion and SIVBs on daily voice. Theoretical and practical implications of these findings were also provided.

Do They Like What I Have to Say? How and When Supervisor Voice Endorsement Predicts Work Engagement

Author: **Yuhuan Xia**; Beijing Jiaotong U.

Author: **Yuanyuan Lan**; Beijing Jiaotong U.

Author: **Alex L. Rubenstein**; U. of Central Florida

Author: **Mengxi Xing**; Qingdao U.

Author: **Shuang Li**; School of Economics and Management, Beijing Jiaotong U.

Drawing on social exchange theory, in this study we develop and test a moderated mediation model of the relationship between voice endorsement and work engagement. Utilizing dyadic data from 87 supervisors and 427 subordinates, our results reveal that leader-member exchange mediated the relationship between voice endorsement and work engagement. Further, we found that perceived

wave survey from 508 dyads of white-collar workers and their direct supervisors in AI-powered organizations in Japan. The results of structural equation modeling (SEM) suggest that: (a) the effects of uncertainty are mediated by organizational members' professional identity (i.e., uncertainty is negatively associated with professional identity, which is, in turn, related to organizational commitment, job satisfaction, and job performance of members); (b) transformational leadership of direct supervisors is positively associated with members' professional identity; and (c) perceived digital literacy of direct supervisors moderates the effects of transformational leadership in a complex manner, such that, when uncertainty is higher and the digital literacy of supervisors is higher, the impact of transformational leadership on professional identity is greater, while the opposite pattern has been detected when uncertainty is lower. These findings are discussed with reference to relevant theories such as the social process of leadership and authentic leadership theory.

Transformational Leadership and Emotional Exhaustion: A Conservation of Resources Perspective

Designated as a "Best Paper" for OB

Author: **Maie Stein**; U. of Hamburg

Author: **Sylvie Vincent-Höper**; U. of Hamburg

In this study, we draw upon conservation of resources theory to suggest that transformational leaders' capacity to encourage extra effort might both energize and exhaust followers depending on their ability to replenish energy reserves. Specifically, we argue that the indirect relationship between transformational leadership and emotional exhaustion via extra effort varies depending on followers' levels of psychological detachment from work during nonwork time. We tested the hypothesized conditional indirect effect model using three-wave data from 214 employees working in various industries. The results showed that transformational leadership was positively related to extra effort. Furthermore, we found that psychological detachment moderated the relationship between extra effort and emotional

power distance moderated the positive relationship between voice endorsement and leader-member exchange, such that the relationship was stronger for employees reporting higher perceived power distance. Finally, perceived power distance also moderated the indirect effect of voice endorsement on work engagement via leader-member exchange, such that the indirect effect was stronger for employees high in perceived power distance. Theoretical and practical implications of our findings, as well as limitations and directions for future research, are discussed.

Maintaining and Changing Categories: Applying a Practice Lens

Sustainability in Finance (session 1210)

Management scholars are increasingly mobilizing research to better address grand challenges that face society. One such challenge is that of integrating sustainability in finance, which involves combining financial objectives with non-financial concerns in investment decision-making. In mixing in non-financial concerns, sustainability is at odds with a traditional finance approach in which profit maximization plays a guiding role. Recent research has shown what actors are doing to embed sustainability in finance; however, they have done so from disparate theoretical traditions. A central tension that has emerged is that of embedding sustainability practices in existing structures or engaging in a friction between sustainability and traditional approaches to finance. We build on the tradition of Institutional Work and the concepts of maintenance and disruption to conceptualize this tension. In this symposium we propose four empirical papers from different view-points (hedge funds, conservation finance, academia, and asset management firms) and extend theory with a discussion on the interplay between maintenance and disruption in grand challenges.

to Categorization Theory (session 1208)

In this symposium, we draw from practice theory in an effort to understand why and how categories, and the social meanings they carry, may change over time. Market and product categories are often defined by the sociocultural practices in which they are implicated and utilized; we engage in a discussion around how categories' meanings are generated and changed through patterns of use in such practices. In doing so, we extend categorization theory in new directions and offer an agenda for future research applying a practice perspective to categorization and classification processes.

New Advancements in Quantitative Institutional-Theory-Testing Research (session 1206)

This symposium makes a direct contribution to the 2020 AOM's theme to "Broaden our Vision," promoting cross-disciplinary dialogue among scholars from organization theory, entrepreneurship, and economics, to deepen our understanding of "how, why, and when" institutions matter for entrepreneurial activity and innovation. To discuss the latest advancements in literature, we feature the work of both strong emerging scholars and established institutionalists that blend theory-building with empirical rigor. Inspired by recent calls made in editorials of the Administrative Science Quarterly, Journal of Business Venturing, and Entrepreneurship Theory & Practice to ensure rigor in scholarship, we feature papers that address some of the most challenging empirical issues associated with studying institutions and entrepreneurial activity. Our symposium also makes a methodological contribution to the 2020 AOM theme as it blends quantitative and qualitative methods showcasing a mixture of empirical tools that include field experiments, multi-level approaches, panel data econometrics, topic modeling, and case studies.

Framing Sustainability (session 1211)

Generational Variation in the Antecedents of Environmental and Social Sustainability in Family Firms

Author: Bikramjit Ray Chaudhuri; S P Jain Institute of Management and Research

Our understanding of the effect of the generational variation on the antecedents of the non-economic strategy of family firms is limited. We bridge this gap by establishing the effects of the generational difference of family firms on the factors affecting implementation of their corporate environmental and social sustainability strategy. Within stewardship theory and organizational life cycle framework, we assert that the importance of the antecedents of the strategies change from first- to second- to third-generation family firms. We developed a proprietary data set of 163 publicly listed Indian firms from a questionnaire survey and secondary sources to support our hypotheses.

Bringing Values into Retail Investments: The Role of Work Identification in Responsible Investing

Author: **Anjali Chawla**; McMaster U.

Author: **Brent Alexander McKnight**; McMaster U.

Author: **Kevin Jason Veenstra**; Degroote School of Business, McMaster U.

Most research on responsible investing (RI) has focused on how the choices, motivations, and behaviors of retail investors influence RI adoption. However, financial advisors also play a critical role intermediating RI acceptance among their clients. In this study we draw on work identification theory to explain how the values and motivations of RI advisors influence how and whether advisors effectively engage their clients with RI products and services. Our qualitative study found that work identification in RI advisors resulted in a higher willingness to invest time and energy, an orientation to develop values-based relationships with clients and a heightened commitment towards RI; each of these positively influenced the professional outcomes of acquiring more RI clients and gaining acceptance for RI among clients. In contrast, the RI advisors who lacked this identification struggled to find acceptance for RI among their clientele.

Combining SDGs: The Need for a Responsive Approach to Manage Sustainability Paradoxes

Author: **Angela Greco**; Ivey Business School

Social purpose organizations are increasingly facing the need to address multiple sustainable development goals simultaneously. One way to address multiple sustainability demands is to seek synergies among them, while minimizing underlying tensions between those demands. Paradox lenses are increasingly used to understand how organizations can manage conflicting –yet

interrelated- sustainability goals. Via action research in the setting of a Dutch housing association, we analyse the process of strategy change while observing the societal response to this change. First, we identify the synergies and conflicts of the organization's sustainable demands, which we categorize as good intentions and unintended consequences, respectively. Second, we define specific types of sustainability paradoxes that emerge while implementing a new sustainable goal. Our abductive study shows that a poor management of tensions hinders an organization's proactive stance to solving sustainability challenges. We contribute to the literature on social purpose organizations by showing that a proactive approach to sustainability does not always lead to positive social impacts and suggesting that responsive approaches are to be preferred when combining sustainable development goals that show paradoxical relationships among each other.

How Do Hybrid Organizations Learn from Collaboration? Knowledge Transfer in Social Enterprises

Author: **Jingjing Weng**; Yuan Ze U.

Author: **Li-Hsiang Yi**; National Tsing Hua U.

Author: **Ying-Che Ali Hsieh**; National Tsing Hua U.

Author: **Harn-Ching Chiu**; National Tsing Hua U.

Research on social enterprises is becoming popular in both practice and academia; it is referred to as a hybrid research context that integrates social and business missions, and develop different strategic alliances, product development, and knowledge management in a business context. In terms of the lack of knowledge research in the hybrid context, this study explores how social enterprises learn from cross-sectoral social partnership, using a

from 152 manufacturing firms representing a variety of industries. Empirical findings generally support the relationship between collaboration and firm performance using a lean and agile strategy. Also, for firms in industries that face an environment characterized by high supply uncertainty and competitive intensity with, technological turbulence, the study finds evidence of a direct relationship between these environmental factors and supply chain collaboration. The findings provide an initial strategic response framework for appropriately aligning a lean and agile supply chain strategy through collaboration with environment context factors to achieve firm performance improvements.

The Role of Structural and Social Mechanisms of Process Management Programs on Ambidexterity.

Author: **Carolina Rojas**; U. Catolica del Norte

Author: **Julio A. Pertuze**; Pontificia U. Católica de Chile

Author: **Amanda Jasmine Williamson**; Waikato Management School

The purpose of this paper is to examine the effect of Process Management Programs (PMPs) on firm ambidexterity under two contingencies: organizational size and environmental uncertainty. We posit that the role and effect of the structural and social mechanisms of PMPs change under such contingencies, thereby affecting ambidexterity. Specifically, we test whether the organizational size and environmental uncertainty moderate the relationship between the structural and social mechanisms of PMPs and the capacity of an organization to become ambidextrous. We tested this moderation model using CEO surveys and archival data from 237 Chileans SMEs. Our findings show that structural mechanisms have a negative effect on ambidexterity for larger firms but a positive effect for smaller firms. Social mechanisms have a positive effect on ambidexterity for larger firms, especially for those operating in uncertain environments. This research contributes to the operational management literature by offering an alternative contingent explanation of the effects of PMPs on ambidexterity and by proposing an appropriate mix of structural or and social

knowledge-based view. By investigating 14 social enterprises in Taiwan, we adopt qualitative research with a grounded theory approach to identify the knowledge types (including business and social) transferred through such partnership. A theoretical framework is proposed to show how the different types of knowledge are transferred through such partnership. Furthermore, we reveal the specific features of social enterprises that facilitate/restrict both intrafirm and interfirm knowledge transfer. Our contributions lie in the connection of knowledge studies to the hybrid context, the disclosure of the differences in knowledge transfer in the business/social sectors and the generation of in-depth insights into how knowledge can be managed under the dual mission in hybrid organizations.

Knowledge Sharing in a Contentious Regulatory Policy Network

Author: **Jeongyoon Lee**; Ball State U.

Author: **Kun Huang**; U. of New Mexico

We examine knowledge sharing mechanisms in a contentious cross-sectoral regulatory policy network where diverse organizational actors collaborate and compete in coalitions to design innovative solutions to collective problems. Interest group diversity and power differences, particularly their effects on knowledge sharing, are overlooked yet important for cross-sectoral regulatory networks. Analysis of relationship data from a local hydraulic fracturing regulatory policy network in New York finds that different group identities and power imbalance in pairwise relationships could negatively affect knowledge sharing, despite relational assets such as trust and informal collaboration. Our research advances knowledge sharing scholarship by unlocking how dyadic differences in interest group identity and power are associated with knowledge withholding in a regulatory policy network.

Effects of Performance Measurement System Uses on Organisational Ambidexterity and Firm Performance

Author: **Matteo Mura**; U. of Bologna

Author: **Pietro G. Micheli**; U. of Warwick

Author: **Mariolina Longo**; Alma Mater Studiorum U. di Bologna

This study considers how performance measurement systems (PMS) can be used to foster organisations' exploitative and explorative orientations, and impact company performance. Drawing on the levers of control framework, the results of a survey of 153 Italian firms show that a diagnostic use of PMS has a positive impact on both exploitation and exploration, whereas an interactive use has no effect on exploitation and only a marginal one on exploration. However, the dynamic tension created by a joint diagnostic and interactive use has the most positive effect on organisational ambidexterity. Contrary to extant research, these findings depict the relationship between diagnostic and interactive uses not as one of opposing forces, but rather as one of synergy where the diagnostic is necessary to guide opportunity search and to establish an appropriate scope for exploration-related activities. Moreover, the use of PMS is found to positively impact organisational performance, although this depends on an organisation's capacity to promote both explorative and exploitative orientations. Finally, we identify the combination of PMS uses as an important antecedent of organisational ambidexterity and show that ambidexterity positively impacts firm performance.

Towards a Revised Conceptualization and Theorization of Lean Supply Management

Author: **Fernando Naranjo**; U. of Western Ontario

Author: **Larry Menor**; U. of Western Ontario

Author: **P Fraser Johnson**; U. of Western Ontario

Author: **Lauren McKeague**; Virginia Tech

Author: **Robin Hargroder Lemaire**; Virginia Tech

This study analyzes the potential for structural subgroups to form in complex, purpose-oriented networks, based on organizational domain. Additionally, it proposes the concept of impartial orchestration as a way to ameliorate the structural isolation of domain-delineated sub-structures within a whole network. By analyzing the structures of two networks in different stages of maturity, we demonstrate both the presence of domain-based subgroups, and the structural effects of impartial orchestration on the whole network over time. The study contributes to both theory and practice by connecting research on network structure with the practical challenges of managing complex, multi-sector networks.

**Strategic Choice Under Institutional Uncertainties:
How Do MNCs Interact with Weak Institutions?**

Author: **Kenyth Alves De Freitas**; Fundacao Getulio Vargas

Author: **Ely Laureano Paiva**; Fundacao Getulio Vargas

Author: **Barbara B. Flynn**; Indiana U.

Although the role of the institutions is to reduce uncertainty, a weak institutional environment can have the opposite effect, increasing uncertainty for a multinational company (MNC). Therefore, MNCs adapt their strategies in a weak institutional environment. However, according to co-evolutionary theory, they also can influence those institutions. Our research focuses on how MNCs adapt their strategy to uncertainty caused by weak institutions and how they can build influence them. We conducted an inductive multiple case study of seven companies, leaders in their global and national markets, in four industries in Brazil: automotive, beverage, cosmetics, and tobacco. Our findings suggest that high levels of institutional uncertainty not only affects MNCs directly, but that it also serves as a source of relational uncertainty by affecting their suppliers and markets. They also reveal how greater uncertainty can result in internal resource improvement through an exploitation strategy, causing an MNC to have a major influence over its

partners and their institutional environments. Finally, they show how market composition can determine channels of influence over institutions, directly by an MNC or indirectly by industry associations. Our study contributes to understanding the role of weak institutions as a source of uncertainty that influences operational strategy definition.

Performance Measurement and Management - 1 (session 1213)

Ambidextrous Sustainability, Organisational Structure, and Performance in Hybrid Organisations

Author: **Joshua Maine**; Jönköping International Business School

Author: **Emilia Florin Samuelsson**; Jönköping International Business School

Author: **Timurs Umans**; Jönköping International Business School

Based on the case of Swedish municipal housing corporation, this study explores how ambidextrous sustainability relates to the organisational performance of these hybrid organisations and how this relationship is contingent on the organisational structure of these organisations. The study is based on the multiple data sources comprising a case on Swedish municipal housing corporations. The data sources consist of the survey sent to all top management team members of Swedish municipal housing corporations, archival data containing financial and non-financial data on these corporations as well as explorative interviews and observations of the top management team and board of directors members of one Swedish municipal housing corporation. The findings suggest that ambidextrous sustainability, i.e. balance between explorative and exploitative sustainability orientation has a positive relationship with the organisational performance of Swedish municipal

Are Governments Better than Donors at Rewarding Nonprofit Performance?

Author: **Jason Coupet**; North Carolina State U.

Abstract Nonprofits engaged in social production can receive funding from both donors and governments. Much of the nonprofit performance theory is based in economic organization literature and suggests that donors are unlikely to base donation decisions on nonprofit production, But governments may prioritize performance in nonprofit funding decisions. Using rare internal production reports from the nonprofit housing sector and dynamic panel data analysis, this study compares the effects of performance on donor and government funding. We find that a 1% increase in production increases donations by only 0.09%, but increases government funding by 0.32%.

Governments are less sensitive than donors to problematic financial ratios and also seem to be better at observing and rewarding nonprofit performance than donors. Governments are also much more responsive to donations than donors are to government funding. Findings indicate that donors face more costs in observing performance than nonprofits do in sharing it, and that future scholarship in both public and nonprofit management should consider that government might have a unique advantage as nonprofit principals.

Performance-Related Pay in the Chinese Education Sector: A Balance Between Efficiency and Wellbeing

Author: **Binhua Eva Huang**; Wilfrid Laurier U.

Author: **John Benson**; Monash U., Malaysia

Author: **Ying Zhu**; U. of South Australia

Performance-related pay (PRP) has been a paradox in the public sector. In recent years PRP has witnessed renewed interest although, as a managerial initiative, it is problematic as it does not seem to fit with the nature and intent of public organizations. Moreover, why PRP continues to be pursued in the public sector remains a puzzle given that it has consistently failed to deliver on its promise. This paper explores this paradox and addresses the question of how best can PRP be introduced in public sector organizations. Data for the study was collected from three-rounds of semi-structured interviews with principals in the Chinese education sector over a ten-year period. Based on this data the research found that by adopting a pragmatic integration model based on the economic paradigm and humanistic management theories, the paradox underpinning PRP could be better understood and that PRP could work well in public organizations. The paper contributes to the literature of both the economic paradigm and humanistic management and offers significant practical implications for the adoption of PRP in the public sector.

When Do Firms Choose Substantive Over Symbolic Compliance with Board Gender Quotas?

Author: **Punit Arora**; City U. of New York

Author: **Patricia Gabaldon**; IE U.

Author: **Cynthia E. Clark**; Bentley U.

This study examines how factors that encourage resource redeployment influence market exit decisions by focusing on the potential for redeploying location-bound fixed assets across businesses within geographic markets. We argue that exit through internal redeployment is more likely when businesses have related siblings (lower adjustment costs), are exposed to negative regulatory shocks (higher transaction costs), and perform poorly relative to their related siblings (inducements). We also suggest that corporate parents redeploy the fixed assets of a withdrawing business to those related siblings that can more profitably expand capacity in the market. Using a unique panel dataset on 3,082 chains from the global retail sector and their potential to redeploy physical stores across sibling chains in 106 foreign markets, we find evidence supportive of our arguments.

RESEARCH

PAPER SESSION

ASYNCHRONOUS

This study assesses whether and when the firms choose to use symbolic or substantive compliance strategies in response to exogenous shocks in their institutional environment. We theorize that the joint effect of a quota target for women on boards and the quality of the firm's performance is such that firms with a high distance to the country's quota target and are satisfied (v. dissatisfied) with their financial performance are more likely to use symbolic (v. substantive) compliance. While institutional theorists have often noted the use of symbolic compliance, ours is one of the first studies to provide conditions under which firms are more likely to prefer one or the other form of compliance. Further, by highlighting the preference of female CEOs for substantive compliance in all scenarios, we provide boundary conditions on institutional theory predictions. We contribute to literatures on institutional theory, behavioral theory and gender diversity on corporate boards.

Board Chair Career Variety, Selection of Independent Directors, and Firm Innovation Outcomes

Author: **Wei Chi**; Tsinghua U.

Author: **Jing Zhou**; Rice U.

Author: **Xiaoye Qian**; Sichuan U.

Given that board chairs are regarded as a firm's most powerful leader in many countries, this study investigates the impact of their career variety on firm innovation outcomes. Building on recent upper echelons theory argument that career variety reflects both one's dispositional preference for novelty and accumulated cognitive breadth, we propose that board chairs with higher career variety are likely to have not only a stronger motivation to pursue innovation but also a greater capability to facilitate innovation thorough the appointments of independent directors who can help their firms improve innovation outcomes. Consequently, we predict that board chair career variety is positively associated with firm innovation outcomes both directly and indirectly via the appointments of independent directors. Using data from a large sample of publicly listed non-state-controlled firms

in China during 2006 to 2016, we find that the number and the overseas experiences of independent directors partially mediate the positive effect of board chair career variety on firm innovation outcomes, as measured by the numbers of patent applications filed and granted. These results support our theoretical predictions and contribute to the literature on how upper echelons impact firm innovation outcomes.

Just Diverse among Themselves: Negative Performance Feedback and Board Diversity

Author: **Heejung Jung**; Imperial College London

Author: **Yonghoon Lee**; Hong Kong U. of Science and Technology

Author: **Sun Hyun Park**; Seoul National U.

This paper studies how negative performance feedback changes the composition of the board of directors, who are instrumental in shaping major strategic changes. When a firm experiences a performance shortfall below its aspirational level, it is motivated to not only search for alternative strategic options but also seek efficiency in its decision-making process. We theorize that these motivations lead the board to adapt differently along two dimensions of diversity. On one hand, the board of an underperforming firm increases expertise diversity based on directors' job-specific experiences, which broadens the scope of knowledge in exploring multiple possible remedies to the current performance problem. On the other hand, the board of an underperforming firm decreases ascriptive diversity based on directors' inherent and impermeable social categories that creates rigid intergroup boundaries for quick consensus building and efficient implementation of the strategic alternative. We further theorize that these tendencies are moderated by having minorities as chairs, either in terms of expertise or ascriptive backgrounds. Based on the boards of 727 U.S. public firms in manufacturing industries, we find that boards of underperforming firms diversify in their expertise pool (e.g., industry experiences, board experience, and functional background) but homogenize in their ascriptive backgrounds (e.g., gender and ethnicity). When the chair of the board is

an ascriptive minority (e.g., female or non-white), the effect of negative performance feedback on ascriptive diversity is weakened. Theoretical and practical implications are discussed.

Stigmatized Industries: Implications for Director Characteristics

Author: **James Grabowski**; U. of Kansas

Author: **Long Su**; U. of Kansas

Author: **Vincent L. Barker**; U. of Kansas

In recent years, research has explored stigma at the organizational and industry level. However, most studies have exclusively explored sin industries which are subset of stigmatized industries. To advance a better understanding of how industry stigma can affect a firm, we explore the stigma literature to advance a better understanding of stigmatized industries and how operating in such industries can cause the organization to become stigmatized. In turn, when a firm experiences organizational stigma, members of the firm, such as the strategic leaders of the firm, can also become stigmatized. Specifically, we explore how the composition of boards of directors of firms in stigmatized industries differs from boards in non-stigmatized industries as a result of a restricted or altered director labor market. Theoretical propositions are developed related to board composition, director social capital and director pay.

How Multipoint Contact in Product Markets Affects Firm's Expansion into Rival's Technological Areas (WITHDRAWN)

Author: **You-Ta Chuang**; York U.

Author: **David Weng**; Vrije U. Amsterdam

STR

OMT

OSCM

Challenges in Managing Interorganizational Relationships (session 1227)

Author: **Chia-hung Wu**; Yuan Ze U.

Past studies on multipoint competition have mainly focused on the effect of multipoint contact in the product-market domain on firm behaviors in product markets. In this study, we argue that multipoint contact in product markets exerts great influence on a firm's behavior in the technological domain. Our analysis of 211 semiconductor firms reveals that the degree of multipoint contact between a firm and a rival in product markets has an inverted U-shaped relationship with the degree of the firm's expansion into the rival's technological areas. We further showed that the firm's relative capacity to the rival's with respect to their market share and technological statuses and alliances between two firms moderate the effect of multipoint contact in product markets on the firm's expansion. We discuss implications for theory and practice.

Star Inventors and Firm Innovation Trajectory

Author: **Chantale Dornez**; U. of Manitoba

Author: **Victor Cui**; U. of Manitoba

Scholars have presented conflicting perspectives regarding whether star inventors have a positive or negative effect on firms' innovation trajectory (i.e., exploratory or exploitative). The objective of this study is to shed light on this important, yet under-theorized, issue in the context of R&D teams. Because stars are at the forefront of knowledge exchange with external parties, we argue that the boundary-spanning ties that stars establish with external parties provide distant learning opportunities conducive to an R&D team's exploratory innovation. However, the positive effect of these ties on team exploration may be undermined, or even flipped, by firm institutions that revolve around stars and the double-edged role of stars' high productivity. Applying multilevel modeling to a sample of 88,835 R&D teams in the U.S. high-technology sector, we find support for our hypotheses. This paper contributes to the literatures on stars and innovation by presenting a paradoxical view of stars' effect on firm innovation and examining the mechanisms underlying firms' innovation trajectory through a micro-lens.

**Explicit and Tacit Practice Transfer Methods:
Evidence from Two Field Experiments**

Author: **Thomaz Teodorovicz**; Harvard U.

Despite the recent advances in communication technologies and the extant literature on intra-organization knowledge transfer, organizations still invest in unsuccessful initiatives to disseminate practices. This suggests that the mechanisms leading to a successful transfer remain elusive. A key obstacle to understand the determinants of successful practice transfer initiative is that these are often endogenous processes. In this paper, I address some of these theoretical and empirical challenges by conducting two field experiments where 804 managers from a national branch of a large multinational firm were exogenously assigned to distinct practice-transfer method pairs. More specifically, I analyze practice transfer implications of employing explicit (non-personalized and non-interactive) transfer methods with heterogeneous credibility (Experiment 1) and further compare explicit to tacit (personalized and interactive) transfer processes (Experiment 2). The main results of the experiments are: 1) credibility is a double-edged sword which facilitates knowledge transfer for practices associated with such credibility while hindering the transfer of other practices; and 2) tacit methods allow for the transfer of knowledge content outside an initially codified scope. These findings complement the knowledge transfer literature by showing that outcomes from a practice transfer initiative depend on the fit between the characteristics of a transfer method and of the practices being transferred.

Where Acquisition Capabilities Reside: Corporate Hierarchy, Acquisition Experience, and Performance

Author: **Mario Schijven**; U. of Illinois at Urbana-Champaign

Author: **Xavier Martin**; Tilburg U.

Whereas most research assumes that acquisition capabilities are a unitary construct at the firm level, we theorize that they are dispersed at the head office (CHQ) and business unit (BU) levels in multi-business acquirers. Leveraging knowledge-based theory, we predict that BUs develop context-specific experience which is separate from CHQ's more diverse but less specific experience. We expect BU-level experience is more useful, at least for a BU's subsequent acquisitions, but that corporate level experience complements this. We use hand-collected data on the acquisitions of all business units of a sample of American software firms to test our predictions. We find considerable support for our predictions and discuss implications.

Corporate Governance and Shareholder Heterogeneity (session 1219)

Female Director Appointments Under Institutional Change: Neutralizing Response to Competing Logics

Author: **Toru Yoshikawa**; Singapore Management U.

Author: **Michael A. Witt**; INSEAD

Author: **Jin-Ichiro Yamada**; Osaka City U.

We examine female board appointments in Japan to investigate how managers respond to conflicting institutional logics: all-male insider control vs. gender diversity. Using fuzzy-set qualitative comparative analysis (fsQCA), we find that female board appointments occur when several factors combine to put pressure on firms: stock market underperformance, high levels of visibility, the absence of a stabilizing family owner, and various configurations of foreign shareholder and outside director power as well as the absence of prior female board appointments. However, most firms appoint women with an internal orientation, i.e., who see themselves as working for insiders rather

Family Business Governance (session 1217)

Family Governance and CSR Decoupling

Author: **Sang-Bum Park**; U. of Bradford

Author: **Hicheon Kim**; Korea U.

The rise of corporate social responsibility (CSR) accompanies the growing skepticism about firms' avowed adoptions of CSR policies, which can be coupled or decoupled from their actual implementations. Although firms often put CSR policies in place as window dressing, published studies about CSR decoupling are scarce, leaving the causes and conditions that shape CSR decoupling poorly understood. Drawing on the socioemotional wealth perspective, we theorize that controlling families are concerned with both economic wealth and socioemotional wealth and how they prioritize these dual concerns plays a key role in deciding over CSR decoupling. Specifically, we examine when family ownership is positively or negatively related to CSR decoupling by focusing on the conditions that make family owners concerned more about their socioemotional wealth. We hypothesize that returns

than outside stakeholders such as shareholders. Firms thus adopt the new logics while simultaneously neutralizing its impact. This suggests a possible extension of theory on resolving conflicting institutional logics. We further contribute to our understanding of the international diffusion of corporate governance processes.

Shareholder Logic Complexity and Agency Theory

Author: **Victor Zitian Chen**; U. of North Carolina, Charlotte

Author: **Ruth V. Aguilera**; Northeastern U.

Heterogeneity of shareholder purposes challenges the standard agency theory, which has overlooked the diverse social contexts shaping shareholder logics. Considering social constitution into bounded rationality of shareholders, we develop a multi-level theoretical framework to understand inherent conflicts across heterogeneous shareholder logics. Shareholder logics may be acquired or developed in response to the external institutional logics in a source field with which shareholders are embedded. The degree of inherent conflicts between coexisting shareholder logics in an investee, which we term shareholder logic complexity, may depend on the centralization and economic commensurability of institutional logics in a shareholder logic's source field, power structure inside the organization of a shareholder and the board of directors of the investee, as well as identification across levels (field, shareholder as an organization, and the board of directors of the investee). Finally, the optimal agency governance between outcome- and behavior-based mechanisms depends on the degree and the focus (goals or means) of shareholder logic complexity. Our augmented agency theory incorporating socially constituted shareholders offers new theoretical implications on some fundamental premises in corporate governance, including corporate objectives, classification of shareholder identities, and agency problems.

[view paper \(if available\)](#)

and risks of CSR decoupling vary across firms according to the priority the family place on financial or nonfinancial gains. We argue that family ownership is positively related to CSR decoupling since family principals are more concerned with economic wealth as their ownership increases. However, this relationship shifts from positive to negative when the family CEO is at the helm of the firm because a family CEO increases family visibility and the family's socioemotional concern. We also find that firm visibility attenuates the positive effect of family ownership on CSR decoupling. Our study uncovers the ambivalence of family control and reconciles previous inconsistencies in the literature on family business and CSR. In this way, we make a larger theoretical contribution to institutional theory and a wide array of decoupling studies.

Dividend Policy of Large Publicly Held Family Firms: Socioemotional Wealth (SEW) Perspective

Author: **Yoonjeoung Heo**; National U. of Singapore

Despite the prevalence of family firm studies based on socioemotional wealth (SEW) perspective, we lack our understanding in what determines the degree to which owner family's SEW encompasses from owner family members to external stakeholders. This paper suggests that, in large publicly held family firms, owner family's discretion level and their interplay with different shareholders affect the degree to which owner family's SEW encompasses its minority shareholders. Assuming that dividend payout indicates firm's level of minority shareholder protection, this study investigates heterogeneity in dividend policy across publicly held family firms in Korea. The results suggest that although family firms are likely to offer higher dividend payout than non-family firms, family-managed firms are likely to offer lower dividend payout than professional-managed family firms. Moreover, the shares of owner family strengthen the negative relationship, while the shares of powerful non-family shareholders weaken the negative relationship between family-managed firms and dividend payout.

The Double-Edged Sword of Retaining Non-CEO Inside Directors on the Board for a Firm's R&D-Intensity

Author: **Ibrahim Shaikh**; U. of New Brunswick

Author: **Zhonghui Wang**; California State U. San Bernardino

Author: **Mohamed Drira**; Saint Mary's U.

Agency theory views board independence, retaining a high fraction of outside directors, as a hallmark of effective corporate governance. As a result, many boards now remain so "independent" that over 50% of S&P 1500 firms only have one inside director, who expediently happens to be the CEO. A small but quickly growing body of 'pro-insider' research in agency theory stresses the value of retaining a few additional inside directors as well; to help ensure outside directors are better informed, and CEOs kept in check. While drawing on this research, we extend agency-theory by postulating that a tradeoff exists between the tacit knowledge possessed by an inside director, and how dependent they are on the short-term oriented stakeholders for resources. We predict that while all inside directors bring firm-specific capital, certain insiders are closer to the short-term financial stakeholders, and less likely to promote R&D. We find talented minority insiders selected from within the internal labor market leads to an increase in R&D spending, whereas the retention of a CFO as an inside director results in a significant reduction in R&D-intensity. Also, the presence of long-term financial incentives weakens the well-documented positive relationship between inside directors and R&D-intensity.

In the Shadow of Predecessors: Intergenerational Succession and Strategic Change in Family Firms

Author: **Zixu Liu**; Tsinghua U.

Author: **Jianghua Zhou**; Beijing Normal U.

Author: **Jizhen Li**; Tsinghua U.

Author: **Chenrui Liu**; Beijing Normal U.

Intergenerational succession is arguably one of the most critical issues in family firms, and is a complex organizational process which often results in changes of business strategies. During the succession process, the first-generation predecessors usually maintain some extent of authority (i.e. some first-generation family members staying in the board/top management team after the second-generation successors have become board chair/CEO) in the family business, so as to legitimate their heirs' role, empower and nurture the heir-successors. But in such a power-transfer process, predecessor-incumbents are often trapped in a paradox of both empowering and dominating their heir-successors. This study of listed family firms in China, shows that in such contexts, predecessors' authority remained in the family firm actually constrains the successors' managerial autonomy, and hampers their ability to implement strategic change. We also investigate individual-level contingencies, i.e. whether the successor is son/daughter of the predecessor and whether the successor is returnee, and show that the negative effect of predecessors' authority on strategic change depends on both the extent of predecessors' influences on successors' decisions, and successors' capabilities to resist their predecessors' domination. The findings in this study provide insights for future research in executive succession, especially in the context of family business.

Author: **Geumjoo Jahng**; U. of Seoul

controlling to the minority shareholders. In this study, we describe and test the consequence of a different form of P-P problem caused by the coordination between the blockholders, which is likely to emerge in firms with a juxtaposition of multiple large shareholders (MLS). We argue that the coordination and bargaining among MLS impair shareholder monitoring and make managers the "tertius gaudens" who expropriate more from firm value. Based on data of Chinese listed firms that are embedded in an emerging economy, we propose and find that the number of large shareholders and the dispersion of ownership among them both lead to higher managerial perquisite consumption. Moreover, different corporate governance mechanisms are not equally effective in mitigating the managerial expropriation entailed by MLS: ultimate controller voting rights and board shareholding are most effective, incentive alignment has only limited effect, and outside director monitoring is not effective. We further discuss the contribution of the current study to corporate governance research.

RESEARCH

PAPER SESSION

ASYNCHRONOUS

Extant literature offers that the alignment of ownership and controls presumably resolves the agency problem. However, traditional governance mechanisms are limited to resolve agency problems in family firms where interests of family owners and managers are aligned but conflicting with those of other shareholders. Drawing on the principal-principal perspective and the social embeddedness, we develop a theoretical framework to address the agency problems in family firms. Specifically, we theorize different earnings management behaviors between non-family and family firms, and under what conditions family owners and managers engage in earnings management. We also propose a business group, independent board, and dissimilarity in top manager functional backgrounds as governance mechanisms to monitor earnings management in family firms. We investigate the earnings management practices of 570 Korean family and non-family firms from 2002 to 2010. We find that, in general, family firms are less likely to engage in earnings management than non-family firms. However, we also find that the higher the level of family embeddedness through ownership, the more earnings management a family firm will commit. In addition, we confirm that business group affiliations and independent boards attenuate the effect of family embeddedness through ownership on earnings management. Our study contributes to corporate governance and family business research by suggesting governance mechanisms to solve socially embedded agency problems in family firms.

Why Fight? Discovering Micro-Rationales for Tactical Actions

Author: Goce Andrevski; Queen's School of Business, Canada

Author: **Olga Hawn**; U. of North Carolina, Chapel Hill

We develop and test the idea that financial markets reward firms for “picking sides” along ideological faultlines. Building on sociology research showing that the views of Americans on certain moral values remain polarized, and that Americans associate products with moral values, we suggest that some individuals will reward firms for supporting a contested social issue—and some, for opposing it. We test our argument using data from the Corporate Equality Index (CEI), which scores a large number of U.S. companies on their LGBTQ-related policies and activities (2002–18). We make several observations: (1) firms tend to score the highest (indicating support for LGBTQ issues) when they are headquartered in liberal states and operate in non-heavily regulated, consumer-facing industries; (2) CEI scores become more polarized over time, with a substantial minority of firms reducing their score (i.e., eliminating HR policies supporting LGBTQ employees) and a substantial majority receiving the highest score; and (3) firms receiving very high scores experience a stock-price increase when the index is released, as do firms receiving very low scores. We draw broader implications for the corporate social responsibility and social movements literatures, as well as for popular accounts of a “culture war” in the United States.

The Effects of Behavioral Distinctiveness Versus Verbal Distinctiveness on Firm Performance

Author: **Hai Guo**; Renmin U. of China

Author: **Yang Li**; Renmin U. of China

Author: **Chao Wang**; Renmin U. of China

How distinctiveness impacts firm performance, the central question related to optimal distinctiveness theory, has been discussed by many scholars. However, there is a lack of uniform empirical evidence. In this study, we synchronize the multiple distinctiveness employed in optimal distinctiveness (OD) theory introducing the notion of verbal distinctiveness and behavioral distinctiveness, and explore their underlying different mechanisms on conflicting pressure of legitimacy and competition. Consistent with our theoretical framework, results

Author: **Danny Miller**; HEC Montreal

Author: **Isabelle Le Breton-Miller**; HEC Montreal

Author: **Walter J Ferrier**; U. of Kentucky

With its keen focus on the dyadic interactions among head-to-head competitors, the field of competitive dynamics has generated significant insights into the nature, intensity, and drivers of competitive rivalry. Unfortunately, however, explanations of the intentions and motivations for competitive actions and responses have been limited to anecdote or to inferences based on characteristics of the actions themselves, their firms, or the competitive context. We know little about the actual rationales of decision makers. As a result, competitive dynamics scholars have evolved overly simple, abstract and rational models of competitive behavior. In this qualitative study, we explore the micro-rationales expressed by leaders for their tactical actions in a highly competitive setting. We find that current models of competitive behavior are lacking in multiple respects: They focus too much on rivalrous explanations versus internal considerations; they neglect important social utilities; and they ignore forbearance as a vital competitive tool. They also neglect critical human, social, stakeholder, temporal and configurational aspects, which endow tactical repertoires with a complexity and inscrutability that make them difficult to predict, react to, and neutralize, and thereby render them powerful strategic weapons.

Three's a Crowd? An Optimal Distinctiveness View on Premium Car Makers' Electrification Strategies

Author: **Christina Bidmon**; Católica Lisbon School of Business and Economics

Author: **Rene Bohnsack**; Católica Lisbon School of Business and Economics

Despite an increasing scholarly effort to integrate institutional theory into strategic management, we still know little about how organizations balance conformity and differentiation when they are pressured to come up with innovation. Drawing on the recently proposed perspective of optimal distinctiveness, we use a comparative case study among German premium car manufacturers to assess how organizations within this group strategically position their electrification strategies in the midst of regulatory and competitive pressures. We identify integrative and compensatory positioning as two strategic levers by which these organizations try to achieve competitive differentiation via their innovation strategies. We also reveal patterns in the relation between these levers and which circumstances predict their use. Our study contributes to the understanding of organizational responses to conflicting demands, the innovation strategies of incumbents, and the role of optimal distinctiveness in this process.

explain the effect of nonexecutive stock option grants on mobility and employee entrepreneurship. The retention logic plainly implies a binding effect that limits mobility and entrepreneurship. Alternatively, we build on the incentive logic to argue that stock option grants can trigger mobility and encourage employee entrepreneurship because the experimentation and risk-taking they induce can also contribute to learning about employment fit and new opportunities. We analyze these effects by examining the distribution of and the risk-taking incentives embedded in stock options grants to rank-and-file employees on their movement to existing firms as well as to entrepreneurship in the US semiconductor industry. We find that stock options grants to rank-and-file employees negatively affect employee mobility to other firms, but positively impact employee entrepreneurship. We also find that risk-inducing stock option plans drive employees' transition to entrepreneurship. Our findings suggest that long-term equity-linked compensation practices designed to support innovation may drive employees to become entrepreneurs.

The Impact of Strategic Change on Corporate Misconduct: A Situation-Specific Governance Approach

Author: **Constantin Cornelius Meyer**; LMU Munich

Author: **Anja Christine Tuschke**; LMU Munich

Firms undergo major strategic changes to realign their operations according to changing internal and external conditions. In this context, we examine the impact of the magnitude of strategic change on the likelihood of corporate misconduct as a severe negative consequence of firms' strategic change activities. Building on the fraud triangle, we analyze how the three elements of motivation, opportunity, and rationalization simultaneously increase during times of strategic change. We use a matched-pairs design methodology (with 217 fraud cases identified through security class action lawsuits of listed U.S. organizations) and find a positive relationship between the magnitude of strategic change and the likelihood of corporate misconduct. However, this likelihood decreases with larger board sizes and a

higher proportion of external CEOs as outside directors. The moderating effects identified in this study path the way towards situation-specific governance mechanisms that increase the board's monitoring effectivity during unstable times, such as strategic change. The findings contribute to an enhanced understanding of specific situations in which firms require additional monitoring efforts to prevent increased risks of corporate misconduct.

Competition Dynamics and Fraudulent Behavior – Evidence from a Multi-Period Experiment

Author: **Viktoria Judith Salomon**; LMU Munich
Author: **Constantin Cornelius Meyer**; LMU Munich
Author: **Marco Kleine**; Max Planck Institute for Innovation and Competition

The idea of a relationship between competition and fraudulent behavior is well-anchored in the management and adjacent literature. Empirical evidence suggesting that fraudulent behavior is more prevalent under severe competition has a taken-for-granted quality. However, these findings are widely based on a static perspective on the link between competition and fraudulent behavior, in which competition is considered as constantly high or low. Acknowledging the validity of these findings for stable industry environments prevailing in the past, we argue that assuming constant competition over longer periods of time seems outdated in light of today's increasingly volatile industries. Thus, we introduce a dynamic perspective, in which we investigate how varying extents of competition over time, or competition dynamics, affect fraudulent behavior. Running a laboratory experiment, we analyze abrupt changes from high to low competition over time and vice versa. By this, we offer a more comprehensive and up-to-date understanding of the link between competition and fraudulent behavior.

New Frontiers in Competitive Dynamics (session 1222)

Developing the Elusive Construct of Speed-Cost Efficiency

Author: **Minjae Lee**; Southern Connecticut State U.
Author: **Joseph T. Mahoney**; U. of Illinois at Urbana-Champaign

We maintain that, despite the importance of speed in the strategy literature, the current definition of speed-cost efficiency has a problem: it draws inconsistent conclusions about relative speed-cost efficiency. First, we use actual firm data to illustrate the problem generated by the current definition. Second, we show that firms with the same speed-cost efficiency can be mistaken as relatively more or less speed-cost efficient, and that less speed-cost efficient firms can be mistaken as more speed-cost efficient, under the literature's current definition. Third, we suggest a new definition of speed-cost efficiency: the extent to which a firm reaches the industry speed-cost frontier. Using simulation data, we show how this new definition solves the issues caused by the literature's current definition. Fourth, we provide an analysis of firm speed-cost efficiency based on our new definition, which generates new findings that contribute to both management theory and practice.

Author: **Laura Costanzo**; U. of Southampton
Author: **Irene Talavera**; Henley Business School, U. of Reading

How do firms develop innovation strategies and capabilities during fundamental institutional transitions? To answer this question, this paper develops a theoretical framework which combines both strategy-based and dynamic capability-based perspectives. A longitudinal multiple case study of China's telecommunications industry was conducted to verify the framework. This study offers an integrated perspective to investigate the complex and dynamic institutional interactions through which firms develop their own strategies for innovation capabilities. The comparative setting of the study between different company ownership structures – in this case, Stated-Owned Enterprises (SOEs) and private companies – identifies the strategic importance of corporate governance structure and entrepreneurial decisions in shaping innovation strategies and capabilities of firms. The finding of the study also suggest that firms' sustained competitive advantage in institutional transitions depends more on what we referred to as the dynamic alignment of their innovation capabilities.

Role Deviations and Rivalry in the U.S. Airline Industry, 1989-2010 (WITHDRAWN)

Author: **Greta Hsu**; U. of California, Davis

Author: **Wei Guo**; Hong Kong Polytechnic U.

Author: **Tieying Yu**; Boston College

In this study, we examine how competitive and cooperative dynamics among firms vary according to the extent to which the role structure is threatened by deviations from expected strategic behaviors. We propose that, when a market resembles an orderly role structure, greater rivalry will exist between strategically similar firms within a market. However, when a market's role structure is threatened by the presence of strategically dissimilar new entrants, markedly different dynamics will unfold. In terms of competitive intensity, we propose role-deviating entrants will create perceptions of heightened threat among market incumbents, leading to greater rivalry among strategically dissimilar firms. We also expect incumbents to attempt to increase their extent of collaboration with similar others as a way of reinforcing and restoring the market's established structure. As a result of their strategic choices of which competitors to retaliate against or to collaborate with, producers help police and reinforce the boundaries defining a given role. To test our theory, we use data on market role positioning and competitive dynamics in the US airline industry from 1989 to 2010.

Piggyback on Rivals? Effects of Bandwagon and Salience on Positive-Sum Competition in Movie

Knowledge integration capabilities are an important element of innovation and firm performance. Despite growing use of this construct, the study of knowledge integration capabilities effectively remains limited because the demand-side perspective has received disproportionately less conceptual or empirical scrutiny when compared to the supply-side perspective. We attempt to address this deficiency by highlighting the critical role customer heterogeneity plays in shaping knowledge integration capabilities important to innovation-based firm performance. Using service industries as the empirical context, this study is guided by the following research question: How does customer heterogeneity affect service innovation-related knowledge integration capabilities? We adopt the dynamic capabilities view and within that contribute to an emerging discourse to identify integrative capabilities at the meso- level (Salvato & Vassolo, 2017), defining these as a firm's capacity to engender productive interpersonal dialogue among employees to combine knowledge within and across the operational boundaries of a firm. We triangulate data collected from semi-structured interviews, publicly available sources and scholarly publications to propose a typology of integrative capabilities applicable to heterogeneous environments.

Unconventional Times: Demand Shocks, Competition, Capability, and Innovation

Author: **Yue Maggie Zhou**; U. of Michigan

Author: **Frank Li**; U. of Michigan, Ross School of Business

Author: **Sendil Ethiraj**; London Business School

We develop a formal model to predict innovation as a choice affected by industry competition, market size, and firm heterogeneity in technological capability. Our model first predicts a selection effect, that the threshold of firm capability for entry will decrease with aggregate market size (holding competition constant) and increase with competition (holding market size constant). In addition, it predicts two opposing effects of market size on innovation: A direct positive effect due to increased demand, and an indirect negative effect due to increased competition induced by the

Industry

Author: **Tianxu Chen**; West Virginia U.

Author: **Lingling Pan**; U. of Pittsburgh

Author: **Wenpin Tsai**; Pennsylvania State U.

Author: **Jianhong Chen**; U. of New Hampshire

In this paper, we develop a model of positive-sum competition to advance the current understanding of competitive dynamics. Departing from the traditional view that competition is a zero-sum game in which rivaling firms' benefits are negatively associated, we argue that rivals' competitive actions can potentially benefit a focal firm. With a particular focus on new product introduction, we argue that rivaling firms' competitive actions may benefit a focal firm in two ways: First, new product introduction by a rival firm may trigger bandwagon behaviors among competing firms who produce similar products. Second, new product introduction of a high-profile product by a rival may create salience which draws customer attention to the whole market category and encourage purchase not only from the rival but also from focal firms. However, the extent to which the focal firm may benefit from the positive-sum competition of rivals depends on the characteristic of its own products. We tested our hypotheses based on a unique dataset on 994 new product introductions (new movie launches) by 63 production studios in the movie industry from 2007-2016.

Boundary Changes as a Trade-off: How Production Outsourcing Influences Innovation Performance

Author: **Stefan Naef**; ETH Zurich

Author: **Mathias Beck**; ETH Zurich

Author: **Martin Wörter**; ETH Zurich

Author: **Stephan M. Wagner**; Swiss Federal Institute of Technology Zurich, ETH

The boundaries of the firm shape the development of capabilities and the accumulation of knowledge within the firm. Changes in the firm's boundaries therefore entail changes in how the firm creates value. For the case of outsourcing of production activities, we theoretically and empirically explore how shifting from hierarchical to market governance affects product innovation performance in firms. We test our hypotheses in a first-differencing model using panel data from the Swiss innovation survey comprising 390 observations from 2005-2011 of manufacturing firms. Our results show that production outsourcing leads to a decrease in product innovation performance. This effect is significantly more prominent on the performance of new products in comparison to the performance of improved products. Investments in a firm's absorptive capacity can mitigate the adverse effects of production outsourcing on innovation performance. We contribute to the understanding of firm boundaries by introducing a theoretically and empirically coherent perspective on temporal innovation performance effects of boundary changes.

Platforms and Complements: Competition and Cooperation (session 1216)

The Optionality in Complements within Platform-Based Ecosystems

Author: **PuayKhoon Toh**; U. of Texas at Austin

Author: **Shiva Agarwal**; U. of Texas at Austin

The literature depicts a complement as a component that creates value to the platform owner via its complementarities with the platform. We offer a different perspective rooted in real options logic – the complement creates value as an option for the platform owner to postpone decision to enter the complement’s underlying product space, reduce uncertainty about value of the space, and abandon entry if entry is infeasible. Using numerical examples with corresponding simulations and data on Apple’s iPhone ecosystem 2008-2015, we demonstrate this optionality value, and establish the main optionality attribute – the greater the uncertainty over the product space’s value, the greater is the complement’s optionality value. We also show that this optionality attribute is more salient with greater likelihood that the space is of low value, as indicated by low average revenues generated by existing complements in the space and the extent to which these complements are not multi-home. This perspective, besides identifying previously-neglected value in a complement, also helps explain why a platform owner may invest in enabling complements that exhibit little complementarities on its platform, and why some platform owner’s entries into complementary product space outperform others.

ways than I might have expected. This paper explores one of these cases, shedding light on when and why power shifts emerge, so that entrants take the driver seat, often with the support of incumbents. This inductive study of the Southeast Asian mobility-as-a-service industry explores how these dynamics unfold. I find that while incumbents often experiment with the new technologies that can lead to platforms, their need to grow consistently with their core offerings and organizational rigidities make them bypass these activities; or sometimes invest in entrants that engage in exploration. Once a platform emerges, incumbents do nothing to challenge it, and often support it, inasmuch as it serves some of their needs. Successful entrants ignore incumbents, while opportunistically pursuing relationships with a host of different actors and focusing on intra-platform competition. With platform leaders emerging, capital market support for entrants makes them oblivious to incumbent response, and incumbents gradually compete between them to support the platforms that ultimately challenge their dominance. This process is amplified by organizational changes, and by the growing role of managers who come from outside of the incumbent industry. Successful platform owners, on the other hand, continue to opportunistically reposition themselves with little regard to the focal sector structure.

How Characteristics of Wide Bridge Partners Affect New Platform Sponsor's Alliance Formation

Author: **Tsu-Hsiang Hsu**; California State U., Fullerton

Author: **Susan K. Cohen**; U. of Pittsburgh

To successfully launch complex new technology platforms, sponsors must attract partners to develop enabling and complementary technologies. Yet, potential partners face risks particular to the interdependence of platform ecosystems and little is known about how sponsors attenuate these risks to attract partners. Research on the diffusion of innovations suggests that wide bridges (multiple indirect ties between a sponsor and potential partners) could lower the perceived risk of joining a new platform ecosystem. We theorize that wide bridge ties with firms that are technologically

prominent, engaged in multiparty alliances, and have diverse alliance portfolios can attenuate ecosystem risks for potential partners. Consistent with our theory, we find that, in an effort to establish CDMA as a cellular communications platform, Qualcomm was more likely to gain the cooperation of partners to which it was indirectly tied, through firms with these characteristics.

Compatibility Strategies of Asymmetric Digital Platforms (WITHDRAWN)

Author: **He Liu**; U. of Chinese Academy of Sciences

Author: **Raphael H Amit**; U. of Pennsylvania

Author: **Han Qiao**; Chinese Academy of Sciences

Author: **Shouyang Wang**; Academy of Mathematics and Systems Science, Chinese Academy of Sciences

We develop a three-stage game-theoretic model within a duopoly setting to investigate the profit-maximizing compatibility strategies of firms that produce revenue-generating asymmetric digital platforms and asymmetric digital application products which are offered as a bundle. For each compatibility strategy we also examine: by how much should the firm that wishes to offer its application product on a rival platform enhance the intrinsic value of the compatible system (i.e., incremental compatibility value). We find that the profit-maximizing compatibility choice depends on the adoption costs of a bundle and on the intrinsic value difference between the two digital platforms and/or application products. An incompatibility strategy is optimal when the adoption costs are low or the intrinsic value difference is small. Larger adoption costs and greater intrinsic value difference, provide greater incentives for both firms to pursue a one-way compatibility whereby the superior application product is compatible with the superior platform since this type of one-way compatibility increases the profitability of both firms. We also find that the greater the intrinsic value difference, the larger is the incremental compatibility value added to the superior application product when it is made compatible and is being customized to the superior platform.

Collaboration: Collaboration and Knowledge Sharing (session 1230)

A Portfolio Approach to Understanding Performance Implications of Repeated Alliance Ties

Author: **Jung-Hyun Suh**; Chinese U. of Hong Kong

Author: **Ribuga Kang**; Chinese U. of Hong Kong

Prior studies have been largely split on the link between repeated alliance ties with the same partner and subsequent firm performance. Some studies suggest that repeated ties merely result in redundant learning and knowledge convergence, while others focus on the establishment of inter-firm routines that facilitate knowledge exchange. To reconcile these perspectives, we focus on the relative characteristics of a partner vis-à-vis other partners within the firm's alliance portfolio. We argue that repeated ties with a relatively unique and capable partner can provide non-redundant learning and motivate the focal firm to allocate more resources to build effective knowledge-sharing routines. Conversely, repeated ties with a relatively less unique and less capable partner can have the opposite effect, thereby dampening subsequent firm performance. Using data on repeated technology alliance ties formed between U.S. firms from 1990-2000, we find support for our arguments that the link between repeated ties and the firm's post-alliance innovative performance hinges on the relative technological uniqueness and capability of the partner. This study has implications for research on repeated ties and alliance portfolios.

Aligning Ecosystem Members: Balancing Hub Control and Ecosystem Members' Autonomy

Author: **Mikko Hänninen**; Aalto U. School of Business

Author: **Lauri Juhani Paavola**; Aalto U. School of Business

Author: **Annabelle Gawer**; U. of Surrey

Ecosystems are increasingly important structures for organizing economic activity and innovation. Despite their economic importance, the literature on how ecosystems align on common initiatives is, however, limited. To address these issues, this study contributes to the emerging strategic management literature on ecosystems, by examining the process with which ecosystems align members on ecosystem-level initiatives. Through a longitudinal study of an alignment process driven by a hub within an existing ecosystem structure, our research shows that the process of alignment takes place as a sequence of three distinct phases; (1) building momentum, (2) using group dynamics and (3) provoking late-adoption. Taken together, the practices that we identify seek to achieve balance between the hub's objective for collective control and the individual ecosystem members desired autonomy. These findings, therefore, enrich our understanding of the process of alignment within ecosystems.

First-Party Complements in Platform Markets: A Dynamic Perspective (WITHDRAWN)

Author: **Stephan Böhmer-Horländer**; Ludwig Maximilian U. of Munich (LMU)

Author: **Tobias Kretschmer**; LMU Munich

First-party complements, complements provided by the platform owner itself, are an important tool for

the impact of network flexibility and its ambidextrous influence on a firm's exploratory and exploitative partnership selection. We develop our hypotheses based on the literature of network flexibility and draw on a sample of publicly listed firms in Taiwan semiconductor and optoelectronics industries. Data are collected from survey questionnaires and archival sources and examine our hypotheses by using the generalized linear model (GLM) approach. Our empirical findings show that configuration flexibility has a greater influence on exploratory partnerships, while manufacturing flexibility has a greater impact on exploitative partnerships. In addition, when firms are ambidextrous (i.e., have both types of flexibility), they are able to simultaneously obtain both exploratory and exploitative partnerships.

Joint Learning, Goodwill Trust, and Destructive Conflict on Product Innovativeness in Coopetition

Author: **AREZIGULI WUBULI**; School of Management, Xi'an Jiaotong U.

Author: **Jianjun Yang**; Xi'an Jiaotong U.

Author: **MAIMAITIJIANG. AIYITI**; Xinjiang U. school of Information engineering

The benefits of "coopetition" on facilitating product innovation have been established. But further investigation is still needed to identify the suitable inter-partner learning mechanisms in cooperative product innovation. Drawing on the inter-partner learning theory and the coopetition framework, this study examines the relationship between joint learning and product innovativeness in coopetition, and the contingency effect of perceived goodwill trust and destructive conflict on this relationship. Using survey data drawn from 282 coopetition alliances in China, we find that joint learning positively relates to product innovation in coopetition. Moreover, goodwill trust strengthens the relationship between joint learning and cooperative product innovativeness, whereas destructive conflict acts as an inverted U-shaped moderator to the relationship. These findings provide novel insights toward understanding how product innovation can be generated and shaped in cooperative inter-partner relationships.

managing the complementor space in two-sided markets. Nonetheless, there is little research about the strategies underlying the introduction of first-party complements. While third-party complementors introduce their complements with the sole intention of maximizing profits from its sales, platform owners also consider the overall performance of the ecosystem. This is particularly important in the early stage of the platform's lifecycle, when it faces the chicken-and-egg problem. We thus investigate at which stage of the platform's lifecycle and into which market segment platform owners introduce their complements. Drawing on data of the video game industry between 1992 and 2008, we find that compared to third-party complementors platform owners introduce their complements earlier in the lifecycle. Platform owners also tend to introduce complements into less developed market segments, particularly in the early stage and when the platform is strong vis-à-vis its competitors. Our study highlights the importance of platform lifecycle and competitive situation for the platform owner's decision between competing with its complementors and growing the platform ecosystem as a whole.

How Does an Established Firm Develop strategies for a New Platform-Ecosystem? A Study of Ericsson in IoT

Author: **Fathiro Hutama Reksa Putra**; U. of Leeds

Author: **Saeed Khanagha**; Vrije U. Amsterdam

Author: **Krsto Pandza**; U. of Leeds

Prior research provides in-depth insights about strategies for new ventures to compete in existing platform ecosystems. However, we know relatively little about the process of creating new platform ecosystems by established firms that have a legacy of 'pipeline' business model. Our longitudinal study shows how Ericsson, a not digitally-born firm, develop strategies to create a platform in the emerging Internet of Things (IoT) ecosystem. While prior studies of platform strategy highlight specific choices of platform design and ecosystem governance at a certain point in time, this study offers a dynamic view of strategy emergence by describing how and why certain platform strategy evolves. Specifically, we identify three platform

Collaborative Innovation as an Occasion for User Reflection: The Meaning of Relational Tactics

Author: **Helle Alsted Sondergaard**; Aarhus BSS, Aarhus U.

Author: **Mai S. Linneberg**; AarhusU.

Author: **Cita Utami**; Aarhus BSS, Aarhus U.

The literature on interorganizational innovation integrates various actors in a collaborative innovation effort to increase the capabilities relevant to the innovation. In terms of innovative organizations' user involvement in the innovation process, the aim is mainly to learn about user's needs, so the innovative solution can be tailored to meet these and thus have superior performance. The user innovation literature and the collaborative innovation literature in general are mostly focused on the motivation of the users to participate and on the performance of the innovation as such, which may also include the learning for the innovating organization. However, collaborative innovation processes are likely to have implications for other than the innovating organization and the performance output. Thus, in analyzing a collaborative innovation process between a digital solution provider and three hospital units, we find that clinical users' participation results in their profound self-reflection. The paper identifies a set of relational learning tactic used by the digital solution provider, which are central to clinical users' reflection on their own practice. Other than contributing to a better innovation output, these tactics foster professional users' reflection over their own communication practices with patients.

On the Division of Labor in Open Innovation Teams: An Empirical Analysis

Author: **Inna Smirnova**; U. of Vienna

Author: **Markus Reitzig**; U. of Vienna

Author: **Hitoshi Mitsuhashi**; Waseda U.

We study how open innovation communities achieve division of labor without authoritative task allocation. We propose that co-specialization in communities is (co)determined by the norm of reciprocity that peers can expect from founders. Founders receiving contributions can reciprocate by gifting to others' projects or by managing contributions to grow their own projects optimally. Employing data from GitHub, we find that only the latter (non-equivalent) reciprocal behavior leads to efficient division of labor and project growth. We show that skill variation among community members and the amount of attention that projects receive moderate our baseline finding. We elaborate on the implications for strategists assessing the viability of communities as complementary assets. We discuss our study's relevance for organizational and social network scholars exploring communities more broadly.

Do Corporate Contributions Spur Innovative Activity in Online Crowdsourced Goods?

Author: **Do Yoon Kim**; Boston College

Author: **Mike Horia Teodorescu**; Boston College

A significant part of the digital economy is built upon “digital public goods”. Despite significant advances in our understanding of the factors that affect corporate provision of digital public goods, the converse question of how corporate participation affects innovation in digital public goods is less understood. In this paper, we test how increased corporate participation affects source code contribution and follow-on innovation in a large open source project. We test whether corporate contributions increase non-corporate contributions or whether they “crowd out” non-corporate contributions. In order to test our hypotheses, we create a unique dataset consisting of every committed change and commit record for the Linux kernel between its origin of 1991 and through the end of 2018. Exploiting a shock created by the generation of the Open Handset Alliance, we find that while corporate contributions attract more contributions (both from other corporations and non-corporate entities), they also lead to less follow-on innovation. Using a shock that increased corporate commercialization incentives, we find that increased corporate contributions have a “crowding out” effect on individual contributions, specifically to corporate authored general-purpose code. Our results suggest that increased corporate participation may limit innovations in online digital contexts.

When Do Firms Trade Patents?

Author: **Jung H. Kwon**; U. of Texas at Dallas

Author: **Haemin Dennis Park**; U. of Texas at Dallas

Author: **Shu Deng**; U. of Texas at Dallas

We consider firms’ decisions to transfer patent ownership to another firm in the markets for innovation. We deem that the proximity of a patent’s technology structure to that of a firm’s patent portfolio will generally result in greater marginal productivity of that patent, leading to the firm’s future economic return. We thus predict that firms are more likely to trade patents when the technology structure of a patent is closer to the technology stock of a potential buyer relative to that of the original assignee. However, such a relationship will be weaker when a potential buyer and the assignee are in the same sector or when the assignee has high technological capability. We test these predictions by employing a dyadic-level analysis of transactional decisions between 1987 and 2016 on 40,110 patents of 57 major biopharmaceutical firms. Our study provides novel insights on factors that facilitate and inhibit patent trade in the markets for innovation.

A Strategic Model of Frictional Knowledge Networks: Linking Behavior and Structure

Author: **Claudio Panico**; Bocconi U.

Author: **Manuel David Gomez-Solorzano**; Tilburg U.

We contribute to research on networks and knowledge by modelling frictional knowledge networks, i.e., situations where knowledge flows imperfectly over network ties. Our model has behavioral and structural components: agents invest to generate but also to codify knowledge, as to reduce frictions, and the ties in the network connect agents that seek knowledge from alters. We compare behavior and structure for the case when the agents individually incur the cost of establishing direct ties and when there is a broker incurring the cost of connecting alters while taking actions to reduce frictions. The generation, circulation, and

GVCs through forward and backward linkages of industries affects their adoption of automation technology positively through a learning and competition effect. Using a panel of industries from seven countries spanning 1993-2016, I provide evidence that backward linkages has a positive effect on the adoption of automation technology, while forward linkages is not significant. Furthermore, I investigate the importance of trade partners by taking into account the origin of intermediate imports and the destination of intermediate exports. Interacting forward linkages with intermediate exports to China shows that exporting more domestic value content in intermediate exports to China has a negative effect on the adoption of automation technology.

Digital Transformation in Manufacturing Ecosystems: A Case of Integration Decoupling

Author: **Paolo Aversa**; Cass Business School, City U. London

Author: **Carmelo Cennamo**; Copenhagen Business School

Author: **Gianni G Lorenzoni**; U. of Bologna

Data are becoming a critical asset for building competitive advantage in an increasing number of sectors. But how can traditional, not born-digital firms successfully leverage this new kind of assets? Traditional manufacturing industries have usually been structured around product system integration, with the firms manufacturing core components holding superior knowledge and supply network integration, and thus an overall control over the product system. Yet, “digital transformation” can potentially renew the firms’ roles in knowledge and manufacturing, thus affecting the whole structure of the ecosystem. In this study we focus on the drivers and mechanisms underlying this process. Through a longitudinal qualitative study of Dallara, an Italian motorsport firm that underwent a process of digital transformation, our research uncovers how the firm managed to process and leverage external data to successfully become a key knowledge and a supply network integrator, while surprisingly remaining in a marginal manufacturing role. At the ecosystem level, this corresponded to a decoupling of the digital

accumulation of knowledge, and the structure of the network supporting the knowledge flow, stem from the agents' independent decisions when participating in a network formation game. The equilibrium analysis of behavior and structure adds to our understanding of network formation and the circulation of knowledge within and across organizations.

Inventor Commingling and Innovation in Technology Startup Mergers & Acquisitions

Author: **Qingqing Chen**; The Wharton School, U. of Pennsylvania

Author: **David Hsu**; The Wharton School, U. of Pennsylvania

Author: **David Zvilichovsky**; Collier School of Management, Tel Aviv U.

How does knowledge recombination via inventor “commingling” in technology startup acquisitions relate to innovation outcomes? Commingled teams have inventors from the acquiring and acquired firms, and reflect collaboration benefits and costs of integrating human resources across organizational boundaries. The benefits to such team design are “unsticking” knowledge and introducing variety to the possible knowledge to be recombined, while the costs include disrupted team standard operating procedures and routines and the need for enhanced coordination. In addition, innovation efficacy of commingled teams may also depend on the form of inter-organizational R&D cooperation, ranging from less integrated (strategic alliances) to more integrated (M&As) structures. We argue that the control and authority associated with integrated structures aids innovation. We assemble a large panel dataset of technology startups which eventually experienced a merger, some of which also had a prior alliance with the acquirer. Using a difference-in-differences design, we find that innovation quantity, quality, and exploration all increase post-merger for firms with higher rates of inventor commingling. Since commingling can be endogenous to the cost of inventor collaboration, we exploit exogenous introductions of direct flights between the acquired and acquiring firms to instrument for commingling, and find robust results.

product integration (i.e., in a virtual, simulated environment) from the physical product integration (i.e., the actual outsourcing and manufacturing), redefining the role of both suppliers and OEMs. We advance a model explaining how digital transformation allows this important decoupling. Implications for theory and practice are discussed.

When Whales Meet Dolphins: Incumbent-New Venture Relationships During Architectural Disruption

Author: **Cristobal Garcia Herrera**; Imperial College London

Author: **Erkko Autio**; Imperial College Business School

We focus on tensions between incumbents and new ventures in an industry-led corporate accelerator set up to 'self-disrupt' the maritime logistics value chain in the context of two technological discontinuities: digitalization and energy transition. First, we explore tensions that arise in incumbent – new venture relationships where the new venture may not represent a direct substitute to the incumbent, but rather, threaten to disrupt a given sector's architecture of value-creating functions and associated ecosystem roles. Second, we explore the dynamics that may either enable or inhibit the ability of incumbents to respond to ambiguous threats in the face of sector disruptions. We develop an inductive model to theorize about these tensions and associated response and mitigations mechanisms in industry-led accelerators. Our research setting is a European maritime port complex where we conducted longitudinal case studies of both new ventures and value chain incumbents in the maritime, logistics, transport, energy, and refinery sectors.

Interorganizational Learning Research: Bibliometric Review and Research Agenda (WITHDRAWN)

Author: **Amitabh Anand**; SKEMA Business School, U. Côte d'Azur, GREDEG

Author: **Louise Kringelum**; Aalborg U., Department of Business and Management

Author: **Charlotte Madsen**; Aalborg U., Department of Business and Management

Author: **Louisa Selivanovskikh**; Graduate School of Management, St. Petersburg State U.

Scholarly interest in interorganizational learning (IOL) has spiked in the last decade due to its potential to absorb, transfer and create valuable knowledge for enhanced innovative performance and provide sustainable competitive advantage. However, only a handful of review studies exist on the topic. The evolution of IOL has not been studied explicitly and, unfortunately, there is a lack of understanding of the field trends. In order to fill this gap, we comprehensively review the literature on IOL and map its evolution and trends using bibliometric techniques. In particular, we use visualization of science mapping (VOS) freeware to systematize our findings and interpret the results. Through an analysis of 208 journal publications obtained from the Scopus database, we synthesise the findings through a set of research questions. Our analysis identifies the leading authors, countries, highly cited papers, key hotspots, intellectual foundations and emerging trends in IOL. We conclude by providing promising avenues for future research.

A Quantile Regression Analysis on the Relationship Between R&D Investment and the Firm Growth

Author: **SooGeun Ahn**; KRRI

Author: **Jeewhan Yoon**; Korea U.

Author: **YoungJun Kim**; Korea U.

Drawing on Gibrat's law that firm growth rates are random and independent of firm size, this article reports theory and examines data through which ways that firms grow and why firms, regardless of their sizes, need to increase their research and development (R&D) investment. Using more than 10 years of longitudinal data on more than 1,000 small and medium-sized enterprises (SMEs) and large firms, this study analyzes the effect of the dynamic interaction between the past growth rate and R&D investment on the future growth rate of firms. Based on a quantile regression analysis, the findings show that high-growth SMEs experience an erratic growth pattern characterized by negative autocorrelation, whereas large firms often undergo a much smoother growth pattern. The findings contribute to advancing a nuanced theory of sustainable growth by theorizing how firms can grow continuously by increasing R&D investment and generating knowledge spill-over. Practitioners should be aware that firms are likely to show declining growth particularly after high growth in the past, while pursuing innovation through R&D investment can be a significant channel for the continued growth of firms.

The Future of Internal Staffing: A Vision for Transformational e-HRM

Author: **Philip Rogiers**; Vlerick Business School, KU Leuven, & Royal Military Academy

Author: **Stijn Viaene**; Vlerick Business School & KU Leuven

Author: **Jan Leysen**; Royal Military Academy, Brussels

Through an international Delphi study, this article explores the new dynamics that are starting to characterize internal staffing, by means of transformational electronic human resource management. Our focus is on three types of information systems that are expected to evolve and be used in function of transformative change in internal staffing systems: human resource management systems, job portals, and talent marketplaces. Together, these systems challenge current knowledge on internal labor market organization, by affording market-like staffing systems that enable employees to construct personalized and self-directed pathways for growth. Further, this article identifies the key challenges for realizing this vision in governments, such as inadequate regulations and funding priorities, a lack of leadership and strategic vision, together with rigid work policies and practices and a change-resistant culture. Tied to the vision in this article, we identify several areas of future inquiry that bridge the divide between theory and practice.

How Online Platforms Transform the Experience of Work within Organizations

Author: **Philip Rogiers**; Vlerick Business School, KU Leuven, & Royal Military Academy

Author: **Stijn Viaene**; Vlerick Business School & KU Leuven

Author: **Jan Leysen**; Royal Military Academy, Brussels

Drawing from an in-depth case study of an online

services through ecosystem perspective, thus helping many manufacturing businesses who not have the capacity to upgrade for its products and services. We examine how might the structure of interdependences in platform ecosystems shape the innovation process focused on the firms' cross-industry innovation. A multiple-case study of Haier's three projects suggests that three boundary spanning capabilities were critical for cross-industry innovation of products and services: resources sharing, cross- networks bridging and digitalization transforming. The coexist of these three boundary-spanning capabilities promoted manufacturing businesses to redesign the new products and services, aligning with the digital innovation process. Importantly, by uncovering the relationship between the structure of ecosystem interdependencies and the cross-industry innovation process in the digital era, this study deepens our comprehension that how firms can shift the innovation process of manufacturing businesses by strategizing the platform ecosystems.

Exploring the Influence of Internal Crowdsourcing on the Development of an Innovation Culture

Author: **Juan Ramón Campos Blázquez**; ESIC Business & Marketing School

Author: **Patricio Morcillo**; U. Autónoma de Madrid

Author: **Luis Rubio-Andrada**; U. Autónoma de Madrid ESQ2818013A

Author: **Marisol Celemín-Pedroche**; U. Autónoma de Madrid

There are few studies which provide empirical evidence of the use of collaborative technologies within organizations as an element which favors the participation of most employees in the innovation process, and, consequently, helps to develop a culture which becomes an adaptive system which benefits the survival of the organization. The purpose of this paper is to explore the impact of internal crowdsourcing initiatives on the development of an innovation culture in large organizations. We built an instrument based on the Rao and Weintraub (2013) innovation culture framework to carry out a PLS structural equation analysis with the 244 observations obtained in three

labor platform within the U.S. federal government, this article introduces and defines a technology affordance model for a new work experience in organizations. Through employees' interaction with distinct platform features, four mechanisms arise that support employees in their quest for self-actualization. Opportunity and autonomy affordances, bundled as growth affordance, allow employees to craft and seek out internal tasks or projects through which they could grow and utilize their skills and abilities in generic, multi-core areas. Reinvention and feedback affordances, bundled together as impression affordance, then allow employees to experiment with different work identities, and construct an aspirational online image of their selves at work. Besides exposing the action potential arising from human-platform interactions, this article also describes how employees become aware of and interpret this potential, as well as how organizational forces promote or constrain its enactment. It emphasizes the applicability of the model to knowledge-intensive work, wherein workers are increasingly under pressure to engage in life-long learning and upskilling, and to continuously shift and reinvent their work identities. This article suggests the framework's wider implications and relevance for research into the future of work and organizations.

An Examination of the Corporate Parent and Divested Unit Governance Mechanisms

Author: **Sandra Teresa Corredor Waldron**; U. of Connecticut

The current paper explores the governance mechanisms that are implemented by corporate parents and their divested units after a divestiture event. This study compares the inter-dependencies of stand-alone divested units and their parent companies by leveraging differences in two focal governance modes for stand-alone divested units, i.e., spin-offs and carve-outs, and the specific mechanisms that govern the relationship between the parent company and the divested unit post-divestiture. In this way, this paper recognizes that governance choices span beyond the choice of a discrete governance mode. The current study contrasts the use of divestiture governance mechanisms with the choice of the focal divestiture governance mode, spin-offs or carve-outs. Using a sample of US corporate spin-offs and equity carve-outs, and their innovation outcomes pre- and post-divestiture, this study finds that non-consistent divestitures, e.g., high(low) autonomous divestiture governance mode and low(high) autonomous divestiture governance mechanisms, may not realize the full innovation benefits of either integration or hierarchy.

Technostress: A Study Among Employees in the Fintech Era

Author: **Nienchi Liu**; National Central U.

Author: **Yung-Chun Wang**; Graduate Institute of Human Resource Management, National Central U.

Author: **Yi-Ting Lin**; National Central U.

Along with the adoption of information and communication technologies (ICTs), employees may experience high levels of technostress when they are aware the technological environment is greatly uncertain. Particularly, the Fintech innovation will build up a great scale of technostress that ultimately leads to overall stress to employees in financial industries. We hypothesized employees' perception of technology uncertainty should be positively related to technostress and overall stress. We also hypothesized employees' current work design (i.e., co-production) and their own adaptability (i.e., skill flexibility) may serve as job resources to directly and negatively associated to technostress. Similarly, the positive relationship between technology uncertainty and technostress will be weakened by co-production and skill flexibility. The results from a two-wave survey in about 300 employees in the financial industry showed technology uncertainty and co-production are positively related to technostress, and technostress mediates the

relationship between technology uncertainty and overall stress. However, skill flexibility is negatively related to technostress. For the moderation effects, co-production weakens the positive relationship between technology uncertainty and technostress when it interacts with the perception of technology uncertainty. However, no significant moderation effect of skill flexibility is found. The implications for the use of ICT and employees' wellbeing are discussed.

Author: **Demetris Vrontis**; U. of Nicosia-Online

Author: **Gabriele Santoro**; U. of Torino

Author: **Michael Christofi**; U. of Nicosia-Online

High performance work systems (HPWS) have caught the attention of the researchers in recent years when better HR practices were positively linked with performance outcomes at the individual, team and organizational levels. Project based organizations face greater challenges as the employees are temporarily assigned to various projects and hence HR practices can greatly influence their motivation, creativity and performance. Using the lens of Ability, Motivation and Opportunity (AMO) framework under the theory of HPWS, our paper hypothesizes that the ability, motivation and opportunity enhancing practices of the project based organizations lead to better innovation performance of their employees through the mediating role of knowledge sharing. Time lagged data of AMO practices and knowledge sharing practices were collected from the employees of 170 organizations with the gap of three weeks. Furthermore, the innovation performance data was collected from the supervisors of these employees with an additional gap of three weeks. Our results confirm the initial hypothesis of the causal relationship between AMO HR practices and innovation performance with the mediation of knowledge sharing. This research has implications

Dancing to Multiple Tunes: How Institutional Pluralism in Narratives Drives Crowdfunding Performance

Author: **Stephanie Weiss**; U. of Siegen
Author: **Alexander Vossen**; U. of Siegen

In search for funding, entrepreneurs often face the challenges of institutional pluralism, i.e. simultaneously addressing diverse audiences with heterogeneous, sometimes detrimental, preferences and logics. This paper examines how an entrepreneurial narrative and its orientation towards such diverse audiences affects crowdfunding success. Hereby, it focuses on the following questions: (1) Is it more important for creators of crowdfunding campaigns to appear warm and authentic, catering to community-based logics of crowdfunders, or to be competent and analytic, catering more to the professional logic of traditional investors? (2) Is it more promising for crowdfunding projects to attempt satisfying the pluralistic demands of multiple audiences simultaneously or to solely rely on the commitment of their crowdfunding community? Using a data set of 572 crowdfunding campaigns by green technology new ventures, we show the following main findings: Taken alone, highly warm and authentic narratives, addressing community logics, and highly competent and analytic ones, addressing professional logics, both independently foster crowdfunding success. Using both simultaneously, however, leads to a mitigation of these positive effects. The favorable effect of a large audience size on crowdfunding success is alleviated for new

for both theory and practice and it can help the project managers of these organizations to better design HR practices in order to improve the creativity and innovation performance of their employees.

Entrepreneurial Career Paths (session 1164)

Employer Size and Career Perspectives after Entrepreneurship

Author: **Maria Hennicke**; Frankfurt School of Finance and Management

Entrepreneurship spells very often end up in transitions into paid employment. However, little is known about where this entrepreneurial human capital is applied and how it is valued by future employers. Using the data on 22,448 individuals, this study provides deeper understanding on the association between employer size, wages and entry into managerial positions of former entrepreneurs in wage employment. Specifically, I find the tendency of former self-employed to work for small firms. Furthermore, the results suggest that although former entrepreneurs receive on average lower wages as compared to wage employees, small and medium-sized firms seem to attribute higher value to individuals with entrepreneurial experience by offering them higher wages and better chances to start work at managerial levels.

Having Your Cake and Eating It Too? Ambivalent Linguistic Framing Strategies in Equity Crowdfunding

Author: **Dennis Holding Jacobsen**; Copenhagen Business School

Author: **Diego Stea**; Copenhagen Business School

Linguistic framing—that is, “the selective use of vocabularies to construct meaning of a particular version of reality and to shape target audiences’ understandings, garner their appreciation, and influence their behaviors” (Pan et al., 2019: 3)—has important consequences for firms that need to convey information to potential resource contributors in order to secure external investments. However, while linguistic frames are ubiquitous and normally simultaneously deployed, knowledge is lacking on the workings and inherent advantages and disadvantages of the concurrent use of contrasting framing strategies—namely, framing ambivalence. To improve our understanding of the importance of ambivalent framing for strategic communication effectiveness, we explore the application in an equity crowdfunding setting of linguistic framing strategies that simultaneously appeal to the familiarity and novelty of a given entrepreneurial project. In particular, we extend a complementarity logic to the context of ambivalent linguistic frames and their rhetorical counterparts to theorize that, while per se deleterious, ambivalent framing strategies lead to increased resource acquisitions when formulated in a clear and simple manner, but result in the opposite effect when formulated in complex ways. Analysis of full-sample, firm-level data on 197 equity crowdfunding campaigns supports these ideas. These findings contribute to the strategic communication, signaling, and crowdfunding literature.

via early entrepreneurial career activities or a transitional phase in employment. Drawing on the theory of planned behavior and life history theory, our study explains how beliefs relevant to behavior and social origins influence individual career paths to entrepreneurship. Results are based on a nationwide survey involving 1003 individuals in a critical career decision phase and show that individuals growing up in rather uncertain environments (i.e., those from lower social classes) are more likely to postpone their entrepreneurial career intentions.

Organizational Managers and their Returns from Entrepreneurship on Re-Entry into Paid Employment

Author: **Vivek Kumar Sundriyal**; Lund U.

Do entrepreneurs benefit post their entrepreneurial careers on re-entry into paid employment? An answer to this question provides a career value of engaging in an entrepreneurial career. Results have so far been inconclusive suggesting that we still do not know whether entrepreneurship pays or not. Using job matching as the main theoretical foundation, this study investigates how the returns from entrepreneurship are likely to be contingent on the re-entry organizational rank (managers versus non-managers) of the entrepreneur re-entering paid employment post a career in entrepreneurship. Additionally, the study investigates how the returns from entrepreneurship are likely to be contingent on the combination of pre-entrepreneurial entry organizational rank and re-entry organizational rank. Matching managers and non-managers from a sample of STLF in Sweden between 1990 and 2008, relative to wage employees with similar observational characteristics, results indicate that upon re-entry into paid employment, entrepreneurs seem to benefit more in managerial ranks suggesting skills from entrepreneurship are likely to provide higher returns in managerial positions.

How Do Entrepreneurs Use Reference Values During the Planning Process?

Author: **Daniel Blaseg**; ESADE Business School
Author: **Armin Schwienbacher**; SKEMA Business School

Nascent entrepreneurs often overestimate the likelihood of success when planning their own activities, which usually results in excess market entry. But how do entrepreneurs adjust their expectations when they are given historical reference values of comparable projects? Does knowing the historical odds of success help entrepreneurs to make informed decisions about starting a venture by developing more realistic plans and expectations? Drawing on a unique dataset of reward-based crowdfunding initiatives that encompasses the different development steps starting from planning to the ultimate outcome of the campaign, we investigate whether and how nascent entrepreneurs use information on historical outcomes of comparable projects. Our findings suggest that entrepreneurs irrationally use the information to adjust their estimates to account for their belief that they are better than others once they see the historical values, thus resulting in an even higher level of optimism. This result holds across different levels of education, occupation, work experience, age, and gender. Finally, we show that entrepreneurs suffering from over-optimism driven by the irrational use of reference values are more likely to eventually launch a crowdfunding campaign and are also more likely to fail, indicating that the irrational use of reference values has meaningful economic consequences for entrepreneurs.

Signals from Founders to Funders: Entrepreneurial Goals in Crowdfunding

Author: **Lingli Luo**; Zhejiang GongShang U.
Author: **Feifei Yang**; East China Normal U.
Author: **Zeyu Wang**; Chinese Academy of Social Sciences

Author: **Jingyi Wang**; UNSW Sydney
Author: **Dapeng Li**; East China Normal U.

Crowdfunding becomes an increasingly popular online platform for entrepreneurs to request fund from a relatively large number of individuals for their innovative projects. Research on crowdfunding has long examined the factors that contribute to funding success. However, the role of funding goals in crowdfunding is still largely understudied.

Drawing from signaling theory, our paper hypothesizes that funding goal, serves as a signal, has a U-shaped relationship with funding success, such that small goals signal low risk and high probability of goal attainment, thus have a high success chance; large goals signal star projects with high potential, thus also have a high success chance. We further hypothesize that such a U-shaped relationship is amplified by project popularity (backer comments and the number of comments) and campaign structure regarding updates but weakened by entrepreneurs' human capital (education level and crowdfunding experience) and campaign structure regarding funding period and patent. Based on a dataset of 15,326 projects listed on Indiegogo from December 2015 to May 2018, our theorized relationships are supported. Our paper contributes to entrepreneurship scholarship toward a more complete understanding of factors contributing/impeding funding success in crowdfunding platforms and provides important practical implications to entrepreneurs and platform designers.

Family Entrepreneurial Teams: The Role of Learning in Business Model Evolution

Author: **Benito Giordano**; U. of Liverpool Management School

Author: **Kourosh Shafi**; U. of Florida

Why do some newly founded ventures succeed, while others fail? To address this fundamental question in entrepreneurship field, we focus on the role of cognitive ability, and specifically how it influences selecting founding team members. We use a near-exhaustive sample of male Swedish entrepreneurs with available data on their cognitive ability. After controlling for non-cognitive ability of entrepreneurs, our results suggest that one standard deviation increase in cognitive ability of entrepreneurs is associated with about %23 increase in sales. This effect is significantly larger for entrepreneurs in high-tech industries relative to entrepreneurs in low-tech industries. This relationship is further mediated by founding team size and their collective cognitive abilities. Our study highlights dependence of new ventures' growth on entrepreneurs' talent to assemble high-quality founding teams.

Exploring the Impact of Endorsement on the Entrepreneurial Journey of the Nascent Ventures

Author: **Keivan Aghasi**; U. of Cambridge
Author: **Stelios Kavadias**; U. of Cambridge

Nascent ventures suffer from limited legitimacy and low social capital endowment which make it difficult for them to gain access to vital information and other pertinent resources necessary to survive and grow. Start-up support programmes offer organizational sponsorship to the nascent ventures to mitigate and overcome these hurdles. This paper focuses on start-up pitch competition as a form of support programme and capture the impact of the sponsorship via endorsement on the entrepreneurial journey of the selected nascent ventures for the competition. After controlling for co-founding effect of selection on the unique sample of 1,322 nascent ventures that have applied to enrol to Pitch@Palace, a well-known pitch competition programme in the UK, the results confirm our hypotheses on positive impact of endorsement on the entrepreneurial journey of the participating nascent ventures, particularly on those with prior entrepreneurial failures or not backed by

Author: **Oswald Jones**; U. of Liverpool

There is limited research linking entrepreneurial learning and business models in start-up businesses. Business models are important cognitive devices that link entrepreneurial thinking and engagement with customers and suppliers during business start-up. This research examines changes business evolution during the first six years of a family-based start-up, which was formed in 2008 by two young brothers. The business grew quickly and achieved a turnover of £4.5m with 15 staff members by 2014. The case study contributes a better understanding of ways in which team-based learning in a family business links experiential and cognitive learning during business model evolution.

Business Model Innovation in Family Firms: Untangling the Impact of Socioemotional Wealth

Author: **Wolfgang Hora**; U. of Liechtenstein
Author: **Ferdinand Thies**; U. of Liechtenstein
Author: **Alexander Zimmermann**; U. of Liechtenstein

Socioemotional wealth (SEW) has been introduced as an important concept to account for the particularities of family firms and as an antecedent to innovation activities. However, little research attention has so far been given to the potentially distinctive effects of its underlying dimensions and on how it fosters broader forms of innovation (e.g., of an entire business model). We address these research opportunities through a deductive study of 414 central European Companies and find that the five dimensions of SEW not only have very different effects but that their impact on business model innovation is also substantially different from what has been previously found for other forms of innovation. This allows us to contribute to family firm and business model innovation research and provide interesting insights for practitioners.

All Hail the Overcomers: How Entrepreneurs Spur Themselves to Start New Ventures

Designated as a "Best Paper" for ENT

Author: **Brandon Mueller**; Iowa State U.

Author: **Carlos David Valladares**; Iowa State U.

In this study, we utilize regulatory mode theory to explore the influence that entrepreneurs' self-regulation holds in leading entrepreneurs to act on and exploit opportunity ideas. By doing so, we extend understanding of how, when, and why certain entrepreneurs are better able to overcome uncertainty when making the decision to launch new businesses. More specifically, using information collected from 204 entrepreneurs regarding their opportunity identification skills and venture founding history, we investigate the role that self-regulatory mode (composed of both locomotion and assessment) plays in determining if and how often an entrepreneur will choose to act on their new venture ideas. Unsurprisingly, results suggest that entrepreneurs who are better able to identify new venture ideas are more likely to end up acting on these ideas. However, we find that this relationship is strongly influenced by an entrepreneurs' self-regulatory mode. More specifically, the relationship between an entrepreneurs' new venture ideas and eventual entrepreneurial action is negatively moderated by the individual effects of locomotion and assessment, and positively moderated by the interaction of locomotion and assessment. These findings play an important role in extending our understanding of why certain entrepreneurs are more likely to act on their new venture ideas than others.

The Effectiveness of Experts' Predictions of Short-Term and Long-Term Startup survival

Author: **Paula Danskin Englis**; Berry College

Innovation Signaling in M&A Announcements of Family Firms

Author: **Alexander Fries**; Doctoral Candidate - WHU Otto Beisheim School of Management

Author: **Max Leitterstorf**; Hochschule Bonn-Rhein-Sieg

Family firms have previously been found to be more efficient in creating innovation internally as compared to non-family firms because of their effective use of resources. Nevertheless, we do not sufficiently understand whether and how family firms signal their innovativeness towards the market to, e.g., enhance their reputation. We discuss this relationship in the context of M&A deal announcements of publicly listed firms. We hypothesize that true family firms mention more innovation in their deal announcements as compared to non-family firms while lone founder firms do so less. Moreover, we argue that being led by a family CEO strengthens this effect. We test our hypotheses based on a sample of 2153 M&A deal announcements and find support for most of our hypotheses.

Family Firm Acquisitions and the Institutional Environment: A Cross-Country Longitudinal Study

Author: **Michele Pinelli**; Free U. of Bozen-Bolzano

Author: **Alfredo De Massis**; Free U. Bozen, Bolzano and Lancaster U.

Author: **Alessandro Zattoni**; Luiss Guido Carli U.

Author: **Francesco Chirico**; Macquarie Business School, Macquarie U.

Prior research suggests that family firms are reluctant to engage in acquisitions to protect their socioemotional wealth (SEW). Yet, it is open to debate whether the prioritization of SEW over economic wealth creation affects the institutional context where family firms decide to acquire and the type of acquisition. To fill this gap, we develop a theoretical framework on family firms' acquisition behavior that builds on both economic and SEW considerations. We theorize that to protect their SEW family firms are less likely than non-family firms to undertake acquisitions in different and less developed institutional environments where the

Author: **Joris M.J. Heuven**; U. of Twente
Author: **Basil Englis**; Berry College

Startup firms are often evaluated by a group of “experts” using criteria inspired by studies that relate venture characteristics to survival. However, experts’ characteristics are not often taken into account. We examine whether the experience of experts impacts new venture evaluation, and whether more experienced experts are better able to predict new venture performance. In the short term (1 year), we find that the quality of the team predicts survival and that expertise does lead to more accurate prediction of survival. In the long term (5 years), we find that team and business model are predictors of new venture survival and that more experienced experts accurately predict new firm survival.

[view paper \(if available\)](#)

Power of Deliberate Practice! A Multi-Wave Field Experiment for Entrepreneurial Behavior Retention

Author: **Ahmad Raza Bilal**; Sohar U. Oman
Author: **Tehreem Fatima**; U. of Lahore Sargoha Campus Pakistan

Individual entrepreneurial orientation training is a promising psychological intervention based on the Theory of Action Regulation that has contributed to the success of small business owners of developing countries. However, training transfer literature warns about the decay in trained behavior and business outcomes over time. The factors that help in the maintenance of post-training effects are still not extensively researched leaving a huge question mark on acclaimed outcomes. We employed a rigorous combination of an experimental and longitudinal approach for testing the impact of individual entrepreneurial orientation training

ENT

Mentoring and Entrepreneurship (session 1167)

The Role of Mentors in Reshaping Entrepreneurial Identity

Author: **Ronit Yitshaki**; Department of Economics and Business Administration, Ariel U.

Mentorship is one of the building blocks of accelerator educational programs. While there is some indication of the role of mentors in assisting entrepreneurs to overcome bounded rationality, only scant research has been conducted on their role in reshaping entrepreneurial identities. This study focuses on how mentors influence the role, social and venture identities of entrepreneurs in an international corporate accelerator. The inductive grounded theory process model indicates that mentors reshape entrepreneur identity by role modeling and providing reflexive feedback. In addition, they also contribute to entrepreneurs’ social inclusion. At the venture level, mentors reshape startup identity by helping entrepreneurs

among 587 small business owners in Pakistan across multiple follow-up waves (T0=before training, T1=at training, T2=1 month after training, T3=6months after training, T4=2years after training). We specifically examined the role of deliberate practice-purposeful, self-regulated, and persistent effort aimed at improvement- in post-training behavior maintenance as well as the subsequent business success. Growth modeling (random coefficient models), mediation, and mediated moderation analyses were done through R. The findings revealed that though individual orientation behavior declines after training, however deliberate practice enhances its maintenance. Moreover, the small business owners who engaged in deliberate practice had higher success rates through the continuous display of individual orientation behavior. The findings implicate that trainees' active approaches help in increasing training effectiveness.

Designing Entrepreneurial Experiments: Knowledge Acquisition Through "Minimum Viable Products"

Author: **Devin Burnell**; Indiana U. - Kelley School of Business

Author: **Regan M. Stevenson**; Indiana U.

Research on entrepreneurial experimentation suggests that designing economic experiments is useful in learning about opportunities. Specifically, entrepreneurs are encouraged to rapidly experiment with "minimum viable products" as learning artifacts to acquire information from markets about products. Nonetheless, this research has yet to consider the social implications of rapid experimentation; there is a lack of theoretical understanding of how entrepreneurs can design experiments without incurring negative social evaluations from external audiences. To resolve this problem, we leverage Herbert Simon's science of the artificial as a meta-framework to explain why and how learning artifacts can enhance learning efficiency while simultaneously inducing negative social judgments. We then propose a set of contingencies that influence the relationships between the aesthetic design of learning artifacts and their structural environments. We conclude with

differentiate their venture identity and creating a fit between their different identity types by triggering them to reconcile potential incongruence between current and future entrepreneurial identities. These findings extend the literature on the role of mentors in fostering entrepreneurial identity work and on scaling up startups in accelerators.

Trading Places: Entrepreneurs and Local Government Officials in Supporting Rural Venturing

Author: **Marcela Ramirez-Pasillas**; Jonkoping International Business School

Author: **Lucia Naldi**; Jonkoping International Business School

Author: **Hans Westlund**; Jonkoping International Business School

Based on a multiple case study of 19 rural places, we shed light on how entrepreneurs and local government officials engage in rural venturing. We conducted 58 interviews with entrepreneurs, local government officials, and association representatives. We find that entrepreneurs and government officials conduct supplementary processes to renew and preserve rural venturing. The renewal of rural venturing was generated from several embedding processes carried out by entrepreneurs, including belonging, knowing, business networking, resourcing, and business modeling that contribute to building and changing the business community. The preservation of rural venturing was originated when we brought local government officials to the foreground. We identified the embedding processes carried out by municipal officials including advocating others, creating networking arenas, crafting hybridity, crafting suitability and avoiding bureaucracy relevant for sustaining rural venturing. These processes were done in order to conserve and hybridize rural venturing. Our study, therefore, reorients embeddedness and entrepreneurship research from a focus on networks and their outcomes to what critical actors do. We also shed light on rural venturing as a multi-level phenomenon driven by the interaction of multiple stakeholders.

theoretical and practical implications for understanding the strategic design of learning artifacts to learn about markets and products while managing negative social judgments.

From Normalization to Innovation in New Product Development Projects

Author: **Xiangming Tao**; Royal Holloway, U. of London

Author: **Deniz Ucbasaran**; U. of Warwick

Although tolerating failure has been regarded as an essential part of the innovation process, much less is known about how failure normalization can drive innovation. We argue that failure normalization facilitates innovation by encouraging learning from failure, which in turn, depends on entrepreneurial passion. Using data from collected a survey of 237 new product development project (NPD) leaders in high-tech ventures, we find that learning from failure acts as a mediator in the relationship between failure normalization and innovation performance in the NPD process. However, failure normalization only provides an opportunity to learn and whether actual learning from failures occurs depends on NPD project leaders' entrepreneurial passion. Our results suggest that the path from failure normalization to innovation in NPD requires a much more nuanced examination of not only the mediating role of learning from failure but also entrepreneurial passion, which functions as a motivational on-off switch for learning from failure.

How Can Business Advisors Overcome Constraints to Become Institutional Entrepreneurs?

Author: **Norin Arshed**; U. of Dundee

Author: **Stephen Knox**; U. of Strathclyde

Author: **Dominic Michael Chalmers**; U. of Glasgow

Author: **Russell Matthews**; U. of Strathclyde

Various UK governments have placed business advisors in the role as key institutional entrepreneurs in entrepreneurial ecosystems, yet they remain marginal actors whose impact is uncertain. This article explores the underlying reasons why by examining the constraints facing business advisors. Drawing on a qualitative study of business advisors from across the UK, we found a mismatch between the demands placed on them and resources made available to them; disconnects in how they interpret their roles and what is often required of them to provide meaningful advice; and tensions between their role which vary between assisting entrepreneurs to come to their own decisions and their role as advisors in providing more directive guidance. We argue constraints prevent business advisors from becoming central figures in the entrepreneurial ecosystem. In doing so, we contribute to theory on institutional entrepreneurship which has focused on central actors in entrepreneurial ecosystems, especially entrepreneurs and policy-makers, and neglected more peripheral figures who have the potential to bring about change.

Who is a New Venture Mentor? A Clarification of the Concept and Implications for Research

Author: **Marta Katarzyna Dowejko**; Hong Kong Baptist U.

New venture mentoring is paramount to startup acceleration and growth. In the past five years we observed a proliferation of scholarly interest in the concept, making it a promising theoretical lens through which scholars can better understand entrepreneurship. To summarize the recent

the building” and consult with customers before any serious efforts to develop a new product or service are undertaken so they can understand what customers really want/need and test the assumptions underpinning their offering. Despite the popularity of this thesis, evidenced by the extraordinary success of the “business model canvas,” “customer discovery,” and “lean startup” movements, there is surprisingly little empirical evidence to support it. In response, we hypothesize that while involving customers during product/service development will help nascent entrepreneurs successfully exploit an opportunity, this benefit is offset by the additional time it takes to engage them. We further hypothesize that these benefits and costs are magnified when market uncertainty is high. Analyzing data from the PSED II, we find support for our hypotheses.

Relating Entrepreneurial Self-Efficacy to Adaptive Performance and Affective Outcomes

Author: **Gavin Joseph Williamson**; U. of Tennessee, Knoxville

Author: **Patrick Coyle**; La Salle U.

Author: **Victoria Ricedorf**; Lycoming College

Author: **Alexandra E. MacDougall**; Central Michigan U.

Organizations have seen an increasing need for entrepreneurial thought and behavior to meet the challenges and demands associated with a dynamic work environment. Interestingly, there is a dearth of scholarly literature exploring the antecedents and outcomes associated with such behavior beyond the scope of new ventures. Accordingly, the present effort draws from the entrepreneurship literature to explore how entrepreneurial self-efficacy (ESE) impacts three types of work-related affect including job satisfaction, work engagement, and affective organizational commitment, via adaptive performance among employees in well-established firms. Data were collected from 251 full-time working adults at two time points and were examined using latent variable analysis. Results indicated that ESE is positively related to adaptive performance, and that ESE positively impacts all three forms of work-related affect via adaptive performance. Theoretical and practical implications are discussed, including recommendations for managers wishing to enhance the adaptability and intrapreneurial performance of their subordinates.

[view paper \(if available\)](#)

historically liberal, Switzerland has over the years developed into a welfare state. Politically, a countermovement has emerged that demands SVs to act in an entrepreneurial and economically successful manner. This article contributes to this topic, which is increasingly being discussed in social entrepreneurship and SV literature, by setting up and testing its own research model and generating numerous managerial implications.

How to Drive Social Venture Performance? An Upper Echelons Perspective on Social Entrepreneurship

Designated as a "Best Paper" for ENT

Author: **Corinna Vera Hedwig Gerleve**; TU Dortmund U.

Research surrounding social entrepreneurship is burgeoning. While the current focus of most researchers is on the formation of social ventures, we still know little about what factors drive social venture performance once a venture is founded. The purpose of our study is to fill this research gap. We introduce upper echelons perspective to social entrepreneurship research and explain the influence of leaders' psychological characteristics and team processes on social venture performance. Empirical analysis of 177 responses from social entrepreneurs reveals that leaders' psychological capital is positively associated with social venture performance, via team value congruence. In line with upper echelons perspective, this study moreover investigates the role of feedback-seeking behavior as an external stimulus. Contrary to our hypothesis, we find that high feedback-seeking behavior weakens the positive indirect relationship. In sum, we contribute to social entrepreneurship research by introducing a well-established theory to this domain and explaining psychological capital as an individual-level antecedent to social venture performance. Moreover, we advance entrepreneurship literature on team processes and especially upper echelons perspective by explaining team value congruence as a sociological process between leader characteristics and social venture performance. Our results have implications for social entrepreneurs and society as a whole.

A Call to Action: Growth Mindset Training Improves Experimental Action Among Necessity Entrepreneurs

Author: **Shad S. Morris**; Brigham Young U.

Author: **W Chad Carlos**; Brigham Young U.

Author: **Geoffrey Kistruck**; Schulich School of Business

Author: **Robert B. Lount**; Ohio State U.

Author: **Tumsifu Elly Thomas**; U. of Dar es Salaam

The poor have few other options than to engage in entrepreneurial activities to sustain their livelihood. To help these necessity entrepreneurs improve their ability to experiment with more effective business activities, technical training programs abound. Yet, these necessity entrepreneurs tend to possess a 'scarcity mindset' that stops them from applying the technical skills they develop in training programs. To combat this scarcity mindset, we suggest that technical training programs should include growth mindset training to help individuals increase their entrepreneurial self-efficacy, which will help them to take more experimental action. More specifically, we created a half-day 'cognitive' training module to complement an existing 'technical' training program. The growth-mindset training was developed and piloted with 339 entrepreneurs in rural Tanzania. Subsequently, we tested our hypotheses using a randomized controlled trial involving 176 entrepreneurs in rural Tanzania. Our results suggest that augmenting a technical-skills training program with a growth mindset component promotes entrepreneurs to improve their entrepreneurial self-efficacy and display subsequent experimental action in their actual business endeavors.

Subjective Experiences of Positive Impact in Social Enterprises: Working for Impact, Seeing Impact

Author: **Andreana Drencheva**; U. of Sheffield

Author: **Wee Chan Au**; Monash U., Malaysia

Author: **Jian Li Yew**; Social Innovation Movement

Individuals start and work in social enterprises anticipating positive impact from their work, thus aligning their work with their values and motivations. Yet, the social entrepreneurship literature assumes that individuals in social enterprises subjectively experience their work as making a positive difference for others directly through their work. In this article we introduce the concept of perceived positive work impact to the social entrepreneurship literature to differentiate between objective social impact and individuals' subjective experiences of work as impactful. With this inductive study we explore how individuals in social enterprises anticipate, perceive, and question their work as impactful and illustrate how these subjective experiences are shaped by processes to create, visualize, maintain, make sense of, and share subjective experiences of work as impactful. In doing so, we challenge taken-for-granted assumptions in social entrepreneurship research and draw attention to a new subjective experience and its significance for talent retention. By investigating the concept of perceived positive work impact in a new research setting where anticipation of positive impact is highly consequential, we extend the current understanding of the concept in OB research.

recipients of free goods and services, customers or suppliers of goods and services to the enterprise, or as employees of the enterprise. Leveraging the Sen's capabilities framework as a tool to measure depth of impact, this paper examines six comparative cases of social enterprises with beneficiaries positioned in different roles to better understand the types of impacts social enterprises can create for beneficiaries. The cases examined indicate that beneficiary positioning has significant implications for the depth of impact created, with beneficiaries as employees having the deepest impacts for beneficiaries and beneficiaries as recipients having the shallowest.

Can Business Schools Better Enhance Idealism and Foster Social Responsibility Among Students? (session 342)

The purpose of this PDW is to examine the disconnect between the optimism with which students, firms, and business schools view the role of business in society, and the career choices of students (who often end up in banking and consulting, despite more impact-oriented intentions upon entering business school). Participants will explore how business schools can either reproduce existing inequalities or create opportunities for mobility. We will dive deeply into the student journey to and through business school, and will discuss the latest research regarding key cultural mechanisms at play, as well as potential levers and critical inflection points to better foster diverse and impact-oriented career paths. Finally, this PDW will include a thoughtful discussion as to the ways in which business schools interact with community partners and other stakeholders, and pose the question of who really benefits from these relationships.

Re-Visioning Management: Quantum Perspectives (session 341)

This symposium addresses the AOM 2020 theme through a series of opening talks and an hour of dialogue around the theme of Quantum Perspectives. The presenters turn to quantum concepts through which physics has described a reality which is unexpectedly conscious and interconnected. The discovery in physics of the quantum realm as a subjective as well as objective reality is opening new possibility for social sciences such as management. Each of the presenters in this symposium explores the relationship between practices of connectedness to gain direct-intuitive insight into the quantum nature of reality and transformation of the discipline of management to be an agent of human flourishing. Our contributions are to eliminate the dichotomies that conventional management theory enact, and to propose alternative narratives from quantum perspectives.

Cooperative Strategy (session 344)

**How Does a Partner's Acquisition Affect the Value
of the Alliance?**

Designated as a "Best Paper" for STR

Author: **Dovev Lavie**; Bocconi U.

Author: **Randi Lunnan**; BI Norwegian Business
School

Author: **Binh Minh Truong**; BI Norwegian Business
School

How does an acquisition initiated by a firm's alliance partner affect the value that the firm can create and capture from its alliance with that partner? We study this question by drawing from the relational view. We contend that the similarity between the businesses of the firm and its partner's acquisition target restricts the firm's ability to create and capture value from its alliance, whereas the complementarity between their businesses enhances the firm's gain from its alliance. We further conjecture that relational embeddedness between the firm and its alliance partner mitigates competition while facilitating synergies ascribed to complementarity with the target's business. We test these predictions during the years 2000-2016, with an analysis of the stock market returns to 361 firms that engaged in 590 alliances with 91 partners around the time these partners' announced the acquisitions of 164 targets. Our findings support the predictions about the implications of business similarity and complementarity, but refute the ones concerning the moderating effects of relational embeddedness. We conclude that a partner's acquisition of a target whose business is similar to that of the firm signifies failure of the embedded relationship between the firm and that partner, while the rigidity of their relation-specific routines undermines the firm's ability to gain from synergies

Navigating Creative Destructions in the 21st Century: External Pressures and Resource Recombination (session 345)

Whether and how firms respond and adapt to external pressures has important implications for organizational performance and evolution. Prior research has established that firms may be impelled to reposition, innovate, or specialize, all of which have important repercussions for resource allocation and recombination. Further research is needed in order to advance our understanding of the specific drivers of industrial renewal taking place across various settings. Papers in this symposium address questions regarding external pressures and resource recombination, offering new theoretical frameworks and drawing on empirical settings including transport, energy, and pharmaceutical industries.

**Competitive Dynamics of Interindustry Systems:
How Structure and Conduct Coevolve**

Designated as a "Best Paper" for STR

Author: **Stephen Thomas Downing**; National Chiao Tung U.

Author: **Jin-Su Kang**; National Chiao Tung U.

Author: **Hun Lee**; George Mason U.

Research on multimarket contact (MMC) explains why mutual forbearance (reduced aggressiveness) may emerge among familiar rivals within certain industries, but less understood is how competition changes when MMC crosses industry boundaries. Taking a system-level view of the competitive arena, we introduce the concept of systemic MMC (extent of embeddedness in industry-agnostic MMC groups) and apply it to explain how the antecedents and outcomes of competitive behaviors differ: network-invariant actions seek advantage within current markets; network-restructuring actions change MMC, reshaping interindustry embeddedness. We posit that systemic MMC facilitates mutual forbearance from network-invariant aggressiveness, while firms employ restructuring actions to improve their position, which they then, in turn, exploit for mutual forbearance. However, this jockeying for position by more numerous direct and indirect competitors limits each firm's ability to maintain its degree of systemic MMC. We find support for these hypotheses with a novel combination of data sets on technology firm competitive relations and action repertoires during 2010-2016. Contributing to the literature on competitive dynamics and multimarket competition theory, this study shows how competitive structure and behavior coevolve endogenously, and mutual forbearance may still arise in interindustry competition systems, but its nature and persistence vary.

From Instrumental to Normative Relational Strategies: A Study of Open Buyer-Supplier Relations

Designated as a “Best Paper” for STR

Author: **Sergio Giovanetti Lazzarini**; Insper Institute of Education and Research

Author: **Dirk Boehe**; Massey U.

Author: **Leandro Simões Pongeluppe**; U. of Toronto, Rotman School of Management

Author: **Michael L. Cook**; U. of Missouri

Scholars have examined conditions in which companies promote close, recurring relations with key stakeholders with the instrumental objective to generate unique rents. However, in practice, we observe open relational strategies with nonexclusive relations and investments that generate positive externalities to multiple stakeholders beyond the focal firm and their direct partners. These open relations create a puzzle since companies invest in partners that are relatively free to transact with other actors, including competitors. In this paper, we adopt an in-depth case study methodology examining Natura, a company in the cosmetic industry that developed a complex web of open vertical and horizontal relations (hence a “netchain”) to procure natural inputs from the Amazon rainforest. We explain the mechanisms behind Natura’s open netchain and propose a set of explanations for its emergence and stability in the long run. Although a possible explanation is in part instrumental (i.e., Natura fosters a distinct positioning strategy based on socially oriented and sustainable practices), a fundamental explanation for the emergence and continuity of Natura’s open relational strategy is the presence of distinct shareholder preferences supporting normative commitment to socio-environmental goals. We thus argue that the so-called shareholder supremacy may actually generate broader positive gains as long as shareholders (or whoever holds residual rights) implement distinct normative principles guiding corporate relational strategies that benefit multiple stakeholders.

Temporal Dynamics in Multipartner Coordination: Sequentiality and Simultaneity in R&D Projects

Designated as a “Best Paper” for STR
Author: **Jingshu Du**; Vrije U. Amsterdam
Author: **Rene Belderbos**; KU Leuven
Author: **Bart Leten**; KU Leuven

Prior research has suggested that collaborating with multiple partners promises better innovation performance. However, multi-partner collaborations also bring additional management challenges stemming from the more complex coordination among multiple, often diverse, partners. Adopting a coordination perspective, this study offers new insights on the optimal temporal coordination in multi-partner collaborations. We argue that effective coordination in multi-partner collaboration is likely to require episodes of sequential collaboration with partners (sequentiality) as well as periods of simultaneous involvement of all partners (simultaneity). The optimal balance between the two is project-specific and depends on the complexity of the technology developed and managerial resource constraints. We find support for these conjectures in analyses of over 1,000 R&D projects in a major firm in the electronics industry.

Focus on Philosophy (session 343)

Institutional Strengthening as Ethical Obligation: An Agonistic Approach to Business Ethics

Designated as a "Best Paper" for SIM

Author: **Tricia Olsen**; U. of Denver

Author: **Harry J. Van Buren**; U. of St. Thomas

Business ethics scholars often write about institutions as relatively static guidelines with which companies may or may not comply (e.g., "rules of the game"). While some institutions, such as rule of law or stable monetary and fiscal policy, are good for business, we also know that (some) businesses (often) seek to manipulate institutions so that the "rules of the game" are tipped in their favor. In this article, we argue that conceiving of institutions in this way limits the role institutions can play in addressing conflict or contention. Instead, we draw from recent work by political theorist Chantal Mouffe on agonism and apply it to the corporate context. We develop the notion of agonistic business responsibility, which overcomes the existing limitations in the literature by legitimizing stakeholder voices. This approach acknowledges the perennial nature of dissensus and, rather than lamenting it, recognizes that greater legitimacy may be gained through contestation.

Collective Rationality and Creative Synthesis in Corporate Governance

Author: **Tobey Scharding**; Rutgers U.

Author: **John Cantwell**; Rutgers U.

In this article, we explain the potential benefits of implementing Hegelian notions of collective rationality and synthesis in corporate governance and suggest strategies for achieving this. Changes to corporate structures over the past fifty years—such as the declining importance of the dyadic principal-agent relationship and the increasing importance of networks—simultaneously raise the stakes in intra- and inter-firm conflicts and make these conflicts more difficult to resolve. Whereas corporate responses to conflicts have typically relied on individual rationality, we argue that Hegelian theory's attunement to social organization offers greater promise. Of contemporary theories of corporate governance, our Hegelian theory most closely resembles paradox theory. It goes beyond paradox theory in elaborating two novel strategies for resolving apparent paradoxes: collective rationality and creative synthesis. After discussing the basis of our theory of corporate governance in Hegelian thought, set forth our strategies and contrast them with other approaches to corporate governance. Next, we illustrate how our strategies may be applied. Finally, we offer propositions and discuss opportunities for future research.

Exploring the Possibility of Ethical Self-Formation in Climate Change Discourses Online

Author: **Mollie Painter-Morland**; Nottingham Trent U.

Author: **Elme Vivier**; Nottingham Business School, Nottingham Trent U.

Author: **Emrah Karakilic**; Nottingham Business School, Nottingham Trent U.

In this paper, we investigate to what extent the writing that takes place in online discussion forums could contribute to ethical subject-formation. We acknowledge the potential negative effects that the use of digital technologies could have for human agency, but also explore its potential contribution in shaping ethical agency. To do so, we draw out the intricacies of subjectification/ subjectivation as it is described in Michel Foucault's (2008) writings on governmentality, and explore to what extent a more positive conception of subjectivity can be articulated in and through contemporary online writing practices. We approach our empirical data abductively, comparing the writing in online forums (Reddit) to/ with Foucault's description of specific writing practices that are central to 'the care of the self', and as such, of ethical subject-formation. We then return to a further investigation of Foucault's (1994) discussion of polemics that characterize polarizing discourses online. We conclude that the subjectivation emerging within online writing functions both positively and negatively, but that care of the self is made unlikely due to a lack of critical self-reflection and the prevalence of polemics.

Communicative Practices of Business Ethics - A Case Study of Self-Writing in Strategic Context

Author: **Visa Penttilä**; Hanken School of Economics

This study develops practice-based understanding of ethics by examining how communicative activities can contribute to ethics in organizing. To conceptualize ethical significance of language use, I draw on Foucault's concept of self-writing that captures the potential of writing in developing the self of an individual, and by extension, that of a collective of individuals. I conduct a single case study of a strategy process between an owner organization and a business conglomerate they own. The writing provides the owner a practice through which it not only steers the conglomerate, but also develops itself as an owner-stakeholder and its relation to business activities. The study extends the notion of self-writing to strategic context and shows how writers can subject themselves to a particular position through 1) normative, 2) temporal, and 3) textual-structural discursive resources. These resources enable the writers to establish a reflexive relation with themselves and develop this relation as an organized collective. These findings contribute to the business ethics as practice literature by extending communicative practices to its scope and articulating a model of self-writing practices in an organizational context.

Discipline and Purpose for Intellectual Athletes (session 347)

Two years ago, at the 78th Annual Meeting of the Academy of Management, we invited doctoral students to discuss the physiological and psychological challenges inherent in pursuing a doctoral degree. From this conversation, we realized that the structure (or lack thereof) inherent in the knowledge work that comprises academic life provides a unique challenge to well-being. This year, we build on this conversation and research by offering a workshop designed to help academics – both faculty and graduate students alike – improve their own well-being and productivity by building better work habits. We draw on the concepts of discipline and purpose in order to demonstrate how people can develop profitable personal strategies for more effectively facilitating both improved work output and sustainable well-being. The purpose of this PDW is to provide resources to help academics to articulate their relevant goals and, in turn, create a plan for following them with a sense of self-accountability. We will draw from research on developing effective work habits, values, and goal-setting in order to provide participants with a template for managing their physical and emotional resources. We believe that training what we have termed “intellectual athletes” will not only improve the general well-being of academics, but will also facilitate more productive research and teaching over time.

Are you interested in doing some work on your own professional and personal development? All you need is a curious mindset and a desire to experiment!

Organizing for the Grand Societal Challenges (session 348)

Today's societies face grand challenges, many of them global in scope. They range from environmental climate change and digitalization to ecosystem disruption and dramatic upsurge of socially divisive forces. The scale, difficulty, non-linear dynamics, and complexities of these transition problems are such that no one entity, discipline, or social sector alone can handle - let alone solve - them. The objective of this symposium is to address the question of how firms, in the light of grand challenges, can learn to organize for a social change towards responsible and sustainable management, collaboratively with their stakeholders. There is scholarly evidence of increasing firm levels of responsibility and stakeholder-orientation as well as their performance implications. By contrast, we are only starting to understand how companies can organize to tackle grand societal challenges and how such trends translate into new developments of management theory. This event will give management scholars, who have already taken up this challenge in their research, the chance to share the evolution of their own thinking. In particular, five panel presentations will look at the topic of responsible and sustainable organizing from different, but highly complementary angles, and thus, help develop new theoretical insights. They will also point to - in their view - implications for our work as researchers and teachers.

The Evolution & Obliteration of Novel Ideas & Problems (session 346)

Problem Framing and Formulation

Author: **Chan Hyung Park**; Washington U. in St. Louis, Olin Business School

Author: **Markus Baer**; Washington U. in St. Louis

Numerous management scholars have noted that strategic decision making starts with problem formulation, or the identification of problems' causes. Problem formulation reduces the uncertainty in problems through finding the underlying causes. When dealing with strategic problems that have both complexity and uncertainty, however, we theorize that problem formulation is not enough. Problem framing, or the decomposition of problems to their subproblems, reduces the complexity of problems. When framing has been successful, problem formulation may then reduce the uncertainty in the problems. Despite the close relationship, we draw on the construal level theory to argue that the cognition that benefits problem framing and formulation are distinct and mutually exclusive. People who adjust their construal level (abstract or concrete way of thinking) while engaging in the two activities would not be able to achieve the optimal outcomes. We conduct four experiments to explore the hypotheses and find support for our arguments.

The Impact of Customer Creativity on Service Employees: An Emotional Appraisal Perspective

Finalist for MOC Division Best Student-Led Paper Award

Author: **Randy Xue Ren Lee**; National U. of Singapore

Author: **Pok Man Tang**; Texas A&M U., Mays Business School

Author: **Anthony Klotz**; Texas A&M U.

Author: **Remus Ilies**; National U. of Singapore

Author: **Shawn T. McClean**; U. of Wyoming

Increasingly, transactions between firms and customers are typified by co-creation of value, wherein customers play an active role in the development of new products and services. In the past two decades, research on the dynamics of co-creation, and its largely positive effects on consumers and firms, has flourished in multiple disciplines of research. However, the effects of customer creativity on the service-providing employees themselves has received far less empirical attention, which is not necessarily surprising, given that research on the consequences of creativity at work, in general, is scarce. To contribute to our understanding of the effects of co-creation on employees, and of the outcomes of creativity, we examine how creative behavior from others at work (i.e., customers) affects the focal employees (i.e., service providers). Specifically, drawing from emotional appraisal theory and interpersonal complementary theory, we predict that perceived customer creative behavior elicits the emotion of inspiration in service employees, which in turn motivates them to engage in customer-oriented prosocial behavior. We also propose that customer creativity can elicit the emotion of performance anxiety, which leads to subsequent work withdrawal among employees. Using an experience-sampling study with three daily assessments in the service industry, we find support for our predictions. Furthermore, we find that the aforementioned emotional appraisal processes are contingent on employees' creative role identity. We conclude by discussing the theoretical and practical implications of our work.

How Creative Organizations Develop Systematic Ways to Recognize and Select Novel Ideas

Finalist for MOC Division Best Paper Award

Author: **Barbara Slavich**; IESEG School of Management, LEM-CNRS 9221

Author: **Pilar Opazo**; MIT Sloan School of Management

Author: **Ignasi Capdevila**; Paris School of Business

The generative side of creativity has received much more attention than its evaluation and adoption sides. The objective of this work is to explore how and why organizations assess and select specific creative ideas for further implementation and what determines that actors within organizations recognize the creative potential of an idea generated versus another one. Our research shows how two highly creative organizations, elBulli restaurant lead by chef Ferran Adrià and the Italian Drama Academy Nico Pepe, developed several processes and routines to continuously evaluate the degree of novelty and finally select ideas for implementation. We show that the processes of ideas' generation and evaluation simultaneously take place at the individual and the collective level and that they involve activities of two distinctive nature: cognitive processes and material practices. Furthermore, we show that by developing a classification system and by doing an effortful and selective use of artifacts, the members of the organization are able to evaluate and ensure continuously novel outcomes.

Obliteration by Divergence in Scientific Networks: The Case of Ego Depletion

Finalist for MOC Division Best Paper Award

Author: **Mustafa Akben**; Fox School of Business, Temple U.

Author: **Ravi S. Kudesia**; Fox School of Business, Temple U.

Scientific literatures provide a valuable context to understand how ideas evolve within social networks. Seminal research concerns obliteration by incorporation: how as a scientific idea is reproduced in a scientific field through new studies, the idea can gradually mutate until its original meaning is lost. We introduce a process called obliteration by divergence, given parallels to divergent evolution. Obliteration by divergence concerns how when a scientific idea crosses from one discipline to another, its meaning can fundamentally change, so two disciplines discuss the same idea but mean something different by it. It is a substantial, but unaddressed, threat to the validity of science, given increasing interdisciplinarity. Through a network analysis of 5,046 works on ego depletion, we show that the management discipline constitutes its own cluster with unique properties that differ fundamentally from the original idea in psychology. Whereas ego depletion research in psychology has diminished in the wake of the replication crisis, we find continued exponential growth in management. We suggest different selection pressures in psychology and management disciplines that may have produced these divergent outcomes and discuss the potential dangers of the resilience of the ego depletion idea as it has evolved in management.

How Governance Paradigm Attachment Enacts a Spiral of Unsaid and Decision-Making in the Boardroom

Author: **Marilieke Engbers**; Vrije U. Amsterdam

How do board members of a board of directors decide what to say 'in the moment' during formal meetings and

consequently decide on strategic issues? By implementing real-time tape-recorded data from 37 meetings of 17 boards and retrospective interviews with 119 board members, we explored the motives behind what board members say and do not say during board meetings. We compared individual level and group level similarities and paradigm differences, implicit voice theories and communicative interactions. We found that board members who consider their governance paradigm objective enact a spiral of unsaid when they try to manage silent performance conflicts through informal decision-making. Then when hot situations are enacted due to these conflicts they manage the conflicts ultimately through scapegoating and ostracizing the board members with the minority paradigm.

Authority and Search in Organizations

Designated as a "Best Paper" for STR

Author: **Valentina Richter**; U. of Vienna

Author: **Robert Janjic**; U. of Vienna

Author: **Helge JD Klapper**; Rotterdam School of Management, Erasmus U.

Author: **Steffen Keck**; U. of Vienna

Author: **Markus Reitzig**; U. of Vienna

This paper studies the effects of formal structure on individuals' search behavior when learning from past performance is difficult. We argue that managerial authority in the form of procedural control induces accountability among subordinates tasked with the search for alternatives to a given problem. Subordinate accountability, so we argue and show, creates an action bias among employees leading them to exhibit more exploratory search behavior than they would otherwise. Exploration is thus susceptible to the framing of managerial control. We test and confirm our hypotheses in a laboratory experiment, employing a modified version of Billinger, Stieglitz, and Schumacher's (2014) "alien game".

The Evolution of Productive Organizations

Designated as a "Best Paper" for STR

Author: **Francisco Brahm**; London Business School

Author: **Joaquin Poblete**; Pontifical Catholic U. of Chile

Organizations devoted to the production of goods and services, such as guilds, partnerships and modern corporations, have dominated the economic landscape in our species' history. We develop an explanation for their evolution drawing from cultural evolution theory. A basic tenet of this theory is that social learning allows for the diffusion of innovations in society, and therefore, the accumulation of culture. However, the well-known Rogers' paradox shows that specific conditions are required for social learning to fulfill this role. Using a workhorse cultural evolution model, we show that productive organizations (POs) can provide such conditions if they possess two characteristics: exclusivity of membership –that is, entry is restricted– and more effective social learning within their boundaries than outside. With exclusivity, the benefit of better social learning is not eliminated by the expansion of social learners; instead, these improvements allow for higher adaptiveness, benefiting society. We illuminate three aspects of POs which have eluded mainstream economic theories of POs. First, we focus on culture, a central part of POs; in contrast, current theories assume a pre-existing cultural pool in order to focus on governance. Second, these theories explain how POs work, a proximate explanation; instead, we provide an ultimate explanation that provides a precise mechanisms for their origin and evolution. Third, while our theory parsimoniously produces specialization of POs, current theories require the addition of trade and comparative advantage. The model also illuminates issues regarding organizational rigidity and the locus of innovation.

Work-from-Anywhere: The Productivity Effects of Geographic Flexibility

Designated as a “Best Paper” for STR

Author: **Prithwiraj Choudhury**; Harvard U.

Author: **Cirrus Foroughi**; Harvard Business School

Author: **Barbara Zepp Larson**; Northeastern U.

An emerging form of remote work allows employees to work-from- anywhere, so that the worker can choose to live in any geographic location of choice. While traditional “work-from-home (WFH)” programs offer the worker temporal flexibility, “work-from-anywhere (WFA)” programs offer both temporal and geographic flexibility. We study the effects of WFA on productivity at the United States Patent and Trademark Office (USPTO) and exploit a natural experiment in which the implementation of WFA was driven by negotiations between managers and the patent examiners’ union, leading to exogeneity in the timing of individual examiners’ transition from a work-from-home to a work- from-anywhere program. This transition resulted in a 4.4 percent increase in output without affecting the incidence of rework. We also report several results related to mechanisms, notably a correlation between examiners relocating to below-median cost of living locations and increased productivity. We also study how geographic flexibility affects the location choice of WFA workers and find a correlation between career stage and the decision to move to Florida. We additionally employ illustrative field interviews and micro-data on geographic distance from the headquarters, an exogenous mandate to use IT, and proxies for examiner effort to shed further light on mechanisms.

Specialized Human Capital in Professional Services: Task Specificity and Firm Performance

Designated as a “Best Paper” for STR

Author: **Ryan Cooper**; U. of Maryland, College Park

Author: **Timothy Gubler**; Brigham Young U.

This paper examines the relationship between the autonomous specialization decisions of service professionals and the tacit human capital they develop. As individuals specialize in production in response to market and organizational factors, they develop task-specific human capital which induces them to continue to specialize. Task specificity of human capital benefits the firm due to its higher productivity, even after negative shocks to the market. Individual specialization in response to market forces also leads to human capital overlap, or shared expertise among co-workers, which may have positive and negative impacts on the firm. Using a novel approach that draws on longitudinal data from the Utah real estate industry, we examine these forces empirically and find that task-specific human capital does benefit firms, even after widespread negative market shocks. Overlap also benefits firms, though it is a substitute for task specificity rather than a complement.

Philosophies of Organizational Research (session 350)

Much of organizational research often relies on a variety of philosophical assumptions that are rarely articulated. In this session, we attempt to bring these issues to the forefront of the discussion on research methodology. The presenters will attempt to enrich and challenge contemporary organizational theory, and illuminate the philosophical underpinnings of organizational research in general, and their own research in particular. In this workshop, we will hew close to the theme of the 2020 meeting, but do so critically. In capitalist society, firms are the hegemonic means of producing, appropriating, and distributing social labor. We will examine the way in which philosophical introspection can help organizations become more egalitarian, and broader in insight. We will also pay special attention to the manner in which the philosophical approaches under discussion inform and are informed by praxis. The session is conceptualized as being highly interactive and will involve substantial audience participation, rather than a symposium format.

Unsung Papers: Ideas That Got Away and Reflections from Their Authors (session 353)

For many scholars, their most successful papers according to standard metrics (e.g. citation count, prestige of the publication outlet) are not always one and the same with the papers they felt were their best. In this PDW (which is continuing in its second year), we offer participants the opportunity to hear from renowned scholars as they revisit what they feel is their most under-appreciated piece of work from their career thus far. Presenting scholars will share the main idea of the paper they chose, why they felt it was an important contribution, and why they suspect it didn't receive the accolades or generate the buzz that they expected. They will further expound on how others might learn from their experiences with "ideas that got away." What lessons, if any, can be gleaned about scholarship and recognition? Is there a way to ensure that good ideas do not fall through the cracks? To what extent are ideas in our field subject to the "slings and arrows of outrageous fortune"? Is recognition arbitrary, or is credit usually given where credit is due? Are there steps that authors or the field at large could take to make sure that good ideas are not overlooked? Participants are invited to explore these questions with a prolific and diverse group of scholars who have experience with this topic.

Capitalism and Deliberative Democracy (session 355)

[A Common Good Perspective on Deliberative Democracy in Business: Learning from Aristotle's Ethics](#)

Author: **Sandrine Frémeaux**; Audencia Business School

Author: **Christian Voegtlin**; Audencia Business School

Deliberative democracy has faced criticism with regard to its possible application to business, on the basis that deliberation can be misused in order to disseminate an ideology, to divert attention from genuine debates or to strengthen the power of certain people. We suggest that Aristotle's ethics of deliberation can mitigate these ethical risks, and can serve as the basis for a new perspective on deliberative democracy in business. A comprehensive common good perspective based on Aristotelian deliberation reveals the relevance of (i) both, individual and collective deliberation, promoting a virtuous, meaningful and authentic reflection that escapes ideological conditioning, (ii) deliberation on both, the ends and the means that facilitates a transcendental and rooted reflection, and (iii) deliberation that is both, open to a plurality of profiles and open to a plurality of ways of pursuing the common good and thus prevents instrumentalization of power by the strongest. We contribute to the emergence of a dynamic perspective on deliberation by identifying the different steps in the deliberative process and discuss how this can contribute to business sustainability and responsibility.

[The Good Fight: Constructive Conflict by Design](#)

Designated as a "Best Paper" for SIM

Author: **Cheryl Gladu**; JMSB, Concordia U.

Author: **Raymond L. Paquin**; Concordia U.

Author: **Rajshree Prakash**; John Molson School of Business, Concordia U.

Deliberative democracy has received growing attention in business ethics as well as in management and organization studies. We consider dialogue a central feature of democratic deliberation and examine the literature to better understand under what contexts dialogue is more likely to emerge, with the intent of understanding how it may be induced to facilitate effective deliberative processes. The nature of participants' engagement with one another is proposed as a moderator, with relational engagement as a predictor of the emergence of dialogue. For this view, we explore how participants in intentionally relational organizations, namely collaborative housing organizations, engage in dialogue as a key facet of managing and resolving conflict in pursuit of seeking consent or consensus. Our findings suggest that when relational engagement is controlled for, other mechanisms and processes contribute to the creation of a context that favors dialogue, namely self-selection, agonism, communication training, facilitation and a separate space for managing tensions. It appears that the commitment of working within consent/consensus seeking processes in the context of collaborative housing organizations has the ability to direct members towards creative deliberative processes that induce productive dialogue as tensions arise, and that this pursuit does not exclude agonistic outcomes and experiences.

Broadening our Sight to Rethink Capitalism: A Multi-level Stakeholder Approach

Author: Flore Bridoux; Erasmus U.

Author: Jan-Willem Stoelhorst; U. of Amsterdam

Market capitalism and the traditional narrative backing it up – namely, that market competition benefits individual freedom and collective welfare – are under attack. At a time where Western societies could either reject or transform capitalism, an alternative, stakeholder narrative of capitalism is taking shape that accepts individual freedom and collective welfare as societal objectives, but sees cooperation as the main engine of welfare, rather than competition. To ground this stakeholder narrative, we propose a multi-level theory starting from the fact that organizations must solve the collective action problems plaguing team production to contribute to welfare. Based on Ostrom’s work on collective action, we argue, first, that the rules-in-use governing team production are central to explain how much welfare an economic system creates. Second, we argue that the traditional narrative, as a higher-order institution, impedes collectives to develop rules-in-use according to Ostrom’s design principles, which are governance principles collectives should adopt to sustain cooperation. Our theoretical analysis shows, on the one hand, how the traditional narrative harms both welfare and individual freedom, and, on the other hand, allows us to derive propositions that, together, offer an alternative, stakeholder narrative of how market capitalism can achieve these goals.

Decolonizing Deliberative Democracy: Perspectives from Below

Author: Bobby Banerjee; City, U. of London

In this paper I provide a decolonial critique of received knowledge about deliberative democracy. The question of colonial difference has generally been overlooked in theories of democracy. These omissions challenge several key assumptions of deliberative democracy. I argue that deliberative democracy does not travel well outside Western sites and its key assumptions begin to unravel in resource extraction zones in the ‘developing’ regions of the world. The rationale for a decolonial critique of deliberative democracy is the violent conflicts over resource extraction between Indigenous communities, states and multinational corporations that are ongoing in the former colonies of Africa, Asia and Latin America. I argue that deliberative processes cannot take into account the needs of marginalized stakeholders who are defending their lands and livelihoods. Power asymmetries between key actors in the political economy can diminish the welfare of communities impacted by extraction. The paper contributes to the literature by (1) offering a critique of hegemonic models of democracy that cannot address issues of inequality and colonial difference and (2) offering possibilities to imagine counterhegemonic alternatives for a democratization of democracy from below.

Author: **Yu Yu**; School of Economics and Management Tsinghua U.

Author: **Kurt Gray**; U. of North Carolina, Chapel Hill

Cover-ups, attempts to hide evidence of one's own deviant behavior, are often worse than their precipitating acts of deviance. Deviance is the starting point for a chain of events that can lead to cover-ups, and existing research has accordingly focused on ways to reduce deviance. However, we argue that theoretical insight can be gained by moving beyond a focus on deviance reduction and towards a better understanding of the chain of events that occurs post-deviance. Specifically, we propose that deviance is associated with increased confessional silence, the withholding of information about one's own deviance from other organizational members, which in turn relates to cover-up behaviors. Further, we suggest that one deviance-reducing tactic commonly implemented by management—increasing organizational punitiveness—may actually increase cover-ups. The more punitive the organizational context, the stronger the association between deviance and confessional silence, and between confessional silence and cover-ups, respectively. We find support for the majority of our theorizing in a multi-wave field study of restaurant chain employees in China and a multi-wave study of working adults in the United States.

Battling Incivility: Increasing Willingness to Voice Through Amplification

OB Division Outstanding Practical Implications for Management Award, sponsored by Mercer Workforce Sciences Institute

Designated as a "Best Paper" for OB

Author: **Kristin Bain**; U. of Utah

Author: **Kathryn A. Coll**; U. of Utah

Author: **Elizabeth R. Tenney**; U. of Utah, David Eccles School of Business

Author: **Tamar Admati Kreps**; U. of Hawaii

Employees regularly face incivility, or disrespectful, low-intensity behaviors with ambiguous intent to harm (Andersson & Pearson, 1999), at work. Incivility has been linked to numerous negative outcomes for both organizations and individuals; one such outcome is employees' reduced willingness to voice new ideas or concerns. In the current set of studies, we investigate incivility's impact on willingness to voice and explore the effectiveness of amplification (public endorsement of another person's contribution in a group, with attribution to the original contributor) as an intervention. In two experiments (N = 2,188), we created an online chat group where participants brainstormed ideas with three peers (in reality, pre-programmed chat bots). We

manipulated the degree of incivility and amplification that the participants experienced in the group. Confirming our pre-registered hypotheses, results show that incivility decreases willingness to voice in future work interactions, but amplification restores it. Thus, we provide evidence that, even in groups plagued by incivility, a simple intervention could increase willingness to voice.

An Integrative Self-Control Framework for Unethical Behavior

Designated as a “Best Paper” for OB

Author: **Casher Belinda**; Kenan-Flagler Business School, U. of North Carolina at Chapel Hill

Author: **Michael Christian**; U. of North Carolina, Chapel Hill

Author: **Erin C. Long**; U. of Georgia

Author: **David Welsh**; Arizona State U.

Author: **Jerel Slaughter**; U. of Arizona

Advancements in theories of self-control have called into question several decades’ worth of management research (Kotabe & Hofmann, 2015; Lian, Yam, Ferris, & Brown, 2017). Central to these theories is the tenet that self-control is a process with multiple, interdependent points of potential failure. This puts organizational scholars in a difficult position, as most management research treats self-control as a single variable. We address this shortcoming by conceptualizing the multicomponent self-control process that culminates in unethical behavior. Our studies illustrate how an individual’s moral identity constitutes a higher-order goal that motivates them to utilize state mindfulness (a form of self-control capacity) to override the desire to cheat. Further, we illustrate how sleep—a naturally-occurring antecedent of state mindfulness—jump-starts the self-control process. In Study 1, we examine the mediating role of state mindfulness in the relationship between sleep quantity and cheating. In Study 2, we manipulate sleep quantity and introduce moral identity as a higher-order goal that directs state mindfulness—and thus self-control capacity—toward resisting the desire to cheat. Lastly, in Study 3, we manipulate state mindfulness and again demonstrate how moral identity operates as a higher-order goal that determines whether individuals utilize state mindfulness to restrain from cheating.

Newcomers’ Slippery Slope of Unethical Pro-Organizational Behavior: The Normalization Perspective

OB Division Best Paper Award

Designated as a “Best Paper” for OB

Author: **Zhaopeng Liu**; Antai College of Economics and Management, Shanghai Jiao Tong U.

Author: **Chao Chen**; Rutgers U.

Author: **Zhen Zhang**; Southern Methodist U.

Author: **Mo Chen**; U. of Science and Technology of China

Drawing on the normalization theory of organizational corruption and the social cognitive theory, we develop and test a psychological normalization model of the slippery slope of unethical pro-organizational behavior during newcomers’ socialization process. Specifically, we hypothesize that instrumental ethical climate in workgroups sets the initial level and affects subsequent escalation of newcomers’ unethical pro-organizational behavior through the serial mediation effects of organization-serving cognitions and moral disengagement. We further expect that these mediated relationships are enhanced by higher strength of instrumental ethical climate. Based on a four-wave longitudinal study of 151 newcomers during their first four months of employment, our results support most of the hypotheses. These findings shed important light on the pivotal

role played by socialization agents like veterans on the immoral acts of newcomers.

From Implementation to Confirmation of Gender-Responsive Budgeting: The Case of Austria

Designated as a "Best Paper" for PNP

Author: **Tobias Polzer**; U. of Sussex Business School

Author: **Johann Seiwald**; Parliamentary Budget Office, Federal Parliament of Austria

The paper proposes a framework for studying the adoption of gender-responsive budgeting (GRB), drawing on Rogers' model on the diffusion of innovations. We analyse the adoption of the Austrian GRB through document analysis of regulatory gender impact assessments and audits since their first implementation in 2013. Results highlight the significant impact of the development context (such as the constitutional anchoring, the preparation plan and methodological guidelines) on the implementation results. Implementation stage and confirmation of GRB varies across government sectors. The study complements the extant literature on GRB – that often has a normative and practical focus – with a contextualized study of the outputs of a GRB approach. The analysis shows that 'implementation' and 'confirmation' are interdependent stages which are path-dependent, rather temporary in nature and multifaceted (as evidenced by different manifestations and traces across sectors, organizations and documents). In order to succeed, the commitment by administrative and political leadership, and civil society are regarded as crucial.

Psychological Contracting Making Obligations Explicit to Support a Transformative Change Partnership

Designated as a "Best Paper" for PNP

Author: **Nicola Jane Burgess**; Warwick Business School

Author: **John Richmond**; U. of Sheffield

Author: **Tina Kiefer**; Warwick Business School

The psychological contract comprises the implicit perceptions of mutual obligations that two parties hold towards each other. We examine the creation and maintenance of an explicit psychological contract designed to facilitate a new relationship between senior representatives of five hospitals and senior representatives of their regulator. This 'new deal' was created to implement new routines and practices with the aim of transforming the quality and efficiency of care delivery in the NHS. A co-created explicit psychological contract clarified the behavioural principles which were to guide the collaboration. We build on Rousseau et al.'s (2018) dynamic phase model of the psychological contract, and use a sensemaking and sensegiving lens to explore the processes related to creation and maintenance of the explicit psychological contract. We draw upon 53 hours of observation and 52 interviews, observed over a period of twenty-four months. Our data evidences how events can disrupt the established psychological contract and how subsequently, both parties attempt to use the disruption to reinstate the relationship. We propose that these disruptions occur because the explicit psychological contract has become implicit, thereby a disruption can serve to pull the psychological contract back into the consciousness, reinforcing the values originally agreed.

How Does Policy Alienation Develop? Exploring Street-Level Bureaucrats' Responses to Policy Context

Designated as a "Best Paper" for PNP

Author: **Danielle Tucker**; U. of Essex

Author: **Jane Hendy**; Brunel Business School

Policy alienation exists when public professionals feel they have little influence on policy implementation (powerlessness), or when they feel a policy is meaningless. Previous research has shown that policy alienation reduces behavioural policy support. Using a processual approach to understand context and agency in an eight-year study, we theorise how policy alienation develops. In the organizational negotiation of policy enactment, the organization can become powerful in determining how meanings and actions are interpreted. We argue that, over time, internal and external contextual shifts alter employees' perception of policy. Powerlessness develops when roles are redefined favouring an externally driven agenda. Meaninglessness develops when shared narrative devaluation leads to changes in internal organization relationships. Street level bureaucrats' responses to alienation play a crucial role in the iterative development of policy alienation.

Broadening our Sight Beyond Growth: Applying Degrowth for Organizing Business in the Anthropocene (session 361)

In the course of the last century, the growth imperative has come to dominate the priorities of scholars, policy-makers, and ordinary citizens. The assumption that economic growth is an absolute requirement of the global political economic system is so entrenched that it is rarely questioned by mainstream economists (Daly, 2013) and is perhaps even more taken for granted in the field of organizational and management studies. This is a dangerous narrowing of our collective field of vision and makes thinking in economic alternatives for organizations and organizing next to impossible. At the same time, this narrow, growth-centered vision of how economies work and how business operates has become increasingly unsustainable. Rampant climate change and approaching planetary boundaries (Rockström et al. 2009) are signifiers of what is termed the "anthropocene", our current geological era in which the impact of humanity on its social ecological system dominates over natural forces with potentially destructive consequences (Reichel & Perey 2018). This PDW is continuing the conversation at the AOM conferences on alternatives to growth and overcoming the shortsightedness of the managerial disciplines. By applying the concept of degrowth (Latouche 2004, 2009) we seek to focus this year especially on how to organize new collectives of transformative practice through connecting business with civil society and local governance institutions (Shrivastava & Kennelly 2013). Emphasis will be laid on collaborative visioning and strategizing beyond a singular economic logic while taking into account various belief systems and their local embeddedness into social and ecological contexts.

Although this PDW does not require any registration, we encourage you to visit <https://degrowthaom.wordpress.com/> for background information and updates on the themes of our workshop.

What Does it Take to be Open? Sustaining Openness Through Closure in Open Organizing Initiatives

SAP Best Paper Award

Designated as a "Best Paper" for SAP

Author: **Damla Diriker**; Vrije U. Amsterdam

Author: **Amanda Porter**; Vrije U. Amsterdam

Author: **Philipp Tuertscher**; Vrije U. Amsterdam

A growing number of organizations pledge to ideals of openness in their organizing processes. However, such attempts to increase openness through greater inclusion and transparency often fail in practice. Using the constitutive view of openness, we seek to unravel how the interaction between modes of openness and closure shapes open organizing as it unfolds over time. Analyzing an award-winning open organizing initiative, we show how four types of legitimate closures are used to increase and sustain openness across time. Against these observations, we propose a process model of punctuated openness, in which open organizing is characterized by a combination of both open and closed modes that generate and sustain desired levels of inclusion and transparency over time.

Temporal Tensions in Human Space Flight: NASA's Practices for Managing Long-term Strategic Change

SAP Best Student Paper Award

Author: **Christina Angelika Wawarta**; Warwick Business School

Author: **Loizos Th. Heracleous**; U. of Warwick

Author: **Sotirios Paroutis**; Warwick Business School

Frequent strategic change in industries with long research and development as well as implementation timelines can negatively impact organizational performance, since products may never reach their maturity phase and enter the market. Through an in-depth case study of NASA's long-term human exploration activities, which frequently face uncertainty and strategic change, we reveal how the Johnson Space Center built a new capability for managing temporal tensions over a 60 year timeframe. Building on this, we develop a process model that shows how temporal practices in settings of long-term strategic change initiatives are subject to temporal and strategic fit assessments that determine whether the outcomes of these initiatives are facilitated or inhibited. Implications for the literature on strategic management and time are discussed.

Mindful Ambidexterity: An Ethnographic Study of How Managers Navigate Exploitation and Exploration

SAP Best Practice-Oriented Paper Award

Designated as a "Best Paper" for SAP

Author: **Kate Booth**; Macquarie U.

Author: **Layla Jayne Branicki**; Macquarie U.

Author: **Richard John Badham**; Macquarie U.

Ambidextrous organizations outperform other firms by successfully navigating the contradictory demands of exploitation and exploration. Yet, how ambidexterity is achieved in practice remains unclear, with research to date emphasizing the pursuit of ambidexterity via structural specialization, temporal switching and outsourcing/external partnering. In contrast, less research has examined how organizational ambidexterity unfolds in practice and the daily managerial challenge of reconciling exploration and exploitation. Separately, recent theorizing suggests a link between collective mindfulness and organizational strategy. Building on this research, we critically evaluate the possible contributions of collective mindfulness for both theorizing and achieving ambidexterity in practice. We draw on a longitudinal ethnographic study of a service firm's pursuit of an ambidextrous strategy to explore how collective mindfulness contributes to ambidexterity. We ask: How do the social processes of collective mindfulness help managers to anticipate and contain the challenges and tensions inherent in pursuit of organizational ambidexterity? In so doing, we extend understanding of the role played by the social processes of collective mindfulness in ameliorating the contradictions and social tensions experienced by firms in the pursuit of ambidexterity. We inductively theorize relationships between collective mindfulness and ambidexterity, highlighting previously untheorized connections, and propose "mindful ambidexterity" as a new qualitative construct.

Sustenance Through Liberation: Vinyl Record Manufacturing After Disruption and Before the Hype

SAP Pushing the Boundary Award

Author: **Rene Wiedner**; Warwick Business School

A technology may generate value after it has been disrupted. Yet, we lack knowledge concerning how a disrupted technology can be sustained when a lucrative consumer market or other financial incentives are absent. Based on a qualitative study of developments concerning vinyl record manufacturing following the successful commercialization of the digital compact disc, I develop a liberation-based model of technology sustenance that highlights how a manufacturing process can become attractive and accessible to a growing number of amateurs. This model, which is informed by a practice-theoretical understanding of technology, comprises the liberation of the technology's use from established meanings, as well as the liberation of specialized materials and competences from the control of a small and declining number of operators and use in specific environments. My analysis suggests that these forms of liberation require amateurs to gain appraisal respect, exploit opportune moments and engage in technological innovation. These findings contribute to an understanding of technology trajectories that, in contrast to the strategy literature, is not directly dependent on end-consumer demand or other financial incentives. They also increase our awareness of the potential role of amateurs in shaping technology trajectories and have implications for the custodianship of practices more generally.

TIM

Open Innovation: TIM Conversations - Consumer and User Innovation (session 366)

Co-Creating Demand: Affective and Cognitive Dynamics in the Consumer Co-Innovation Process

Author: **Gerda Gemser**; Faculty of Business and Economics, U. of Melbourne

Author: **Giulia Calabretta**; Delft U. of Technology

Author: **Ingo Karpen**; RMIT U.

Consumer co-innovation is evolving into an important avenue for organisations to leverage external knowledge. However, knowledge on the effective management of consumer co-innovation is lacking. This is problematic since innovating with consumers may be challenging due to varying levels of commitment, skills, and motivations, which have cognitive and affective foundations. In innovation literature, however, the cognitive, rational underpinnings of innovation behaviour are foregrounded, relative to affect, which limits explanatory capacity for effective co-innovation with consumers. Drawing on 83 in-depth interviews with designers, managers, and consumers involved in co-innovation, in situ observations, archival data, and focus group discussions, we introduce an integrative process model of consumer co-innovation. We identify eight constituent and recursive co-innovation activities, which aggregate into three phases of the co-innovation process: co-creating context, content, and convergence. We furthermore unpack affective and cognitive dynamics that concurrently condition the effectiveness across the consumer co-innovation process. Our integrative process model offers important insights into the complementary yet understudied role of cognition and affect, while providing concrete pathways for organisations seeking to renew their innovation process with a focus on leveraging the organisation's external consumer resource base.

The Stage is Yours – How to Involve Customers in Multiple NPD Stages

Author: **Caroline Kettner**; TU Dortmund U.

Author: **Oliver Burger**; TU Dortmund U.

Author: **Tessa Christina Flatten**; TU Dortmund U.

At the interface of innovation and marketing literature, scholars discuss the effects of customer involvement on new product performance. Influencing factors seem to be the stages of firms' new product development (NPD) processes. However, to date, the effectiveness of customer involvement in NPD stages is unclear, since research disagrees on the NPD stage in which customer involvement enhances new product performance most. Given the fragmented and inconclusive research findings, this study aims to shed more light on the ongoing debate. It introduces a new perspective on how customer involvement drives new product performance by integrating a multi-stage perspective with different customer involvement forms. Based on the customer involvement framework developed by Cui and Wu (2016; 2017), we examine the influence of two different customer involvement forms along the NPD process stages on new product market performance. Thereby, we utilize cross-sector survey data from 272 NPD managers and hierarchical regression analysis to unravel that the success pattern for customer involvement along multiple NPD stages differs for both investigated forms. Thus, this study highlights the importance of the stage-related perspective and the need to distinguish between different customer involvement forms.

Experimental Evidence on Adoption Bias and Legitimacy Strategies for Pure User Innovations

Designated as a "Best Paper" for TIM

Author: **Daniel Ehls**; Helmut Schmidt U.

Author: **André Schorn**; Hamburg U. of Technology

Author: **Cornelius Herstatt**; Hamburg U. of Technology

Recent research in open and user innovation has shown that users, as well as households, significantly contribute to improving existing products and may even innovate completely new solutions which better correspond to their unfulfilled needs. But many, if not most of these, remain unknown to the public and research on household sector innovation shows that these inventions often fall short when it comes to their diffusion to potential customers. With this study we aim to contribute to a better understanding of the reasons for this lack of diffusion beyond known aspects. To do so, we particularly address and analyze the effect of the perceived product origin on consumer adoption decisions. Based on two randomized experiments within the household sector, building on legitimacy theory, our study reveals significant differences in the acceptance for identical products, dependent on whether they are introduced as pure user innovations or products from an established firm. We can show that pure user innovations cause adoption bias and, therefore, represent a barrier for diffusion in the general population. However, when user innovators employ certain practices, their innovations are significantly more likely to be adopted and are even on par with incumbent products. Thus, user innovators can apply certain legitimacy strategies to overcome this adoption bias. We test variations in these best practices and show how user innovators can stimulate adoption of their solutions. Our findings contribute novel and relevant implications for the diffusion of household innovations, co-creation and user entrepreneurship, and provide avenues for future research.

Patients and Informal Caregivers as Healthcare User Innovators

Author: **Pedro Oliveira**; Copenhagen Business School

Author: **Leid Zejnilovic**; NOVA School of Business and Economics

Author: **Helena Canhao**; NOVA Medical School

Patients, as well as their informal caregivers, often develop new innovative solutions to help them cope with their health disorders. This activity might increase and improve the availability and diversity of health solutions, decrease costs in healthcare, and improve individual well-being and social welfare. Despite its growing importance, little is known about the factors contributing to the process. Also, peer adoption of the solutions developed by patients or caregivers has not been studied. Given easy access to vast internet resources and peers globally, it is increasingly important to understand what may influence user innovation and its adoption in health, for improving individual well-being and ensuring their safety. In particular, how interactions with peers, with physicians, or search behavior, along with socio-demographics, may influence the decision to develop a solution or adopt one developed by a peer. In this paper we investigate the development of user innovations in healthcare (by patients and their caregivers), as well as the adoption by other patients, and identify individual-level factors associated with these processes. A large, random, and representative sample of adult residents in Portugal of over 6200 respondents was collected via computer-assisted phone survey. 1.3% of the respondents reported having developed a solution for own use and 3.3% reported to have adopted a solution developed by another patients. Three groups (Developers, Adopters, Remaining population) has distinctive characteristics. Gender plays an important role in the solution development, as women are less likely to develop one. Education is positively associated with the development activity, but also with the intentions to adopt a peer-developed

solution. Search for health-related information is positively associated with the development, adoption, and the intentions to adopt a solution. Interactions with peers over the internet and rare, but in-person interactions are frequent and have positive association with the dependent variables in all three groups. The results also suggest that the trust in doctors represents an important dimension that shapes the attitudes of the population towards peer-developed solutions. The study has important implications for the practice and theory.

Appropriation, Translation, and Implementation: From Evidence to Practice (session 1265)

Appropriating Management Tools in Health Care as Legitimate Sociomaterial Work

Author: **Élizabeth Côté-Boileau**; U. of Sherbrooke
 Author: **Linda Rouleau**; HEC Montreal
 Author: **Jean-louis Denis**; U. of Montreal
 Author: **Mylaine Breton**; U. of Sherbrooke

In recent years, a longstanding research agenda has developed around the appropriation of management tools to tackle the journey and impact of tools in contemporary healthcare organizations. Management tools are defined as sets of technologies, processes and technical or synthetic systems that are used to guide collective action. Drawing on an extensive literature review, we found that prior and existing work on the appropriation of management tools has traditionally focussed on three theoretical perspectives: rational, psycho-cognitive and socio-politic. While this body of research offers valuable insights by exploring diverse aspects (rational, psycho- cognitive, socio-politic) of appropriation, it neither theorize how these aspects fit together, nor goes beyond these specificities to provide a comprehensive theoretical definition of appropriation. Moreover, these perspectives do not seriously take into account the material (non-human) agency of management tools, the institutional contexts in which they are implemented and the purposeful efforts provided by managers and others in the process of their appropriation. Yet these aspects are far more important when these management tools are enacted in healthcare organizations. In this paper, we argue that there is a need to overcome the traditional perspectives on appropriation of management tools with a comprehensive and appropriate theoretical definition of this concept adapted to the empirical realities of healthcare organizations. Building on insights gained from prior work and calls for further research, we explore the potential contribution of three frameworks for addressing the theoretical gaps mentioned above: sociomateriality, institutional theory and work

HCM

Leadership, Staffing, and Health Care Performance (session 1266)

Coping with Hybrid Managers' Attributes Throughout Physicians Performance Management

Author: **Beata Buchelt**; Cracow U. of Economics

Although physicians are strategic employees in hospitals, there is still a visible lack of investigative research towards the issue of their management. This paper aims to explore the physicians' performance management (PM) practices from the perspective of hybrid managers. Due to the nature of the area of research, a multiple case study approach was adopted. The results of the study reveal that professional attributes of medical doctors who perform managerial roles are exposed within the PM practices they execute. This phenomenon should not only be encountered by managers responsible for hospitals, but investigated more comprehensively in regards to other managerial practices.

[view paper \(if available\)](#)

Uncover the Black Box of Nurse Slack-Performance Relationship

Author: **Xiaosong Peng**; U. of Houston
 Author: **Yuan Ye**; California State U. Sacramento

This research explores the fine-grained relationships between nurse slack and hospital operating performance with respect to care quality and operating costs. We also investigate the effect of competition in local hospital markets on these relationships. Our analyses lead to several important findings: First, nurse slack initially is associated with improved care quality (measured by 30-day readmission rates) until it reaches a turning point, beyond which nurse slack is associated with worse care quality, exhibiting a U-shaped relationship. Second, a similar pattern applies to the relationship between nurse slack and operating costs, although the turning point is at a much lower nurse slack level. Third, market competition

studies in organization theory. We hypothesize that the aggregation of these theoretical lenses will help to conceive the appropriation of management tools in health care as “legitimate socio-material work”. This paper offers theoretical and practical insights in support of a new organizational scholarship to rethink the empirical and emerging problem of unanticipated effects of management tools in healthcare organizations.

[view paper \(if available\)](#)

Using Organizational Theory to Explain ‘How’ EBP Implementation Occurs in HCOs (WITHDRAWN)

Author: **Pavani Rangachari**; Augusta U.

Despite increasing use of theory in the field of implementation science over the past decade, the literature has largely focused on using deterministic frameworks to retrospectively understand ‘what’ factors are essential for effective implementation of evidence-based practices (EBPs). On the other hand, gaps remain in using organizational theory to prospectively understand ‘how’ successful EBP implementation occurs in healthcare organizations (HCOs). This paper discusses the theoretical and empirical contributions of two selected recent exploratory research works, which provide a starting point for addressing the identified gaps in the literature, with the purpose of deriving implications for theory, practice, and research in implementation science. The selected works used the theory of ‘effective knowledge sharing network structures in professional complex systems (PCS),’ developed through an integration of organizational theories, to design prospective interventions for enabling EBP implementation in HCOs. In doing so, these studies have helped explain ‘how’ inter-professional knowledge exchange and collective learning occurred, to enable successful EBP implementation in HCOs. Correspondingly, the selected works have served a dual purpose in 1) identifying evidence-based management practice strategies for successful EBP implementation, while 2) further developing the theoretical literature on ‘effective knowledge sharing networks in PCS.’ Importantly, by addressing the identified gaps in the literature, the selected works serve to either complement or supplement existing theoretical approaches in implementation science. To this effect, they provide

moderates the relationship between nurse slack and care quality so that the turning point of nurse slack will be higher when the degree of competition is higher. This shift of turning point is also observed in the relationship between nurse slack and operating costs. Collectively, the study findings point to three ranges of nurse slack in which hospitals will likely experience simultaneous improvements, a tradeoff, or simultaneous decline of care quality and operating cost when investing in more nurse capacity.

unique insights for theory, practice, and research in implementation science, including insights into a potential 'dual-role' for the future implementation researcher—one of advancing implementation science, while working to strengthen implementation practice. Based on these contributions, it could be argued that the selected works provide a starting point for a new research stream that has potential to occupy a distinct position in the taxonomy of theoretical approaches used in implementation science.

Beyond Barriers: Organizational Implementation Processes Shaping Technology Innovation Outcomes in H

Author: **Yiannis Kyratsis**; Vrije U. Amsterdam

Author: **Harry Scarbrough**; City U. London

Author: **Raheelah Ahmad**; Imperial College London

Author: **Alexandra Ziemann**; City, U. of London

Healthcare systems and organizations have been slow to adopt and implement many effective clinical, administrative and technological interventions. Understanding the factors that determine successful implementation in healthcare organizations is essential to accelerating the translation of effective interventions into practice. We report on a field study investigating 34 technology implementation journeys in infection prevention and control across 12 NHS Trusts. All hospitals studied operated in the same policy and institutional environment of the National Health Service in England, had comparable reputation and patient outcomes in infection management, and were provided with similar funding by the Department of Health with free reign to select and implement technologies to help them tackle healthcare associated infections. Yet they exhibited striking differences and considerable variance in implementation success. Even within the same Trust there was success in some cases and failure in others. The same technology failed to be implemented in some cases, yet implementors succeeded in others. The implementation of relatively simple technologies failed, while significantly more complex technologies were successfully put into use. Analysis of qualitative data suggests a number of situated factors at individual, organizational and collective levels that shaped

implementation processes and differentiated between successful and unsuccessful outcomes. Applying Qualitative Comparative Analysis, we singled out among other factors that a more organic and bottom up approach was linked to significantly higher levels of success. User feedback, involvement in technology selection, participation in trials and customization was linked with semiotic, political and technical implementation advantages that determined successful outcomes.

Organizational Identity Comparison, Organizational Identification, and Organizational Commitment (session 1281)

The present symposium brings together multiple approaches on organizational identity comparisons and important individual-level outcomes, such as organizational identification and a wider range of phenomena. From the presentation of four different contexts, methodologies, and approaches, this symposium promises to highlight opportunities and limitations of using organizational identity comparisons in identity research. In a final discussion, David Whetten will share his thoughts, reactions, insights, and concerns, along with suggestions for moving forward, both methodologically and theoretically.

The Costs and Benefits of Making Moral Claims in Organizations (session 1279)

Past research has established that moral hypocrisy is damaging for individuals, leaders, and organizations (Effron, O'Connor, Leroy, & Lucas, 2018; Jordan, Sommers, Bloom, & Rand, 2017). However, moral consistency is not achievable in every circumstance; therefore, some level of hypocrisy is often inevitable. Since moral communication can still have many favorable consequences (Zlatev & Olivola), more work is needed to understand how individuals and institutions can communicate moral norms without incurring the penalties of perceived hypocrisy. This symposium features four papers that present novel insights on the costs and benefits of making moral claims in interpersonal, organizational, and political settings. We refine the current understanding of moral hypocrisy by identifying additional costs of renegeing on moral views (i.e. Kreps & Chambers), documenting the intergenerational consequences of organizational inconsistencies (Lucas, O'Connor, Effron, & Berry), and highlighting some unexpected benefits to endorsing moral values that one fails to uphold (Huppert, Herzog, Landy, & Levine). Taken together, these four papers offer a more nuanced view of both the downsides (Kreps & Chambers; Lucas et al.) and upsides (Huppert et al.; Zlatev and Olivola) of taking firm stances on moral issues, even

What It Is to Be Human at Work: Philosophical and Empirical Exploration of Workplace Humanization (session 1280)

It is ironic that people feel more and more lonely, anxious, and depressed when we have so many gadgets and ways to help us connect with others. We imagine that the psychological and existential suffering and pain that many suffer today arises from the dehumanizing conditions of their work lives. Therefore, the purpose of this symposium is to focus scholarly attention on the question of how to re-humanize the way we think about ourselves and, importantly, how to re-humanize modern

Internal and External Career Mobility (session 1251)

Skillsets, Coordinative Capabilities, and Employment Outcomes in the U.S. Civil Service

Author: **Joshua Robert Bruce**; U. of Illinois at Urbana-Champaign

What makes a person's skillset valuable? Many scholars have focused on a generalist-versus-specialist theoretical framework. Rather than focusing on skill breadth, this paper theorizes that skill-based linkages between employees are a core mechanism in human-capital driven career outcomes. Specifically, as an employee becomes

workplaces. This symposium will bring together scholars to present their work that provides invaluable insights on what it is to be human and how to recover the lost humanness in the organizational context. This symposium will also include an interactive session designed to uncover important new research questions that we hope will stimulate further interest in workplace humanization within the study of management.

more connected to the knowledge held by their coworkers, this focal employee is hypothesized to experience higher levels of downstream pay. Counteracting this connectivity benefit is a redundancy cost; as the focal employee's coworkers share more knowledge between themselves, the focal employee is less necessary to coordinative success. The theory is tested using an administrative dataset covering over 28,000 civil servants in the U.S. government from 1979-2014. Results confirm the hypotheses, and marginal effects estimation is used to investigate when greater skillset connectivity most benefits civil servants throughout their careers. Limitations, generalizability, and future research directions are discussed.

Downward Occupational Mobility and Subjective Well-Being: When Does it Hurt Less?

Author: Ying Zhou; U. of Surrey

Author: Min Zou; Henley Business School, U. of Reading

Author: Mark Williams; Queen Mary U. of London

Downward occupational mobility is a generally under-explored subject in career research despite its widespread occurrence. This study investigates the impact of downward occupational mobility on job satisfaction trajectory and the individual and contextual factors that moderate such impact. Drawing on a UK longitudinal sample of 10,000 individuals from 5,500 households followed over eighteen years, our analysis shows that downward occupational mobility has significant and enduring effects on job satisfaction following the transition. However, these detrimental effects are absent when individuals make downward career transitions after a spell of unemployment or when they live in regions with high unemployment rates. These results are likely to reflect the influence of self- and social comparisons, as individuals tend to evaluate their current jobs relative to their past career trajectory as well as other people's labour market experiences. This study highlights the relativity of individuals' well-being functions. It appears that no life event is simply 'good' or 'bad' for subjective well-being, as the meaning of the event is shaped by an individual's life course and social environment.

Do Global Careers Pay? Implications of International Moves Within and Between Firms

Author: **Matthew James Bidwell**; U. of Pennsylvania

Author: **Giovanna Capponi**; Copernicus Institute of Sustainable Development, Utrecht U.

Author: **Isabel Fernandez-Mateo**; London Business School

Author: **Martine Haas**; The Wharton School, U. of Pennsylvania

Many individuals move internationally during their careers, yet we know little about how these moves affect career outcomes. Prior research has suggested potential benefits and costs of international moves, but it has generally focused on single expatriate assignments rather than multiple moves, on psychological or short-term promotion outcomes rather than longer-term rewards, and on moves within rather than between firms. We overcome these limitations by utilizing a unique dataset on the careers of MBA graduates to examine the relationship between different international moves and economic compensation. Our findings reveal this relationship to be positive and driven by moves that occur within firms, later after MBA graduation, and to countries other than those of birth. We did not find any significant effects of international moves between firms or gender differences in the effects of these moves. We also find that the positive relationship between international moves within firms and current compensation is more consistent with a selection mechanism - i.e. stronger performers are more likely to move - than with a treatment mechanism through which movers gain experience or status that subsequently proves valuable to them. We discuss the implications of these findings for theory and practice.

My Manager Moved! Manager Mobility and Subordinates' Career Outcomes

Author: **Minseo Baek**; The Wharton School, U. of

Pennsylvania

Author: **Matthew James Bidwell**; U. of Pennsylvania

Author: **JR Keller**; Cornell U.

How do managers' moves across jobs affect the subordinates they leave behind? Manager mobility disrupts established manager-subordinate relationships, as subordinates must now learn to work with a replacement. We explore how this relational disruption affects subordinates' objective career success – specifically their financial rewards and subsequent promotion chances. We argue that manager mobility may have both positive and negative implications for subordinate outcomes. The absence of an established relationship may reduce subordinates' performance and managers' propensity to reward them; on the other hand, relational disruption may make subordinates more willing and able to seek out valuable opportunities elsewhere in the organization. We also argue that these effects are likely to be greatest for those subordinates who performed best under the previous manager. Using eight years of personnel data of employees working in the US offices of a Fortune 500 healthcare company, we show how managers' mobility leads to a decrease in subordinates' financial rewards, but an increase in promotion prospects. Contrary to our expectations, these outcomes are little affected by how subordinates performed under their prior manager, with those who were performing well seeing similar changes to those who were performing poorly.

Leaps of Faith: Cross-Industry Mobility, Industry Status, and Executive Compensation

Author: **Halil Ibrahim Sabanci**; IESE Business School

Author: **Marta M Elvira**; IESE Business School

This study examines how and why the compensation change for cross-industry moving executives differs from that of executives who change jobs within the same industry. To understand the relationship between cross-industry job movements and compensation, we conceptualize the job-candidate fit as an interpretative process that is influenced by the social judgements of both supply (candidate) and

demand (recruiter) sides and which, in turn, affects compensation outcomes. Drawing on the categorization literature and conceptualizing industry as a categorical lens, we argue that mobility to a different industry leads to a reduction in the expected compensation premium due to the categorical confusion experienced by recruiters. We also hypothesize that the cross-industry penalization is moderated by industry status, such that the penalty is more severe if the executive moves from a low-status industry to a high-status one. Findings from the compensation evolution for executives in S&P 1500 firms support both the baseline and the moderation hypotheses. Besides the theoretical implications on the role of industry boundaries in executive job markets, the results also contribute what to date might be the first empirical indication that industry status impacts compensation outcomes of external job mobility by providing a non-pecuniary employment benefit that is exchanged for monetary rewards.

Understanding Work-Life Interface in the Global Context: A Cross-Culture Discussion (session 1252)

As workforce and family structures change, as well as the nature of jobs, work-life issues are of increasing importance to both scholars and society. Work-life issues have been studied across countries, though the results have not always been consistent across countries. Thus, a better understanding of work-life issues, such as the sources and consequences of work-life balance/conflicts and an individual's coping strategies in the global context, is still needed. Additionally, the impact of globalization on organizations and individuals must be further scrutinized in order to garner a better understanding of the most effective work-life balance initiatives for decreasing the negative consequences of work-life interference on behaviors, attitudes, and well-being, and for

2019), covering its definitions, measurements, antecedents, outcomes, and moderators. First, we analyzed the 16 different definitions, provided a conceptual clarity of OCM and offer a new definition of OCM. Second, we briefly reviewed more than 20 kinds of OCM measurements and evaluate 5 widely used measures as the main reference, explain why so many different measurements exist and make a distinction between OCMP (measurement at the organizational level) and POCM (measurement at the individual level). Third, we sort the outcomes, antecedents, and boundaries into different categories, map the theoretical and nomological network of OCM try to explain why conflicting outcomes exist and what else should we do to enhancing the understanding of OCM. Finally, we give some future directions based on preliminary reviews.

Profiles of Weekly Career Self-Management and their Relation to Career Resources and Stressors

Author: **Francisco Wilhelm**; U. of Bern, Work and Organisational Psychology

Author: **Andreas Hirschi**; U. of Bern, Work and Organisational Psychology

Dynamic behavioral processes lie at the center of career self-management (CSM). In this study, we explore a novel approach towards understanding such processes by integrating a person-centered with a short-term longitudinal perspective. We suggest that previous research of CSM has not comprehensively examined how CSM may be characterized by combinations, or profiles, of co-occurring behaviors and how such profiles may differentially relate to career resources and stressors. Using multilevel latent profile analyses on 469 weekly responses of 95 employees, we find that weekly CSM behaviors (i.e., learning, networking, self-exploration and environmental exploration) form qualitatively and quantitatively distinct profiles, that these profiles dynamically change on a week-to-week level, and that membership in these profiles can be predicted by career resources and stressors (i.e., career self-management self-efficacy, job insecurity, and high-activation pleasant affect). We explore the theoretical and practical implications of our findings in the context of the dynamics of career

managing cross-national careers. This panel symposium intends to provide scholars with insights regarding work-life research in a global context. Discussions will focus on, but are not limited to, the influences of cultural value, government policies, and cross-national careers on the work-life interface.

Antecedents of Career Self-Management: Home-Country and International Careers in Kuwait (WITHDRAWN)

Author: **Ikhlas A H Abdalla**; Kuwait U.

Author: **Awad M. Alzufairi**; Kuwait U.

The purpose of this paper is to examine how leadership aspiration mediates the effect of career self-efficacy on employees' engagement in career self-management (CSM; i.e., deployment of career advancement strategies concerning access to power, psychological boundaryless and self-promotion), whether self-efficacy directly influences CSM, and whether these relations are conditional upon nationality (which is a proxy for domestic and international careers in Kuwait). A questionnaire was completed by 615 highly educated young Kuwaitis and self-initiated expatriates (SIEs; Arab and South Asian nationals) working in Kuwait. The results demonstrate that self-efficacy, directly and indirectly (mediated by leadership aspiration), influences the three types of career advancement strategies. Moderated-mediation analyses suggest that SIEs and Kuwaitis engage in similar CSM behaviors when it is motivated by self-efficacy, which is mediated by leadership aspiration. Also, self-efficacy has greater direct effect on SIEs' CSM than Kuwaitis', but Kuwaitis have higher tendency for CSM behavior. It is suggested that interventions aiming to improve employees' engagement in CSM may focus on enhancing their psychological capital and contexts, while minding the differential effects of nationality and self-efficacy on CSM of Kuwaitis and SIEs. The study provides unique information about CSM utilizing understudied populations namely, Middle-Eastern and self-initiated expatriate employees. It confirms the effects of self-efficacy and leadership aspiration on CSM and reveals different effects of nationality depending on the motivators at play.

How Career Exploration Affects Employment Outcomes: A Two-wave Study among Chinese Young Adults

Author: **Lu Xin**; Beijing U. of Chemical Technology
Author: **Sixue Zhang**; Beijing U. of Chemical Technology
Author: **Fangcheng Tang**; Beijing U. of Chemical Technology

The careers landscape has changed remarkably over the last few decades due to the fast-changing employment patterns. Employees nowadays play an increasingly active role in career development. Based on social cognitive career theory, this study examined whether career success criteria clarity and career decision-making self-efficacy mediate the relations of career exploration to employment outcomes (career satisfaction and person-job fit) and the moderation effect of family socioeconomic status in the relationship between career exploration and career success criteria clarity. Results based on a two-wave survey of 239 Chinese young adults showed that career exploration correlated positively with career success criteria clarity, career decision-making self-efficacy, career satisfaction, and person-job fit. In addition, career success criteria clarity and career decision-making self-efficacy were shown as key mediators for the relationship between career exploration and employment outcomes. Moreover, career success criteria clarity is more strongly related to career exploration when family socioeconomic status is lower. These findings advance the current understanding of social cognitive career theory and carry practical implications for both the career educators and consultants.

The Implications of Power and Hierarchy (session 1253)

Threatened and Unreceptive: How Hierarchical Threat Affects Leaders' Incorporation of Others' Input

Author: **Ingvild Müller Seljeseth**; Kristiania U. College

GDO

Increasing Diversity in the C-Suite: Europe, U.S., the Caribbean, India, and Australia (session 1262)

Advocates for diversity and inclusion (D&I) have long had their eyes on corporate boards and the C-Suite. Increasing the diversity of senior leadership in major business corporations is a major step toward achieving the vision of equitable representation

Author: **Mehrad Moeini Jazani**; Groningen U. (RuG)

Author: **Miha Skerlavaj**; U. of Ljubljana, School of Economics and Business

Author: **Bob Fennis**; Groningen U. (RuG)

Author: **Luk Warlop**; KU Leuven & BI Norwegian Business School

Building on functional theories of leadership, we propose that a context of hierarchical threat influences leaders' incorporation of others' input. In one experiment and one multi-source, cross-lagged field study we investigate when and why hierarchical threat affects leaders' incorporation of others' input. First, we show that, relative to hierarchically non-threatened leaders, threatened leaders are less likely to incorporate inputs (experiment and field study). Second, we investigated the mechanisms for this relationship by using a dual-path model. In line with our prediction, we found that leaders' devaluation of followers' competence mediated the relationship between leaders' perception of a hierarchical threat and input incorporation (as perceived by the follower). Contrary to our prediction, our results did not support a mediating role of leaders' devaluation of followers' benevolence. Overall, this research shows the negative effects of hierarchical threat on leaders' willingness to incorporate others' input and the mechanism behind this relationship.

"To Thine Own Self be True!": Ascending the Organizational Hierarchy Through Authenticity

Author: **Nir Kaftan**; Tel Aviv U.

Author: **Daniel Heller**; Tel Aviv U.

Author: **Serena Chen**; U. of California, Berkeley

What makes people ascend the organizational hierarchy? Is being true to the inner-self an effective strategy to achieve and maintain power? Given the importance of organizational hierarchy in work-life, we test whether targets' authenticity—the degree to which individuals connect with and act upon their true selves—leads perceivers to accord targets more power. Because authenticity is considered a virtue reflecting the moral inner-self, we further posit that the effect of authenticity on power affordance is due to its perceived morality. Extending previous

among major decision-making groups in business and society. This symposium presents new research on the question of how to diversify major business organizations at the very highest levels. The five papers reflect perspectives from a dozen countries spanning the globe as well as both the developed and developing world. We leverage both quantitative and qualitative research methods to address a shared research question, specifically: how do we diversify the C-Suite in major corporations around the world?

Equality for (Almost) All: Social Egalitarians Reject Sexism and Racism, but not Ageism

Author: **Ashley E. Martin**; Stanford Graduate School of Business

Author: **Michael North**; New York U.

Past research has assumed that social egalitarians reject group-based hierarchies and advocate for equal treatment of all groups. However, contrary to popular belief, we argue that social egalitarians are more likely to support “Succession”-based ageism. Although facing their own forms of discrimination, older individuals are perceived as “blocking” younger people, and other unrepresented groups, from opportunities—which in turn, motivates egalitarians to actively discriminate against older adults. In six separate studies, we demonstrate that egalitarians endorse less prejudice towards—and show more support for—women and Blacks, but harbor more prejudice towards (Study 1-2b), and less advocacy for (Study 2a, 2b, 3-5) older individuals. We demonstrate behavioral implications for this effect, such as prioritization of, and resource allocation to, diversity initiatives (Study 4-5). Further, we isolate opportunity-blocking as a critical mediator, demonstrating that egalitarians believe that older individuals obstruct more deserving

groups from receiving necessary resources and support to get ahead (Study 5). Together this research suggests that when it comes to egalitarianism, equality for all may only mean equality for some.

Job Mobility Decreases Work Desirability by Reducing Cognitive Trust and Affective Trust

Author: **Jiyin Cao**; Stony Brook U.-State U. of New York

Author: **Alvaro San Martin**; IESE Business School

Author: **Hajo Adam**; Rice U.

Americans employees in general, and millennials in particular, like to change jobs. According to several national surveys, millennials are a job-hopping generation, changing jobs three times more frequently than non-millennials, and 75% of millennials believe that frequently changing jobs helps advancing their careers. However, whether job mobility can actually help career advancement remains unclear. Drawing from the literatures on mobility and trust, we consistently found that job mobility decreased one's likelihood to be hired (Study 1) or chosen as work partners (Study 2), because it reduced other people's cognitive and affective trust in the mover (Study 1). In addition, we identified two distinct components of mobility: entry mobility and exit mobility. Whereas entry mobility increased work desirability by enhancing cognitive trust and affective trust, exit mobility decreased work desirability by reducing cognitive trust and affective trust; the negative effect of exit mobility was much stronger than the positive effect of entry mobility (Study 3). The negative effect of exit mobility even held after accounting for voluntary vs. involuntary exit (Study 4). Whereas previous research has focused on how job mobility affects movers (i.e., those who move between jobs), our work illuminates how job mobility affects observers (i.e., those who react to movers).

Multiple Identities and Non-Prototypicality: Intersectionality at Work (session 1264)

Everyone has multiple social identities that influence the way they are perceived and treated and, in turn, how they perceive and respond to their social worlds at work. To date, research has tended to focus only on one identity at a time. The papers in this symposium investigate how different combinations of multiple identities affect a variety of outcomes at work, from biases and beliefs to recruitment, fundraising, and perceptions of speech and discrimination. This symposium has three goals: (1) to shed light on emerging theory on intersecting social identities, (2) to present innovative scholarship about how multiple intersecting social identities affect how individuals negotiate their workplaces and what treatment they receive, and (3) to create space for complicating the conversation about diversity and inclusion in order to examine the complexities of intersectionality and non-prototypicality.

Scientists Who Publish in Gender-Homogeneous Teams are Preferred in Promotions

Author: **Myriam Bechtoldt**; EBS U. of Business and Law
 Author: **Boas Bamberger**; U. of Mannheim / Germany

This research project investigated whether universities apply different performance standards to women's and men's publications in order to appoint them professors. In Study 1, we analyzed the number of (non-)peer-reviewed publications and their scientific impact indices in a multidisciplinary sample of about 4800 professors. The results show that women have to publish more and in more renowned scientific journals in order to be appointed as professors. Study 2 confirmed these results in subsamples of professors who were matched with regard to their parental status before their first appointment and the rank of their professorships. In both studies, however, the gender main effect was moderated by the gender of coauthors: Both women and men who publish in more gender homogeneous coauthor networks have to publish less successfully in order to be appointed professors. Study 3 shows that this effect is explained by the stability of coauthor relationships and the specialization in research topics: Scientists publishing in more gender homogeneous teams have more stable relationships with their coauthors, leading to more publications with the same group of coauthors; they also publish on fewer research topics. Both prove to be advantageous in the promotion process. The research project shows that not only the gender of the applicants, but also the gender of their coauthors indirectly influences the decision of selection committees.

Author: **Jiping Li**; Frankfurt School of Finance & Management

Author: **Jing Zhu**; Nanyang Business School

Author: **Lida Lingling Zhang**; U. of Macau

Author: **Prithviraj Chattopadhyay**; U. of Auckland

People face a challenge on diverse teams about dealing with the stereotypes of their social identity groups. However, it is less known regarding how people manage the stereotypes of their social category to construct positive social identities. By integrating the literature on stereotype and the social self-regulation theory in relational demography research, we identify a dual-path self-regulation process—self-monitoring on competence and self-monitoring on warmth—and propose a joint effect among demographic dissimilarity, demographic categories, and perceived status permeability to explain when and who are likely to engage in such behaviors. We also examine the effectiveness of these stereotype managing behaviors by proposing its effects on individual respect. The results from a sample of 1,211 kindergarten teachers in 173 groups from 57 kindergartens supported that, perceived education dissimilarity elicited more self-monitoring on competence for those with lower education degree who perceived the big chance to move up the organizational hierarchy. And self-motoring for competence paid off by contributing to individual respect especially for those with a higher education degree. We discuss the implications of this study for relational demography research.

Think-Leader-Think-Women: Are Females More Effective Leaders of Teams with Hidden Goals?

Author: **Jing Hu**; UNSW Business School, Australia

Author: **Geoffrey Leonardelli**; U. of Toronto

The workplace is witnessing several biases towards females. Women are seen as less leader-like, regardless of their actual performance. This paper aims to identify a situation (the hidden-goal situation) in which we believe women will be more effective and more favorably rated as leaders than men: namely, team tasks that require goal discovery

before teamwork. Using an experimental methodology, we compared team members' self-rated and other-rated criteria in the hidden-goal condition (i.e., the team's goal is not apparent to the team members) versus the clear-goal condition (i.e., the team's goal is clearly provided to the team members). We found that, although male and female members actually performed similarly in both conditions, compared to women, male members were more confident and received higher leadership effectiveness ratings by others in the clear-goal situation; such gender differences were not pronounced in the hidden-goal situation, suggesting a gender equalization effect of the hidden-goal condition.

The B-Team: Gender-Diverse Teams and Prototypes of Success

Designated as a "Best Paper" for GDO

Author: **Isabelle Solal**; INSEAD

Author: **Kaisa E. Snellman**; INSEAD

Teams are increasingly encouraged to diversify by bringing in more women and members of underrepresented minorities. Yet studies on the relationship between performance and demographic diversity have yielded mixed findings, and team diversity has been associated with increased risk of failure and greater difficulty obtaining resources. One reason for this, we argue, is that in contexts where uncertainty is high and decision-makers are selecting teams for their potential for future success, they are more likely to fall back on culturally dominant schemas or prototypes, based on existing successful cases. As a result, the presence of minority members on the team may make the team less successful, not because this drives down objective performance, but because the team is no longer perceived as conforming to the ideal type. We test this prediction using data from a university entrepreneurial pitch competition, and find that while teams with female participants receive similar evaluations for their business idea and are no less likely to place second, they are six times less likely to win the competition compared to all-male teams. Implications for diversity and inclusion in entrepreneurship and

HR

Employee Termination and Disengagement (session 1269)

You're Fired! Toward a Sociopolitical Framework of Employee Termination

Author: Kathy Ma; Texas A&M International U.

Half of all employee turnover in the U.S. is involuntary. Perhaps due to the mistaken assumption that only poor performers are fired, research has largely neglected the subject of involuntary turnover on the basis that it is typically functional in nature. Empirical evidence, however, suggests that the majority of firings occur for reasons unrelated to performance. And consequences for both organizations and employees often seem quite negative, e.g., lawsuits, decreased firm productivity, poor physical or psychological health, and uncertain re-employment prospects. The potentially dysfunctional nature of involuntary turnover highlights the need to examine false premises and develop a theory of involuntary turnover that is more reflective of reality and solidly grounded in theory. We thus develop a sociopolitical framework of employee termination that suggests that relational and political processes in organizations often drive termination decisions. By integrating three divergent theories (attribution theory, social identity theory, and an organizational political-behavior perspective), we offer propositions articulating the interplay among workplace politics, in-group/out-group bias, and the termination process. This allows us to propose a framework linking macro and micro elements in organizational research with four distinct sociopolitical forces through which firing intentions and actions likely emerge.

HR Analytics (session 1270)

How Does Practicing HR Analytics Establish HRM Credibility? An Epistemic Practice Approach

Author: Markus Ellmer; U. of Salzburg

Author: Astrid Reichel; U. of Salzburg

Whether HR Analytics (HRA), i.e., the processing of (big) data to optimize HRM decisions and interventions, promotes HRM credibility in organizations remains a puzzling issue in extant literature. Framing HRA as epistemic practice, we attend to the question how HR practitioners establish HRM credibility by practicing HRA. Drawing on observational and interview data from a case study of HRA practices at TechCom, a large German multinational company (MNC), we show that establishing credibility is largely a result of accumulating, integrating, and translating expertise distributed across the organization, which enables practitioners creating relevant insights and demonstrating HRM's value added to its stakeholder. Within these practices, we identify epistemic alignment, i.e., aligning to HR stakeholders' perception of business reality as well as to norms of knowledge creation when creating analytical outputs, as the main mechanism behind establishing credibility. At the same time, our analysis uncovers HRA practitioners' need for handling a range of contingencies, i.e., compliance issues, internal dependencies, and political tensions, constraining them from fully exploiting the potentials of HRA. Highlighting the role of dashboard-building in establishing HRM credibility, our findings illustrate HRA is a deeply sociomaterial process in which knowledge and its presentation are constantly negotiated.

Engaging to Disengage (WITHDRAWN)

Author: **Michael Halinski**; Ted Rogers School of Management

Author: **Jennifer A. Harrison**; EM Normandie Business School, Métis Lab, France

As efforts to increase work engagement are commonly thought of as an organizational approach to motivate employees and reduce turnover, there has been little research connecting employees' work engagement and their boarder career development. Drawing on an employability framework, the present study examines how work engagement may promote employed job search behavior over the course of two studies. Study 1, which involves a two-wave design with a 4-month time lag, finds support for a positive, direct effect of work engagement on preparatory job search behavior, as well as the moderating effect of employment status (i.e., permanent versus non-permanent) on this relationship. Study 2 uses a three-wave design to find a positive, indirect effect of work engagement on preparatory job search behavior via personal skill development, as well as the conditional indirect effect of employment status on this relationship. Practical and theoretical contributions are discussed in terms of their general implications for understanding a process, and a boundary condition of this process, that facilitate the understudied positive relationship between work engagement and employed job search.

HR Analytics Conceptualization and Adoption: Key Issues

Author: **Vicenc Fernandez**; U. Politècnica de Catalunya·BarcelonaTech

Author: **Eva Gallardo Gallardo**; U. Politècnica de Catalunya·BarcelonaTech

Despite analytics have been seen as a 'game changer for the future of HR', organizations struggle to move to them. Why is this happening?. In order to answer this question, perhaps, one should start by wondering, what does really HR Analytics encompass? We report the findings of a comprehensive literature review on analytics as applied in HR, that help to not only clarify what is meant by this, but also to identify what are the main barriers to HR Analytics adoption in organizations. We relied in two of the major multidisciplinary publication databases (i.e., Scopus and WoS). A total of 64 manuscripts from 2010 to 2019 were content analyzed. The results reveal that, although unexpected in a nascent field such as this one, several lexemes are used to refer to analytics in HR, being 'HR Analytics' the most frequently used. Unfortunately, we found that only a few manuscripts offer a clear definition of the concept they are studying. However, most of the publications consider this kind of analytics as being about collecting, analyzing and reporting data to improve people-related decisions, and, in turn, improve individual and organizational outcomes. We have also identified 25 different barriers for HR Analytics adoption regarding 4 key success factors: data & models, technology & tools, people, and management. This paper aims to give vision and direction to both academics and practitioners in particular on the conceptualization and operationalization of HR Analytics.

21st Century HR: A Competency Model for the Emerging Role of HR Analysts

Author: **Steven McCartney**; Trinity College Dublin

Author: **Caroline Murphy**; U. of Limerick

Author: **Jean Anne McCarthy**; U. of Limerick

The transformation and digitalization of human resources (HR) over the past three decades has enabled the emergence of HR analytics; the collection and analysis of workforce data to inform and aid in strategic decisions. In light of this digital transformation, the demand for professionals who can effectively conduct, perform, and interpret analytics has seen a dramatic increase in HR leading to the development of a new and distinct role within the HR function; the HR Analyst. The purpose of this paper is to develop the first competency model for this newly emerging role by systematically identifying the key competencies and skills required by HR Analysts to perform effective HR analytics. Drawing upon Campion, Fink, Ruggeberd, Carr, & Odman (2011) best practice framework, we first, conduct a content analysis on 110 job descriptions collected from five countries; Australia, Canada, Ireland, the United Kingdom, and the United States of America and second, analyze twelve interview transcripts derived from in-depth semi-structured interviews conducted with HR analytics professionals from Canada and Ireland. Our findings add to the developing and fast-growing field of HR analytics literature by offering evidence supporting a set of six distinct competencies required for HR Analysts including business acumen and HR knowledge, consulting, data fluency and data analysis, research and discovery, storytelling and communication, and technical knowledge. Additionally, we present and discuss the practical implications the research has in the areas of human resource development and recruitment and selection while outlining several directions and areas for future research.

The Acceptability of HR Analytics: Exploring the Importance of the Individual Perspective

Author: **Graham Hughes Lowman**; Kennesaw State U.

Author: **James Edward King**; U. of Alabama, Tuscaloosa

Author: **Yi-ren Wang**; U. of Alabama

Author: **Dwight William Lewis**; -

Human Resource Analytics has been heralded as a

wonderful tool with vast benefits for organizations; however, the perspective of current and potential employees is missing from this emerging field of research. To address this gap, we introduce a measure of Belief in Analytics (BIA) to explore reactions to analytics as a HR tool. In doing so, we examine antecedents of BIA, as well as how BIA influences the intended use of data analytic information for making employment decisions. These relationships were evaluated using individuals currently seeking or recently accepting employment (last semester undergraduate students) and individuals with diverse work experience (collected using Amazon's Mechanical Turk). Results indicate that conventional interest type and exposure to analytics predicts BIA, and that intention to use data analytics differs across employment decision stages. Building on these findings, we discuss the implications for research and practice.

HRM and Leadership (session 1267)

Synergistic Partners: How HRM and Leadership Climate Shape Employees' Ambidextrous Behavior

Author: **Lukas Hölzl**; U. of St. Gallen

Author: **Stefan Berger**; U. of St. Gallen

Author: **Heike Bruch**; U. of St. Gallen

Recent advancements in ambidexterity research suggest that HRM plays a vital role in shaping contextual ambidexterity. Building on paradox theory and social information processing theory, the present study extends this literature by putting the spotlight on two fundamental, yet often implicit assumptions of contextual ambidexterity. First, we examine how HRM practices that are specifically designed to promote ambidextrous cues (i.e., ambidexterity-oriented HRM [A-HRM] practices) are related to contextual ambidexterity. Second, we address the premise that such HRM practices actually affect all employees in an organization. In addition, we introduce transformational leadership

Job Demands and Resources (session 1268)

Private Life Events and Work Ability

Author: **Karen Pak**; Radboud U. Nijmegen

Author: **Dorien Kooij**; Tilburg U.

Author: **Annet De Lange**; U. of Applied Sciences Arnhem and Nijmegen

Author: **Marc Van Veldhoven**; Tilburg U.

Although previous research on work ability extensively examined the role of job demands in predicting work ability, this research largely overlooked the influence of home demands such as disruptive private life events as a potential predictor of work ability even though home demands are assumed to influence work outcomes in a similar way to job demands. The aim of this study is to contribute to the literature on work ability by examining home demands as a potential predictor of work ability. More specifically, we investigate whether private life events have a negative impact

(TFL) climate as a critical boundary condition that helps to translate paradoxical signals of A-HRM practices to the employees. We tested these relationships in a multi-source sample of 16,740 employees from 94 organizations and found support for the proposed interaction effect of A-HRM and TFL climate on employees' ambidextrous behavior and, in turn, organizational performance (i.e., indirect effects). Our study contributes to a better understanding of creating contextual ambidexterity and the important role of leaders in the implementation of A-HRM practices.

Architectural Leadership and Structuring of HRM Processes: From Leading People to Leading Processes

Author: **Galy Binyamin**; Ariel U.

Author: **Eldad Kollenscher**; Tel Aviv U.

Author: **Abraham Carmeli**; Tel Aviv U.

This paper integrates research on the human resource management (HRM) architecture with the emerging theory of architectural leadership to demonstrate the role of leaders in structuring organizational processes. Specifically, we bridge theory and practice to develop the concept of structuring HRM processes and suggest that this is a core role of the architectural leader. We first present the theoretical foundations of the construct and elaborate on the seven dimensions that constitute HRM structuring. Then, we illustrate through the design of a managerial framework of recruitment and selection process and its translation into systematic and methodological patterns of activities. We elucidate how each of the seven dimensions can be manifested in the structuring of this process. To demonstrate how architectural leaders help implement strategy through structuring HRM process, we analyze how Jack Welch, the former General Electric (GE) CEO, structured the promotion process for top executives. In so doing, we contribute to the literature on leadership and HRM by highlighting the power of leaders as architects and explicating why and how the structuring of HRM processes can create organizational value.

view paper (if available)

on work ability, and examine whether the use of on-the-job training and a positive supervisor support climate can buffer this relationship. To this end, we conducted a study with a sample of 2123 healthcare employees from 26 health institutions. Results showed that private life events have a negative impact on work ability. Moreover, use of on-the-job training and supervisor support climate do not moderate this relationship. However, our results indicate that the beneficial effect of on-the-job training was significantly lower for individuals who faced high disruptive life events in a work environment that was characterized by low levels of supervisor support climate compared to individuals who faced high disruptive life events in a work environment that was characterized by high levels of supervisor support climate. This study gives managers in the healthcare sector insight into the job and organizational resources that are effective in overcoming the negative impact of private life events on work ability.

The Accumulation and Depletion of Personal Resources for Managing Work-Life Balance

Author: **Yuyang Fan**; U. of Edinburgh

Author: **Kristina Potocnik**; U. of Edinburgh

Author: **Paul Norris**; U. of Edinburgh

This study aims to examine the impact of multiple demands and resources in work and home domains on long-term personal outcomes through changes in personal resources of time and financial management capacity over a period of six years. Using a nationally representative sample of 8,376 British working female caregivers, our results indicate that childcare and work demands depleted personal resources, which in turn predicted lower work-life balance satisfaction and higher levels of depression, supporting the resource depletion assumption. In contrast, having a partner and the utilization of the working-from-home arrangement increased personal resources and in turn, improved work-life balance satisfaction and reduced depression, supporting the resource accumulation assumption. Contrary to our predictions, childcare support reduced the perceived adequacy of how much time caregivers spent with their children and

Managing Uncertainty: An Examination of Leadership Factors that Increase HRM System Strength

Author: **DJ Steffensen**; Middle Tennessee State U.

The purpose of this dissertation was to extend research that examines the overlap between leadership and human resource management (HRM). Specifically, it sought to understand the leadership factors that would predict HRM system strength. Using a sample of 385 employees nested in 32 restaurant units, a model was examined that explored the relationships between leader political skill, leader communication behaviors, HRM system strength, and the multilevel outcomes of unit-level financial performance, leader likeability, and employee job performance. Through an integration of social/political influence theory and uncertainty reduction theory, it was predicted that leaders' political skill and communication behaviors would lead to an increase of HRM system strength, which would then increase the three multilevel outcomes. The results of this dissertation suggest that leader communication behaviors relate the strongest to HRM system strength. There is also a modicum of support for political skill and its indirect effect, via leader communication behaviors, to HRM system strength. HRM system strength demonstrated significant effects on unit-level financial performance, albeit in the opposite direction than was hypothesized. Taken together, this dissertation contributes to research related to the antecedents of HRM system strength, the refinement of the social/political influence theory, and in helping further explore the shared space between the leadership and HRM research domains.

Configural Effects of Job Demands and Resources on Exhaustion

Author: **Wei Jee Ong**; U. of Washington

Author: **Michael Johnson**; U. of Washington

Research on the effects of job demands and resources on exhaustion has largely adopted a variable-centered perspective to test the main and interactive effects of individual demands and resources. Although this approach can inform what happens on average, it cannot detect distinct configurations of job demands and resources that may lead to exhaustion in different subpopulations. To address this limitation, we adopted a person-centered approach to examine configurations of job demands and resources that are necessary and/or sufficient for exhaustion to occur. Using fuzzy set qualitative comparative analysis (fsQCA) across two studies, we found three distinct configurations that were sufficient for the presence of exhaustion, and one configuration that was sufficient for its absence. We further compared our results to the conventional variable-centered approach and found that the person-centered approach yielded more theoretically consistent results. Our findings highlight that certain job demands may only be buffered by specific resources, and that certain configurations of demands may not be buffered at all.

[view paper \(if available\)](#)

Organizational research has predominantly adopted the classic dispositional perspective to understand the importance of personality traits in shaping work outcomes. However, the burgeoning literature on personality psychology has documented that personality traits, although relatively stable, are able to develop throughout one's whole adulthood. A crucial force driving adult personality development is transition into novel work roles. In this paper, we introduce a dynamic, role-based perspective on the adaptive nature of personality during the transition from the role of employee to that of leader (i.e., leadership emergence). We argue that during such role transitions, individuals will experience increases in job role demands, a crucial manifestation of role expectations, which in turn may foster growth in conscientiousness and emotional stability. We tested these hypotheses in two three-wave longitudinal studies using a quasi-experimental design. We compared the personality development of two groups of individuals (one group promoted from employees into leadership roles and the other remaining as employees over time), matched via the propensity score matching approach. The convergent results of latent growth curve modeling in the two studies support our hypotheses regarding the influence of becoming a leader on enhancing conscientiousness and the mediating role of job role demands.

A Longitudinal Between and Within Person Analysis of the Job Demand Control Support Model

Author: **Eva Kyndt**; U. of Antwerp & Swinburne U. of Technology Melbourne

Author: **Timothy Colin Bednall**; Swinburne Business School, Swinburne U. of Technology

Many authors have argued that modern work organisations are highly characterised by rapid changes leading to an increased need for continuous work-related learning. However, awareness that these changes often lead to higher demands placed on employees and the impact this might have on their well-being is also growing. The current study examines the impact of job profiles on both employees' learning behaviour and well-being starting from the job demand- control support model (JDCS; Johnson & Hall, 1988; Karasek, 1979). Moreover, as little is known about the dynamics of the relationship described in this model, the current study analyses the longitudinal survey data using the general cross-lagged panel model (GCLM; Zyphur et al., 2019). GCLM offers important extensions over a traditional cross-lagged model, enhancing its ability to identify causal relationships within a longitudinal dataset. In total, 1362 employees from the public sector were followed across the period of one year including four waves of data collection. A limited yet interesting number of significant relations were identified: autonomy seems to have a positive short-term effect on formal learning (via the impulses), but a negative long-term effect. Similarly, the short-term (impulse) autoregressive effect of learning from personal sources is positive, but the long-term effect is negative. Autonomy also appears to have a paradoxical effect on employee well-being. Autonomy has positive effects in the short-term (it increases vitality and reduces exhaustion), but has the opposite effects in the long-term.

Thriving in the Golden Age of Algorithms: Gig Workers' Learning, Adaptation, and Success (session 1271)

IM

Best Paper in Corporate Social Responsibility and Sustainability Finalist (session 1273)

The widespread algorithms have deeply reshaped the nature of work, causing new challenges for organizations and individuals. Less studied, however, is the impact of algorithmic management - defined as using self-learning algorithms to make and execute labor-related managerial decisions - on individuals beyond producing economic value. Our symposium aims to explore the questions: (1) what is the role of algorithms in talent management in the gig economy? (2) How do gig workers learn and adapt to certain algorithms to form work norms? (3) How do gig workers handle the challenges associated with algorithms to achieve objective and subjective career success? (4) What are the ups and downs of algorithmic management in the eyes of gig workers and why? Our symposium covers a variety of research methods (a conceptual paper, a big-data driven study, a lab simulation study, and a qualitative study), types of gig work (offline routine work and online non-routine work), samples (web doctors, ridesharing drivers), and theoretical lenses (talent management, norm, emotion, justice). It aims to facilitate cross-division dialogue among Organizational Behavior, Human Resources, and Careers scholars.

Follow the Smoke: The Pollution Haven Hypothesis in Global Sourcing

IM Division Best Paper in Corporate Social Responsibility and Sustainability Finalist
Author: **Heather Berry**; George Washington U.
Author: **Aseem Kaul**; U. of Minnesota
Author: **Narae Lee**; U. of Minnesota

In this study, we empirically examine the pollution haven hypothesis (PHH) in the context of global sourcing. We argue that firms may not only directly invest in establishing operations in countries with weak environmental standards, they may also source from third parties in such countries to take advantage of weaker standards indirectly. Empirical analysis of foreign product flows into the US from 77 countries across 84 industries supports this argument, showing that the share of sourcing from a country increases as its carbon emissions per capita rise. This result holds for both offshore outsourcing and offshore integration, and is robust to the use of the Kyoto agreement as an instrument. Supplementary analyses also show that these results hold irrespective of an industry's toxic intensity, concentration, or capital intensity, and are more pronounced for industries with low technological intensity. By providing robust empirical evidence for the PHH in the context of global sourcing—especially offshore outsourcing—our study draws attention to an important but hitherto largely neglected aspect of the role of environmental standards in driving international business choices.

the corporate social responsibility (CSR) decoupling between CSR reporting adoption (i.e., the likelihood of issuing CSR reporting) and CSR implementation (i.e., the quality of CSR reporting) of emerging market multinationals (EMMs)? Despite extensive interest in how internationalization affects CSR reporting decoupling, the relationship between religious diversity in host countries and EMMs' CSR reporting remains largely unexplored. In this study, religious diversity is thought to involve a broad range of CSR expectations that facilitate CSR reporting, but also mix inconsistent standards and expectations that they can't implement simultaneously. Specifically, we argue that when experienced heightened conflicting religious tension within host countries, EMMs tends to symbolically adopt CSR reporting, but less likely to substantively implement CSR reporting with high quality—a form of CSR “decoupling” that we identify as a convenient arrangement between firms and stakeholders. Furthermore, we argue that internationalization can amplify such dual impacts of religious diversity on the adoption and implementation of CSR reporting, because internationalization enhance the salience of global stakeholders. Empirical testing of the CSR reporting of 619 publicly listed Chinese EMMs in the 2008-2013 period generally provides support for these ideas.

Organizational Contexts of Human Capital - Hiring MNC Employees and Exporting in Domestic Firms (WITHDRAWN)

Author: **Pedro Faria**; U. of Groningen

Author: **Torben Schubert**; Lund U. and Fraunhofer ISI

Author: **Wolfgang Sofka**; Copenhagen Business School

Starting to export is a crucial but risky step for the growth strategy of most firms. Hiring managers with international experience can propel export decisions but we know little about where domestic firms find this expertise and whether it can be fruitfully applied in their context. We integrate theoretical mechanisms from the transferability of strategic human capital into models explaining export decisions. We theorize that hiring managers from MNCs increases the odds of domestic firms to start exporting and this effect benefits from similarities in the organizational context of the hiring firm with MNCs. We hypothesize that young firms, without international diversity in the workforce and flat hierarchies will benefit comparatively less from hiring MNC managers because the conditions for transfers of human capital are too dissimilar. We test and support these hypotheses for 159,680 domestic firms in Sweden, their hiring and export decisions between 2010 and 2015.

Partner Choice in Internationalization (session 1275)

Partner Substitutability and International Joint Venture Termination: A Partner Interdependence View

Author: **Chi Ma**; Tsinghua U. School of Economics and Management

Author: **Jiyu WANG**; U. of Texas at Dallas

Author: **Xinran Joyce Wang**; U. of Missouri

Author: **Yang Liu**; Cornell SC Johnson College of Business

Previous studies have largely focused on the decisions of multinational partners when investigating the stability of cross-border interorganizational relationships, but ignored the importance of local partners, assuming that multinational firms often have certain advantage over local firms. From an interdependence perspective, we argue that for international joint ventures (IJVs), post-formation alliances activities by both multinational and local partners, which make the focal IJV substitutable, may lead to the instability and termination of the focal IJV. Moreover, post-formation alliances activities by both multinational and local partners can accelerate the IJV termination. However, when IJVs involving higher levels of technology transfer complexity, the mutual dependence of multinational and local partners increases and thus the negative effects of their post-formation alliances activities on IJV survival diminish. We test our theory using data on 841 IJVs formed by 763 local firms and 714 multinational firms from 1990 to 2018 in a multi-country context. Our results show supports to our ideas.

For Ease of HQ Control? A Study of the Motives for Location Choice of HR Shared Services in MNEs

Author: **Chipoong Kim**; Samsung Economic Research Institute

Author: **Chul Chung**; Henley Business School, U. of Reading

Author: **Jeeyun Yoon**; Samsung Economic Research Institute

Author: **Jungwoo Park**; 2020

Author: **Yongwoo Lee**; Samsung SDS

Author: **Jaewon Kim**; U. of Pennsylvania

Shared service centres (SSCs) have become an important mechanism for multinational enterprises (MNEs) to deliver HRM services to their dispersed operations. Location choice may be critical to understanding the motives behind utilising HR SSCs in MNEs, but few studies have explored this issue. We examine the factors and underlying motives for selecting a location for an SSC, drawing on a case study of six large MNEs from North America, Europe and Asia. Our study reveals that the concern of headquarters (HQ) for control over SSCs is an important motive in relation to location choices alongside cost efficiency and service quality. We also identify specific factors for SSC location decisions, associated with the HQ control motive, namely: home-country language capabilities, geographical proximity to the home country and time zone. Our findings offer a novel insight into the nature of an SSC by highlighting the significance of governance issues in managing SSCs within an MNE.

The Effect of Linguistic Distance on Cross-Border Merger and Acquisition (M&A) Deal Duration

Author: **Yoona Choi**; Australian National U.

Author: **Sarbari Bordia**; Australian National U.

This paper presents a conceptual model of the role of linguistic distance affecting the duration of cross-border merger & acquisition (M&A). The duration is defined as the time taken for the official completion of negotiations among parties. We theorize that the larger the linguistic distance, the longer the duration of a cross-border M&A deal. This is because linguistic distance can create communication barriers in the negotiating process of cross-border M&A. However, there are mitigating factors that can weaken the effect of linguistic distance on cross-border M&A deal duration. Based on the research stream of language in international business (IB), we argue that lingua franca and culture similarity will weaken the effect of linguistic distance on cross-border M&A deal duration. Moreover, based on transaction cost economics, we argue that the participation of intermediaries in the cross-border M&A process, as well as industry technical standardisation, will weaken aforementioned effect of linguistic distance on cross-border M&A deal duration. This paper contributes to the international business literature by providing a nuanced understanding of how language differences can affect the M&A deal duration and presenting several moderating variables that may reduce the negative effect of linguistic distance.

Culture and the Length of Joint Venture Contracts

Author: **Andres Velez-Calle**; U. EAFIT

Author: **Santiago Sosa**; U. EAFIT

Author: **Joshua Large**; U. EAFIT

Culturally-bound communication styles affect the specificity of verbal and written messages. Contracts are no exception. The purpose of this paper is to explore the relationship between cultural

needs. International staffing decisions are conceptualized as real-option-based decisions, whereby MNEs assign top executives in an attempt to maximize strategic flexibility in their future executive succession decisions. In our empirical context, we submit that replacing a local with an expatriate top executive would induce more adjustment costs than replacing an expatriate with a local. Therefore, from a real options logic, when the industry demand uncertainty is greater, the MNE is more likely to assign an expatriate top executive initially to maintain flexibility in the subsidiary. Later, when the industry demand uncertainty sufficiently reduces, the MNE is likely to exercise the real options by replacing an expatriate top executive with a local. We also explore boundary conditions of such real-options logic. We suggest that the local institutional environment and the performance feedback that the MNE receives from the focal subsidiary and other subsidiaries influence the asymmetric adjustment costs and the value of strategic flexibility. Data on Japanese subsidiaries in China largely support our hypotheses.

Controlling Developed-Country Subsidiaries via Human Resource Management (WITHDRAWN)

Author: **Can Ouyang**; Cornell U.

Author: **Mingwei Liu**; Rutgers U.

Even though the presence of Chinese multinational corporations (MNCs) in developed economies have grown substantially, the knowledge about how these firms manage their developed-country subsidiaries remain rather scant. This study applies agency theory to explore how ownership type influences Chinese MNCs' control over developed-market subsidiaries. Findings based on the qualitative data collected from Chinese MNCs demonstrate that private-sector businesses (PSBs) and state-owned enterprises (SOEs) experience different agency problems in developed countries and thus apply different control strategies. PSBs are likely to implement a relational control system that strengthens the interdependence between headquarters and subsidiaries, whereas SOEs tend to adopt a hybridization control system that separates the management of home-country expatriates and employees hired locally. This study

communication style and joint venture (JV) contract length. Using a database of 470 JV contracts, we empirically test the relationship between the parties' cultural communication styles, cultural distance and JV contract length. We apply Edward T. Hall's high- and low- context communication construct and find that JV contracts are longer when made between parties of low and high context cultures and shorter when both parties come from high context cultures. Additionally, we find the higher the cultural distance in terms of individualism vs. collectivism between partners, the shorter the contracts. These results highlight the influence of culture on contractual length and, as such, upon contract negotiation and design costs. This paper contributes to the culture and alliance literatures by moving beyond the assumption that low-context culture contracts are longer and high-context culture contracts shorter by actually testing it empirically. In addition, the paper focuses on the interaction of high- and low-context cultures, which to the best of our knowledge has not been done before, in producing shorter or longer contracts, as well as how cultural distance affects contract length.

Whom to Acquire – Culture, Country, or Kilometers in Target Selection

Author: **Magdalena Langosch**; Loughborough U. London

Author: **Justin Tumlinson**; Loughborough U.

We investigate the role of cultural distance—linguistic, religious and political—on merger and acquisition (M&A) completion and disentangle it from the role of different regional and national formal institutions as well as geographic distance. In a large-scale sample of German and Austrian M&As, we find one standard deviation increases in linguistic distance—as captured through dialect differences that vary continuously across national and regional borders—and religious distance, holding all else constant, are associated with 25% and 20% lower probabilities of merging respectively, while political distance has no robust effect. Although when measured alone, a standard deviation increase in geographic distance is associated with a greater than 50% drop in merger

provides implications to the literature on agency theory and control theory and advances the research of emerging market MNCs.

Performance Challenges in International Management (session 1276)

Mitigated Liability of Origin: A More Salient Category Triggered by M&A as an Establishment Mode (WITHDRAWN)

Author: **Yan Zuo**; School of management, Zhejiang U.

Author: **Jiang Wei**; Zhejiang U.

Author: **Niels G. Noorderhaven**; Tilburg U.

This article explores the relevance of emerging economy multinational corporations' (EE-MNCs) establishment modes when entering developed economies to their subsequent experiences of liability of origin in these countries. Following the causal-model theory of categorization, we theorize that mergers and acquisitions as a categorical cue can trigger the emergence of a more salient category diluting the one defined by the EE-MNCs' country-of-origin, while greenfield investment cannot. Consequently, EE-MNCs that enter a developed economy by GI experience heightened liability of origin while entries using mergers and acquisitions are associated with mitigated liability. We further examine institutional distance and entry age as boundary conditions influencing the saliency of entry mode in categorization and shaping stakeholders' perceptions. Taking Chinese listed firms' direct investments in developed economies as our sample, we find supportive empirical evidence. The research implications and directions for future studies are further discussed.

The Process of Internationalization in SMEs (session 1277)

The Effects of Timing and Order of Government Support Services for SME Exports and Firm Growth

Author: **Priit Tinitis**; Aalto U. School of Business

Author: **Carl Fey**; Aalto U. School of Business

When SMEs enter export markets, they face liabilities of smallness and foreignness. Thus, their chances of success increase if they receive some support. In much of the world, home governments have realized that success in exports helps firm success and that there are positive spillovers resulting from SME export success. Consequently, most home governments offer some export assistance services. In our paper, we test the efficacy of three such services: support for strategic export planning, support for trade fair participation and participation in ministerial state visits. Unlike in past studies, we go beyond testing the effect of one support mechanism and compare the effect of the above different support mechanisms. We also explore the temporal interactions including the importance of the order of receiving multiple support mechanism. We found evidence for the benefit of receiving multiple support mechanisms and support for the importance for the timing and order of receiving the different support mechanisms. Empirically, the study is tested on a data set of Estonian SMEs receiving different types of government export support services during the period 2009-2017. The data set was constructed from registry data covering the entire population of

The Double-Edged Sword Effect of Brand Adaptation Strategy on Performance

Author: **TAO WANG**; the Economics and Management School of Wuhan U.

Author: **Gao Jie**; the Economics and Management School of Wuhan U.

To improve our understanding of the bright side and the dark side of brand adaptation strategy and determine the processes linking brand adaptation strategy to brand performance, we investigate the underlying mechanism of adaptation brand strategy' effects from the perspective of institutional theory and organizational learning theory. we posit that strengthened legitimacy and reduced synergy mediate the effect of brand adaptation on firm performance. In addition, to capture the nature of the relationship between brand adaptation strategy and firm performance, we adopt a contingency perspective in our examination of the moderating roles of cultural distance. Specifically, we suggest that cultural distance enhances the positive effect of brand adaptation strategy on firm legitimacy and synergy. Moreover, market uncertainty strengthens the positive effect of brand localization on legitimacy and synergies. We test our hypotheses using a survey with 202 respondents in China. In conclusion, our findings provide important insights into how brands effectively utilize brand adaptation strategy to improve their performance.

A Real Options Perspective on Pattern, Process, and Outcomes of Entrepreneurial Internationalization

Author: **Jiaju Yan**; Baylor U.

Author: **David W. Williams**; U. of Tennessee

Especially in this era of de-globalization, uncertainty plays a major role in both entrepreneurial and internationalization processes. Yet, prior international entrepreneurship (IE) and international business (IB) literature has not fully accounted for the nature of high and changing levels of host country uncertainty when predicting firms' entrepreneurial internationalization patterns and outcomes. By applying real options theory (ROT), we re-conceptualize firms' entrepreneurial internationalization pattern, process, and outcomes as the results of active uncertainty leveraging in the face of high and changing levels of host country institutional and economic uncertainty. Utilizing a representative sample of 680 U.S. new international firms that exported to 115 different host countries between the year 2009 and 2019, we find that host country uncertainty positively relates to firms' choice of "real option" entry (i.e., low initial investment combined with high collaboration). In contrast to the predictions of Transaction Cost Economic (TCE) approaches to internationalization, a ROT approach enables firms to achieve relatively faster entry, enter more distant destinations, and allows flexibility to exit markets over time. More importantly, we discovered firms using such "real options" entry strategies can mitigate the negative performance impact of host country uncertainty.

Service Sector Versus Nonservice Sector EMNCs: Asset-Seeking Cross- Border Acquisition Performance (WITHDRAWN)

Author: **Sathyajit Gubbi**; U. of Groningen, Faculty of Economics and Business

This study examines the role of home market context and nature of business in cross-border acquisitions by multinational firms from emerging markets. We propose that due to inherent differences in market conditions and nature of business, service sector acquisitions outperform those by nonservice sector. Furthermore, though the decision to acquire management control in the target has desirable consequences to acquisition performance, the benefits are lower for service sector acquirers than to nonservice sector firms. Our findings are supported by analysis of 540 cross-border acquisitions by Indian firms over the period 2000-2007.

PAPER SESSION

intermediate mechanism between post-entry speed of internationalization (PSI) and export performance through the lens of dynamic capabilities. Specifically, this study investigates the impact of PSI on two firm-specific dynamic capabilities, i.e., adaptive capabilities (AC) and knowledge capability upgrading (KCU), and then explores the mediating role of these two dynamic capabilities in the relationship between PSI and financial and non-financial export performance. Employing a sample of 212 New Zealand exporting SMEs, our findings confirm the existence of a positive relationship between PSI and both AC and KCU. Furthermore, the findings demonstrate support for the mediating role of dynamic capabilities in the relationship between PSI and export performance and reinforce that the process capabilities creation and upgrading is a viable channel for SMEs to achieve the superior performance implications associated with rapid internationalization. Our findings reveal that rapid internationalization provides no guarantee that firms achieves the desired performance implications. Rather, obtaining these benefits depends on the firm's ability to leverage on the opportunities provided by rapid internationalization to renew its stock of knowledge and improve its adaptive capability.

The More the Merrier? Geographic Scope and SME Growth Dynamics

Author: **Hadi Fariborzi**; U. of Sussex Business School
Author: **Carlos M. DaSilva**; HEG School of Management Fribourg / HES-SO // U. of Applied Sciences Wes

The impact of international activities on SME success has been extensively studied in the vibrant literature on SME internationalization, particularly with respect to the performance and survivorship implications of sales on foreign markets. Yet, prior literature leaves largely unanswered the question of performance implications of the SME's geographical scope (i.e., the number of countries a firm operates in), which brings substantive benefits, like access to larger markets, but also major challenges in the governance of operations. Drawing on the contemporary perspective on internalization theory,

we build a theoretical framework suggesting that the SME geographical scope has a positive impact on firm growth rate, yet making the latter less reliable. We also suggest that this relationship is highly context-dependent, with positive benefits of the increasing scope materializing only when the firm can manage the rising complexity of operational governance through leveraging the managerial international competencies (obtained, e.g., through international education) and constraining the geographical expansion to familiar regions. The framework is empirically tested on data from Swiss SMEs engaged in international operations, employing the multiplicative heteroscedasticity regression model specification with endogenously modeled scope.

Emerging Issues in Organizational Change (session 1278)

Decreasing Turnover Rate by Stimulating Teacher's Job Satisfaction: Intervention-Research Case

Author: Alain Tannous; Doctoral Candidate

Author: Jeremy Salmeron; ISEOR

Job satisfaction can be considered one of the important issues that affect the organization's performance. A dissatisfaction at work leads to excessive turnover which in turn increases the organization's direct costs. This project highlights the factors responsible for low levels of teachers' satisfaction and high levels of turnover rate in a private international school in Dubai. Data will be collected and analyzed qualitatively through semi-structured interviews, quantitatively through financial analysis, and the socio-economic strategic implementation are constructing the whole study to identify the major factors responsible for the high turnover rate and improve the labor process through retaining skilled and qualified employees.

A Natural Law Framework for Understanding Action, Virtue, and the Pursuit of Goods

Author: Paul Oslington; Alphacrucis College

This discussion paper explores a natural law framework for that is an alternative to the rational choice theory of action and utilitarian moral philosophy that dominates the management literature. It draws on the new natural law theory developed by philosophers John Finnis, Germain Grisez and others over the last thirty years. In this framework, action is oriented to seven fundamental goods, moderated by and moderating stocks of virtue. Moral judgements are made on the basis of impacts of action on fundamental goods, and the formal model is a tool for such judgements. Any discussion of markets must engage economists if it is to have an impact on public attitudes and public

Opening sight of teachers by including them in a change process have impacted the performance of the school. Results are analyzed, evaluated and communicated with the upper management team. How to align strategy with individual and collective skills: the case of an SME

Author: **Carole Bousquet**; IDRAC Business School

Author: **Miguel Delattre**; IAE - U. of Lyon 3

Author: **Jessica Lichy**; IDRAC Business School

This submission presents a longitudinal case study conducted over 3 years, 2015-2018, in an SME ('company A') with 45 employees, forming the basis of a PhD study. It highlights the need for better articulation between HRM and strategy within organizations – more precisely, between competencies and strategy – to consolidate and develop business performance. This performance can be interpreted through the lens of socio-economic theory. By means of an illustration, the authors use a management tool, the periodically negotiable activity contract (PNAC), implemented in over 1800 companies in line with the Socio-Economic Institute of Enterprises and Organizations (ISEOR). Our work highlights the more-than-favorable impact of this tool in facilitating the articulation between individual and collective skills in business strategy. Finally, our work is relevant for both for researchers and practitioners who are looking for ways to involve their staff more closely, while rewarding them for their efforts. It calls into question, in particular, the granting of bonuses or profit-sharing, which are often unrelated to the achievement of objectives, regardless of the position or hierarchical position held.

The Integration of the Control Departments to Manage Complex Norms. The Case of a Lebanese Bank

policy. We need a theoretical framework, and any proposed framework needs to be articulated as a formal model if it is to have any chance of engaging economists and management scholars, especially if the framework departs from rational choice theory of action combined with a preference satisfaction view of welfare. The alterative natural law framework allows consideration of virtues and a richer notion of goods, as well as being tractable and connecting with the existing powerful analytical tools of contemporary economics and management.

Experiences of Clergy Managing Church Finances with Varying Degrees of Financial Literacy Training

Author: **Michelle French-Holloway**; Mount Saint Mary's U., Los Angeles

Clergy financial literacy has been discussed as a vital tool to help leaders effectively manage their personal finances, as well as the financial responsibilities of church and parish governance. However, these discussions have not adequately addressed the issue of clergy whose denomination judicatories lack a formalized system of financial literacy training for local leaders. This research focuses on Roman Catholic clergy. This project addresses the issue of clergy who perform parish governance without the benefit of formal financial training. The study findings suggest that managing church finances without being taught how to do so results in feelings of uncertainty. The lack of financial oversight or assistance requires the pastor to take it upon himself to ensure that the church is administered properly. In conclusion, this project, by revealing the rarely acknowledged experiences of those clergy who do not receive financial training, sheds new light on the importance of clergy financial literacy.

Institutionalizing Distinctiveness: Halal Food Business Evolution and Muslim Integration in Canada

Author: **Jamel Stambouli**; Saint Paul U.

Author: **Jocelyne Boulos Eid**; ISEOR, Magellan, IAE Lyon, U. Jean Moulin

The financial crisis that impacted the global economy and the financial systems have often been accompanied by a flood of norms. Political authorities and institutions were forced to strengthen their norms and regulations to protect against future crisis. This flood of norms, aimed to mitigate risks are becoming multiple and complex to the point that today we are talking about the difficulty of controlling their application (Savall & Zardet, 2013). This paper presents a case study involving socio-economic approach to management (SEAM) management consulting method carried out in a private Lebanese Bank. The research tension analyze the impact of management system of standards impact on organization performance . In the studied Bank , the integral management of norms has been particularly enhanced by the socio economic approach to management (SEAM) intervention. The paper presents what has been carried out, and illustrate the socio-economic tools applied at work as well as the main achievements in terms of social improvement and economic performance.

Author: **Dave Valliere**; Ryerson U.

The halal food industry is growing exponentially all over the world and it is therefore receiving increasing interest from researchers. In a migratory context, it offers diversification to the host societies, including changing the food industry. Halal food businesses and products are becoming very common within non-Muslim societies, and they are also gaining an important share of markets in the mainstream food industry. To better understand how the halal food business has developed, and what are its particularities and impacts on Muslim communities and their host societies, we studied halal food businesses in Canada. We conducted more than 30 interviews with immigrant entrepreneurs from different countries of origin who started and manage halal food businesses. By employing optimal distinctiveness theory (Brewer, 1991; Zhao et al., 2017), we discovered that the halal food industry in Canada has followed a non-conventional growth process. By examining our data, we developed a model that explains how the halal-food business model evolved over time and how it impacted the integration process of newcomers.

Prosocial Religion as a Resource: A Source of Competitive Advantage for Family Firms

Author: **Nicholas Wong**; Newcastle Business School, Northumbria U.

Author: **Allan Fernando Discua Cruz**; Lancaster U. Management School

Author: **Nicholas Burton**; Northumbria U.

Recent studies emphasize how prosocial religious beliefs promote behaviors that lead to success in intergroup competition. We extend this research by introducing the Prosocial Religion as a Resource perspective into the field of family business. This perspective explains how prosocial religious beliefs act as resources for family firms. Our model includes the following stages: acquisition by owner-managers of prosocial religious beliefs; prosocial behavior by the owner-managers and their agents; stakeholder observation of the firm's behavior;

improvement in firm reputation. Our propositions explore situations where the prosocial religious beliefs of owner/managers provide a source of sustainable competitive advantage for family firms.

Death and Work: Utilizing Diverse Methods to Integrate Mortality into Management Research (session 1296)

Many occupations involve mortality cues, or external stimuli that remind employees of death. Yet we know relatively little about: (1) how employees experience mortality cues in workplaces and (2) the effect of mortality cues on employees and organizations. On one hand, mortality cues can

substance use needs more theoretical attention and empirical evidence. Building upon Conservation of Resources theory and the self-medication hypothesis, we conducted a mega-meta analytic path analysis examining the relationships among the Big Five traits, work-to-family conflict (WFC) and family-to-work conflict (FWC), anxiety and depression, and substance use. By coding existing meta-analyses on bivariate relationships in our model, we accumulated a 10-by-10 correlation matrix as input to a path modeling software program. We found that agreeableness and conscientiousness predicted substance use through both WFC and FWC and depression as well as through FWC and anxiety. Extraversion and openness-to-experience had relatively weaker influences on substance use through WFC, anxiety, and depression. Neuroticism was the strongest driver of the two forms of conflict, the two mental health conditions, and substance use. From this model it can be inferred that WFC and FWC may be generative mechanisms by which the impact of personality is transmitted to mental health outcomes when analyzed via the Conservation of Resources lens.

On the Road Again: The Mitigating Effects of Commuting on Work-Family Negative Spillover

Author: **Matthew Piszczek**; Wayne State U.

Author: **Kristie Lynne McAlpine**; Rutgers U.

Commuting is an inescapable part of working for most employees and is often seen as a burdensome and stressful chore. Many flexible work initiatives are valued in part for their ability to reduce commuting time. However, boundary theory suggests that commutes may serve an important role in the transition between work and family domains. The present study views the commute through the lens of a role transition as opposed to an independent event. We examine how work-family detachment during the commute interacts with work-family segmentation preferences in order to mitigate negative spillover of emotional exhaustion from the work domain to the home domain and vice versa using an experience sampling approach. Results suggest that detachment during the

trigger employee stress, trauma, and uncertainty. On the other hand, employees can bond and find humor and purpose in these experiences. Our symposium reports qualitative and quantitative research that extends the understanding of mortality in the management literature, and, in so doing, strongly contributes to the Academy of Management's conference theme "20/20: Broadening our Sight". The symposium includes four papers showcasing the influence of mortality cues on employees' emotions, work orientations, well-being, and performance. We address dichotomies in this symposium – that mortality cue exposure has both positive (e.g., work engagement, meaning) and negative (e.g., emotional exhaustion) employee outcomes – and clarify mechanisms and boundary conditions contributing to these dichotomies. Taken together, our papers and discussion, led by Dr. Peter Bamberger, endeavors to provide insight into the consequences of mortality cues for employees and organizations, deliver actionable recommendations for managers, and generate future academic research.

The Effects of Boundary Management Strategies on Employees' Recovery and Well-Being

Author: **Carmen Binnewies**; U. of Muenster

Author: **Verena C. Haun**; Johannes Gutenberg-U. Mainz

Author: **Julia Törk**; U. of Muenster

Author: **Corinna Brauner**; Federal Institute for Occupational Safety and Health (BAuA)

Author: **Sascha Haun**; Haun Consulting

Building on the pioneering work of Kreiner, Hollensbe and Sheep (2009) this study examines five specific boundary management tactics: a) Setting nonwork times and b) banking work times as two temporal boundary management tactics, c) physical boundary management, d) communicative boundary management, and e) behavioral boundary management as predictors of employees' recovery experiences (psychological detachment, relaxation, control, and mastery experiences) and psychological well-being (work-nonwork conflict and emotional exhaustion). We conducted two studies: Study 1, a cross-sectional study including three different samples from different organizations and occupations with a total of 889 employees, and Study 2, a field intervention on boundary management tactics with a randomized pre-post waitlist-control group design including 74 participants (35 in the intervention group and 39 in the control group) from diverse occupations. Concerning Study 1, results of multiple hierarchical regression analyses showed that boundary management tactics in general positively predicted psychological detachment, relaxation and mastery experiences. Behavioral boundary management was unexpectedly negatively related to mastery experiences. Control during nonwork time, work-nonwork conflict and emotional exhaustion were only associated as predicted with the temporal tactic banking work times. Communicative tactics were unexpectedly related to increased work-nonwork

Supervisors' Family-to-Work Enrichment and Conflict

Author: **Peng Wang**; Miami U. Ohio

Author: **Laurens Bujold Steed**; Miami U.

Author: **Zhen Wang**; Ren Ming U. of China

This paper utilizes a Conservation of Resources lens to examine the crossover of supervisor family experiences to their subordinates in the workplace. Supervisor family-to-work enrichment and conflict are proposed to influence subordinate perceptions of supervisor support for work-family. This perceived support, in turn, is hypothesized to positively affect subordinate work engagement and job satisfaction and negatively affect subordinate turnover intentions. Results of multilevel analysis of a study of 496 employees nested within 83 supervisors support the proposed relationships. Supervisor family-to-work conflict and supervisor family-to-work enrichment have negative and positive effects (respectively) on subordinates' perceptions of support for work-family. Further, we find an overall indirect effect of supervisor family-to-work enrichment and family-to-work conflict on subordinate work engagement, job satisfaction, and turnover intentions through the mediator of perceived work-family support. Limitations and future research directions are discussed.

Dominance and Prestige : When are they Used, How are they Communicated, and When are they Preferred? (session 1298)

There are two distinct leadership styles that are used to attain social rank, both of which effectively promote influence and shape the attention of others, yet which result in notably different forms of social rank. These strategies have been labeled prestige, which involves the demonstration of knowledge and expertise to earn respect and freely chosen followership, and dominance, which involves the use of aggression and intimidation to induce fear and forced deference. The current symposium brings together leading scholars to highlight situations in which followers prefer and work more effectively under prestigious and dominant leaders, and how these leaders communicate their social rank and influence team members. We conclude that neither a prestigious nor dominant leadership style emerges as universally more effective. However, if managers carefully consider their team members' dispositions and individual characteristics, as well as the situation or task at hand, they can use nonverbal behavior to communicate the most appropriate leadership style, command group influence, and secure power.

Dynamics of Proactivity: Advancing Insights into Implications of Self-Initiated Action at Work (session 1297)

Self-starting and change-oriented behaviors are increasingly important in today's decentralized and uncertain work context. This symposium presents five methodologically and culturally diverse studies with a shared focus on investigating the dynamics of proactivity at work. Collectively, the studies provide insights into the role of temporality and the implications of self-initiated actions at work. First, Weisman, Bindl, Gibson, and Unsworth advance a temporal theory of job crafting, a specific type of proactive behavior, which considers implications of proactivity for both individuals and organizations, over different time frames. The presentations by Cangiano and Parker, and by Fatimah, Lee, and Ferris, both focus on short-term implications of engaging in proactivity at work, while Yu and Starzyk advance insights into longer-term implications of proactivity. Finally, Wu, Tangirala, van Knippenberg, Shu, and Guo conclude with research on the importance of temporal aspects in team-level proactivity at work for relevant organizational outcomes. The themes of the symposium will be drawn out by the discussant, Susan Ashford, who is a recognized expert on the topic of proactivity. A particular feature of this symposium is its international composition, including researchers from Australia, Asia, Europe, and North America.

Predicting Employee Engagement in Low and High Severity Counterproductive Work Behavior

Author: Katherine E. Ciarlante; U. of Central Florida
Author: Mindy Krischer Shoss; U. of Central Florida

Counterproductive work behaviors (CWBs) have the potential to cause significant harm in the workplace. Because of the considerable threat CWBs pose to organizational and employee well-being, a literature has emerged to better understand the structure of these behaviors and identify the factors and conditions that effect employee engagement in counterproductive acts. While past research has distinguished between types of CWBs less attention has been paid to the specific forms these behaviors take including variation in behavioral severity. The current study introduces a novel conceptualization of CWB severity that distinguishes between intra-behavioral differences and develops modified

New Perspectives on the Drivers of Newcomer Socialization (session 1295)

The time of early entry, when newcomers experience organizational socialization, is one of the most critical phases of the employer-employee relationship. Decades of research has led to a wealth of knowledge regarding the importance of the socialization process, where newcomers undergo an adjustment period to transform from organizational 'outsiders' to contributing and effective 'insiders'. Yet changes to the contemporary organizational landscape (e.g. increased workforce mobility and alternative work arrangements) continues to generate new research questions, as well as prompting the need to revisit traditional assumptions to broaden our understanding of this important organizational phenomenon. Through four presentations and discussion time with two esteemed scholars in the field, we aim to expand

versions of the CWB-C (Spector et al., 2006) which assess engagement in low and high severity CWBs. These measures are utilized to test a hypothesized model of CWB severity that predicts how individual (negative affect and self-control) and contextual factors (consequences) interact to predict low and high severity CWBs.

Thwarted Self-Promotion Increases Counterproductive Cognitions

Author: **Jungwoo Ha**; UCLy - ESDES - U. of Lyon

Although research has thoroughly examined how self-promotion impacts others' judgments of the self-promoter, by observing others' reactions and feedback, self-promotion also provides a vital opportunity for individuals to verify and construct their self-view, thus serving a self-verification function. To highlight the importance and implications of self-verification aspects of self-promotion, the current research examines instances in which individuals attempt to self-promote but are prevented from doing so (thwarted self-promotion). Four studies demonstrate that a lack of self-verification caused by thwarted self-promotion leads to competence uncertainty (Studies 1a–b), which generates counterproductive cognitive reactions (Studies 2 and 3). Additionally, I show that these consequences of a lack of self-verification due to thwarted self-promotion are driven by individuals with an internal locus of control, but not by those with an external locus of control (Study 3). I discuss the theoretical and practical implications.

understanding on improving the drivers of successful socialization both from methodological and theoretical points of view. This symposium is wide-ranging in its scope, bringing an international perspective on socialization with contributions from Canada, New Zealand, the Netherlands, and Australia with discussants from the United States. Our symposium takes into account the changing nature of work while drawing from rich information gained from previous research on socialization. Specifically, two papers test propositions of the recently developed and increasingly recognized Socialization Resources Theory, one explores organizational socialization in virtual contexts, and another introduces a refined framework and scale for socialization tactics. In doing so, we hope to stimulate meaningful discussions and future investigations into organizational socialization research, in particular how we can tailor socialization practices to employees' situational circumstances for the benefit of employees and organizations alike.

Author: **Kimberley Breevaart**; Erasmus school of Social and Behavioural Sciences

When competitions for jobs get more intense, many highly educated employees feel that they are “big fish in a small pond”. Current paper aimed to examine perceived overqualification through the lens of conservation of resources, arguing that people with higher perceived overqualification would be more likely to perform negative work behaviors, since being overqualified violated people’s intrinsic motivation to preserve resources and invest resources to gain new for future. This sense of investing energy and time in vain would lead to anger, and further to negative work behaviors, such as counterproductive work behaviors (CWB) and withdrawal. By including both CWB and withdrawal in research, we want to validate the effect of perceived overqualification, and provide empirical evidence to response to the debate about the relations between CWB and withdrawal. In addition, we proposed recovery experience of learning and relaxation would play the moderating role. We test our hypotheses using time-lagged sample of 179 workers in China. Results showed that anger mediated the relationship between perceived overqualification and both CWB and withdrawal. Relaxation moderated the effect of perceived overqualification on anger, as well as the indirect effect of perceived overqualification on CWB and withdrawal, but learning did not significantly moderate the effects. Despite the insignificant moderating effect of learning, we found a direct effect of perceived overqualification on learning experience.

Psychological Safety (session 1290)

[Team Emergent State Development, an Enigma No More: Investigating Psychological Safety Emergence](#)

Author: **Christina Noelle Lacerenza**; U. of Colorado,

Author: **Min-Soo Kim**; Hanyang U.

Although researchers have argued that the leader's positive affective display will effectively trigger the member's work motivation, this affective display has not always caused desirable outcomes. This research addresses these important issues through considering three-way interaction of the characteristics of expression, the positive affect of the members, and LMX. To verify our hypotheses, 698 days from 47 leaders and 146 members were collected through the Experience Sampling Method. The analysis was conducted using HLM, and the results showed that, for members with high LMX, the positive effect of perceived deep acting on work engagement was strengthened when positive affect was high, and the negative effect of perceived surface acting was weakened when positive affect was high. On the other hand, members with low LMX showed a stronger positive effect of perceived deep acting on work engagement when positive affect was high, and the negative effect of perceived deep acting was mitigated when positive affect was low. These results highlight that LMX acts as a context of the affective display between the leader and the member and the effect of displaying positive affect relies on the member's perception of the characteristics of the expression and the affective state.

Leader Gratitude Expression and Employee Ego Depletion: An Emotions-as-Social-Information Model

Author: **Qiqi Wang**; Renmin U. of China
Author: **Zengxin Li**; Renmin U. of China
Author: **Xueling Fan**; School of Business, Nanjing U.

In this study, we identify leader gratitude expression as a social factor that can relieve employee ego depletion. Drawing on the Emotions as Social Information (EASI) model, we treat work meaningfulness and positive affect as the mediators between leader gratitude expression and employee ego depletion. Furthermore, we propose and test relational identity as a moderator of the relationship. We tested our hypotheses using a multi-wave data gathered from 276 employees in

Boulder

Author: **Shannon Leah Marlow**; U. of Texas At San Antonio

Psychological safety is an important team construct, popular among both scholars and practitioners due to its notable strengths in improving team dynamics and performance. While previous research has provided rich data highlighting the value of team psychological safety, a common call among team scholars is the need for longitudinal examinations of this team construct. By analyzing team psychological safety over time, we respond to this need and open up the black box regarding team emergent state development. In doing so, we broaden our insight regarding team dynamics and leverage state-of-the-art research methods to test our proposed model. Results suggest that team psychological safety climate develops over time through consensus emergence and that this process is triggered by early information sharing. We also find that gender diverse teams are more likely to engage in early information sharing, thus heightening psychological safety climate emergence. Implications for science and practice are discussed.

Does National Status Influence Psychological Safety Growth in Newly Formed Multinational Teams?

Author: **Sam Farley**; Leeds U. Business School
Author: **Jeremy F. Dawson**; U. of Sheffield
Author: **Thomas Greenaway**; Sheffield U. Management School
Author: **Keelan Meade**; Sheffield U. Management School
Author: **Daria Hernandez-Ibar**; Sheffield U. Management School

In multinational teams, psychological safety promotes learning as members are willing to share tacit knowledge and volunteer ideas. However, little is known about how non-native team members experience psychological safety. We therefore sought to examine whether differences exist in the starting levels and growth of native and non-native team members' psychological safety in newly formed teams. We also examined how it impacts on

China. Our results showed that the positive predictive role of leader gratitude expression on work meaningfulness and positive affect were stronger for employees with high relational identity. Furthermore, work meaningfulness and positive affect were both significantly related to employee ego depletion. We discuss theoretical and practical implications for ego depletion and leader gratitude expression.

Author: **Yirong Guo**; Tsinghua U. School of Economics and Management

Author: **Lynda Song**; Remin U. of China

Author: **Dan Ni**; School of Economics and Management Tsinghua U.

Although scholars have begun to explore the role of gratitude in organizations, research has often focused on gratitude as an emotional state while overlooking the impact of gratitude expression. In a series of two quasi-experimental field studies, this paper examines the impact of a gratitude expression intervention on employees' psychological and behavioral outcomes. Drawing from the emotions as social information model, we theorize that through increased received gratitude, participation in a gratitude expression intervention enhances employees' own felt gratitude and perceived prosocial impact, and in turn, these psychological reactions to received gratitude are positively linked to employees' work engagement and organizational citizenship behavior. Results from two quasi-experimental field studies, including one study in a service organization in the aviation industry and another in a medical training program, provide support for our model.

How Do You Feel About Interactions with Coworkers? The Role of Positive Relational Affect

verbal behaviour and the competence ratings that members receive from their teammates. In a sample of 519 team members (101 teams), growth curve modelling showed that non-native team members start with lower levels of psychological safety than native team members. Moreover, data collected on five consecutive days showed that non-native team members' psychological safety grew at a slower rate than native team members'. We also found that psychological safety growth and verbal behaviour sequentially mediated the relationship between national status and competence ratings, such that non-native team members experienced lower psychological safety growth, engaged in verbal behaviour to a lesser extent and received lower competence ratings from their peers. The results were fully replicated on a separate sample of 538 team members (90 teams) in a second study using an identical research design. Our findings advance understanding on how psychological safety unfolds in newly formed multinational teams.

LMX Ambivalence and Creative Performance: The Roles of Psychological Safety and Trust in Leader

Author: **Jeongeun Kim**; Sungkyunkwan U.

Author: **Michael Paik**; Sungkyunkwan U.

Author: **Kyeong-eun Lee**; Sungkyunkwan U.

Author: **Hyunjoo Lee**; Sungkyunkwan U.

Author: **Jiseon Shin**; Sungkyunkwan U.

This research examines how employees respond to leader-member exchange (LMX) ambivalence formed through interaction with their leaders. Drawing upon attachment theory, the purpose of this research is to examine how LMX ambivalence has an effect on employees' creative performance via psychological states (i.e., psychological safety and trust in leader). In addition, power distance orientation is examined as a moderating factor that weakens the negative relationship between LMX ambivalence and psychological states, thereby influencing creative performance. Data were collected from team leaders (N = 38) and employees (N = 163) working in manufacturing and trading organizations located in South Korea. The finding shows that LMX ambivalence was negatively related to psychological safety and trust in leader.

Author: **Hee Young Lim**; Hanyang U.
Author: **Min-Soo Kim**; Hanyang U.

This paper examines the role of affect in dyadic interactions between coworkers. Because task performance is becoming more team-driven, organizations are taking an increasing interest in the relationships among socially embedded team members. Emerging literature indicates that affect in relationships among coworkers has a critical role in organizational life; interpersonal affect is thus of central importance in the workplace. Drawing from the affect theory of social exchange and conservation of resources theory, we argue that when individuals experience positive affect in their interaction with a partner, they are more likely to request help from that partner. Additionally, experiencing positive affect during interaction with dyadic partners increases individuals' resources and facilitates work engagement. We used experience sampling strategy to examine the workplace interactions and work engagement of 173 individuals (634 dyadic relations) for a period of 5 days, and analyzed the cross-classified multilevel model using round-robin design. The results supported the study's hypotheses. We also discuss the theoretical and practical implications of our findings.

The Effect of Cultural Value Orientation on the Relationship Between Psychological Safety and Voice

Author: **Yunsun Ahn**; KAIST College of Business

Abstract Although the important roles of psychological safety on voice behavior have been empirically supported, not much attention has been drawn on the critical question—a boundary condition for when psychological safety is particularly less helpful. Drawing on implicit voice theory (Detert & Edmondson, 2011), which explains about the voice-reluctant phenomenon in organizations as the “taken-for-granted rules of self-censorship”, this study suggests psychological safety is less important antecedent of voice behavior of employees culturally hardwired to be reticent. Using survey data from 342 full-time employees working at diverse organizations in South Korea, this study tests how cultural value orientation moderates the relationships between psychological safety and voice. Finally, the results suggest that the perception of psychological safety would not be sufficient to lead voice even more with employees high in power distance orientation, as the power distance orientation increases self-censorship. Study concludes with a discussion of the areas in need of future examination.

Identities (session 1288)

My Network, My Self: A Social Network Approach to Work-Based Identity

Author: **Jordana Moser**; King's College London

Author: **Blake E. Ashforth**; Arizona State U.

As the organizational landscape becomes increasingly turbulent and the gig economy grows, the conventional anchors for a work-based sense of identity – a stable organization, workgroup, and/or occupation – are losing relevance. We argue that a “network identity,” defined as the sense of oneself as a member of a network (e.g., “we are high-achievers”), helps fill this growing void because networks tend to be egocentric (i.e., agentic) with more or less fluid boundaries and portability. These attributes enable individuals to develop or join networks that may transcend specific contexts and adapt to change. Networks simultaneously implicate all three levels of self – personal, relational, and collective – such that they are potentially very powerful means for realizing common identity motives. Crossing the dimensions of network boundary strength and network density, we offer a typology of networks and discuss their implications for network identities and what kinds of individuals might prefer each network.

Alumni Events, Sociability, and the Residual Organization

Author: **Michael Kevin Power**; London School of Economics and Political Science

Author: **Penelope Tuck**; U. of Birmingham

This paper argues that alumni events are not only settings where professional identities are renewed in social gatherings, or simply instruments to build and sustain commercially valuable networks. They can also be continuous with the organizations they celebrate by reproducing latent structural features of these organizations long after they cease to exist. Based primarily on participant observation of three annual lunches for alumni of the former accountancy firm Deloitte Haskins & Sells, and interviews with participants, organizers and non-

Mindfulness and Motivation Trajectories Across the Workweek: An Entrainment Theory Perspective

Author: **Scott Dust**; Miami U.

Author: **Haiyang Liu**; London School of Economics and Political Science

Author: **Siting Wang**; Hong Kong Baptist U.

Author: **Chris Reina**; Virginia Commonwealth U.

Employee performance is commonly investigated as a static, one-time aggregation of prior employee behaviors. For the studies that do acknowledge that performance fluctuates over time, the timeframe decision is disconnected from theoretical underpinnings. To make this connection clearer, we draw on entrainment theory and investigate trajectories in motivation and performance across the five-day workweek. We hypothesize that motivational control (i.e., staying on course and sustaining effort in pursuit of goals through the redirection of attention) and performance have a declining trajectory across the workweek. Drawing on self-determination theory, we also hypothesize that trait-based mindfulness (i.e., non-judgmental present moment attention and awareness) negatively relates to the downward trajectory in performance across the workweek via the downward trajectory in motivational control. Finally, we take a trait activation theory perspective, hypothesizing that mindfulness is relevant as an indirect influence on performance trajectories through motivational control trajectories only when job demands are high. The hypotheses are generally supported. There is a downward trajectory in motivational control and performance across the workweek. Further, job demands conditionally moderate the indirect effect of mindfulness on performance trajectories through motivational control trajectories. We test our model using 155 full-time employees in a medical device company. We collected data from participants twice daily across the five-day workweek and used a person-centric trajectory approach to investigate the proposed relationships. Theoretical and practical implications specific to dynamic motivation and performance, entrainment, and mindfulness literature are discussed.

[view paper \(if available\)](#)

participants, the paper makes two inter-related contributions to the study of professional service firms and to organization theory. First, it argues that alumni events reveal the variable durability and re-enactment of hybrid professional-social relations - what we call "sufficient sociability" - which were formed during intense working in small groups. Second, we show that these social relations, via table seating choices at an alumni event, produce what we call the "residual organization". In this way, a modest alumni lunch in a central London hotel is transformed from an event of marginal interest, into a "site" where core issues of organization theory are at stake.

Exploring the Role of Negative Relationships in Social Networks on Individuals' Innovative Behavior

Author: **Vojkan Nedkovski**; U. of Milan

Author: **Marco Guerci**; -

Author: **Luca Carollo**; U. of Bergamo

Much of the work in social network perspective of individuals' innovative behavior has been conducted by examining the role of positive interpersonal relationships such as work-related communication, friendship, advice giving or knowledge sharing. However, as the concept of asymmetry suggests, negative relationships at work may impose social liabilities that often exceed the benefits that accrue to individuals from their engagement in positive relationships. In this study, we apply both quantitative and qualitative methods to examine the role of direct and indirect negative relationships on individuals' innovative behavior. The results of our empirical study on 62 employees (response rate was 100%) in an Italian architectural studio demonstrate that both direct and indirect negative relationships affect individuals' innovative behavior at workplace. Our study furnishes important insights for the social network perspective and specifically, we make specific contributions to the structural holes theory and structural balance theory.

The Experience of Working for Traumatic Stress Sufferers: Work as Therapy or Trigger? (WITHDRAWN)

Author: **Scott D. Williams**; Wright State U.

Author: **Jonathan Williams**; Wright State U.

While a return to work following trauma exposure can be therapeutic, this is not always so. As with many topics related to traumatic stress in organizations, several contingency factors complicate the effort to draw an overarching conclusion about whether returning to work is therapeutic. The goals of this paper are twofold. First, it presents important determinants of whether work is therapeutic or triggering for those with traumatic stress conditions. Second, the need for contingency approaches in the study of traumatic stress in organizations is illustrated. Three of the key determinants of whether a return to work is therapeutic or triggering for traumatic stress sufferers are (a) the type of traumatic event experienced, (b) the stress condition developed, and (c) the nature of the work setting. For instance, task-related traumas are more likely than natural disasters to make a return to work triggering. Additionally, while individuals with treatment-resistant posttraumatic stress disorders may exhibit very similar symptoms to those with acute stress disorders, acute stress disorders are more likely to respond favorably to a return to work. Finally, organizational compassion, managerial actions, and the presence or absence of culprits can affect how therapeutic an employee's return to work posttrauma is.

How Workplace Social Stressors Influence Marital Behaviors: A Social Model of Work-Family Spillover

Author: **Helen Pluut**; Leiden U., The Netherlands

Author: **Remus Ilies**; National U. of Singapore

Author: **Runkun Su**; National U. of Singapore

Drawing on work-family spillover and self-regulatory depletion theories, this study proposes and tests an interpersonal model of work-family spillover. Our model specifies how social stressors at work (i.e., workplace incivility, abusive supervision, interpersonal conflict) result in experiences of a

Network Dynamics: A Review and Research Agenda

Author: **Diego Stea**; Copenhagen Business School
Author: **Dennis Holding Jacobsen**; Copenhagen Business School

There has been a tremendous increase in scholarly interest in the emergence, evolution, and change of organizational networks. This has led to key insights on the phenomenon, and to a clearer understanding of its uniqueness and importance. Yet, the rapid increase in the number of publications on network dynamics, the fact that longitudinal network data significantly differ both across and within levels of analysis, and the fact that network dynamics can be explained invoking different logics (e.g., agency, inertia, opportunity) which are differentially embedded in various disciplines (e.g., economics, sociology, strategy) have led to fragmentation in the existing literature, which is scattered across a wide range of scientific journals. This hampers cumulative knowledge growth and risks leading to a duplication of efforts. Drawing on 162 peer-reviewed articles, we systematically review and integrate research on network dynamics into a conceptual framework that allows us to identify persisting gaps in research and promising avenues for advancing our understanding of network dynamics.

PAPER SESSION

ASYNCHRONOUS

social-based form of work-family conflict, ultimately influencing marital behaviors at home on a daily basis. The mediating role of depersonalization and the moderating role of dispositional trust were also examined. A two-week experience-sampling study with daily employee surveys at work and at home and with spousal ratings for employees' marital behaviors in the evening provided general support for the proposed relationships. Within individuals, social stressors at work were associated with depersonalization, which mediated the effect of workplace social stressors on social-based work-family conflict. In line with congruence response models, we observed that those who are trusting (agreeableness facet) were more negatively affected by social stressors at work. On evenings when employees experienced social-based work-family conflict, their spouses reported more withdrawn and angry behaviors and less supportive behaviors shown towards them. Overall, the current research explicates a specific form of work-family conflict, one in which social stressors in one domain result in negative behaviors in the other domain via depersonalization.

Team Creativity (session 1284)

Role Differentiation in Creative Processes: A Configural Approach to Team Creativity

Author: **Suqing Wu**; U. of Groningen, Faculty of Economics and Business

Author: **Yingjie Yuan**; U. of Groningen, Faculty of Economics and Business

To achieve team creativity, team members must engage in various processes, such as problem construction, information search, idea generation, and idea evaluation and implementation. In this paper, we propose that teams may develop a pattern of role differentiation, defined as the specialization of team members in different creative processes. It is proposed that role differentiation allows teams to achieve creativity effectively and efficiently, and will positively relate to team creativity especially when resources are scarce and when teams have sufficient decision making authority (i.e., low centralization). In both a lab study and a field study, we demonstrate that role differentiation is positively related to team creativity, and that this positive effect is stronger when teams have fewer resources for creativity. The field study further showed that this effect is contingent on low centralization of decision-making. These results point to the importance of structuring distinct creative inputs of team members to achieve team creativity, and suggest that not only the amount of attention that is given to different creative processes matters, but also how they are distributed among team members.

relative weight analysis with each sample to identify which PERMA dimensions were focal predictor variables in explaining variance in the performance dimensions. Implications regarding the usefulness of the PERMA framework in future cross-cultural organizational research are discussed.

Inside the Leader-Member "Double-Interact": A Temporal Theory of Leader-Member Exchange (LMX)

Author: **Jesse Theo Vullings**; Vrije U. Amsterdam

Author: **Omar Solinger**; Vrije U. Amsterdam

Author: **Edina Doci**; Vrije U. Amsterdam, School of Business and Economics

Author: **Joeri Hofmans**; Vrije U. Brussel

Author: **Timothy A. Judge**; The Ohio State U. Fisher College of Business

Author: **Paul G W Jansen**; Vrije U. Amsterdam

In this study we conceptualize the process of leader-member exchange (LMX), with the leader-member 'double-interact' at its core. We take a dynamic systems approach and build on recent insights from personality dynamics research (e.g., Sosnowska, Kuppens, De Fruyt, & Hofmans, 2019) and interpersonal theory (e.g., Hopwood et al., 2018) to capture and understand the patterns of interpersonal behavior in the leader-member dyad. We dissect the emergent pattern of interpersonal behavior and show how these different patterns influence the quality and sustainability of the leader-member relationship. Next, we explain how this leads to four general LMX- development scenarios that differ in their quality and sustainability. Our temporal theory contributes to the literature by capturing and explaining the moment-to-moment interpersonal behavior dynamics in the leader-member dyad, incorporating trait-perspectives, behavioral-perspectives, LMX theory, and power

How Information Diversity and Integration Relate to Team Creativity and Innovation: A Meta-Analysis (WITHDRAWN)

Author: **Kris Byron**; Georgia State U.

Author: **Sejin Keem**; Portland State U.

Author: **Tanja R. Darden**; Towson U.

Author: **Christina Shalley**; Georgia Institute of Technology

Author: **Jing Zhou**; Rice U.

Although having diverse knowledge and perspectives is considered crucial to team creativity and innovation, research examining diversity's relationship to team creativity and innovation has been decidedly mixed. This meta-analysis examines diversity's relationship to team creativity and innovation, and considers factors that may allow teams to more fully realize the potential benefits of diversity. Employing a knowledge integration perspective, we proposed that teams are likely to be more creative and innovative when team members offer a diverse set of informational resources and are structured in a way that motivates or enables them to integrate these resources. We tested our theoretical contentions with a random-effects meta-analysis of 156 independent samples. We found that diversity tends to have positive effects: teams with greater surface-level or deep-level diversity and those with more members tend to be more creative and innovative. We also identified important contingencies. For example, teams with greater racial/ethnic diversity or with more team members are more creative and innovative when they have experience working together (as opposed to when they are newly formed) or when they have a clear creativity goal (as opposed to when they do not). Finally, we found little difference in the relationships between various team factors such as surface-level diversity or size and team creativity or team innovation, supporting our combined use of these measures.

A Temporal Analysis of Employees' Situational Work Motivation and Well-Being

Author: **Zheni Wang**; School of business, Southern Connecticut State U.

Author: **Alexandra Joelle Panaccio**; Concordia U.

Work scheduling is a challenge to manage under the perceptions that employees dislike unconventional working hours for sociocultural and economic reasons. This research used a complete temporal approach (Shipp & Cole, 2015) to answer the research question of how time (subjective and objective time of the workday, day of the workweek) predicts employees' daily/weekly well-being (vitality and affect; Ryan & Deci, 2001; Ryan & Frederick, 1997), basic needs satisfaction, and situational work motivation under the framework of self-determination theory (Deci & Ryan, 1985; Ryan & Deci, 2000) and hierarchical model of self-determined motivation (Vallerand, 1997; Vallerand & Ratelle, 2002) at work. We collected the multi-level data using the survey structure outlined under the day reconstruction method (Kahneman, Krueger, Schkade, Schwarz, & Stone, 2004) with part-time working undergraduate students. Multi-level structural equation modeling results showed that vitality started out at a high level and decreased with both subjective and objective time of the workday and day of the workweek. Affective well-being didn't demonstrate similar daily/weekly temporal patterns. In addition, work events scheduled during the weekend also had a significant positive indirect effect on vitality and positive affect through increasing basic needs satisfaction and situational autonomous motivation. We discussed the implications and limitations of this study.

Author: **Erica Xu**; Hong Kong Baptist U.
Author: **Ye Zhou**; Shanxi U. of Finance and Economics

Knowledge sharing between employees with diverse functional and professional backgrounds is crucial for work groups. To understand and make use of a functionally dissimilar partner's expertise, an employee should engage in deep knowledge dialogues and intensive knowledge exchanges with the partner. In this paper, we clarify the elements of deep dialogues and develop a model of deep knowledge sharing and creativity. In the pilot study, we developed the constructs and measures of deep knowledge sharing and integrative understanding. In the main study, based on survey data, we showed that an employee can achieve an optimal understanding of the expertise of a dissimilar partner only when both parties simultaneously and intensively engage in deep knowledge sharing. We also found that a focal employee needs to engage in deep knowledge sharing with every other functionally dissimilar member in order to assimilate others' expertise to generate creative ideas and solutions.

The Impact of Newcomer Socialization on Team Creativity

Author: **Jia Yu**; Louisiana State U. Shreveport

This paper examines newcomer entry into teams and team creativity in a field setting. Unique information and perspectives brought by newcomers have been proposed to provide "fresh blood" for teams, which can benefit team creativity. However, the addition of newcomers can also disrupt the optimal team processes and reduce team effectiveness. To provide insight into the relationship between newcomer entry and team creativity, the present study bridges the socialization and team creativity literatures and shows that newcomer entry did not automatically increase post-entry team creativity. However, post-entry team creativity increased, compared with pre-entry team creativity, when coworkers engaged in helping behaviors toward newcomers or newcomers were proactive. Moreover, coworker helping behaviors and newcomer proactive personality interacted with

The Impact of Sleep on Work (session 1289)

The Mechanisms and Boundary Conditions Linking Sleep Duration to Work-Related Functioning

Author: Wladislaw Rivkin; Aston Business School

Author: Stefan Diestel; U. of Wuppertal

Author: Jakob Stollberger; Aston Business School

Author: Claudia Alexandra Sacramento; Aston U.

Research suggests that sleep is linked to work-related functioning. Moreover, recent studies have identified individual traits and organisational boundary conditions that modulate this relation. However, moderators identified so far are relatively stable and difficult to change for employees themselves. In addition, the mechanisms underlying the link between sleep and work remain largely unexplored. In the present study, we address these gaps by examining first, implicit theories about willpower (i.e., believing that regulatory resource availability is limited rather than non-limited) as a malleable protective resource that moderates the relation between sleep and regulatory resource availability, and second the interplay of regulatory resource availability and motivational processes in the form of basic needs satisfaction as a mechanism linking good sleep to work-related functioning. To develop our research model, we integrate notions on sleep and self-control, implicit theories about willpower, and self-determination. We test our model in two daily diary studies across 10 days with samples of N=51 (Study 1) and N=145 (Study 2) employees. Findings from both studies consistently reveal that the relation between sleep and regulatory resource availability is stronger for individuals holding a limited- as compared to a non-limited resource theory. Moreover, as hypothesized, we find mediating effects of regulatory resource availability and basic needs satisfaction on work

engagement, as well as in- and extra- role performance as indicators of work-related functioning. Subsequently, we discuss theoretical and practical implications as well as limitations of our research.

Procrastinate at Work, Sleep Badly at Night: How Job Autonomy Matters

Author: **Baihe Song**; The Hong Kong U. of Science and Technology

Author: **Qian Jing**; Beijing Normal U.

Author: **Bin Wang**; Curtin U., Perth

Drawing on appraisal theory and examining the detrimental effect of procrastination on sleep quality, this study extended existing literature on the outcomes of procrastination. Results of 2026 daily data demonstrated that at within-person level, day-specific procrastination is negatively related to subsequent sleep quality at night through the serial mediators of rumination and negative affect. Furthermore, we identified an important boundary condition, i.e. job autonomy, on the effectiveness of the negative influences of daily procrastination at between-person level. Specifically, job autonomy moderates the within-person effect of procrastination on rumination, such that this effect is stronger for employees with higher levels of job autonomy. In doing so, this study could enrich the findings of the negative influences of procrastination, reveal an underlying mechanism, and more importantly, show how to effectively cope with daily procrastination.

Sleep Architecture and Employee Burnout: A Conservation Of Resources Theory Perspective

Author: **Olivier D. Boncoeur**; U. of Texas at Dallas

Sleep is an important organizational phenomenon that operates that the cusp of employees' work and nonwork lives. The literature on sleep in the organizational literature suggests its importance in rendering employees able to come to work the next

day, filled with energy and capable of interacting with organizational stakeholders. However, this literature has evolved despite assumption that sleep is an inactive and state in which the brain is 'turned off' and that 'turning on' the brain would interrupt the restorative process. Yet, individual go through characteristic patterns of activity throughout each period of sleep, and that it is sometimes more active during asleep than when wakefulness. Drawing on the rapid-eye-movement sleep (REMS) and non-rapid-eye-movement (NREM) sleep characterizations of sleep, we theorize the centrality of REMS in decreasing employees feeling excessive demands on their resource and abilities to further invest in work employees. We draw from the insights of neuroscience to examine how REMS contributes to the recovery process that allows employees to be at work, and we integrate this to the conservation of resources theory to derive our hypotheses. We also consider the potential of daily strategies that employees engage in to conserve their resources. We find support for this model using a combination of actigraphic measures, combined with an experience sampling data. Our paper contributes to the sleep literature in management by advancing our knowledge of sleep by opening the black on the processes through which sleep enhances daily recovery, which, in turn, reduces the feeling of burnout by the employees.

The Reciprocal Relations Between Sleep and Procrastination

Author: **Xiaotian Sheng**; Department of Experimental and Applied Psychology, Vrije U. Amsterdam

Author: **Yang Bai**; Guanghua School of Management, Peking U.

Author: **Zhang XiChao**; Faculty of Psychology, Beijing Normal U.

From the within-person and between-person perspectives, we investigate the reciprocal relations between sleep quality/duration/regularity and procrastination. Based on the self-regulation and recovery perspectives, we examine the different mediating role of self-regulatory resources and affective rumination. Using a time-lagged diary

study, our hypotheses were tested in a sample of 149 participants who completed three times-daily surveys over a two-week period. Study results confirm our hypotheses that poor and insufficient sleep reduces individuals' next morning's self-regulatory resources, which in turn enhances procrastination behaviors. Moreover, procrastination induces negative affective rumination before going to bed, which in turn undermines the sleep quality and sleep duration at that night. As expected, we found that the effect of sleep quality was stronger than the effect of sleep duration. Finally, concerning individual differences, sleep regularity has a negative indirect effect on procrastination through the mediating role of self-regulatory resources. This result highlights the unique contribution of sleep regularity after controlling the effects of sleep quality and sleep duration. We discuss the theoretical and practical implications of our findings.

When Teams Consist of More than Humans: On Teaming Up with Robots and AI in Workplaces (session 1299)

Humans increasingly interact with artificial agents (Hortensius and Cross, 2018), intelligent technologies able to receive and interpret inputs and communicate with humans. Collaborative robots, intelligent personal assistants, chatbots powered by artificial intelligence, and other such technologies become intertwined in social and economic relationships (Rahwan et al., 2019; Shiller, 2019). For organizations, the introduction of artificial agents implies changes in the ways humans work across individual, group, and organizational levels. Consequently, our understanding of these multi-level processes has to evolve to account for these changes (Amabile, 2019; Chan, 2019; von Krogh, 2018). Organizational scholarship needs to integrate

positively relates to team performance through team identification, whereas benevolence positively relates to team performance through emotional exhaustion. Based on the findings, theoretical implications, managerial implications, and research limitations are discussed.

The Dark Side of High-Quality LMX: Relational Tensions and Their Impacts on Members (WITHDRAWN)

Author: **Lusi Wu**; U. of Electronic Science and Technology of China

Author: **Brian R. Dineen**; Purdue U.

Author: **Lu Chen**; U. of Electronic Science and Technology of China

As one of the most popular approaches to study leadership, the leader-member exchange (LMX) theory focuses on the dyadic relationship between a leader and a member (Gerstner & Day, 1997; Graen & Uhl-Bien, 1995). Characterized by trust, support, loyalty, and commitment (Uhl-Bien & Maslyn, 2003), high quality has been documented to produce many positive outcomes, such as higher job satisfaction, organizational commitment, in-role and extra-role performance, and lower levels of stress (Dulebohn et al., 2012; Gerstner & Day, 1997). The beneficial aspects of high-quality LMX to high-quality LMX members dominate the LMX literature. Though it is intriguing to believe that high-quality LMX does only good to members, there may be more to the story. Drawing on Relational Dialectics Theory (DRT), which posits that interpersonal relationships are by nature paradoxical (Baxter, 1990, 2004; Montgomery & Baxter, 1998), this research investigated relational tensions members experience in high-quality LMX and their effects on members across three studies. We identified six types of relational tensions high-quality LMX members experience using grounded theory approach, developed a scale to measure them, and examined how they influence members' relationship attitudes using survey data. Our research illuminates the potential costs for members in high quality LMX, providing a more comprehensive understanding of LMX.

Bitter Sweet Brightness: The Impact of CEOs' Bright Personality Traits on Corporate Fraud

Author: **Moritz Hagen**; FAU Erlangen-Nürnberg

Author: **Christina Wittmann**; FAU Erlangen-Nürnberg

Author: **Jan Mammen**; Friedrich-Alexander U. of Erlangen-Nürnberg

Author: **Sebastian Junge**; U. of Erlangen-Nuremberg

Recent corporate scandals entail tremendous consequences for firms and their stakeholders, encouraging scholars from various research fields to investigate motives for such behavior. Continuing in this vein, we examine the impact of CEOs' bright personality traits ('Big- Five') on the corresponding propensity to engage in corporate fraud. Applying an innovative linguistic analysis, more precisely an open vocabulary approach followed by neural networks, on transcripts of earnings conference calls, we measure the personality of 186 CEOs of S&P 500 firms in the years 2002 to 2017. We find that the levels of conscientiousness and neuroticism are positively related to the likelihood to commit corporate fraud. By counterintuitively connecting bright personality traits with detrimental company outcomes, we contribute to upper echelons theory and literature on personality traits.

Author: **Meng Hui**; -

Author: **Xiaowei Guo**; Shanghai U. of International Business and Economics

Using an inequity perspective of over-reward under social exchange theory, the current research (1) develops a new construct, i.e., guanxi practice on punishment avoidance (GP-PA); (2) focuses on the double-sword mechanism (i.e. guanxi practice on reward acquisition, GP-RA, and GP-PA) through which subordinates with supervisor-subordinate guanxi (SSG) could perform both positive and

Malte Friedrich Jung; Stanford U.

Tsung-Yun Ho; Cornell U.

SYMPOSIUM

ASYNCHRONOUS

negative behaviors simultaneously; and therefore (3) distinguish supervisor-subordinate guanxi from leader-member exchange (LMX) according to the exclusive mechanism the former depends on to benefit the preferred subordinates. The results from the 363 Chinese supervisor-subordinate dyadic data collected in three waves indicated that (1) subordinates with better SSG could obtain the privilege allowing them either achieve valuable resources or seek immunity from the punishment, the former encourages the beneficiaries to display more citizenship behaviors toward both the organization and other colleagues, while the latter entices the preferred subordinates to engage in more deviant behaviors toward organization rather than interpersonal deviance; (2) unlike SSG, LMX could only benefit the preferred subordinates by rewarding extra resources, which prompting more citizenship behaviors, but not protect them from punishment, therefore suppressing undesirable behaviors. Theoretical and practical implications are discussed.

OCIS

Managing IT for Successful Outcomes (session 1302)

[Unravel the Black Box between Fear and Security: Coping Behavior: The Role of Learning from Failure](#)

Author: **Chengqi (John) Guo**; James Madison U.

Leadership and organizational learning theorists have argued that psychological safety is associated with learning from failures at all three levels - individual, group, and organization. Meanwhile, behavioral information systems (IS) security researchers have produced various frameworks to explain individuals' psychological and behavioral responses to security threats and risks. Their findings, however, do not explain how learning from failure - a critical factor for improvements at multiple levels - unfolds in the IS security paradigm where fear plays a key role in exerting impacts on

relatively piecemeal. The major purpose of the current meta-analysis is to clarify the relationships between workplace incivility and discretionary work behaviors and their intervening mechanisms. Drawing from social exchange theory, affective events theory, and self-regulation theory, we examine three related yet distinctive psychological processes – i.e., social exchange quality, negative emotional reactions and psychological strain – that transmit the effects of experienced workplace incivility on two types of discretionary work behaviors – i.e., organizational citizenship behavior (OCB) and counterproductive work behavior (CWB). A meta-analytic path analysis based on the current study's meta-analytic findings ($k = 128$) and relevant existing meta-analytic findings indicates that the negative relationship between workplace incivility and OCB is not direct, but primarily mediated through social exchange quality and, to a lesser extent, negative emotional reactions. In contrast, the positive relationship between workplace incivility and CWB is not only direct but also mediated through negative emotional reactions, and, to a lesser extent, social exchange quality and psychological strain. Implications of these findings for relevant theory and practice will be discussed along with study limitations and future research directions.

Workplace Incivility: An Integration of Affective Events Theory with Approach-Avoidance Framework

Author: **Egan Lua**; Georgia Institute of Technology

In this article, I integrate Affective Events Theory with the approach-avoidance framework to develop a unifying theoretical model that interconnects experienced, witnessed, and instigated incivility. Incidents of workplace incivility are conceptualized as affective events that elicit different discrete emotions (anger, guilt, fear/anxiety, and sadness) for each individual – the target, the observer, and the instigator. These discrete emotions, in turn, lead to the individual's approach and avoidance-oriented behaviors in response to the uncivil event. Next, I propose that different cognitive coping strategies can buffer or amplify the impact of emotions on

individuals' emotional state and subsequent behavioral manifestations. We propose that a cross-paradigmatic examination of the theoretical underpinnings of psychological safety, fear, leadership roles, and threat-response appraisal may benefit our academic society, who continuously seeks innovative ways to elucidate befuddling, sometimes conflicting, security-based behaviors. We theorize how the presence of moderate fear stimuli, in conjunction with psychological safety, may augment learning performance and thus positively affect the security coping intention and behavior of information workers. We also initiated a discussion of moving beyond the dichotomy of what we learn better from - success vs. failure, by suggesting that an organic permutation of learning from success and failure experiences, if carefully assessed and calibrated, appears to serve our best interests.

The Effect of IT Resource Orchestration on Strategic Behaviors

Author: **Inmyung Choi**; Texas Tech U.

Author: **Alain Pinsonneault**; McGill U.

Author: **Kunsoo Han**; McGill U.

This study explores how conformity and differentiation in IT resource management influence the strategic behaviors of firms drawing upon the institutional theory literature. Prior studies have suggested two competing arguments (i.e., institutional isomorphism and strategic differentiation) and examined whether conformity or differentiation in IT resource deployment provides superior market performance. This study reconciles these two countervailing views and suggests a specific way that firms can conform to industry isomorphism and differentiate themselves simultaneously in deploying IT resources. Specifically, we introduce a novel concept, IT resource orchestration, which captures how a firm differentiates its IT resources compared to industry peers over time. Using a sample of 1,854 firm-year observations from the United States, we find that IT resource orchestration is associated with differences in the strategic behaviors of firms. Further, our results indicate that a firm's business environments moderate the relationship between

those behaviors. Finally, I discuss the implications of the model and propose future research directions.

Workplace Incivility and Deviant Silence: The Role of Moral Attentiveness

Author: **Ghulam Murtaza**; Kedge Business School, France

Author: **Rahman Khan**; Iqra U. Karachi, Pakistan

Author: **Jean Pierre Neveu**; U. de pau et des pays de l'Adour

In the present study, we examine the reciprocal relationship between employees' perceptions of workplace incivility and their deviant silence. We also explore the moderating role of moral attentiveness on this relationship. Utilizing three-wave longitudinal data from 297 full-time employees working in different industrial sectors in the United States, we find support for the reciprocal model as the best fit to the data, thus validating relationships over time between our study variables. Taken together, our results suggest that workplace incivility at T1/T2 significantly predicted deviant silence at T2/T3. The results also reveal that deviant silence at T1/T2 significantly predicted workplace incivility at T2/T3. Importantly, we found that reflective but not perceptual moral attentiveness significantly reduced the negative influence of workplace incivility on deviant silence in subsequent time periods.

Keywords: workplace incivility, deviant silence, moral attentiveness, reciprocal model

Curbing Cyberloafing: Studying General and Specific Deterrence Effect with Field Evidence

Author: **Przemyslaw G. Hensel**; U. of Warsaw

Author: **Agnieszka Kacprzak**; U. of Warsaw

Although the General Deterrence Theory has frequently been employed to study the prevention of misconduct associated with computer use, the common reliance on survey data makes it difficult to measure the general and specific deterrence effects. We use one-group pretest-posttest quasi-experiment based on data from a monitoring system covering 230 employees for nine months to study general and specific effects of two interventions: the reminder about possible punishment of cyberloafers and the actual punishment. The interrupted time series analysis (ITSA) with ARIMA modelling employed to study the longitudinal effects of the interventions allowed to deliver novel findings. Punishing the violators of organizational policy affected both the punished and unpunished employees (decrease in cyberloafing by 41% and 24%, respectively). The effect was maintained for three months, that is until the end of our dataset. The punishment had a stronger effect on unpunished employees located closer in the organizational structure to the punished ones than on the remaining unpunished employees. Moreover, we show that reminder about the possibility of punishment brought no statistically significant effect, likely due to the earlier experience of punishment avoidance. We discuss implications for theory and designing organizational policies intended to curb cyberloafing.

Lean Principles for Developing Information Systems: Evidence from Health Crisis Management

influence of personality characteristics on how individuals perceive uncivil behaviors in the workplace. The original study found that trait anger, and unexpectedly positive affect, were the strongest predictors of perceived workplace incivility. In addition, it failed to support the hypothesized relationships between perceived incivility and agreeableness, emotional stability and negative affect. To assess success of replication, we used four different criteria (prediction intervals, original study confidence interval, replication confidence intervals, and significance testing) in an independent literal replication (student sample) and an independent constructive replication with a sample of employed participants. In both replications, positive affect and trait anger were the strongest predictors of perceived workplace and replicated across the four success criteria. The constructive replication found different effect sizes of negative affect, agreeableness, and emotional stability, providing some support for the original hypotheses that were not supported in the original study. Finally, the findings related to openness, conscientiousness and extraversion were inconsistent across studies. Taken together these replications suggest the need to continue exploring the role of personality traits in incivility perceptions with constructive replications that provide methodological improvements beyond improving the sampling.

Author: **Stefan Feuerriegel**; ETH Zurich

Author: **Dirk Neumann**; Albert-Ludwigs-U. Freiburg

Up to 70% of all organizational undertakings to realize information systems (IS) turn out as failures or at least flawed. This severely hampers the benefits of IS and thus the IS research disciplines must provide effective remedies. The IS and management communities have advanced practices for the development of IS, such as agile software development. However, they guide development only towards the point of delivery through a development team, while it is not their objective to harmonize the IS in its full socio-technical context of an emergent organization. There is a lack of research about how to conduct IS development in a real-use environment that changes and yet requires stability. These open issues are addressed by this work. Using a mixed-methods approach, we develop principles that support IS practitioners in maneuvering the organizational and technological development process that stretches from making design choices to managing usage of the IS to ensure fit and organizational utility. The principles are inspired by lean paradigms from management practice and regarded through the lens of affordances. This study formalizes them to guidelines for IS development; thus, we call them "lean IS". The resulting framework reconciles the opposing activities of systematization and flexibilization in evolutionary development cycles. Our lean principles for IS are demonstrated in the challenging setting of an international health crisis where we show how an IS can evolve from a minimum viable design to a fully scaled implementation balancing contextual flexibility and central standards.

**Managerial IT Capabilities in the Upper Echelons:
The Role of the Chief Information Officer**

Author: **Robin Wagner**; Westfälische Wilhelms-U. Münster

Information technology (IT) is fundamentally transforming and challenging businesses across all

industries, creating the need for managerial IT capabilities in the firm's upper echelons to coordinate and drive strategic business value creation through IT. In this context, information systems research has extensively described the Chief Information Officer's (CIO) role and responsibilities based on mostly qualitative studies. However, the contingencies affecting CIO presence in the firm's upper echelons are still not well understood. Drawing on the IT capabilities perspective and the resource-based view of the firm, our study addresses this gap in research and argues that CIO presence in the firm's upper echelons is contingent on the interplay of managerial IT capabilities and IT task demands. To test our hypotheses, we use a cross-industry panel of U.S. S&P 500 firms. We contribute to information systems and strategic management literature by extending research on managerial IT capabilities in the upper echelons, by validating contingencies of CIO presence identified in prior contributions, and by developing guidelines for practitioners on how to represent managerial IT capabilities in their upper echelons.

Immersive Virtual Environments in Organizational Routines of an Architectural Office

Designated as a "Best Paper" for OCIS

Author: **Christian Kasper Hofma**; Copenhagen Business School

Author: **Arisa Shollo**; Copenhagen Business School

Author: **Ioanna Constantiou**; Copenhagen Business School

Popularized under the name of virtual reality (VR), virtual environments (VEs) are increasingly gaining traction. However, current research on immersive VEs has focused mainly on the individual level, overshadowing the organizational context, while black-boxing the technology that facilitates the immersive VEs (i.e. head-mounted displays). Hence, we draw on a longitudinal case study to investigate the interaction between head-mounted displays and organizational routines. Employing insights from organizational routines and Leonardi's (2011) imbrication lens we demonstrate how head-mounted displays interact with organizational

successful change effort in Japan?" The preliminary inquiry into the question indicates that the generative change process convinces change sponsors that changing the dominant discourses and welcoming alternative ones can lead to the long-term development of the organizations and themselves. With respect to the sources of alternative discourses, while psychological safety and trust in the external authority figure are generally required, the importance of the players' survival anxiety and talent diversity may vary across the broad contexts on which organizations depend. The development of the discourse-based change framework with applications to the concepts of a political sensemaking approach and economic sociology is also emphasized in this context.

Commiseration: A Chinese Way to do Anger Management in a Context of Leadership at Work

Author: **Jean Sebastien Goulet**; HEC Montreal

This research is to understand how Chinese managers manage their anger when they exercise leadership over a subordinate and feel anger towards this person. On the empirical side, this research innovates since the results and the analysis are based on interviews conducted with Chinese managers in top senior positions. With such high-quality of the sample, this research covers a gap identified with most previous researches on the topic of leadership in China, which were done with lesser or inexperienced people. On the theoretical side, our interpretation of the results leads us to propose a new mechanism called commiseration as a way Chinese managers manage their anger at work. Also, on the practical side, we believe that a better understanding of these mental processes will help managers here and there to have a different perspective on this emotion, and thus improve their leadership in conflictual situations.

"From One of Us to Us": Developing a Theoretical Model of Collective Deviance in IS

Author: **Gabriela Labres Mallmann**; U. Federal do Rio Grande do Sul

Author: **Andreas Eckhardt**; German Graduate School of Management & Law (GGS)

Author: **Antonio Carlos Gastaud Macada**; U. Federal do Rio Grande do Sul

Deviance-related behaviors like violations of Information Systems (IS) policies are increasingly common in organizations. These situations of non-compliance with IS policies are subject to various mechanisms inside workgroups, suggesting the collective-level as an important supplement to individual-level explanations to understand deviant acts in the workplace. We rely on social psychology and criminology literature to address collective deviance and to explain its importance for IS research. Our purpose is to investigate the mechanisms behind the deviant behavior among workgroup members, uncovering reasons for the dissemination of collective deviance within organizations and offering a theoretical model that explains the phenomenon. We performed a qualitative study with an exploratory perspective by interviewing members of 5 workgroups deviating from IS policies. The results show that collective deviance immediately disseminates after introduction, emerges as predominant group norm, and indefinitely continues over time in an uninterrupted way despite changes in group size and membership.

Pathways of Enactment to and from Organizing Visions: Evidence from 3 Countries' Embrace of

Author: **Runtian Jing**; Shanghai Jiao Tong U.

Author: **Mia Raynard**; WU Vienna U. of Economics and Business

Momentum is increasingly recognized as having a significant influence on the success or failure of organizational change efforts. Despite a proliferation of research on momentum, the plurality of perspectives has generated a rather compartmentalized understanding of social mechanism of momentum. In this article, we draw upon Eastern philosophical and management traditions to identify conditions under which seemingly contradictory explanations may be reconciled, and develop a cognitive-configuration model of momentum that advances understanding of the interrelationships amongst momentum, human agency, and organizational change. The model foregrounds an "indirect" form of change agency, wherein change agents recognize, assess, and leverage momentum as a substitute for direct interventions. We articulate three momentum-based strategies for enacting organizational change, each of which implicates a different role for change agents and varying degrees of momentum affordance.

Pushing and Pulling Organizations to Paradigm Shift: Taking Direction from Indigenous Imagery

Author: **Kiri Dell**; U. of Auckland

Author: **Chellie Margaret Spiller**; Waikato Management School

Author: **Nimbus Staniland**; Auckland U. of Technology

In a world facing increasing global challenges such as climate emergency, wildlife extinction, pollution and poverty, most people recognise the dire need for fundamental societal change, yet, we are struggling to respond at a pace required to effect healing transformation. The paper offers two contributions, firstly an articulation of Indigenous-Maori images of the organization and secondly, we demonstrate how Indigenous ontologies and epistemologies, specifically seen here through Indigenous imagery contribute to shifting the paradigm of management and organizational

ICT4D

Designated as a “Best Paper” for OCIS

Author: **Caroline Stratton**; Florida State U.

Author: **Diane E. Bailey**; Cornell U.

Through an in-depth field study of information and communication technologies for development (ICT4D) initiatives in three South American countries, we investigate how actors’ responses to prior discourses about IT innovations prompt variation in how they translate discourse about a current related innovation. Drawing upon Swanson and Ramiller’s (1997) theorization of an “organizing vision” resulting from such discourse, and developing their idea that organizing visions may fall in a sequence, we document striking differences among what we term “pathways of enactment” of the ICT4D organizing vision. Construing a pathway of enactment as a series of discourse events, technology choices, and ground-level organizing activities, we show how actors’ responses to prior organizing visions placed them in stronger or weaker positions when they encountered the ICT4D one. Actors in the strongest positions were able to participate prominently in the global ICT4D discourse and leverage their prior technological choices and ground-level organizing activities to exploit the potential of the ICT4D discourse while actors in the weakest positions had no voice in the larger ICT4D discourse, but did manage to leverage it into resources that supported modest new IT initiatives. Tracing the sources of variation in pathways of enactment should enable us to build theory about organizing visions (and, more broadly, collective senses of IT) that recognizes linkages across sequential innovations. Specifically, we discuss how scholars can begin to account for the role that prior organizing visions might play in shaping the set of technology choices and ground-level organizing activities that actors undertake with respect to a current one, including recognition that actors within a network may differ in their prior responses and thus be positioned differently upon contact with the current organizing vision.

[How to Avoid Falling into Death Spiral: Switching and Multihoming Behaviours in Two-Sided](#)

knowledge and practice. In doing so we address how nations might shift organizational paradigms in order to help tackle challenging problems and achieve healing transformation. We present seven Indigenous (Maori) metaphors for organizations: Papatuanuku (personification of nature), kaitiaki (organizations as guardians), whanau (familial networks), taonga tukuiho (legacies), waka (navigators), raranga (weaving), and Maui (innovators). In doing so, we demonstrate how Maori knowledge has had an immense influence on New Zealand management and organizational practices, and signals the beginnings of a paradigmatic shift in the organizational landscape. We discuss the notions of pushing down and pulling up Indigenous imagery as a form of paradigm shifting, which taken up in other contexts presents potential for global transformation.

Platforms

Author: **Nastaran Hajiheydari**; U. of Sheffield

Author: **Mohammad Soltani Delgosha**; UWE Bristol

Two-sided platforms are increasingly faced the challenge of managing their customers' diverse needs in both sides, while keeping their network balanced and sustainable. This paper develops a conceptual model for examining the customers' decision about switching or multihoming in using on-demand labour platform, either as a consumer or as an individual service provider. To configure our theoretical framework, we incorporated PPM (Push-Pull-Moring) model as a basic theory in migration and role theory as a logic to describe distinguished roles of platform customers. Analysing 472 platform consumer data and 342 service provider samples revealed interesting insights about the salient antecedents of switching and multihoming behaviours. Theoretically, this study extends the extant literature in switching behaviour in platform context by investigating the influential factors in each side of platform, while examining multihoming as a common practice in this context. Practically, we propose a deeper understanding about how platform firms can apply different policies to reduce the effect of unfavourable features, counteract the appealing impacts of alternatives, and simultaneously increase the lock-in mechanisms for both groups of customers.

Organization of Production and Labor Income Inequality

Author: **Vicente Salas-Fumás**; U. of Zaragoza

Author: **Luis Medrano-Adan**; CUD Zaragoza

This paper investigates how and why the organization of production (relative sizes of

exchanges, or central banks, the management literature has lacked a direct focus on the organizational dimension of financial markets. As a result, there is unique potential for new management analyses of Wall Street that draw on management constructs and traditions such as sensemaking, institutional theory, practice theory, and materiality. We believe that management scholars can provide important insights into the 'grand challenge' of making financial organizations a force for good. The present symposium aims to advance along this path by showcasing the potential for management scholars to make a central contribution to our understanding of the financial sector. All four selected contributors build on the core idea that finance is comprised by organizations and thus shaped by organizational processes and practices — hence, worthy of being explored by management scholars. The symposium introduces a key novelty in its format. All four research projects showcased in it are related to books, whether in the form of monographs or edited volumes. The decision to bring together four book authors stems from a growing interest in research books in management. Thus, in this symposium, we also invite a reflection on the distinct advantages and possibilities of research monographs as scholarly outlets.

From Sonnets to Statistics: How Open Scientists Leverage Occupational Heterogeneity for Change

Author: Maximilian Heimstädt; Weizenbaum Institute

Author: Blagoy Blagoev; Leuphana U. Lüneburg

Occupations and their transformation have received only little attention in research on open organizing. To address this shortcoming, we advance a vernacular view on openness and use it to

opportunities in uncertain environments. Specifically, I created the concept of functionality that captures what purposes firms' products provide for the customers. I predict that product experience allows firms to learn about the underlying functionalities and they use such information to guide subsequent product launches. Using fine-grained data on mobile application developers in the US Apple Store ecosystem, I find that firms with greater functionality breadth in their prior product experience are more likely to launch new product, and the effect is largely in firms' core functionalities rather than peripheral and new ones. In particular, these new product launches tend to highlight more of these core functionalities as opposed to recombining with new functionalities. These findings suggest that in uncertain environments, experience breadth has the surprising merit of enabling firms to gain greater clarity in their core functionalities through establishing the boundaries and connections of different functionalities.

Going it Alone or Partnering? Collaboration, Visibility, and Quality in the Video Game Industry.
Author: **Elisa Operti**; ESSEC Business School
Author: **Jerome Barthelemy**; ESSEC Business School

This paper proposes a role theoretic approach of inter-organizational collaboration in cultural industries. Complementing traditional resource-based arguments with identity considerations, we explore how the separation or consolidation of production and distribution roles affects the visibility and quality ratings of cultural products. We contend that roles primarily serve two functions in cultural industries. First, they grant access to resources. When roles are separated, each organization can access specialized resources and use them to target a different audience. Thus, products resulting from role separation are more visible than those launched by integrated creative producers or integrated distributors. Second, roles provide a basis for social categorization, and determine the criteria used by audience members to evaluate products. Role consolidation provides unambiguous evaluation cues, whereas role separation engenders ambiguous identity

empirically examine how the open science community in Germany addresses a typical challenge of occupational change: occupational heterogeneity. We deepen current understandings of open organizing by theorizing the vernacular lens as a complement to the programmatic and constitutive views. It allows us to analyze openness as a practical resource for organizing rather than as a mandated principle or an imprinted value. We further theorize identity inception work as a set of activities that facilitate peer-driven change in heterogeneous occupations. Identity inception work creates a supplementary and versatile "add-on" identity that can be easily attached on top of a primary identity as specialist in a sub-discipline of academia, but in subtle ways commits its carriers to an increasing number of open practices.

Standing on the Shoulders of Giants: How Star Scientists Influence their Co-Authors (WITHDRAWN)

Author: **Nathan Betancourt**; Amsterdam Business School, U. of Amsterdam

Author: **Torsten Jochem**; U. of Amsterdam

Author: **Sarah M. G. Otner**; Imperial College Business School

Despite prior research that supports the link between collaborations with star scientists and their co-workers' productivity, empirical findings on this relationship are surprisingly mixed. To address this, we theorize and empirically disentangle two mechanisms through which star peer effects can occur: a collaboration can convey a direct peer effect by acting as a pipe, through which ideas and knowledge are conveyed from a star to her co-workers, or an indirect peer effect by acting as a prism, meaning that a collaboration with a star signals the quality of her collaborators' work to others. To investigate this, we examine the effect of collaborating on scientific publications with a star who either won, or was nominated for but did not win, the Nobel Prize in Physics. We use the death of a star to isolate pipes and do not find that the co-authors of Nobel Prize winners publish fewer articles than the co-authors of Nobel Prize nominees. Isolating prisms, we find that the articles

expectations. Thus, products resulting from role consolidation are characterized by higherratings. We test our hypotheses using a novel dataset of video games launched globally between 1980 and 2011. We complement these results with field interviews, drawing implications for the division of labor in cultural industries in the digital era.

Creativity: The Interplay of Structural and Individual Characteristics

Author: **Jobin Ordoobody**; Tilburg U.

In this study, I examine creativity (i.e. experts' consensus over novelty of production) as the result of interplay between individual background and structural properties. More precisely, I try to investigate whether and how network positions interact with individual focus to determine creativity. The findings of the study will indicate, for example, whether a filmmaker who can broker ideas of other film professionals is most creative when focused on a specific genre (Western) or role (directing). I contend that while network position reveals (or constrains) opportunities for enhancing creativity, individuals have agency in choosing types and aspects of production that would enable them to recognize and make use of those opportunities. As such, this study departs from purely structural explanations of creativity which posit a deterministic view. The context of the study is the American film industry with a focus on feature film titles distributed in the 90s and early 2000s

Lone Geniuses Or Collaborative Pairs? Formal Role Separation to Enhance Organizational Creativity (WITHDRAWN)

Author: **Isabella Pozzo**; Bocconi U.

Author: **Paola Cillo**; Bocconi U.

Author: **Frederic Clement Godart**; INSEAD

Drawing from the literature on formal roles and organizational creativity, we tested whether formal role separation between creative and business functions at the top of organizations enhances their creativity and under which conditions such separation has a significant impact. While the "role as resource" approach sees in functional separation a way to combine diverse claims and access various forms of capital, we investigate its link with the generation of novel and useful outcomes. In the setting of high-end fashion houses, we found that when two distinct individuals filled the formal roles of creative director and CEO, organizational creativity was significantly higher. Organizational creativity is especially enhanced in cases of formal role separation when the creative director works on multiple projects because this improves specialization and gives more freedom to creative directors to experiment with novelty. Besides, companies, whose creative director and CEO started working for them at the same time, show superior creativity results. We found no evidence that formal role separation is beneficial for the focal firm's creativity when its creative director works for multiple companies. Our findings suggest that when companies face multiple goals, like creative organizations, having a clear formal role

configuration is beneficial to organizational creativity.

Digital Curation as a Catalyst for Open Organizing: Brokering Meaning, Relationships, and Emotion

Author: Elizabeth Long Lingo; Worcester Polytechnic Institute

While a rich body of scholarship illuminates the inherent conflict and paradoxes of open organizing and open strategy processes, how low-power actors might advance open organizing to exert control over their organization's strategic decisions remains a black box. In this paper, I present findings from an inductive study of 40,000 social media posts and comments from the Save Market Basket Facebook page to develop a theory of digital curation—how actors leverage their brokerage role to select and interpret digital material (e.g., digital videos, online news reports, others' social media contribution, emails, etc.) to shape meaning, relationships, and emotion among disconnected parties. My paper 1) contributes to scholarship on open organizing and brokering by illuminating how digital curation of meaning, relationships, and emotion enables low-power individuals to advance open organizing and exert control over strategic decisions affecting their organizations; 2) illuminates how contests over meaning and control in open organizing are navigated through digital curation; and 3) provides insight to the role of emotion in both the brokerage and open organizing literatures.

Paradoxical Learning: A Process Study of Firefighting Innovations

Author: **Greta Onken-Menke**; WWU Münster
Author: **Ghita Dragsdahl Lauritzen**; Technical U. of Denmark
Author: **J. Nils Foege**; WWU Münster

This study examines how potential employers shape potential employees' social identity before joining the organization. Drawing on social identity theory and signaling theory, we argue that potential in-group members (potential employees) follow a routine similar to that of in-group members (employees) when assessing the value of organizational membership for their self-concepts. Our study uses organizational crises as identity-threatening events to investigate whether and how they influence potential employees' anticipations about social identity, as well as their perceptions of the organization's attractiveness. Empirical evidence from our scenario-based experiments with 1,617 individuals conducted in the United Kingdom and the United States shows that identity changes occurring from organizational crises decrease organizational attractiveness and that anticipated self-continuity and anticipated self-esteem mediate this relationship. The effects become stronger with increasing crisis responsibility.

Organizational Resilience: A Model and Future Research Agenda

Author: **Xun Yang**; School of Management, College of Business, RMIT U.
Author: **Kosmas X. Smyrniotis**; RMIT U.

In the face of challenging conditions, resilience capabilities are essential for organizational survival and sustainability. Despite significant academic interest and practical utility of this construct, a lack of theoretical foundation, definitional inconsistencies, and an apparent operational muddle predominates. Extant reviews of this topic comprise an amalgam of frameworks, conceptualizations, and empirical findings from disparate perspectives such as supply chain, strategic, and operational management. Frames of reference from an organizational level are rare. We extend past reviews by deconstructing management-related definitions and measures of

Author: **Joakim Hans Netz**; Jönköping U.
Author: **Sara Öhlin**; Stockholm Business School
Author: **Jan Löwstedt**; Stockholm U.

Process research increasingly emphasizes how organizations face tensions from competing demands characterized by multilevel complexity and irrationality. Although such theory development provides valuable advancements to understand paradox phenomena, it also suffers from complexity with regard to pragmatic problem-solving. This paper shows how process research can offer resolutions if feedback is added to the equation of competing demands. In particular, we focus on the complex equation of amplified innovation in knotted tensions across multiple multilevel paradoxes. Analysis of field data from the rescue service sector in Sweden and work to improve firefighting operations serve as illustrative case material. The results uncover how four types of feedback on competing demands (single-level pole, single-level paradox tension, tension-to-pole, and tension-to-tension in the context of multiple multilevel paradoxes) operate as they unfold in concurrent construction. The concurrent construction of the four feedback types triggers, reinforces, and expands learning about paradoxes. We propose that the notion of paradoxical learning captures this process and examine how multiple multilevel tensions are dealt with when innovative work complexity unfolds. Paradoxical learning clarifies how organizational agents can amplify movements in an increasingly richer world of competing demands.

From Taking to Shaping – Why Temporal Tensions Matter for Organizations

Author: **Maximilian Weis**; WU Vienna

In this paper, we advance the notion of temporal tensions by building on three time-related constructs that address how individuals perceive and think about time: temporal depth, temporal focus, and urgency. Our focus lies on how actors shape and embrace temporal tensions on multiple levels within and outside the organization. Embracing such temporal tensions enables actors to

organizational resilience through a series of in-depth and broad-based text mining exercises using Leximancer. We found five distinctive research streams, suggesting that organizational resilience is comprised of cognitive, behavioral, and micro-foundational components. We conclude with a unifying definition that can bring coherence and clarity for future research. The central role of contextual contingencies such as the environmental conditions, time, and timing is highlighted.

Some Organizational Antecedents of Evil

Author: **Yijia Ding**; London Business School

Author: **Freek Vermeulen**; London Business School

Author: **Yajing Zhu**; U. of Cambridge

Employees sometimes engage in acts of evil, particularly towards people under their care or control. Using a situationist perspective, we examine the sadistic abuse of vulnerable patients by care home staff. Our theory links organizational control to pathways to abuse. Observations on 14,000 care homes between 2006-2014 show that the neglect of patients, minor rule breaches, and physical restraint escalate into active sadistic behavior. A lack of both informal and formal monitoring mechanisms gives rise to these gradual pathways, although forms of formal supervision – both by managers and team leaders – largely fail to curtail the abuse. Whereas prior research focused on how organizational measures around control, rules, and monitoring can unleash positive employee behaviors such as creativity, our findings indicate that organizational context can also unleash the darker inclinations in human behavior.

Learning Paradox: Antecedents and Mechanisms of Paradox Mindset Development

Author: **Raphael Boemelburg**; HSG U. of St. Gallen

Author: **Alexander Zimmermann**; U. of Liechtenstein

Author: **Maximilian Palmié**; U. of St. Gallen

As organizations face persistent, contradictory demands, the individual managerial ability to manage such paradoxes is highly relevant for organizational viability. While research in this area is generally scarce, the newly introduced construct of paradox mindset describes lasting interindividual differences in the ability to manage paradoxical tensions. We build on psychological mindset theory to formulate a socio-psychological model of paradox mindset development to clarify the antecedents of this crucial construct for the first time. Based on primary data from 199 employees of two Central European companies, we find strong support for our model: Leadership behaviors in line with our theoretical influence angles predict higher paradox mindset in followers, and this effect is fully mediated through follower`s engagement in paradoxical tasks.

Contextualizing Paradox Management: The Political Role of Coaching

Author: **Pauline Fatien**; Grenoble Ecole de

common and expected or rare and unexpected. This polarisation ignores the existence of events which are rare and yet expected. These expected rare events may be easily definable but, for those which are clouded by uncertainty, developing specific response repertoires is prohibitively complex. Instead, organisations must rely upon generic response repertoires to manage such events, often entailing improvisation, as planning and action coalesce. I explore the link between organisational improvisation and expected rare events by studying the Civil Aviation Authority's (CAA) handling of Monarch Airlines' collapse into administration. Grounded in interview and archival data, my analysis reveals the CAA drew on its previous experiences of similar events to build capabilities (relational; resource; cognitive; behavioural) and devise a minimal structure. In order to successfully handle the ambiguities of the event, the organisation planned for improvisation by enabling individuals to draw upon these capabilities. My analysis subsequently reveals that adaptability and, thus, organisational resilience in the face of an expected rare event was enabled by allowing improvisation to occur.

Management

Author: **Dima Louis**; Grenoble Ecole de Management

Author: **Gazi Islam Islam**; Grenoble Ecole de Management

Paradox management is mostly attributed to individual abilities, such as cognitive or emotional abilities. This individual focus draws attention away from the role of context, overlooking how individuals think in relation with others and their environment. In particular, the political context of paradox management deserves more attention. Our research engages with this void by exploring how the political context of paradox management is shaped by coaching, a holding environment that potentially soothes tensions and facilitates paradox management. We conducted an inductive study of 57 semi-structured interviews with executive coaches using the critical incident technique. Our study shows that coaching shapes three different political contexts for paradox management, with distinctive holding units and holding functions. In doing so, it provides a dynamic approach to paradox management.

Sometimes More: The Effect of Preference Diversity on Exploration

Author: **Jose Pablo Arrieta**; ETH Zurich

This study investigates how preference diversity affects the amount of exploration a prototypical organization – a majority voting triad – perform while learning in an uncertain environment. We employ a multi-agent-based model to study this question as an extension of the prior models on learning under uncertainty. We find that preference diversity (i.e. how different are the preferences of the least similar agents in the triad) can increase (+15%) or decrease exploration (-50%) when compared to triads with homogenous preferences. We find that when the diverse preferences are balanced (i.e., the median agent is equidistant to the other two agents) then exploration is higher. Conversely, exploration decreases when the preferences are imbalanced (i.e., two agents have preference close together). The paper explores further aspects that affect exploration, as organization size, preference polarization in larger organizations, and the type of environment. All further analyses maintain the general finding of the paper, namely: Preference diversity on its own does not explain the amount of exploration done by an organization.

Cooperation and Competition within Organizations: A Multi-Level View (WITHDRAWN)

Author: **Andrea Thorpe**; Kedge Business School
Author: **Frank Figge**; Kedge Business School

In this article we examine simultaneous cooperation and competition within organizations, with a specific

positions. It has, however, provided few insights into the status dynamics of an entire field. In this research, we shed light on the categorical work undertaken to preserve a category's status over time in the context of an evolving status order. We explore our research question in the field of the French high-end fashion industry, from 1911 until today. This setting is appropriate because high-end fashion is structured by a sophisticated stratified system of categories and key actors who actively contribute to the construction and alteration of these categories. Focusing on the haute couture category, we show how, over time, the field main professional association attempted to juggle two imperatives that became increasingly at odds: maintaining the category status while ensuring its survival. We argue that such status maintenance work can only be understood by taking into account the status order in which the category is embedded, an order contested and remodeled through the joint influence of endogenous and exogenous forces.

How Constituents Evaluate Configurations of Status and Conformity

Author: **Chris Moos**; U. of Oxford
Author: **Michael Smets**; U. of Oxford

Recent management research on institutional pluralism has surfaced that today's organizations typically face multiple – oftentimes competing - institutional expectations. Despite this recognition, research on institutional pluralism remains circumscribed in two important ways: First, the existing literature typically assumes that pluralistic organizations straddle two sets of competing expectations, rarely more. Second, competing expectations are represented and evaluated by discrete sets of constituents with unidimensional expectations, for example when investors only evaluate financial aspects, and environmentalists only environmental aspects of firms. Examples that challenge these two assumptions abound, for instance when impact investors evaluate firms holistically based on their financial, environmental, and social performance. Where individual constituents have those multidimensional expectations, we argue, they holistically evaluate

focus on teams and their members. We extend theory on how the different levels involved with 'coopetition' interact; how activity at one level influences activity at another level. Our approach of simulation-assisted theory building unpacks our overall contribution to understanding the multi-leveled nature of coopetition by illustrating three main insights. First, competition between two - or more - teams, encourages cooperation between team members who also compete with each other. Second, the relationship between value creation and appropriation is bidirectional; that is, creation at the level of the team influences appropriation at the level of the individual, and vice versa. Third, there are specific conditions under which selfishness, or 'non-cooperation', is optimal at the individual level, including the comparative extent of altruism at the team level, and the point in time at which such a strategy is leveraged. We primarily contribute to the coopetition literature. However, such theory also has implications for practice, as it informs managers how best to organize their teams for optimal value creation and performance.

how organizations conform with multiple, interdependent expectations. Yet, such configurational approaches to evaluating pluralist organizations are currently absent from the literature. To address this gap, we conducted a fuzzy-set configurational analysis of 117 international business schools to uncover the configurations through which prospective students evaluate how MBA programmes conform with their expectations. Based on our analysis, we make three contributions to the literature on institutional pluralism. First, we explain how organizations are evaluated holistically as configurations of multiple interdependent, rather than independent expectations represented by individual constituents. Second, by doing so we add to current accounts of institutional outcomes. We extend current, binary accounts of the existence or demise of pluralist organizations to consider social evaluations as a more nuanced outcome of pluralism. Third, we provide new insights about how configurations of conformity and status interact in producing holistic evaluations in the context of institutional pluralism.

Venturing with Caution: Insights into the Investment Strategy of Venture Capital Firms

Author: **Ananya Chatterjee**; Emory U., Goizueta Business School

Author: **Demetrius Lewis**; Emory U., Goizueta Bus Sch

The literature on portfolio diversification in venture capital contrasts industry specialization as a strategy that helps venture capital firms leverage accumulated industry expertise to diversification as strategy that spreads risk and allows venture capital firms to select riskier, higher-ceiling ventures within each industry. These strategies are generally treated as mutually exclusive and focus on firms' internal expertise. We introduce a social perspective to this literature to argue that firms at different positions in the inter-firm status hierarchy have varying strategic incentives for diversifying their portfolios and also to resolve the trade-off between diversification and specialization. For venture capital firms at the bottom of the status hierarchy, diversification provides a means to seek out riskier ventures that

offsets accessing relatively worse equity positions within syndicated investments. For firms with moderate status, specialization provides a means to improve confidence in their credibility to manage investments successfully, improving their ability to gain better equity positions. Firms at the top of the status hierarchy leverage their social influence to coordinate closely related external expertise of syndicate co-investors when they diversify and spread their risk across industry categories while still leveraging specialized knowledge to manage ventures successfully. Analysis of investments made by venture capital firms from 1990 to 2018 reveals that firms low and high in the status hierarchy diversify their portfolios more than firms in the middle of the status hierarchy. When firms higher in the status hierarchy diversify their portfolios, their syndicated investments involving other co-investing firms reflect domain expertise more closely related to the venture company's industry category.

Servants of Multiple Masters? Aligning Plural Institutional Logics in a Climate Change Context

Author: **Christian Lebelhuber**; Johannes Kepler U. Linz

Author: **Dorothea Greiling**; Johannes Kepler U. Linz

Mitigating climate change requires a fundamental transformation of the energy system. This is a challenging task, particularly for publicly owned energy utilities. While they literally act as energy supply backbones, they are often in public ownership and thus – as hybrid organizations – confronted with a particularly complex institutional field. To better understand how such hybrid organizations respond to manifold institutional demands, this paper builds on the theoretical concept of institutional logics and complexity with a focus on decoupling. It adopts a case-study methodology and investigates the actions of four

conflict and clarify the meaning of these constructs using a structural and cultural framework for WLB policies and WPC accommodations. Further, we discuss levels of deployment in WLB policies and WPC accommodations and how such levels can have differential implications for organizations and its employees. Theoretical and practical implications are discussed.

Broadening Vision Around Values: An Integrative Two-Factor Theory of Workplace Value Congruence

Author: **Zoleikha Abbasi**; U. of Wollongong

Author: **Jon Billsberry**; U. of Wollongong

Author: **Mathew Todres**; U. of Wollongong

Value congruence is an important determinant of human behavior in organizations. It influences positive states for workers (e.g., a sense of belonging, job satisfaction, and positive affect) and is beneficial for organizational work practices (e.g., commitment, citizenship behaviors, and tenure). Conversely, value incongruence leads to negative states (e.g., out-groups, organizational exit, and depressive symptoms). To date, values have been conceptualized context-free (e.g., human or personal values) or disaggregated in the work environment (e.g., work values, political values, leadership values, and cultural values) and value congruence has been viewed almost exclusively as a positive construct. Based on the underlying theories of variation theory, salient value similarity hypothesis, self-categorization theory, and signaling theory, and adopting the ‘similarity leads to attraction’ and ‘dissimilarity leads to repulsion’ hypotheses, we develop an integrative two-factor theory of value congruence. This model integrates work, political, cultural, and leadership values, and conceptualizes the impact of congruency and incongruency as two separate psychological processes. We conclude with a discussion of directions for future research.

regional energy utilities in Austria vis-à-vis the strategic objectives of their public majority shareholders to transform the regional energy system in line with climate targets. It is suggested that the degree of conformity of a hybrid organization with different institutional logics is the result of the prioritization of predominant institutional logics and the organization’s sensitivity to these logics. The paper reveals that this prioritization is not straightforward but results from a multidimensional process with various interdependencies between the different logics. It investigates why and how energy utilities decouple from different logics and suggests that hybrid organizations decouple to compromise between different demands. In terms of practical implications, the paper argues how short-term prioritization of the community and business logics works against longer-term policy objectives, and it explains how this ultimately delays climate change mitigation.

Broadening our Sight of Camping and Climate Change Relationships: A Camping-Sector Climate Index

Author: **Siyao Ma**; U. of Arkansas

Author: **Christopher Craig**; Murray State U.

Author: **Song Feng**; U. of Arkansas

Camping is a nature-based tourism activity that involves traveling away from one’s home to stay one or more nights in a natural setting. The three camping categories include tent, recreational vehicle (inclusive of campers), and cabin. Camping is unique compared to other tourism activities because it is also considered an accommodation, the largest sub-sector of tourism. Accommodations account for over \$300 billion of the overall economic impact of the broader tourism industry, and camping has grown at a faster pace than accommodations in general over the past five years. Because of the natural setting of camping, it is particularly susceptible to weather conditions, weather extremes, climatic variability, and climate change. This study introduces the Camping Climate Index (CCI), a camping sector tourism climate index. Specifically, we empirically develop an index based on observed

Struggling to Make Sense of it All: The Emotional Process Of Sensemaking in Scrutinized Occupations

Occupations

Author: **Graham Dwyer**; Swinburne U. of Technology

Author: **Cynthia Hardy**; U. of Melbourne

Author: **Haridimos Tsoukas**; U. of Cyprus / U. of Warwick

This paper examines the practice world of practitioners working in 'scrutinized' occupations through a qualitative study of emergency management practitioners who were involved in a major bushfire incident, participated in the subsequent public inquiry, and were responsible for the implementation of the inquiry's recommendations. We show how such practitioners engage with their practice world through three different 'modes of involvement' as a result of a cycle of scrutiny that flows from the incident, through the inquiry, to implementation. We also explore the different emotions experienced by these practitioners during this process and draw attention to the important role of one particular emotion – anxiety – which takes different forms depending on the particular mode of involvement. Our findings indicate that anxiety helps practitioners deal with scrutiny by facilitating sensemaking and developing knowledge, allowing us to develop a general model of sensemaking and emotion in scrutinized occupations more broadly.

Clean Your Desk! Dressage and Activity-Based Working in a French Banking Organization

Author: **Marie Hasbi**; Vrije U. Amsterdam

Author: **Sytze Kingma**; Vrije U. Amsterdam

As part of popular new kinds of activity-based working, many companies seek to implement so-called clean-desk policies, in which users have to empty their desk after completing a task, so that other workers can feel free to use this desk. Following Henri Lefebvre's discussion of 'Dressage' in the context of Rhythm-analysis (Lefebvre 2004 [1992]), we argue that clean desk policies are part of a wider organizational strategy in flexibilizing working practices, focusing on the performative

behaviors (i.e., camping occupancy), validate the index compared to other prominent and modern tourism indices, and use the index to demonstrate changing climatic variability for 29 camping locations. The study seeks to broaden our sights of camping and climate relationships by providing detailed discussion, limitations, and future research sections pertaining to the CCI.

Improving Executive Compensation in the Fossil Fuel Sector to Influence Green Behaviours

Author: **Rohan Crichton**; Clarkson U.

Author: **Thomas Walker**; Concordia U.

Author: **Paul Shrivastava**; Penn State U.

Author: **Faraz Farhidi**; Georgia State U.

Environmental degradation, increased poverty, and displacement, are just some of the effects brought about by climate change. As these effects continue to batter the world, the call to mitigate climate change is becoming louder and more frequent. In responding to this call we commence our related investigation with a review of the multidisciplinary literature in this area. This includes integrating the human resource management literature, the sociology literature, the environmental studies literature, and an econometrics methodology into examining and analyzing compensation practices as innovative solutions for tackling climate change. We employ a fixed panel analysis, and examine disclosed organizational data from 42 of the largest global fossil fuel organizations – arguably the principal climate change contributors. Our analysis takes into consideration multiple control variables (e.g., age, size, value), and employs a broad dataset (2005-2016). Our findings suggest that executive stock- option compensation oriented around a three-year or more vesting period will enhance green behaviours by the respective management. In part, this can likely be attributed to the link between personal profitability and its contingency on a firm's stock price growth and overall organizational performance. The contributions of this paper reach beyond the traditional human resource management literature, where many studies are oriented around only linking sustainability targets to compensation in hopes of mitigating climate

management of bodily and material aspects of work demonstrating control over these aspects. In drawing on a case study of a French Bank, which introduced a flexible working environment in 2016-2018, and following Lefebvre's ideas, we argue that and how dressage can be understood as a separate but key component in the domination and embodiment of flexibilized work practices.

Mimetic Pressure for Sustainability Efforts in a Metropolitan Area

Designated as a "Best Paper" for ONE

Author: **Hyunjung Ji**; U. of Alabama

Metropolitan cities can serve as laboratories of sustainable development by experimenting with innovative sustainability programs while leveraging advantages of metropolitan areas. With the importance of cities' sustainability efforts, scholars have increasingly explored what factors motivate local governments to implement voluntary sustainability programs by focusing on internal government and community characteristics. However, what is missing in the previous discussion is whether or not city governments respond to sustainability efforts by other government entities, especially neighboring local governments. By analyzing sustainability programs of 251 suburban cities in 66 metropolitan areas, we find that suburban cities are likely to consider sustainability efforts of central cities in the same metropolitan area when determining the extent to which they implement their sustainability programs. However, they are not necessarily responsive to sustainability efforts of nearby suburban cities. Drawing on mimetic isomorphism literature, our research sheds light on how local governments make sustainability policy decisions in the relationships with other local governments and provides policy implications for the important role of central cities in facilitating collective sustainability efforts in metropolitan areas. We combined the importance of geographical proximity with the concept of mimetic isomorphism and provided theoretical justification for choosing organizational role models in the local sustainability context.

The Effects of Air Pollution on Sales Promotions and Channel Use Across Online and Offline Retail

Author: **Jaehoon Jeong**; U. of Maryland R.H. Smith School of Business

Author: **Dongwon Lee**; Hong Kong U. of Science and Technology

Author: **Anand Gopal**; U. of Maryland

When the air quality is expected to be bad, it is common for people to wear anti air pollution masks to protect themselves or systematically restrict their outdoor activities. While this avoidance behavior is beneficial for the customers, it is unclear how deteriorating air quality may affect their other economic activities. In this paper, we focus on the retail sector that is prone to such disruptions. We study how diminished air quality affects the substitutive relationship between offline and online sales associated with a cosmetics retailer located in South Korea. This retailer offers regular and systematic promotion days monthly – during these days, consumers get significant discounts on all their purchases at both the offline stores as well as through the PC and mobile channels. While the point of these promotions is to boost demand on these days, we specifically test how air pollution may affect the actual demand that manifests during these promotion days across the offline and online channels. Interestingly, air pollution significantly affects consumer behavior. In general, polluted air boosts online sales and online promotion effectiveness. Unexpectedly, air pollution is unlikely to hurt the offline sales, and even increase offline sales and offline promotion effectiveness. We also find a notion of the inverted-U shaped reaction to the seriousness of polluted air consistently in offline sales. These show the combined effect of channel substitution and recreational shopping. Considering the significance and size of the effect, this paper points out that climate change should be added in the function of the business.

Internalizing Environmental Sustainability Through Lifecycle Management

Author: **Guia Bianchi**; Scuola Superiore Sant'Anna

Author: **Francesco Testa**; Scuola Superiore Sant'Anna

Author: **Olivier Boiral**; Laval U.

Author: **Fabio Iraldo**; Sant'Anna School of Advanced Studies and IEFE – Institute for Environmental and

Implementing a substantial environmental strategy addressing all phases of the product lifecycle in a meaningful rather than superficial way is a complex challenge that most organizations fail to meet. Based on a case study of five frontrunner companies located in Italy and Norway, this study explores the factors that promote, or hinder, the learning process underlying the implementation of substantial measures for lifecycle management and how this can contribute to further internalize environmental sustainability throughout the organization. The paper contributes to the literature on the internalization of environmental sustainability and lifecycle management by showing, from a dynamic perspective, the enablers of organizational learning required for the implementation of a successful strategy in this area. It also highlights some of the benefits accrued from a substantial, rather than superficial, implementation of environmental sustainability. Managerial implications are also discussed.

Government Procurement and Firm Performance: The Role of Network Centrality

Author: **Ellie C. Falcone**; U. of Arkansas Sam M. Walton College of Business

Author: **Brian S. Fugate**; U. of Arkansas Sam M. Walton College of Business

Author: **Steven Carnovale**; Portland State U.

The U.S. government, as the world's biggest buyer, can substantially impact private suppliers. Although important, government contracting is an understudied topic. This research bridges the gap in current literature by investigating the impact of U.S. government contracting on the short- and long-term financial performance of private suppliers. Juxtaposing agency theory, property rights theory and analyzing panel data collected from the Federal Procurement Data System, Factset Revere and Compustat, this research investigates the interplay of government contracts, firm network centralities, and financial performance of 2,834 firm-year observations (627 firms). The empirical analysis suggests that government contracting bolsters suppliers' short-term financial performance (ROA), but negatively affects the long-term financial performance (Tobin's Q). In addition, network quality, measured as eigenvector centrality, ameliorates the negative effect of government contracts on long-term performance. On the contrary, network quantity, measured as degree centrality, demonstrates a negative moderating effect.

Author: **Anne Quarshie**; LUT U., School of Business

Why do firms often fail to deliver more sustainable products despite ever-stronger consumer preferences for them? Setting aside cost and availability explanations, we suggest that upstream firms may strategically anticipate downstream consumer preferences, which leads them to favor input materials possessing positive extra-functional attributes like environmental sustainability. However, existing input dependencies increase opportunity costs and difficulty of switching, thereby lowering the effect of anticipated downstream preferences in the mind of the upstream decision-maker. At once, input independence should have the opposite effect, increasing willingness to switch to more sustainable materials. A conjoint experiment with Finnish manufacturing firms provides support for our hypotheses.

The Role of Purchasers in Successful Circular Purchasing: A Comparative Case-Study

Author: **Petra Neessen**; The Open U., Netherlands

Author: **Marjolein C.J. Caniels**; Open U., The Netherlands

Author: **Bart Vos**; Maastricht U.

Author: **Jeroen De Jong**; Radboud U. Nijmegen

The transition towards a circular economy puts pressure on the purchasers to purchase in a circular manner. However there are many hurdles to overcome. The aim of this research is to investigate the role of the purchasers in the circular purchasing process and investigate the drivers and constraints that influence circular purchasing. We interviewed purchasers, supervisors and policymakers of successful and unsuccessful organizations and organizations that showed the intention towards transitioning towards circular purchasing by signing a green deal and organizations that did not show this intention. The results of this comparative case study show that the main role of the purchaser is that of coordinator, facilitator and advisor, but the combination of being intrapreneurial, sustainability minded and having knowledge about the circular economy describe the circular purchaser. The drivers (creating sense of direction and grasping the complexity of the circular economy) that influence circular purchasing are identified. Also, the market,

Corporate requirements for modern slavery-type risks in global supply chains, have gained increased attention in recent years. Limited research however has sought to address the context-relevant implications of the contractual mechanisms used to distribute and 'enforce' such requirements. In particular, the socio-economic and cultural factors that underpin and facilitate modern slavery and how these inform supplier and worker choices, have not been addressed by prior SCM scholarship. Ensuring suppliers meet modern slavery requirements, in ways that create legitimate change in the sub-tier environment, remains a complex problem that remains unresolved. For modern slavery type exploitation, the suppliers most at risk of violation exist in the sub-tiers, and in operating environments culturally removed from western-headquartered ideologies. We interviewed 36 executive level Purchasing Directors, from medium to large size firms with headquarters in Australia, the US and Finland. We employed agency and construal level theories to frame our analysis. Overall, several themes emerged regarding the limitations of the principal-agent relationship to address modern slavery risks at a supply chain scale, that reflect significant social, hypothetical and spatial psychological distance between principals, and agents. Importantly, our research drew out a range of significant themes surrounding the conflicts purchasing executives face when attempting to align western policy with complex global operating conditions, and the actual workers they seek to support. Our study sheds light on the challenges of agency theory and highlights the complexity of operationalizing modern slavery type requirements in global supply chains.

Participation in Fast Fashion Brands' Clothes Recycling Plans in an Omnichannel Retail Environment

Author: **Peng Shao**; Xi'an Polytechnic U., School of Management

Author: **Hermann J. Lassleben**; Reutlingen U.

The rise of the fast fashion industry allows more and more people to participate in fashion consumption, but goes along with negative consequences on the environment. To reduce wastage, fast fashion retailers have begun to offer used clothes recycling plans to which customers can submit clothes they no longer wear. Since these recycling plans have mainly been operated in offline stores so far, the rise of omnichannel retailing poses new challenges on retailers with regard to organizing the plan and motivating consumers to participate. On a sample of N=370 Chinese fast fashion consumers, this paper investigates, which factors determine consumers' willingness to participate in fast fashion brands' used clothes recycling plans in an omnichannel retailing environment. It finds that consumers' clothes recycling intention is determined by individual predispositions (environmental attitude, impulsive consumption), as well as by organizational arrangements (channel integration quality), as well as by the outcomes of their interaction (consumer satisfaction, brand identification). Conclusions are drawn, implications for omnichannel fast fashion retailing practice, as well as for further research, derived, and limitations discussed.

Circular Economy Business Model Practices: A Multi-Tiered Supply Chain Perspective

Author: **Santosh Nandi**; U. of South Carolina

Author: **Hale Kaynak**; U. of Texas Rio Grande Valley

Insourcing as a means to countermand former outsourcing decisions is becoming a widespread practice nowadays, particularly in high-tech manufacturing industries. Researchers have focused on the underlying Operations & Supply Chain Management (OSCM) performance drivers (e.g., lead times, control costs, or responsiveness), while the behavioral aspects underlying insourcing decisions remain less empirically explored. We derive a model grounded in the theory of planned behavior (TPB) to study the effects of managers' internal and external drivers as well as their interaction on insourcing intentions and behavior. We test our hypotheses in a vignette-based experiment among 145 managers. We find support for the positive effects of attitude and mimetic pressure on insourcing intentions and several interaction effects, both on insourcing intentions and behavior. Our contextualization of motivational drivers provides new empirical insights into the behavioral aspects of insourcing decision making and suggests a theoretical integration between TPB and Institutional Theory in explaining individual decision making. As part of our results, we provide evidence of a unique boundary condition to TPB in the insourcing context, which allows deriving interesting avenues for future inquiry and recommendations for managers considering insourcing.

A Dynamic Analysis of Supply Management and Supply Risk

Author: **Gökçe Esenduran**; Purdue U.

Author: **Burcu Tan Erciyas**; U. of New Mexico

Author: **John Gray**; Ohio State U.

Supplier bankruptcies are among the most common causes of major supply chain disruptions. In this study, we analyze the effect of buyers' risk management and supply management practices on two outcomes: the supplier's bankruptcy risk and the buyer's financial bottom line. We specifically study the common supply management practice of buyer-imposed extended (delayed) payment terms on suppliers. By building a dynamic simulation model, we show that delayed payment terms increase supplier bankruptcy risk. As such, a

The growing awareness of circular economy (CE) and circular economy business model (CEBM) has pushed scholars to consider its organizational role in the field of supply chain management. Implementing CEBMs requires a paradigm shift when moving from a traditional supply chain to a sustainable supply chain. Although studies have unearthed important aspects of CE applications, they have limited suggestions about CE's applicability, more specifically, how it works in a multi-tiered supply chain. Hence, this study aims to address this glaring gap in literature about firms' rationale and involved complexities of implementing CEBM in a multi-tier and multi-industry supply chain using qualitative multi-case approach. Data were collected primarily by interviewing officers (i.e., sustainability managers, plant managers, purchasing managers and supply chain managers) of the participating firms. Findings suggest that firms' practice CEBMs as "core business" and "part of sub-systems". Further, the rationale and complexities of CEBM practices vary based on their positions in the supply chain.

PAPER SESSION

comprehensive supply risk management program must account for the impact of this practice. We also show that commonly recommended supply chain risk management practices for buyer firms can sometimes backfire. For example, quick response to supplier disruptions may not always be optimal for the buyer. Finally, we show that a backup source not only provides the buyer with continuity of supply in the event of a supply disruption, but also helps the disrupted supplier recover, thereby reducing the supplier bankruptcy risk.

Why Do Some Strategic Ideas Take Off? Affective Dynamics as Key Elements of Strategic Sensemaking

Author: **Henrika Franck**; Arcada U. of Applied Sciences

Author: **Philip Gylfe**; Aalto U. School of Business

Author: **Eero Vaara**; U. of Oxford

This paper adopts a sensemaking perspective to develop an understanding of how strategic ideas take off during strategic change. In particular, we focus on the crucial but underexplored role of

efficiency of the resource acquisition process, which impacts organizational diversification into new services and geographic regions. More specifically, we propose that a higher number of resource providers and a shorter relationship between the organization and its resource providers make organizations less likely to diversify. We examine the effect of these two determinants—number of providers and relationship duration—on diversification empirically in the context of institutional donors that fund humanitarian organizations, using more than 150,000 donations over 20 years. Our results give support to our arguments; we demonstrate that relying on a large number of resource providers constraints diversification while relying on long-term relationships is positively related to diversification.

Governing for the Common Good: The Possibilities of Dynamic Governance for Nonprofit Organizations

Author: **Daniel King**; Nottingham Trent U.

Author: **Martyn Griffin**; U. of Leeds

Author: **Simon Pek**; U. of Victoria

Within nonprofit studies there are two predominant interpretations of good governance. The first, compliance governance drawn from the principle-agent perspective reads good governance as tantamount to the board of directors and privileges efficiency and control, but, its critics argue, with a democratic deficit as wider stakeholders have little say in the most important decisions. The second, the workplace democratic perspective, promotes high levels of participation, but potentially at the cost of efficiency. This paper explores a third direction, Dynamic Governance, also known as sociocracy. Dynamic Governance offers the possibility of effective and inclusive organization, through a system of self-governance. Within Dynamic Governance decision-making operates through consent, the governing powers usually conferred onto boards are distributed to circles with clear domains for authority and control and creating a culture where every voice matters. This paper assesses the possibilities for Dynamic Governance within nonprofits and their potentiality to create

affective dynamics in strategic sensemaking. Based on an ethnographic analysis of strategic change in a broadcasting company, we identify three types of sensemaking dynamics: progressive, regressive and ambivalent sensemaking. We then elaborate on three ways in which this sensemaking may be steered by sensegiving: framing, emotional manipulation, and emotional containment. We show how micro-level affective dynamics in strategic sensemaking is related to the takeoff of strategic ideas. Our analysis also adds to a better understanding of strategic agency in and through strategy meetings by elucidating the forms of sensegiving that can steer strategic sensemaking.

Emotional Reactions as Inhibitors of Sensemaking: How Emotions Nourish from and Shape Dual Changes

Author: **Maria Skov Jensen**; Aarhus U., Department of Management

This paper addresses how employees' emotional reactions influence sensemaking, and what implications it has for the implementation process in a context of dual strategic changes. Drawing on a longitudinal case study, the paper presents and elaborates two different findings. Firstly, the paper identifies three sets of sensemaking inhibitors evoked from different intensity of employee' emotional reactions: redirecting sensemaking to emotions; redirecting sensemaking to process; constrained sensemaking of content. Secondly, the paper demonstrates a longitudinal process of how emotional reactions, sensemaking inhibitors and implementation processes interrelate and co-evolve across changes and different reaction patterns. The findings contribute to existing research on the role of emotions in sensemaking processes, as it improves our understanding of how emotions not only facilitate but also inhibit sensemaking processes and thereby the progress of changes. Furthermore, it contributes to existing research on emotions in strategizing by having an explicit focus on the role of emotions as continual constructs that can coexist and evolve during dual changes. The paper demonstrates how several emotions are evoked during changes and how, in turn, such a mix

good governance.

Intended and Unintended Consequences of Social Media in Humanitarian Operations

Author: **Mohammad Moshtari**; Tampere U.

Author: **Paulo Gonçalves**; U. della Svizzera Italiana

Author: **Amin Maghsoudi**; Hanken School of Economics

This study investigates the intended and unintended consequences of the use of social media to support humanitarian operations. Adopting a theory-building research approach, it develops an in depth case study of the humanitarian response to the 2017 Kermanshah Earthquake. It uses causal loop diagramming (CLD) to identify and explain the relationships between social media risks and operational implications in a humanitarian setting. The study reveals multiple benefits associated with the use of social media to support humanitarian operations (e.g., needs assessment, mobilizing funds and volunteers, communicating within and among actors, and improving the efficiency of humanitarian operations). However, the use of social media also carries risks, which have detrimental effects on the humanitarian response. The unverified information, short expected time to supply, and perceived ease of humanitarian operations originating from social media destabilize disaster response efforts by intensifying the time pressure on humanitarian actors, eroding public trust in their capability, and altering individuals' donation behavior. These behaviors result in a number of unintended consequences, some directly affecting the humanitarian response (e.g., diminished operational performance, increased coordination tension, and competition among actors), and others indirectly affecting beneficiaries through cascading effects (e.g., the emergence of diseases, and changing lifestyles). This study responds to recent calls to shed light on the risks of using social media in operations and supply chain management and strategies to address such risks within a humanitarian setting. The research formulates propositions, and offers managerial implications for humanitarian practitioners and policy makers.

of emotions lead to different strategy implications. More specifically, it contributes to how a mix of emotional reactions evoked from one change influence subsequent sensemaking and implementation of another simultaneously change.

Chain Reactions of Emotions and Actions in Strategic Adaptation

Author: **Suvi-Tuuli Helin**; Aalto U.

Author: **Timo Olavi Vuori**; Aalto U.

Most studies of emotions' impact on strategic adaptation focus on either to the practices that generate emotions in organizations or to the firm-level outcomes of some emotions. In our three-year ethnographic study of a management consultant organization, we focus instead on practices that generate "chain reactions" of emotions and actions that enables successful adaptation. In particular, practices that focus on information reinforcing optimistic perceptions of current capabilities generate confidence, leading to ambitious commitments and high expectations. A mismatch between the high expectations and actual ability to deliver in the short-term generates anticipatory feelings of shame, which energizes extensive efforts to develop the needed capabilities rapidly and meet the confidently set expectations. As a contribution to theory, the mechanisms of the emotional chain reactions integrate previously disconnected insights regarding practices, emotions, and adaptation, and complement the cognitive mechanisms of strategic adaptation.

Hansmann's Contract Failure Theory: Correct but Irrelevant?

Author: **Eva Witesman**; Brigham Young U.

Author: **Curtis D. Child**; Brigham Young U.

Author: **Chris Silvia**; Brigham Young U.

We assess whether nonprofit status serves as a valuable indicator of trust in the presence of information asymmetry, as Hansmann posited in his (1980) theory on the role of nonprofit enterprise. Using choice-based conjoint analysis, we find that in the absence of additional information (such as consumer ratings and third-party certifications), nonprofit status serves as an important value signal to consumers. However, in the presence of consumer ratings and third-party certifications, nonprofit status becomes less relevant. We also find some evidence of a nonprofit halo effect, in which consumers have a strong preference for nonprofit organizations when consumer ratings are low. Given that Hansmann was writing before the ubiquitous availability of online rating and certification information, we find that his theory was prescient, but that it provides little explanation for consumer behavior in the current environment. As information becomes more abundant and organizational forms continue to converge, it is likely that the contract failure thesis will become increasingly obsolete.

strategy making on social issues. Our analysis reveals an under-researched emotional mechanism we call "emotional resourcing," which denotes a dynamic view of emotional resources in organizing. Our study shows how formulating a new strategic direction for social good involves starting with a generic schema, fuelled by energizing emotional resources directed toward addressing others' well-being. Emerging contests over competing specific schemas, however, results in a severe depletion of emotional resources. That depletion, which threatens actors' own internal well-being, shifts their attention toward their personal wellbeing by seeking to rebuild their own emotional resources. We show how this process of emotional resourcing enables cognitive change and allows for the emergence of a dominant schema, which is unexpected by the actors. Our study contributes to the strategy and social issues literature by depicting the hidden dynamics of emotional resources that foster schema change as outcome.

Internal/External Stakeholder Tensions (session 1320)

How Do Independent Directors Respond to Internal and External Stakeholders?

Author: **Ruijie Jin**; Xi'an Jiaotong U.

Author: **Xu Jiang**; Xi'an Jiaotong U.

Do independent directors on corporate boards make a difference in firms' strategic responses toward corporate social responsibility (CSR)? To address this question, this study examines how firms having a variety of independent directors on their boards (i.e. politically connected, foreign, and female) articulate the tradeoffs in their CSR strategies when facing conflicting claims from internal and external stakeholders. Drawing on a longitudinal data covering Chinese publicly listed firms between 2008 and 2015, the results suggest that firms with politically connected independent directors on their boards are more likely to adopt social practices related to external stakeholders while neglecting internal social practices. We also find that firms with foreign or female independent directors on their boards tend to adopt social practices that reflect the interests of internal stakeholders while largely neglecting external social practices. This study contributes to our understanding of stakeholder management, CSR strategic choices, and corporate governance reforms.

Self-Repair in the Workplace: A Qualitative Investigation

Author: **Kenneth D. Butterfield**; Washington State U.

Author: **Warren Lee Cook**; The College Of Saint Rose

Author: **Jerry Goodstein**; Washington State U.

Author: **Natalie Liberman**; Washington State U.

Despite widespread interest in the topic of reparative and restorative practices in the workplace, little is currently known about why and how offenders repair themselves in the aftermath of incidents in which they harmed other people or their work organization. We conducted a two-phase qualitative study using revealed causal mapping (RCM) to develop an inductive model of self-repair in the context of health care organizations. The findings reveal a set of key preconditions, motivating factors, methods of self-repair, outcomes, and moderating factors. The model is intended to guide future research on self-repair and offers insight to practicing managers.

Paradoxical Tensions in Diversity Management: Stakeholder Perspectives and Coping Strategies

Author: **Mélanie Jaeck**; Montpellier Business School

Author: **Cédrine Joly**; Montpellier Business School

Author: **Magalie Marais**; Montpellier Business School

Author: **Lutz Preuss**; Kedge Business School

Recent scholarship on organizational paradox has highlighted that the effects of paradox on organizational success are highly dependent on the ways in which the underlying tensions are constructed and acted upon by organizational actors. Hence this paper examines systematically how the internal and external stakeholders of an organization deal with the tensions surrounding one particular paradox, that of combining social and economic objectives in a diversity policy. It emerges from our data that stakeholders perceive of paradoxical tensions in a nested fashion: some only see one category of tensions, while others perceive a much wider range. Engagement with paradoxical tensions also seems to go through a U-shaped curve: stakeholders who are little or very much involved with the diversity policy look more to acceptance strategies, whereas those with a medium level of engagement are more likely to use a resolution strategy. Furthermore, we identified seemingly novel acceptance strategies from the data that operate not at the level of an individual stakeholder but at the collective level.

By utilizing social identity theory to understand the

Organizations receive multiple benefits when their members act ethically. Of interest in this study is if the actors receive benefits as well. Specifically, we highlight a series of ongoing ethical behaviors (explored using the professional moral courage competency) and their relationship to the actor's work and life well-being. Drawing on self-determination theory and affective events theory, we explore how exercising professional moral courage in one's work leads to positive work and life outcomes. Data from 116 administrative staff of international fraternal organizations demonstrate the positive benefits of acting ethically at work. Specifically, professional moral courage is found to be significantly related to both work meaningfulness and individual eudaimonic life well-being. Our findings highlight positive benefits for individuals who demonstrate this ethical competency and provide support for organizations seeking to develop it within their employees; benefits for organizations and employees go beyond just the gains from ethical behavior into other positive psychological processes.

Lean as Mean: When Values Converge to Produce Depersonalized Bullying

Designated as a "Best Paper" for SIM

Author: **Samir Shrivastava**; Swinburne Business School, Swinburne U. of Technology

Author: **Robert Jones**; Swinburne U. of Technology

Author: **Nikola Djurkovic**; Swinburne Business School, Swinburne U. of Technology

Concurring with the view that the workplace bullying literature would benefit by shifting part of its focus from the interpersonal aspects of the pathologized individual to the depersonalized aspects of the pathologized organization, this conceptual paper makes an attempt to identify the antecedents of depersonalized bullying. Since organizational values tend to drive organizational behavior, we link organizational bullying to the values embraced by organizations. We limit the scope of our analysis to the lean automotive manufacturing industry. Drawing from the extant organizational values literature, we argue that that in the lean context, depersonalized bullying is a consequence of lean

mediation mechanism through which external and internal corporate social responsibility (CSR) influence employees' emotional labor. We postulate that CSR practices for external stakeholders augment perceived external prestige whereas CSR practices for employees' welfare enhance perceived organizational support. In result both enhance the deep acting of employees whereas diminish the surface acting of employees as their emotions management strategies at workplace. Data are collected from front line employees of banks operating in Pakistan. The results fully support our theoretical framework as proposed, and are discussed in terms of their theoretical as well as practical implications not only for managers and researchers but for the society as well in eastern workplace settings of banking sector in Pakistan.

Conflicts Between Firms and External Stakeholders: A Configurational Approach

Author: **Ilir Haxhi**; U. of Amsterdam

Author: **Juan Francisco Chávez R.**; Gustavson School of Business

Author: **Matthew Murphy**; U. of Victoria

Author: **Miguel Rivera-Santos**; Babson College

Complementing prior case-based studies that emphasize the idiosyncrasies of specific conflicts between firms and their external stakeholders, we seek to uncover generalizable patterns of interaction that explain conflict intensity. We ground our reasoning in stakeholder theory and develop a configurational approach that integrates the three main conflict-related domains identified in the literature. We argue that characteristics of firms (domestic or foreign), communities (stakeholder diversity, rural versus urban, and international environmental nonprofits), and governments (rule of law and economic industry dependence), interact to create identifiable configurations that lead to higher or lower levels of conflict intensity. We follow the logic of the fuzzy sets (fs/QCA) technique to uncover these patterns on a world-wide database of 711 socio- environmental conflicts in the extractive industry. Our results show that no single conflict-related domain can explain conflict intensity on its own, and that they need to be considered together,

manufacturing practices being implemented in a manner that coerces all other legitimate value forms prevalent in the organization to converge with the espoused organizational values. Such value convergence stifles dissent and, in fact, forces the employees to undermine their own well-being. Our arguments imply that there might be a case for re-examining lean values in the interest of making leaning organizations more humane. (Keywords: depersonalized bullying; lean manufacturing; lean values; pathologized organization; organizational values)

When Employees Repay Employer for CSR: A Three-Way Interaction Study

Author: **Hwayoung Kim**; Hanyang U.

Author: **Se Hyung OH**; Hanyang U.

Previous studies have shown that internal and external CSR have positive effects on employee attitudes and behaviors. However, researchers haven't paid much attention to the potential of the interaction effect of the two types of CSR on employees' attitudes and behaviors. In this study, drawing from Rupp's (2011) justice process model, we theorize and test the interaction effect of internal and external CSR on employees' citizenship behavior. We also examine the moderation effect of employees' cynic attitude towards the employer, called organizational cynicism, on the interaction effect of the two types of CSR. Data from 239 employees in 19 organizations revealed that the proposed two-way and three-way interaction effects are significant in predicting employee OCBO. Theoretical and managerial implications are discussed.

Adding Individual Cognition to Organizational Theories Changes Everything (session 1328)

This symposium explores how integrating individual cognition into organization-level theories alters well-trodden predictions in organization and management theory. While augmenting traditional macro-level management theory with cognition typically begins as a micro-foundational effort to bolster extant theory, it often results in the development of an entirely different, novel theory. The symposium explores this approach in the context of a variety of firm-level theories and is intended to prompt rich discussion between micro and macro communities regarding the benefits and drawbacks of incorporating cognition into traditional management and organizational theories.

CEO Regulatory Focus and Strategic Change: The Importance of Context

Author: **Richard Scoresby**; Ball State U.

Author: **Ronda M. Smith**; Ball State U.

Author: **Imran Syed**; Ball State U.

This research extends upper echelons theory by exploring the impact of CEO personality factors, specifically regulatory focus, within various contexts. Findings reveal that CEO regulatory focus can influence firm strategic change, but only in consideration of specific contexts. Firm performance prior to a new CEO taking office, new CEO status, ongoing CEO tenure, and institutional stock ownership all have a moderating effect on the relationship between CEO regulatory focus and firm strategic change. We test our hypotheses using a panel dataset of 531 public firms. These results provide insight for CEOs, boards of directors, and other stakeholders who are impacted by CEO decision making.

Prior research on CEO succession has often focused on involuntary CEO departure (dismissal). Our study emphasizes an important but under-researched phenomenon, namely voluntary CEO departure. Voluntary departure is defined as the CEO's decision to terminate his or her tenure, without significant pressure from other stakeholders or institutional processes. Drawing upon self-determination theory, we develop and test a theoretical model to explain why and when some CEOs voluntarily leave their positions when they are under little pressure to do so. Our core premise is that the motivation behind voluntary CEO exit is shaped by CEO aspirations. We distinguish between backward-looking and forward-looking aspirations and analyze how each influences the likelihood of voluntary CEO departure. Further, we develop theoretical arguments to explain how two important situational factors – the presence of a successor and CEO career stage – moderate the CEO aspiration => voluntary CEO exit relationship. Using a sample comprised of the S&P 500 from 2000 to 2016 we find empirical support for our hypotheses. Our study contributes to scholarship at the nexus of CEO succession, aspirations, organizational identification, and self-determination literatures.

Beyond Bounded Rationality: CEO Reflective Capacity and Firm's Sustainable Performance

Author: **Yingya Jia**; Shanghai U.

Author: **Anne S. Tsui**; U. of Notre Dame

In this study, by proposing, defining, measuring, and theorizing on CEO reflective capacity, we convey that CEO cognitive capability warrants systematic research in the upper echelons and managerial cognition perspectives. CEO reflective capacity is conceptualized as a behavior-oriented cognitive capability that may challenge the assumption of bounded rationality by transcending the three-stage filtering and narrowing information process into a broadening vision. We developed and validated a three-dimensional measure of CEO reflective capacity using multiple executive samples and then

tested three hypotheses on how CEO reflective capacity links to a firm's sustainable performance through two mediating mechanisms, based on the upper echelons framework and informational perspective. The results, based on analyses of multi-source two-wave surveys from 213 Chief Executive Officers and 256 of their subordinate-executives in Chinese small-to-medium enterprises (SMEs), reveal that: (1) CEO reflective capacity is positively associated with firm sustainable performance including economic, societal, and environmental dimensions. (2) Strategic decision comprehensiveness and CEO behavioral complexity mediate the relationship between CEO reflective capacity and sustainable performance. We discuss the implications of this study for future research on strategic leadership and managerial cognition in complex and dynamic contexts.

50 Million Followers Can't Be Wrong, or Can They? The Influence of Social Media on CEO Communication

Author: **Amirhossein Zohrehvand**; U. College London

The rise of social media introduces new ways in which executives communicate and receive feedback on their words and actions. Social media feedback is generated quickly in large volumes with a format that discourages in-depth critical feedback (e.g., availability of only "like" option), from partly unknown (and unknowable) and heterogeneous sources. In this paper, I theorize and test how long-term exposure to social media feedback influences the communication patterns of CEOs. Through applying novel machine learning methods on 820,000 communication threads of CEOs from S&P 1500, I found that long-term exposure to aggregate social media feedback increases the frequency and affective tone of communication. The relationship is moderated by recent textual feedback. These findings have important implications for the literature on CEO communications and feedback.

How to Make an Alliance Work: Governance and Contracts (session 1322)

Solving Contracting Problems: How an MNC Adapted Contracting Knowledge to Local Requirements

Author: **Beverly B. Tyler**; North Carolina State U.

Author: **Tejasav Kalra**; U. of Bath

Author: **Jens Roehrich**; U. of Bath

Drawing on the problem-solving perspective of the knowledge-based view (KBV), we propose and assess how a business resolved the problem of how best to contract with suppliers as a business of a multinational corporation (MNC) entering a new country with a legal system different from their own. We posit such a business will search for knowledge from outside the firm codified in the standard industry templates for both legal systems and combine it with firm knowledge accumulated by the MNC in prior contracting. We then analyze the contracting templates developed by a business of a French MNC hired by the United Kingdom government to build a major project in the UK. We find the resulting customized portfolio of contracting templates reflect the negotiated shared beliefs of the authority-based hierarchy, defining the area of the solution landscape where directional search will take place during supplier negotiations. We discover they resolved their contracting problem by addressing six sub-problems associated with distinctive knowledge sets and designing six customized templates. Our comparison of the two standard industry templates and six customized templates suggest the business integrated contracting knowledge taken from two legal systems and the MNC in their portfolio of customized templates.

Inter-Firm Ties, Capabilities, and Feedback (session 1327)

How Does Performance Feedback from Alliances and Acquisitions Influence Choice Between the Two?

Author: **Jaemin Lee**; Imperial College Business School

Author: **Joon Mahn Lee**; Korea U. Business School

Author: **Ji-Yub (Jay) Kim**; INSEAD

Despite the importance of choice between acquisitions and alliances for accessing resources located outside a company, previous research has not considered the behavioral drivers of such choices. To fill this gap, this paper examines how firms' choice of alliances vs. acquisitions is based on an evaluation of performance from the same as well as the other mode relative to the respective aspirations. We argue that while a lower acquisition/alliance performance results in a higher likelihood of choosing the alternative mode, the relationship is stronger in the above-aspiration domain than in the below-aspiration domain for both types of performance feedback. We also predict that the effect of performance feedback derived from acquisitions is stronger than that of that from alliances, and that these types of feedback moderate one another. We test and find support for our predictions using a sample of alliances and acquisitions completed by Fortune 500 companies. This study extends research on corporate strategy by providing a behavioral explanation of the choice between acquisitions and alliances. It also enriches the behavioral theory of the firm by providing new insight into why and how the effect of performance changes when it is below and above aspirations.

Antecedents of Coopetition Network Dynamics Performance Feedback and Network

Author: **Jongwook Kim**; Western Washington U.
Author: **Shantala Samant**; Western Washington U.

We examine the impact on innovation performance of alliance partners' intent to exchange tacit knowledge. Building on insights from the alliance governance and organizational learning literatures we hypothesize that the ex ante intent to exchange tacit knowledge allows partners to engage in the type of non-contractible collaboration best suited for the development of new inventive output. We also submit that differences in their governance mechanisms will have an impact on their ability to exchange knowledge and consequently on their innovative performance. We empirically examine our hypotheses in the context of biopharmaceutical alliances.

Partner Competition and Stability in Interorganizational Relationships (WITHDRAWN)

Author: **Tadhg Ryan-Charleton**; U. of Otago
Author: **Robert Galavan**; Maynooth U.

Stability in interorganizational relationships is commonly associated with cooperation, whereas competition between partners is viewed as 'gasoline' that spreads opportunistic behavior and generates instability. We build on multimarket competition (MMC) literature to explain two mechanisms by which competition is also 'glue' which bonds partners together and stabilizes interorganizational relationships. Using a longitudinal dataset of R&D agreements in the global semiconductor industry (1995–2010), we find that MMC between partners is beneficial for stability to a point, resulting in 3.9 months greater stability versus relationships without MMC. The positive effect reverses when MMC is extremely high, leading to an overall inverted U. We also find an intriguing interaction with previous cooperation between partners, which 'flips' the effect of MMC from an inverted U to a U.

Revising Machine from Within: Toward Mid-Range Theory of Agency in Inter-Organizational Relations

Author: **Juri Matinheikki**; Aalto U. School of Business

Embeddedness

Author: **Elio Shijaku**; U. of Barcelona
Author: **Paavo Ritala**; LUT School of Business and Management

Coopetition (i.e., collaboration between competitors) takes place across alliance networks within an industry. Such 'coopetition networks' provide the embedded firms with both opportunities and challenges. However, it is not well known what drives a firm to increase the level of competitive intensity among its overall alliance network. This study establishes a theoretical explanation combining behavioral perspective and the network perspective to formation of coopetition networks. We argue that firm's search behavior in terms of problemistic and slack search, as well as its network embeddedness, leads to different implications in terms of driving the market commonality and resource similarity in its alliance networks. We find that problemistic search drives market commonality, while slack search resource similarity in firm's networks. Network centrality has a negative direct effect on resource similarity, but on the other hand, it has a positive moderating role on the effect of slack search on both market commonality and resource similarity.

Complex Knowledge Association Patterns Drivers: Redundant Knowledge and Diverse Partner Resources

Author: **Ann McFadyen**; U. of Texas At Arlington
Author: **Edward Levitas**; U. of Wisconsin, Milwaukee

We advance the notion that the impact of knowledge resources on the knowledge creation process can best be understood by simultaneously examining an individual's previously accumulated knowledge base and that individual's direct exchange partners. Our study is at the individual level of analysis and our focus is on the knowledge bases of biomedical research scientists and resources offered through the exchange partners to whom they are directly connected through co-authorship. Few previous studies have simultaneously examined the relationship between focal scientist's previously accumulated knowledge

Author: **Katri Kauppi**; Aalto U. School of Business

Author: **Alistair Brandon-Jones**; School of Management, U. of Bath

Author: **Erik M. Van Raaij**; Erasmus U. Rotterdam

The pursuit of strategic or operational synergies between organizations frequently leads to the formation of an inter-organizational relationship (IOR) with a mutual interest. Despite an inherent pursuit of cooperation, such IORs are subject to agency problems caused by goal incongruence and information asymmetry between the independent organizations. In this study, we take the first steps towards a mid-range theory of agency in IORs. We begin with a review of IOR agency literature in the four fields of general management, marketing, operations management and economics. We identify similarities (e.g., an explicit focus on information asymmetry) and differences (e.g., assumptions about self-interest and opportunism) between the four disciplines. Then, we categorize the governance mechanisms identified in extant literature and create a framework of inter-organizational agency relationships explaining reasons for the differential deployment of governance mechanisms leading to four archetypical IOR forms.

PAPER SESSION

base in conjunction with their direct exchange partners, and the combined impact on the value of new knowledge creation. We extend previous knowledge creation research and provide empirical evidence that because individuals possess idiosyncratic knowledge bases, the ability to recognize recombination opportunities of resources offered by direct exchange partners is dependent upon the scope and depth of the focal scientist's previously accumulated knowledge base. Further because a previously accumulated deep knowledge base offers complex interrelated knowledge association patterns, scientists are able to recognize recombination opportunities of diverse resources offered through direct exchange partners, even in the presence of mostly redundant prior accumulated knowledge generally associated with deep expert knowledge bases.

How Firms Actually Use Non-Competes and Why it Matters

Author: **Cassandra Torgnes**; NHH Norwegian School of Economics

This study presents the first qualitative evidence on why and how firms actually use non-compete clauses in employment contracts. While the majority of the extant literature on non-competes focuses on the outcomes of non-compete enforceability at the state level, no studies to date look at the actual behavior of firms that use non-competes. Utilizing qualitative data from 32 interviews in three different innovation clusters, this study explores the motivations behind why firms use non-competes and how the use of non-competes influences firms' behavior toward employees. The study finds that contrary to the assumptions of the rational actor model used to defend non-competes (e.g. firms invest more in employees' human capital when employees are bound by non-competes), firms do not change levels of human capital investments based on whether or not their employees are bound by non-competes. I offer possible explanations for this discrepancy, and suggest ways to improve the rational actor model to account for actual firm behavior and thus improve the model's stability and predictability.

Strategic Orientations, Misperceptions, and Coopetition (session 1323)

The Goodness and Badness of Network Misperceptions

Author: **Jingyu Li**; Chinese U. of Hong Kong
Author: **Haifeng Wang**; Shanghai International Studies U.

Author: **Jun Xia**; U. of Texas at Dallas

Existing network research takes an accuracy-based perspective emphasizing accurate network perception as an advantage, but largely ignores certain benefits of misperceptions. To supplement this perspective, we advance a bias-based perspective to differentiate between cognitive overrepresentation and underrepresentation as two types of misperceptions and posit that managers may benefit from overrepresentation to a certain degree. Overrepresentation refers to a situation in which some ties an individual perceives do not actually exist because they are not reciprocally perceived by his/her peers, whereas underrepresentation refers to a situation in which certain ties an individual does not perceive actually exist because they are perceived by his/her peers. Using survey data from 97 subunit managers of a large Chinese multi-unit firm, we find an inverted U-shaped effect of structural holes derived from overrepresented networks on subunit managers' social status, while structural holes derived from underrepresented networks negatively affect subunit performance. Our study provides useful implications for cognitive network research.

Knowledge Gains and Efficiency Losses: Member Turnover and Organizational Performance

Author: **Susanna Reetta Emilia Mansikkamäki**; Jyväskylä U. School of Business and Economics
Author: **Akseli Mansikkamäki**; NMR Research Unit, U. of Oulu, Finland

In order for organizations to avoid the fate of becoming rigid and obsolete over time, they need to update their knowledge base in a changing environment. One potential tool for this is member turnover that enables bringing in new knowledge. In this study, we model the effect of member turnover on organizational knowledge over the organizational life course with March's [March, J. G. 1991. Exploration and exploitation in organizational learning. *Organization Science*, 2: 71–87] model of mutual learning and extend the estimation to broader organizational performance by including also the negative aspects of turnover, the diminishing internal cohesion and the shortening member tenure. The results show that there is a trade-off between knowledge gains and efficiency losses in the member turnover process. The balance between the positive and negative consequences of the process is also context dependent and changes over the life trajectory of an organization. The present work contributes to employee mobility literature by elucidating the twofold consequences of member turnover and to the studies on organizational aging by taking a temporal view on

Based on a unique company culture valuing circular principles, companies like Patagonia have proven to be commercially successful, while being able to provide environmental benefits and securing their own resource stream. Surprisingly, although reasons for firms to change from a classical take-make-dispose model towards implementing circular economy practices are manifold, indicators measuring circularity have not significantly changed over the past years within the European Union. Thus, the question remains how organizational culture can be leveraged to overcome barriers of circular economy practices implementation. For the first time in a European context and with a focus on senior managers of manufacturing firms, our study aims to empirically examine specific configurations of strategic orientations and the underlying mechanisms that drive circular economy practices development. Our results suggest that market orientation is positively related to closed-loop orientation and closed-loop orientation mediates the relationship between market orientation and two circular economy practices; internal environmental management and eco-design. Thus, our results yield important insights on antecedents and mechanisms of implementation of circular economy practices, which can serve firms as practical guidelines on how to adopt them.

The Role of Stakeholders in Firms' Response to Social Issues (session 1324)

When and Why Do Organizations Respond to Environmental, Social, and Governance Issues?

Author: **Olga Hawn**; U. of North Carolina, Chapel Hill

Author: **Ioannis Ioannou**; London Business School

Firms face growing pressures from multiple stakeholders on a variety of environmental, social, and governance (ESG) issues. When do they respond, and why? We use media criticisms to identify a number of ESG issues that organizations face simultaneously – this allows us to model their interdependencies. We hypothesize that the risk of peer contamination and the need for reputational cleansing motivate organizations to respond to a focal issue to a greater extent, and that in conjunction with issue advantageousness and media gravity, both mechanisms produce even stronger effects on organizational action. Importantly, given that firms are criticized both in traditional and social media, our primary data, collected by RepRisk daily by screening over 80,000 sources globally in 15 languages, captures multiple stakeholders and media sources. This large and unique dataset involving 3,037 firms and 20 ESG issues between 2007 and 2016 allows us to produce two sets of results – panel data and matching analyses – generating a more nuanced understanding of the mechanisms underpinning the organizational decision-making process for responding to ESG issues. We contribute to the social evaluation

Investee Peers and the Imitation of Corporate Social Strategy

Author: **Xinhao QIAO**; Hong Kong U. of Science and Technology

Author: **Jinyu He**; Hong Kong U. of Science and Technology

Author: **Xueying Bian**; Singapore Management U.

As institutional ownership becomes prevalent, firms are faced with competitions not only from their industry peers but also from investee peers with whom they share common investors. To compete for the limited financial resource, firms likely refer to and imitate their investee peers' behaviors to gain equal or favorable treatment by the common institutional investors or to prevent the investors from withdrawing their capital investment. In this study, we investigate how firms react to their investee peers' corporate social responsibility (CSR) performance using data on 2267 listed firms in the U.S. from 2002 to 2017. After addressing potential endogeneity issues, we find that high CSR performance of investee peers motivates the focal firm to improve its own CSR performance. Further, the investee peers' effect on the focal firm's CSR performance is more pronounced if the investee peers are more visible. Also, when investee peers are linked by dedicated vis-à-vis transient institutional investors, the peer effect becomes stronger.

Individual Power Holders' Twitter Statements about Firms and their Consequences for Stock Prices

Author: **Anita Gerstbauer**; WU Vienna

Author: **Patricia Klopff**; Rotterdam School of Management, Erasmus U.

Author: **Phillip C. Nell**; WU Vienna U. of Economics and Business

Institutional theory suggests that stakeholder pressures influence firm value and behavior. Stakeholder pressures can be exerted by groups as well as by individuals in positions of power, i.e. individual power holders. New online communication channels have made it increasingly easier for individuals, in particular, to exert pressure on firms. Their messages can now reach a plethora of people in a minimum of time. When individual power holders make negative statements about firms through social media, they may result in sudden and unexpected pressures for firms. We theorize about the relationship between negative statements that individual power holders make via social media about firms and these firms' stock prices and expect it to be negative. We also study how firms' geographic concentration and political activities in the power holder's dominion moderate the suggested negative relationship. Using Donald Trump's tweets to study the relationship between firm-targeted public statements and stock prices, we find support for a negative relationship between negative public statements and the targeted firm's stock price. Our results yield support for a weakened relationship between public statements and stock prices for more politically active and geographically exposed firms.

Firm Resources, Complementary Assets & Survival: Lessons from the Solar Energy Venture Capital Boom

Author: **Patrick J. Callery**; Sprott School of Business, Carleton U.

Author: **Youngbin Joo**; U. of Leeds

This study develops and tests a set of novel theoretical predictions about the conditions under which key resources undermine new venture success. To do this, we revisit the presumption of investment in core technology innovation and complementary assets in a nascent and rapidly growing industry. Drawing on insights from control of complementary assets and innovative business models, we suggest that key resources for the boom period of industry emergence do not necessarily lead to greater rewards during the industry shakeout. Our empirical analysis of exit of new ventures in the solar energy sector supports our approach: startups with core domain positioning, venture capital investment, and technological innovation are less likely to survive and to exit successfully during the period of industry shakeout. Highlighting an understudied paradox in practical settings, this study offers several contributions to knowledge of firm resources and complementary assets, and motivates new lines of inquiry in technology and business model innovation.

It's Not You, It's Me: Technological Learning and Investment Termination in Corporate Venture Capital

Author: **Peiyuan Huang**; U. of Pittsburgh

Author: **Ravindranath Madhavan**; U. of Pittsburgh

Corporate venture capital (CVC) investment has become an important source of critical resources to corporate investor and invested venture alike. However, despite an extensive exploration of the establishment and performance outcomes of CVC-venture dyads, the literature has largely neglected

Author: **Panos Panagiotopoulos**; Queen Mary U. of London

Author: **Frances Bowen**; U. of East Anglia

Given the rise in the prevalence and reach of information-based regulation over the past two decades, strategists need to understand when and how firms respond to being publicly rated by regulators. Most previous research explains the influence of regulatory ratings on firm behavior through external stakeholders pressuring target firms for improvements on previously unobservable metrics such as environmental pollution or safety records. In contrast, our study focuses on the attention of internal actors, particularly managers, to their firm's responses to rated issues. We present empirical results based on a natural experiment arising from a regulatory change in the UK and a dataset of the food hygiene rating scores of 286,605 food outlets over the period 2015-2019. Our attention-based view extends research on how firms respond to being rated by demonstrating how regulatory ratings can serve as attentional carriers, drawing organizational attention to the regulated issue and triggering changes in firm behavior. Our analysis confirms two core attention-based view principles, that is, the principle of selective attention and the principle of situated attention, as drivers of firm responses to information-based regulation. We conclude with the implications for research on information-based regulation and the attention-based view, as well as the practice of designing effective regulatory rating schemes.

Being Good or Being Bad: A Demand-Based View of Customer Landscape and Corporate Social (Ir)Responsibility

Author: **Lizhen Wang**; Guanghua School of Management, Peking U.

Author: **Weiguo Zhong**; Peking U.

Author: **Anni Chen**; Peking U.

While researches on the disclosure of corporate social responsibility (CSR) and irresponsibility (CSiR) recognize the influence of between stakeholder group heterogeneity and multiplicity, less attention has been given to the within stakeholder sub-group

the mechanisms that lead to the termination of these intriguing interorganizational relationships. Although termination has been studied in independent venture capital, the dual objectives of CVC i.e., access to superior technology in addition to financial returns, make it important to study the unique factors that drive CVC termination. Accordingly, we studied how the corporate investor's technological learning explains the likelihood of the termination of an existing investment dyad. Applying a resource dependency framework, we theorized how achieved technological learning reduces mutual dependency and enhances power imbalance, thereby predicting a higher likelihood of investment termination in the subsequent rounds. We also explored how the proposed relationship is contingent on knowledge usefulness and product market similarity. Using a combined dataset on CVC investment and corporate new invention, we find supports for our hypotheses.

Uncovering the Impact of Venture Capital Firms on Startup Innovation

Author: **Elisa Alvarez-Garrido**; U. of South Carolina

I seek to uncover the effect of venture capital (VC) on innovation by studying which VC firms and in what context foster the startup innovative process. I argue that specialist VC firms have the knowledge to help the startup innovate faster, but that this effect is moderated by context: the research environment of the country where the startup innovates is both a complement and a substitute to the effect. I find empirical support from a sample of 923 VC-backed biotech startups, from 26 countries, during a period of high growth of the biotech industry (1996-2006). The results suggest selection is not the main driver. Qualitative insights from interviews with 18 VC partners further shed light on the mechanisms underlying the effect of VC on innovation.

demand heterogeneity and the relative importance of these demands. We develop a framework wherein CSR reporting is viewed as an organizational response to features of one of the most significant stakeholder groups of a firm—its customers. Drawing upon the demand-based view and stakeholder theory, we argue that two fundamental dimensions of customer base—customer heterogeneity and customer concentration—help explain how firms make balance along multiple social demands. We propose that customer heterogeneity drives firms to invest in diverse types of CSR activities (i.e., higher level of CSR strength) and restricts CSiR activities (i.e., lower level of CSiR strength) to gain customer legitimacy and support. While customer concentration allows firms to invest in limited CSR activities (i.e., lower level of CSR strength) and initiate more types of CSiR activities (i.e., higher level of CSiR strength) for efficiency considerations. Our framework was supported through a longitudinal analysis between 1991 and 2008. Our study contributes to the literature on strategic CSR, stakeholder theory, and demand-based view.

Technology Legitimacy and the Legitimacy of Technology: The Case of Kidney Disease Treatments

Author: **Sanjay Jain**; California State U., Northridge
Author: **David Ahlstrom**; Chinese U. of Hong Kong

In this paper we explore how the institutional environment in which technologies are embedded serves to select certain technologies and marginalize others. Specifically, we trace the dynamics occurring within the legitimacy ecosystem – that is, the distributed set of actors who employ different evaluation and endorsement methods to collectively confer legitimacy to a technology. We employ a historical narrative of the evolution of chronic kidney disease (CKD) treatment modalities to demonstrate how two of these (dialysis and transplantation) have become accepted forms of treatment while another (dietary protein restriction) has been institutionally locked out. In doing so, we highlight how legitimacy ecosystems are historically conditioned to select “science based” technologies. Our analysis also indicates that the role for institutional entrepreneurship activity is often circumscribed. Finally, we elaborate on the unintended impacts that such legitimization processes have on the evolution of a technological field. Our findings contribute to the technological change literature as well as the growing discourse on technology legitimacy, besides offering important implications to the medical practice and healthcare policy domains.

How Cooperative Behaviors Activate Members to Submit Ideas on Crowdsourcing Platforms for Innovation (WITHDRAWN)

Author: **Mark Boons**; Vrije U. Amsterdam

Author: **Christian Fieseler**; BI Norwegian Business School

Author: **Christoph Lutz**; BI Norwegian Business School

Author: **Katarina Stanoevska-Slabeva**; U. of St. Gallen

Crowd-based platform organizations critically depend for their success on the willingness of their registered members to participate and perform in tasks, such as idea generation and innovative problem solving. A widely held assumption is that these platform organizations are successful, because they have such large member bases. For any given task, even though they might require specialist capabilities, someone within the ranks of their members will be able to perform it well. In reality, however, only a fraction of the crowd actively engages with tasks and if that, then in most cases, only for a limited period of time before phasing out of active participation. Crowdsourcing platforms therefore in effect depend heavily on a comparatively small number of active members. In this study, we aim to uncover these dynamics and investigate how members’ experiences with cooperative behaviors on a platform affect their willingness to continue to participate and perform for the platform organization over time. Specifically, we explore how their own commenting and rating behaviors and that of other members affect members’ idea submission behavior over time. Based on the longitudinal analysis of the activity of

Green Technology Transfer in a Developing Country: Experiences from Vietnam

Author: **Thinh Gia Hoang**; RMIT International U. Vietnam

Author: **Nam Vu**; Ho Chi Minh U. of Transport

Author: **Dat Le**; Centre for Applied Economics and Business Research

This study explores the transfer of efficient & eco-friendly technologies through the perceptions of both business and technology specialists in four Vietnamese organisations. Twenty-two semi-structured interviews were conducted with business leaders and technology scientists. The interviewees were asked to share their views on the motivations for importing green technology; their familiarity with, knowledge of, and understanding of green technology transfer and the current green technology performance in their organisation. Oliver's (1991) theoretical framework of actors' resistance to institutional demands is employed as a theoretical lens to investigate the perceptions of practitioners. Our study suggests that despite some benefits of the adoption of green technology, there are huge concerns over the use and importation of green technology such as the lack of operational tests, the old technologies and the lack of knowledge transfer. This is one of the first studies to explore eco-friendly technology transfers in a developing country from the micro-level perspective of both business and technology practitioners of green technology -recipient organisations.

Paradox of Middleware: Innovation Enabler and Creativity Constraint

Author: **Milan Miric**; U. of Southern California - Marshall School of Business

Author: **Hakan Ozalp**; Vrije U. Amsterdam

A critical determinant of the success of digital platforms is the availability of third-party complements. In order to foster the creation of such complements, platforms often rely on boundary resources: software tools and libraries that support and lower the costs of developing complementary innovations. However, while such boundary components are increasingly widespread, little is understood about how these components shape subsequent innovation outcomes and the overall platform generativity. Here, we focus on a particularly important form of boundary resource for digital platforms: Middleware components for software development. We theorize how middleware may shape both the novelty of products being created and their subsequent market value, and propose a number of mechanisms for these effects, for which we provide evidence. We test for these different mechanisms by looking at the development of console games during 6th and 7th generation of gaming consoles. We find that the introduction of licensed middleware such as third-party game and graphics engines lead to the creation of less novel, but more commercially successful products. We attribute this to the fact that middleware allows firms to reallocate resources from developing basic functionality (such as programming how the graphics will be rendered for the target platform), to other elements that make games more valuable and successful on the market (such as story or game mechanic innovation). Our results have implications for how we think about the impact of boundary resources such as middleware on digital platforms, and recombinant innovation more broadly.

sector and firm functions are sources of variance in management responses. We show, theoretically and empirically, that digital technology adoption is positively associated to divergence in management attention of managers belonging to different organizational functions within a given organization. We also show that, overall, digital technology adoption is positively associated to convergence in management attention of managers from different organizations. We test our hypotheses in the context of the US financial sector (934 banks and 221 insurers, from 2006 to 2018) and we find strong support for our predictions.

The Microstructure of Complex Design Architectures: A Theory of Design Network Motifs

Author: **Sabine Brunswicker**; Purdue U., West Lafayette

Author: **Satyam Mukherjee**; Indian Institute of Management, Udaipur

The established stream of literature on design architectures argues that designers should aim for modular architecture in order to increase the system's technical performance by lowering the propagation costs of the system's design: A system with a small stable "core", a cycle of coupled parts of the system, and a large variable periphery reduce the risk of technical failure and increase opportunity for innovation. However, such a core-periphery view ignores the micro-level dependency structures that emerge in open collaboration when a large number of developers produce a complex technical system at distance, virtually, and outside of formal employment relationships. In this paper, we develop a theory of design network motifs that accounts for the smallest design dependencies in the system that emerge in situ. Informed by network theory, we introduce the concept of a design network motif to describe distinct patterns of design interdependencies within the smallest substructure of a system architecture. We develop a theory of design network motifs that describe a system's microstructure and explain how certain motif patterns affect the performance of a system as a whole. We empirically examine our design network motif theory using architectural data of the Open Stack repository NOVA, consisting of 2359 files and 1545532 lines of code. We extract all potential design network motifs created by 872 developers for 5 years. Our results show that design network motifs offer a new way to explain hidden dependencies in complex system architectures. Surprisingly, it is not just cycling that significantly impacts a system's performance but instead, a "feed-forward loop" motif. Our results contribute to the literature on design architectures and open collaboration more broadly.

Entrepreneurship & New Venturing: Entrepreneurial Outcomes (session 1330)

The Double-Edged Sword of Knowledge Inheritance: Knowledge Overlap and Spin-Outs' Performance

Author: **Aliasghar Bahoo Torodi**; Alma Mater
Studiorum U. di Bologna

Author: **Salvatore Torrisi**; U. of Milano-Bicocca

This study explores the impact of knowledge overlap with parent organizations on the performance of start-ups founded by former employees of these incumbent firms. Building on the entrepreneurship literature on spin-outs, we argue that the degree to which spin-outs' technological and market knowledge overlap with their parent organizations has a nonlinear impact on their performance – breadth of technological search (which in turn affect innovativeness) and survival. Knowledge relatedness is beneficial to spin-outs because it reduces the uncertainty surrounding the early steps of a new venture. However, a high level of overlap with the parent's technological and market capabilities indicates a limited spin-out's ability or willingness to undertake explorative search, which may eventually hamper its innovativeness and competitive advantage. Moreover, substantial market overlap may spark the parent's hostile reaction, giving rise to disruptive competition that may reduce the spin-out's likelihood of survival. Also, we argue that the overlap-performance relationship is moderated by the founders' hierarchical position in the parent firms. The analysis of 131 biotech spin-outs spawned by 116 industry incumbents supported our hypotheses. Our results contribute to the entrepreneurship literature on spinout-parent relationship.

IP Strategy: Evolution of Intellectual Property Rights Regimes (session 1331)

Empirical Analysis of License Policy for Declared Standard Essential Patents in Standard Setting

Author: **Dong Huo**; Harbin Institute of Technology,
Shenzhen

Author: **Jianwei Dang**; Tongji U.

Author: **Kazuyuki Motohashi**; U. of Tokyo

Standard-setting organizations (SSOs) generally request their participants to commit to offering licenses ex ante to implementers on fair, reasonable, and non-discriminatory (FRAND or RAND) terms. To adjust for the RAND context, court judges adopt modified Georgia-Pacific rules to determine patent damages ex post in infringement lawsuits involving standard essential patents (SEPs). In this paper, we review the literature on intellectual property rights policy in SSOs and modified Georgia-Pacific rules from court practices and, accordingly from technical and legal aspects, explore the determinants of licensing terms in the RAND context. By employing a novel dataset that consists of over a thousand declared SEPs in the Internet Engineering Task Force (IETF), we find that, in general, technical and legal characteristics are significantly associated with reciprocal licensing terms, despite that most of their associations with royalty-free (or royalty-bearing) terms are nonetheless trivial.

How Did the Terms of Protection Affect Patenting and Innovation Activities?

Author: **Hyo Kang**; USC Marshall School of Business

This study examines how intellectual property rights change the behaviors of innovating firms and characteristics of their inventions. We focus on the discontinuous change in the U.S. patent term in 1995 which significantly affected scientific invention

Author: **Elisabeth Mueller**; German Graduate School of Management & Law (GGS)

Author: **Laura Koerner**; U. of Passau

Author: **Patrick Figge**; U. of Passau

Author: **Carolin Haeussler**; U. of Passau

Entrepreneurial teams are critical to the performance of new ventures. While prior research has focused on their composition, recent studies have started a debate on the importance of their internal structure. We contribute to this debate by examining how ownership distribution between entrepreneurial team members influences novelty of the inventive activities within their ventures. Drawing on judgment theory and literature on entrepreneurial teams, we argue that an unequal ownership distribution in teams positively influences novelty creation. Further, we propose that the participation of entrepreneurial team members in inventive activities facilitates novelty creation. Controlling for endogeneity, our analysis of 4,890 inventive projects supports our reasoning and suggests that entrepreneurial teams with an unequal ownership distribution are more likely to pursue higher novelty and that direct involvement of entrepreneurial team members in inventive activities matters. Our findings contribute to the emerging debate on how the design of the internal structure of entrepreneurial teams affects organizational outcomes.

Learning After Doing: A Case of Corporate Incubation at Ericsson

Author: **Mayur Prataprai Joshi**; Ivey Business School

Author: **Adam Uhrdin**; U. of Leeds

Author: **Ning Su**; Ivey Business School

Author: **Krsto Pandza**; U. of Leeds

Author: **Saeed Khanagha**; Vrije U. Amsterdam

Innovation has since long been known as key to organizational success and survival, which has driven in particular large technology firms to systematize their research and development activities and explore various complementary approaches of corporate venturing and renewal, including corporate venture capital funding, open innovation and internal corporate venturing. Yet,

and patenting behavior. We provide patent, firm, and industry-level analyses and discuss implications for relevant policies. We first document that firms increased their patent applications ninefold right before the new term was applied. They also increased the number of claims per patent and breadth of their claims. These patents had higher backward citations, but the increase mostly came from outlier patents with an unreasonable number of citations, which prolonged the examination period; the review process for each patent took 25 percent more time. We found that the rush to patents was most prominent in the chemistry sector, while the mechanical engineering sector was least responsive. Firms – large, U.S. corporations, in particular – responded more prominently than individuals. Nevertheless, the change in patent term did not affect the overall quantity and quality of inventions that were patented. Finally, we provide a case study of Firm X that exemplifies the ways in which firms have used the 1995 change to obtain double the actual patent term offered.

Distance Puzzle in Knowledge Spillovers: A Revisit from the Legal Perspective

Designated as a “Best Paper” for TIM

Author: **Qinyu Wang**; U. of hong kong

Author: **Yanfeng Zheng**; U. of hong kong

Recent studies found that the localization effect of knowledge spillovers has strengthened during the past few decades, a surprising trend amid the age of digitalization. In this paper, we develop an analytic model to understand this phenomenon from a legal perspective. Our model shows that potential litigations and licenses impose a legal cost on follow-on innovators. The strength of patent protection thus shapes the pattern of knowledge spillovers such that a stronger protection leads to more localized spillovers. We test the model predictions exploiting the introduction of the Court of Appeals for the Federal Circuit (CAFC) in 1982, a remarkable pro-patent shift in the US. Using a matched sample of approximately 2.6 million actual and control citations around the shift, we find that knowledge spillovers became more localized after the creation of the CAFC and this change in the localization effect

corporations are increasingly facing ambiguous digital disruptions and lasting era of ferment rendering the known means of corporate innovation insufficient. In response several large corporates have started adopting more experimental approaches to their corporate innovation strategy, including lean start-up approach, corporate incubation and corporate acceleration. Addressing this increasingly relevant phenomenon, our study examines how large industry incumbents establish corporate incubation programs to facilitate strategic innovation in the wake of ambiguous environmental changes. Grounded in the context of telecommunications industry facing digital disruptions, our study reports an in-depth, longitudinal field study of corporate innovation strategy of Ericsson for the period of 2013 to 2019. We demonstrate the iterative and path dependent learning process of corporate experimentation and show indirect benefits of corporate incubation projects to the parent firm. Accordingly, we contribute to the emergent literature on corporate experimentation as well as the literatures on strategy-making processes and internal corporate venturing.

How do Dynamic Capabilities and Market Orientation Drive Ambidextrous Business Models?

Author: **Ralf Wilden**; Macquarie Business School
Author: **Siggi Gudergan**; U. of Waikato

Despite both business models and market orientation being relevant to value creation and firm performance, little research has investigated their relationship. Importantly, designing a business model often requires adjustments, which rests on the deployment of dynamic capabilities. Yet, we know little about the role of dynamic capabilities in fostering business model innovation. Thus, in this study we aim to understand the particular processes through which firms in general, and SMEs in particular, produce innovations to their business model in line with their market orientation. We develop process framework of business model innovation of an SME from start-up to scale-up, enabled by dynamic capabilities. More specifically, the paper clarifies the kind of dynamic capability

was more pronounced for judicial areas that were less friendly to patent owners in pre-CAFC litigations, compatible with model predictions. Our study contributes to the literature on knowledge spillovers by introducing a novel legal perspective and offers important policy implications.

Government R&D and Private Innovation: Empirical Evidence from the Bayh-Dole Act

Designated as a "Best Paper" for TIM
Author: **Yun Hou**; National U. of Singapore
Author: **Ivan Png**; National U. of Singapore

Performing government R&D can enhance and certify a firm's competencies, but impose resource costs. Here, we investigate the net effect of government R&D on private-sector innovation. From 1983, President Reagan allowed large businesses to patent inventions arising from government R&D. Empirically, large businesses increased government R&D, and this led to less R&D for internal use, but no significant change in R&D for external industry clients. We interpret these results as due to resource re-allocation to government R&D outweighing competency enhancement and certification for internal R&D, but not external R&D.

Knowledge Management & Learning: Decision-Making and Problem-Solving (session 1332)

Modeling Massive Social Network Problem Solving via Network Goal Analysis vs. Social Network Analysis

Author: **James D. Westaby**; Columbia U.

It is critical for organizations and their members to get questions answered and problems solved in service of objectives and innovation. For this reason, many utilize social input from massive online platforms, such as Google, Facebook, Youtube, and Stack Overflow. We refer to such socially-sourced efforts as social network problem solving (SNPS). This study employed network goal analyses (NGA) to operationalize the answering linkages, which we refer to as goal striving (G) toward question goal nodes. NGA then models the system support (S) linkages to the goal striving. This is hypothesized to generate a distinct network landscape versus traditional social network analyses (SNA). Using Q and A data from the Operations Research community in Stack Overflow, we tested the predictive validity of the G and S distinction on question innovation importance ratings. Controlling for process variables, results confirmed the predictive validity of degree G and S (and G x S moderator) on goal node importance. Degree G also predicted goal node betweenness indicating that strong G behavior results in goal nodes having the

Talent Management & Innovation: Roles and Innovation (session 1334)

Cultural Intelligence and Innovative Work Behavior

Author: **Basheer M. Al-Ghazali**; King Fahd U. of Petroleum and Minerals

The role of cultural intelligence in activating employees' innovative work behavior is yet to be explored in the innovation research. The purpose of this preliminary study is to examine how cultural intelligence boosts employees' innovative work behavior through work engagement and interpersonal trust. Data were collected via a questionnaire survey from 381 multinational organization employees in Saudi Arabia. The findings reveal that cultural intelligence is positively related to innovative work behavior. Moreover, both work engagement and interpersonal trust played partial mediating roles in the cultural intelligence-innovative work behavior relationship. The findings advance the literature on individual innovation by studying an underexplored type of intelligence (cultural intelligence) in relation to employee innovative work behavior. They also extend our knowledge of the antecedents of innovative work behavior. Practical implications are discussed at the end.

[view paper \(if available\)](#)

shortest paths across the network. As hypothesized, NGA uncovered a more diffuse SNPS system than traditional SNA, thereby providing a new complementary approach to SNPS processes.

Biased Information Transmission in Investor Social Networks: Evidence from Professional Traders

Author: **Sonya Lim**; DePaul U.

Author: **Jacqueline Lane**; Harvard U.

Author: **Brian Uzzi**; Northwestern U.

This research examines how the positive or negative valence of proprietary information affects both the likelihood that people diffuse this information through their social networks and the likelihood that recipients' access to this information provides them with a source of comparative advantage. Using a unique dataset of over 2 million stock trades and associated profits and losses, and 1 million instant messages exchanged between professional day traders at a U.S. hedge fund, we show that day traders are more likely to talk about their gains than their losses with their close contacts, suggesting that positive information is more likely to be shared among one's close network of strong ties. However, by examining the subsequent behaviors of message recipients, we find that recipients tend to discount the value of positive, gains related information, being both more likely to pass on and profit from negative information related to trading losses, particularly from their strong ties. Our results suggest that although individuals are more likely to share positive information with their contacts, message recipients appear to account for the asymmetry in their subsequent communications and decision-making.

Opportunity or Threat? Exploring Middle Manager Roles in the Face of Digital Transformation (WITHDRAWN)

Author: **Sebastiaan Van Doorn**; U. of Western Australia

Author: **Marko Reimer**; WHU - Otto Beisheim School of Management

Me and I – How Personality Shapes Inventive Performance

Author: **Stefan Wagner**; ESMT Berlin

Author: **Karin Hoisl**; Mannheim U.

The search for external knowledge increases inventive performance. We extend this established view by considering how an inventor's personality is related to her inventive performance. Focusing on plasticity, a higher-order personality trait comprising openness to new experience as well as extraversion, we propose that plasticity is positively related to inventive performance. This effect can be decomposed in a direct effect (plasticity => performance) and an indirect mediated effect via its association to search behavior (plasticity => external search => performance). We test our theoretical predictions in a model of moderated mediation relying on a sample of 1,327 industrial inventors. A positive direct effect of plasticity on inventive performance can be identified across all inventors. The overall positive effect of external search, however, is more pronounced for inventors characterized by low levels of plasticity.

The Role of Domain Specialists: A Case of New Product Development

Author: **Kenneth Nygaard**; Aarhus U., Department of Management

Role development is often a process driven through the likes of coworker and peers. This study investigates self-driven role development through task adjustment for highly educated technical specialists. The results of a qualitative case study including 26 semi-structured interviews reveal that specialist roles develop through a balancing act between performing formal tasks and an explorative emerging task. This is catalyzed by understanding the process of new product development which specialists build by interactions and observation within an organization. This study contributes to the understanding of continued occupational role development of highly specialized workers in high-

There has been much controversy concerning the effects of automation on the role of middle managers in contemporary organizations. Some scholars adopt the “automation-as-a-threat” perspective to argue that middle manager roles will disappear with digital automation. Yet, others take a “automation-as-an-opportunity” view to underscore the advantages digital technology offers to individuals and organizations. Drawing on role theory, we develop a framework that reconciles these opposing views, and argue that the effect of digital transformation on middle management involvement in strategic decision-making depends on which middle-management tasks are automated. Data from 74 middle managers of large firms in Germany, Austria and Switzerland, show that automation of routine tasks can help middle managers to build capacity (both, in terms of time and cognition), offering opportunities to become more involved in strategic decision-making. At the same time, the automation of non- routine tasks precludes middle-managers’ meaningful engagement with strategic narratives. Overall, our study highlights that digital transformation is a double-edged sword for middle managers’ involvement in strategic decision-making – and its effects depend on which aspects are replaced by digital technology.

Why Can't You See What I Can? Reputation Allocation for Solitary Innovators and Fluid Teams

Author: **Michael Zaggi**; Aarhus BSS, Aarhus U.

Author: **Matthias Müller**; U. of Hohenheim

In many distributed innovation systems, the “true” skills of the actors are hidden and reputation is the only observable proxy. Knowing about the actor skills is essential for evaluators and recruiters to predict actors’ future performance. In this paper, we build a theory on reputation allocation. Using a simple agent-based simulation model, we explore which information should be considered for calculating reputation in order to maximize the alignment between reputation and the underlying skills of actors. We consider several conditions for reputation allocation, most importantly fluid teams, that is when multiple actors produce an aggregated outcome, but reputation needs to be assigned to the individual actors. We relate our model the hiring, specifically hiring in academia. In doing so we challenge current practices of reputation allocation, show their downsides and offer solutions that increase the accuracy of rankings of actors.

hand, deeply entrenched cognitive structures, biases, and overconfidence might lead experts to be maladaptive to new technologies and practices, and less likely to accept advice—especially from algorithms. Our results reconcile these opposing forces. Exploiting a field experiment within a large technology firm, in which IT support workers were assigned to resolve problems both manually and using an ML-based tool, we find an inverted-U shape between accuracy with the tool and expertise (a relationship that is not present for manually solved tickets). We show that this relationship is largely driven by the propensity of both low experience and high experience IT workers to reject correct recommendations from the algorithm, compared to workers with intermediate experience. We discuss implications for machine learning tools and human capital, expertise and adoption of new organizational routines, and expert judgment in decision making.

Effectuation and Socioemotional Wealth in Family Firms

Author: **David Michael Lehmann**; ESCP Business School

Author: **Matthias Mrozewski**; ESCP Business School

Author: **Rene Mauer**; ESCP Business School

Family ownership and control lead to affective endowments of business owners, which influences the firm's strategic orientations toward corporate entrepreneurship. Using a sample of German family-owned firms, we deliver an early empirical account of the relationship between these affective endowments called socioemotional wealth (SEW) and effectual control orientation (ECO). The effects of (E) emotional attachment between family members and (I) identification of family members with the firm on ECO are significant but

Emotions and Entrepreneurship: The Road Traveled, Boundary Conditions, and New Approaches (session 1261)

Interest among entrepreneurship researchers in emotional issues is growing in recognition of the role emotions play in the entrepreneurial process (Shepherd, 2016). A large number of studies on emotions in entrepreneurship examine categories of emotions such as positive or negative affect, moods, or feelings as antecedents to, boundary conditions of, and/or a consequences of, the entrepreneurial process at individual or multiple levels of analysis (Foo, Uy, & Baron, 2009). Yet the study of affect and emotions in entrepreneurship is still an emerging domain. There has been limited work challenging the quality of affect-based scholarship in entrepreneurship with regard to utilization of methodologies or conceptualization of emotions, both of which deserve attention. Further,

contradicting. We discuss this interplay of SEW with ECO and provide avenues for further research on family effectuation.

Entrepreneurial Behavior in SMEs: CEO Regulatory Focus as a Determinant of Effectual Orientation

Author: **Mark Tornow**; RWTH Aachen U.

Author: **Andrea Greven**; RWTH Aachen U.

Author: **Denise Fischer**; RWTH Aachen U.

In order to successfully deal with uncertainty resulting from today's turbulent environments, established firms may benefit from employing entrepreneurial approaches such as effectuation. Although literature initially introduces effectuation as an individual-level decision-making logic to manage uncertainty, scholars expand its reach to the whole organization, redefining effectuation as a strategic orientation. However, our understanding on how managers can actively promote effectual behavior within established firms is limited. Drawing on upper echelons theory, we aim to close this research gap by examining the impact of CEO's personality, in particular regulatory focus, on effectual orientation. Our results base on primary research data of 448 CEOs from established SMEs in Germany. We find a positive relationship between promotion focus and effectual orientation, whereas prevention focus positively relates to the conservative effectuation sub-dimension being affordable loss. Our study advances literature by relating regulatory focus to entrepreneurial behavior in the corporate context and establishing an important antecedent to effectual orientation.

Causation, Effectuation, and Innovation Performance: The Mediating Role of Absorptive Capacity

Author: **Christopher Steinert**; Doctoral Candidate

Author: **Christian Landau**; EBS Business School

Author: **Nikolaus T. Uhlenbruck**; U. of Montana

This essay addresses the question how new

entrepreneurs experience significant and persistent dilemmas when it comes to experiencing and displaying their emotions, as well as managing and reacting to employees' or other stakeholders' emotions. There is, therefore, a need to understand the role of affect, emotions, moods, or feelings at different stages of entrepreneurship and/or at different levels of analysis. It is also useful to pause and take stock of the progress being made in the field to identify what is silent or misrepresented in the growing 'emotions and entrepreneurship' literature. There is also a need to provide greater insight into the ways in which entrepreneurs resolve various emotional dilemmas.

ventures create innovation performance through the application of two entrepreneurial decision-making approaches, namely causation and effectuation, and the usage of absorptive capacity. We build a conceptual model and use partial least squares structural equation modeling in order to analyze survey data on 150 BioTechs and FinTechs operating in three European countries. Our results reveal that causation does not directly impact a firm's innovation performance, but that this relationship is fully mediated by absorptive capacity. We further find effectuation to significantly influence innovation performance, while absorptive capacity partially mediates this relationship. In addition, industry growth negatively moderates the path between causation and absorptive capacity. We contribute to theory on entrepreneurship—in particular to literature on effectuation and knowledge spillover—and dynamic capabilities theory by showing that causation and effectuation have different effects on the creation of innovation performance. Furthermore, we establish the understanding that absorptive capacity enhances the influence of both decision-making approaches on innovation performance. In particular, absorptive capacity is a necessary precondition for an applied causal approach to create innovation performance. When an effectual approach has been applied, absorptive capacity can be considered a supportive precondition. The respective managerial implications as well as limitations and future research avenues are discussed.

Who Contributes to Innovations?

Author: **Karnoukhova Elena**; National Research U. Higher School of Economics

Author: **Stepanova Anastasia**; HSE U.

Innovations are a major driver of the global economy. Recently, the typical major owner become an institutional investor. Moreover, the stakes of institutional owners have increased, which lead to the ownership concentration among types. Traditional investment managers, banks, insurance companies and hedge funds have different goals and strategies, so their roles in firms differ significantly. In this article we analyze the influence of different types of investors on the innovation input and output of Russell 3000 index US companies. This research uses a GLS models to suggest on 17346 firm-year observations for period 2004–11 that different types of investors have different effects on the innovative performance of

Financial Knowledge and the Acquisition of Debt Financing: Implications for Born Globals

Author: **Laurence Rijssegem**; Ghent U.

Author: **Egle Vaznyte**; Jheronimus Academy of Data Science

Author: **Petra Andries**; Ghent U.

Author: **Ine Paeleman**; U. of Antwerp

This study investigates the relationship between founders' knowledge of different debt financing mechanisms and their start-up's ability to attract debt financing. Building on the cognitive psychology literature, we propose that the depth of founders' debt financing knowledge is positively associated with a start-up's ability to acquire debt financing while the breadth of their debt financing knowledge is negatively associated with this outcome. Moreover, integrating insights on international entrepreneurship, we argue that these relationships will be more pronounced for born globals than for non-born globals. Analyzing survey data on 1,385

US companies. By focusing on the ownership concentration, we demonstrate first, that grey investors decrease innovative output; second, that passive independent institutions enhance innovation input and output in virtue of their active monitoring and long-term investment horizons; third, that the concentration of the industry, size and financial constraints play an important role in the innovative performance.

Pre-Entry Knowledge of Entrepreneurs and Market Strategy

Author: **Seojin Kim**; U. of Maryland

I investigate how and why the sources of entrepreneurial knowledge, namely prior experience that founders gained in academic, user, and employee settings, may affect market strategy of new ventures. While prior studies did not examine the heterogeneity of pre-entry knowledge in predicting strategy and performance of startups, I argue that each firm type possesses a distinct comparative knowledge advantage regarding key elements of the industry's technological system, thereby leading to firm differences in technological and value chain positioning. I assembled the quantitative and qualitative data of 173 prosthetic startups created between 1991-2017. My results indicate that academic startups were likely to choose component-level products based on nascent technology, while employee startups were likely to choose finished products based on established technology. Also, user startups were likely to choose niche, component-level products leveraging established technology. Through qualitative data, I interpret my findings to suggest that entrepreneurs' strategic choices are constrained by their initial strengths and the cost of acquiring additional resources. Together, I suggest that entrepreneurial strategy can be better understood by considering the interaction of the types of entrepreneurial knowledge and the industry's technological system.

Follow the Money: The Funding Acquisition Process of Nascent Ventures

Author: **Lukas Held**; Utrecht U.

Author: **Andrea Monika Herrmann**; Columbia U.

Author: **Friedemann Polzin**; U. Utrecht School of Economics

This paper integrates the largely separate literatures of financial bootstrapping and pecking-order theory (POT) in order to explore how funding acquisition processes evolve at the firm level. Based on novel optimal matching techniques combined with binary logistic regressions, we identify how the most typical funding acquisition processes of nascent ventures evolve in specific circumstances. In accordance with financial bootstrapping theory, the majority of nascent ventures rely on bootstrapped finance. Importantly, we are additionally able to theorize – in line with pecking order theory – under which circumstances the minority of nascent ventures transition from founder and insider equity towards market-based (debt and equity) finance. As a result we offer a novel theoretical approach to understand how funding acquisition processes evolve in nascent venture.

The Impact of Parents and Neighbors on the Capability Development of New Ventures

Author: **Vilma Chila**; Tilburg U.

Author: **Shivaram Devarakonda**; Tilburg U.

Author: **Xavier Martin**; Tilburg U.

The central role of knowledge for firms' innovation and growth has heightened interest in where new ventures source their most critical input -- knowledge. We focus on spin-out firms. Some studies propose that these firms inherit knowledge from parents, whereas others argue that startups obtain knowledge from geographic neighbors. We argue that spin-outs obtain knowledge both from parent(s) and from geographic neighbors, and that the use of this knowledge varies systematically as the venture matures. Our results show that both knowledge inheritance and geographic proximity affect the knowledge sourcing behavior of new ventures. Furthermore, geographic proximity dampens the relationship between inheritance and knowledge sourcing. Finally, these effects depend upon the age of the startup. We examine these effects in a sample of American semiconductor firms over 21 years.

Innovation in the Public Sector: The Role of Creative Self-Efficacy, Managerial Support, and Workload (WITHDRAWN)

Author: **Hugo Verver**; Tilburg U.

In this study, we examine to what extent managerial support and workload affect the relationship between creative self-efficacy and innovative behavior. We contribute to creativity and innovation literature by developing theory and providing empirical evidence on how the managerial support and workload act as moderators that facilitate or hinder innovative behavior. We examine this novel approach in the public sector, using a sample of seven Dutch municipalities. Our results indicate a positive relationship between creative self-efficacy and innovative behavior, and perceived managerial support strengthens this relationship, while we find no support for the level of workload as a boundary condition.

assets and the likelihood of entering entrepreneurship. It is well documented that blacks possess less housing wealth than whites on average in the US. Though the literature identifies racial differences in access to financial capital generally as a leading driver of black-white disparities in entrepreneurship, it is virtually silent on the extent to which black-white disparities in housing wealth, in particular, may explain racial differences in firm starts. Using Blinder-Oaxaca decomposition technique, I estimate that the differences in average levels of home equity account for approximately 13 percent of the black-white gap in firm starts among homeowners. I also estimate entrepreneurial choice models on panel data from 2003 through 2013, a time frame that includes a housing boom and subsequent bust. I exploit the variation in home-based assets during this period to examine whether there is a differential effect of these assets on firm starts by race. I find no relationship between homeownership and starting a business, however, conditional on owning a home, an increase in home equity is positively related to the probability of starting a business for whites but not for blacks. Thus, while deficits in home assets contribute to black-white gaps in entrepreneurship, blacks who do own home assets are less able to access the housing collateral channel than whites with similar levels of home assets.

Identity and Entrepreneurship 1 (session 1257)

Entrepreneurial Diversity: Contextual Variety of Entrepreneurial Identities and Experiences

Author: **Sibel Ozasir**; Nijmegen School of Management

This study explores entrepreneurial diversity through the analysis of everyday experiences of women entrepreneurs and their entrepreneurial identity construction processes in relation to context and questions the manner in which entrepreneurial experiences and identities vary across contexts. Capitalizing on life story narratives of Turkish women entrepreneurs in two country contexts – Turkey as the country of origin and the Netherlands as the country of residence, we evaluate migration as a significant contextual element along with country-specific opportunity structures and look at what differences it makes with respect to entrepreneurial identities and experiences of these Turkish women entrepreneurs. We analyze the social, political, and institutional opportunity structures and the relationship between these opportunity structures and entrepreneurial identities and experiences in Turkey and the Netherlands comparatively. We propose that Turkish women entrepreneurs in Turkey engage in processes of ‘self-defense’, whereas in the Netherlands they engage in processes of ‘self-discovery’. The women in the Netherlands challenge existing opportunity structures either by providing alternative images of a Turkish migrant woman or questioning culturalist perspectives behind these opportunity structures. In Turkey, women

Entrepreneurial Gravity: An Additional Metaphor of Tie Structure

Author: **Israel Fortin**; Indian Institute of Management, Bangalore

“Entrepreneurial gravity” locates the most attractive actors of an entrepreneurial ecosystem within the most central, cohesive, and dense areas of this ecosystem. This thought experiment based on a metaphor encompasses four meanings describing a phenomenon integrating several established tie structure dynamics and explicitly connecting them with the entrepreneurship literature. We first justify the need for an additional metaphor of tie structure in entrepreneurship research. Second, we review the literature on tie structure evolution and establish links between centralization, cohesion, attraction, and density. The integration of these four concepts leads to the definition of entrepreneurial gravity, which includes a dialectic between a self-reinforcing process and change underlying entrepreneurial gravity pole shifts.

Instrumental Self Guides: Drivers in the Formation of an Entrepreneur Identity

Author: **SHASHA LIU**; Renmin U. of China

Author: **Claudia Smith**; U. of Victoria

Author: **Brock Smith**; U. of Victoria

Identity influences entrepreneurial decision-making and persistence, among other behaviors. The formation of an entrepreneur role identity is important in reflecting entrepreneurial intent, a key precursor to entrepreneurial activity. Most entrepreneurs transition to entrepreneurship from paid employment, yet little is known about the process these individuals undertake to establish an initial entrepreneur role identity. We begin to address this gap based on conceptual evidence from literature outside of entrepreneurship, and through depth interviews with 30 founders who left paid work to start ventures and 12 employees who had not yet decided to venture. A comprehensive model of entrepreneur role identity formation in the liminal period is developed. This model establishes the importance of balance between feared and aspirational possible selves, and shows the instrumental value of self-guides to the entrepreneur-to-employee identity transition. We also identify the complex cognitions and context factors that support this transition.

Towards a Contingency Theory of How Network Structures Influence the Entrepreneurial Process (WITHDRAWN)

Author: **Peter Kalum Schou**; NHH Norwegian School of Economics

This paper proposes that different network structures influence the entrepreneurial process – the discovery and realization of opportunities by entrepreneurs- in different ways. Generally, there are two forms of network structures that produce two forms of social capital. There are network structures with structural holes that produce information as social capital for the player brokering a hole. Then there are closed network structures that produce trust as social capital for the player placed in a closed network. The paper argues that (1) placement in structural holes increases the chances of discovering opportunities, whereas network closure decreases the chances. (2) Placement in a closed network allows for easier access to resources that facilitates realization of opportunities, whereas placement in networks with structural holes decreases the ability to gain resources. This leads to (3) entrepreneurs need different types of social capital at different times during the entrepreneurial process. Thus, they should change network structures during the

Author: **Jeremy Woods**; California State U., Bakersfield

Author: **Gloria Sweida**; Southern Illinois U., Edwardsville

Author: **Denise Kenyon-Rouvinez**; International Institute for Management Development - IMD

In this qualitative study, we ask about the extent to which in-laws are perceived as family members by investigating how and why some families hire in-laws while others do not. Although an in-law is legally a family member, the decision to hire in-laws is made differently from the decision to hire born-in family members. Social identity theory offers an explanatory lens to understand how and why some families engage in-laws in their businesses. As the social identity that a family and an in-law form together is subject to change over time, reinforcing familial trust is critical to maintaining family support. This research challenges the conventional treatment of a family as a homogeneous group and nonfamily as a homogeneous group within family firms.

When Identities Collide: How Founder Identities Emerge and Change

Author: **Jody Delichte**; U. of Cape Town, Graduate School of Business

Author: **Ralph Hamann**; U. of Cape Town

Founder identity is a burgeoning field of study; however, we know little about how founder identities emerge and change. We explore this question using an extreme case of a nascent business context in Northern Kenya through a longitudinal, qualitative study of 51 pastoralists newly introduced to business. Applying identity theory and social identity theory lenses, we develop a model illustrating the process through which different founder identities emerge based on varied responses to identity conflict between extant and new identities salient to founders in their work. Founders follow one of three pathways, either maintaining emphasis on extant identities, balancing emphasis between extant and new identities or transforming to emphasize new identities. The pathway a founder follows, and therefore who they become as a founder, is regulated by other salient

process of discovering and realizing opportunities. The paper seeks to clear up existing contradictions on the role of social capital in the entrepreneurship literature and argue for a processual view on how entrepreneurs build and use different types of social capital.

The Causal Mechanisms of Social Capital in Social Entrepreneurship

Author: **Xiaoti Hu**; Southampton Business School, U. of Southampton

Author: **Angelika Zimmermann**; Loughborough U.

Author: **Susan Marlow**; U. of Birmingham, U.K

Social entrepreneurship is a multilevel phenomenon emerging from dynamic interactions between agency and structures at institutional, individual and community levels. Social entrepreneurs must bridge gaps between different individuals, organisations, industries, societal sectors through networking. However, little effort has been made to develop theories to explain how social networks/capital work and little empirical evidence has been provided. This paper aims to close this gap by developing a critical realist analysis of the role of social capital in social entrepreneurship. We draw on social capital theory and critical realism and propose that social capital is the inherent causal power embedded in social networks. As a causal power, social capital may or may not be actualised and, when actualised, it enables entrepreneurial actions to create social value. Through a multiple-case study that involves 45 semi-structured interviews, we identify three mechanisms – sparking, manifesting and scaling – through which social entrepreneurs use their social capital to obtain information, knowledge, market access, business resources, power and influence. These mechanisms enable entrepreneurial actions to create social and economic value. This paper develops our understanding of SE as a multi-level phenomenon by analysing the relations between individual networks and social capital, organisational resources and social sector market. It also extends social capital theory by exploring social capital in SE and highlighting its enabling effects on entrepreneurial actions.

and/or central identities. Our findings also show how founders engage in external identity work to change perceptions of who they are as a founder when they diverge from extant values, norms and expectations. Our contributions extend understanding of founder identity by explaining the process of founder identity emergence, and explaining variation in founder identity change, as well as by bringing external identity work to the fore in founder identity construction.

Legitimation Patterns of Social Enterprises as Hybrid Organizations

Author: **Ji Hoon Park**; Hanyang U.

Author: **Zong-Tae Bae**; Korea Advanced Institute of Science and Technology (KAIST)

On the basis of an inductive multiple case study of ten social enterprises, this study explores how social enterprises, which incorporate for-profit and not-for-profit logics as a hybrid form, gain legitimacy. The analysis suggests the existence of three types of social entrepreneurs' hybrid identities and shows how these hybrid identities systematically shape legitimation patterns of social enterprises. Furthermore, the findings suggest social enterprises' organizational types as hybrids also determine their legitimation patterns. These findings theoretically contribute to the research on hybrid organizing, legitimation of new ventures, and social entrepreneurship.

New Venture Team Learning: The Development of Learning Behaviors in the Venture Creation Process

Author: **Iselin Kristine Mauseth Steira**; Nord U. Business School

Author: **Gry Agnete Alsos**; Nord U. Business School

Author: **Marianne Terese Steinmo**; U. of Nordland

Author: **Andrew C. Corbett**; Babson College

New venture creation is a dynamic process, where learning under uncertain conditions is a critical aspect (Vogel, 2017). Hence, the entrepreneurs' ability to learn may have crucial implications for how the venture develops and its subsequent success. This is particularly the case for novice entrepreneurs, which due to their lacking experience, need to figure out also how to learn in the process. In this paper, we examine how novice new venture teams develop their learning behaviors during the process of setting up a new venture. Drawing on longitudinal case studies of five new venture teams, we identify three distinct types of learning behavior and the conditions under which these learning behaviors tend to develop. We thereby inform the literature on entrepreneurial learning, as well as the scholarly development of team learning in the entrepreneurial context.

[view paper \(if available\)](#)

Author: **Abdullah Al Faruq**; Leeds Beckett U.

This paper examines the nature of managerial tensions that may result in hybrid SEs due to co-existence of values and influences from pluralistic institutional domains. The paper also explores how such organisations mobilise resources and capabilities in order to respond to internal tensions. The study adopts a multiple case study approach, collecting data from ten Bangladeshi SEs. The study identifies a number of competing pressures originating from multiple institutional domains which have affected the way they accomplished their dual value and approval from multiple stakeholders. This interplay between SEs' dual goals and institutional influences led to seven different tension types inside the studied cases. The management of these tensions, at the strategic level, involved five different responses: i) forced adoption/coercive adoption, ii) proactive response, iii) adapt, iv) influence, and v) side-stepping. At the functional level, this involved orchestration of SEs' resources and capabilities in a particular way.

Striking a Balance: Revenue Drift, Incentives, and Effort Allocation in Social Enterprises

Author: **Theodor Lucian Vladasel**; U. Pompeu Fabra and Barcelona GSE

Author: **Simon Parker**; Ivey Business School

Author: **Randolph Sloof**; U. of Amsterdam

Author: **Mirjam Van Praag**; CBS

Social enterprises often exhibit revenue drift, i.e. an excessive focus on purpose at the expense of profits. Despite the threats this poses for organizational performance and survival, social entrepreneurs are reluctant to use performance-based pay due to the perceived incongruence of incentives with social impact and the risk of mission drift. We argue that monetary incentives can elicit a balanced effort allocation by redirecting employee effort to commercial tasks and by attracting workers who are less prone to exerting excessive social effort. We vary incentive strength in an online, real-effort experiment and find that both modest and strong incentives produce a more balanced effort allocation by redirecting worker attention to

The Curvilinear Relationship Between Team Identification and New Venture Performance

Author: **Hao Ji**; Ningbo U.

Author: **Wencang Zhou**; Montclair State U.

How entrepreneurs define their concept of selves is likely to have important impact on the process and outcome of new venture creation. However, almost all of past studies focus on entrepreneurs' individual identity, and overlook that most of new ventures are started by entrepreneurial teams rather than individual entrepreneurs. This study tends to explore the effect of team identification on new venture performance. We propose that the relationship between team identification and new venture performance may be inverted U-shaped, and environmental uncertainty may moderate this curvilinear effect. We tested these hypotheses using a sample of 54 new venture teams in Internet Technology (IT) industry. As expected, we found that team identification has a positive effect on new venture performance firstly, however, this effect turns to negative when team identification is too high. Moreover, this inverted U-shaped relationship is more salient at a low level of environmental uncertainty rather than at a high level of environmental uncertainty.

Mixing Person and Position: Social Capital Fit in Entrepreneurial Teams

Author: **Jianhua Ge**; Renmin U. of China

Author: **Di Zhu**; Renmin U. of China

Author: **Jane Lu**; City U. of Hong Kong

This paper investigates the relational dynamics within entrepreneurial teams through the lens of social capital. Both bonding and bridging social capital are vital to entrepreneurial performance, but how to integrate them is still puzzling. Prior research has mainly considered the person side, i.e., team members. In this study, to fully capture the team functioning, we propose to take both person and position into account. Specifically, we theorize on the social capital nature of team positions and draw

commercial tasks. While strong incentives lead to a small decrease in workers' social motivation, modest incentives do not affect social enterprise workforce composition. Social enterprises that combine mission and monetary rewards not only attract more workers, but also succeed in directing worker attention to both commercial and social tasks.

Author: **Malavika Nair**; Troy U.

Given differences in the motivating factors of commercial and social entrepreneurship, in what kinds of ways might firms/organizations in each structure innovation? Building off the literature related to distributed innovation, network theory, and social entrepreneurship, this paper expands upon Klein et al. (2019) in addressing triadic relationships between autonomy, sponsorship, and incentive structuring within organizations. Specifically, it establishes a multilevel theoretical framework for assessing the antecedents and consequences of structural complementarity decisions, and it suggests an additional parameter by which organizations' structural complementarities might be assessed—namely, the degree to which a firm conducts learning internally vs. externally. I argue that considering how commercial and social entrepreneurship differ in terms of performance measurement, goal complexity/ambiguity, and ex post selection across multiple levels simultaneously allows us to make better sense of the underlying phenomena. To illustrate a potential application of the framework, I look to evidence from the emerging sharing economy through the perspective of a construct developed in Nair and Miller (2019), private philanthropy through technology (PPT).

[view paper \(if available\)](#)

a distinction between bonding positions and bridging positions as the functioning of different positions (e.g., finance vs. R&D) may request different forms of social capital. We further argue that when a team's positions are occupied by those holding appropriate social capital, namely person-position fit, its functioning and performance will be elevated. Otherwise, a misfit leads to poor performance. We find evidence from an analysis of 2,914 entrepreneurial teams in China. This study contributes to our understanding of the functioning of entrepreneurial teams from the social capital perspective and highlight the importance of considering the role of functional positions in the integration of both bonding and bridging capital.

The Influence of Entrepreneurial Teams' Structural Power Inequality on Firm Performance

Designated as a "Best Paper" for ENT

Author: **Miriam Bird**; TUM School of Management, Technical U. of Munich

Author: **Mateja Andric**; U. of St. Gallen

Author: **Karin Maria Kristina Hellerstedt**; Jonkoping International Business School

In this research article, we investigate how structural power inequality within entrepreneurial teams influences firm performance. We argue that very high and very low levels of structural power inequality undermine cooperation and communication within the team and therefore inhibit the efficient deployment of entrepreneurial team members' resources. We find evidence for an inverted U-shaped relationship between structural power inequality and firm performance. Furthermore, we investigate the influence of social ties and find that the inverted U-relationship becomes stronger in the presence of co-worker ties and weaker in the presence of family ties. These results provide important contributions for research on power in organizations and entrepreneurship.

Unveiling Time in Strategic and Organizational Change (session 367)

How Tensions in Valorizing Time Influence Planned Organizational Change

Winner of ODC Division Best Paper Award

Designated as a "Best Paper" for ODC

Author: **Marina Biniari**; Aalto U.

Despite the importance of organizational members' worktime for the implementation of organizational change, studies of how organizational members' worktime is valued and reallocated during change remain rare. To illuminate this important but underexplored issue, we investigated how members responded to the time requirements of a change initiative in a multidivisional engineering company. Our analysis revealed that the ways in which members responded to the reallocation of their time – required to implement organizational change – reflected the different ways in which they (and their organization) valued the reallocated time. In particular, three types of value became salient: economic value, social-symbolic value, and personal-symbolic value. Tensions among the time requirements and these three types of values explain variation in the degree to which members felt energized and allocated their worktime to the initiative, and more or less actively resisted the process. This variation significantly influenced the evolution of planned organizational change, in particular its time-delivery goals and pace. Our theoretical insights have significant implications for understanding the valuation and use of organizational members' worktime during a planned change process.

Stickiness, Dissonance, and Strategic Renewal: A Temporal Perspective

Designated as a "Best Paper" for ODC

Author: **Gwyneth Edwards**; HEC Montreal

Author: **Rick Molz**; Concordia U.

Strategic renewal is undertaken by organizations for a variety of reasons, one of which is in response to an industry shock. Although research has investigated strategic renewal retrospectively, lack of empirical data has led to cross-sectional analysis; we know much less about how the process occurs over time. In this research, we take advantage of a unique data set that allows us to study a firm's attempt at strategic renewal over a period of 10 years. We analyze Nortel, a Canadian-based leading telecommunications manufacturer, which undertook a strategic renewal process in response to a major industry shock that occurred in 2000/2001. We employ path constitution analysis to identify the firm's strategic renewal efforts and outcomes from 2001 to 2009. Our findings indicate that, as a firm makes efforts to engage in strategic renewal and to move off path, dissonance between initial and newly introduced self-reinforcing processes reduces strategic options and, over time, erodes firm resources, preventing strategic renewal. We contribute to theory on strategic renewal and path dependence by identifying the mechanisms that can prevent a firm from altering strategic paths.

Reconceptualizing Strategic Change as Emergence: A Theoretical Model of Nested Evolutionary Processes

Designated as a "Best Paper" for ODC

Author: **Andrey Pavlov**; Cranfield School of Management

Author: **Cliff Bowman**; Cranfield U.

Strategic change is one of the central concepts in strategic management, and the evolutionary perspective has long been recognized as one of the most suitable analytical lenses for studying it. Despite this, the study of strategic change on the macro level (economic systems or populations of organizations) has been largely independent on the micro level (individual and organizational learning). This resulted in the fragmentation of the field and a theoretical discontinuity in explaining strategic change. In this paper, we integrate the mechanism of the evolutionary perspective with the explanatory apparatus of complexity theory to theorize strategic change as emergence of nested evolutionary processes. This conceptualization allows us to make a step towards theorizing strategic change holistically, from individual action to organizations and populations of organizations.

Strategic Path Dependence and Transformation: The Impacts of External Positive Feedback

Author: **Fang Su**; Management School of Jinan U.

Author: **Ji-Ye Mao**; School of Business, Renmin U. of China

Author: **Sirkka Jarvenpaa**; U. of Texas at Austin

Whereas prior research has focused on why organizations cannot break their strategic path with new strategic options after environmental changes, it remains unclear what kind of new strategic options can/cannot form a new strategic path, and why. By classifying self-reinforcing effects into external positive feedback and internal positive feedback, this comparative case study of two IT outsourcing companies reveal that dominant strategic options that generate the same external positive feedbacks as original ones may lead to strategic path dependence by bringing similar external resources and reactivating original strategic patterns that constrain deliberate actions and enable emergent actions, while dominant strategic options that generate distinct external positive feedbacks from original ones may realize strategic path transformation by bringing new external resources and shaping deliberate actions. This research contributes to the literature by offering new explanations of strategic path dependence and transformation from the perspective of external positive feedback.

The Context of HRM (session 1336)

Implicit Person Theory – Null Effects in Organizational Contexts (WITHDRAWN)

Author: Françoise Cadigan; MacEwan U.

Author: Dara Hysmith; Fielding Graduate U.

Author: Giverny De Boeck; Centre for Transformative Work Design / Curtin U.

Seminal studies on implicit person theories were undertaken by social psychologist Carol Dweck and her colleagues to explore the impact of holding entity versus incremental theories on perceptions (of the self and others), behaviors, and related outcomes. Entity theorists view and understand behavior and its effects using static traits as the dominant lens; whereas incremental theorists view specific behaviors and outcomes through the lens of their analysis and understanding of relevant and mediating psycho-social and situational factors (e.g., Dweck, Chiu, & Hong, 1995). We extend these researchers' findings to organizational scenarios in which managers judge aspects of their direct reports. Over a series of three studies, we find mostly null results, which is in surprising contrast to our predecessors' significant reports. In a first survey, we find that managers with differing implicit person theories do not show age bias when rating older versus younger employees on potential. In a second survey, we find no significant relationship between managers' implicit person theory and their espoused theories about employee potential. In a third survey, we find null effects of high versus average performance, high versus average potential, and managers' level of implicit person theories on managers' ratings and rankings about which employees are identified as talented and who should be included in organizational talent programs.

Employer Strategy and Employee Job Quality: A Real Options Perspective

Author: Ki-Jung Kim; U. of Illinois

Although employers are fundamental actors who determine employee job quality, prior research has paid little attention to how employers' strategy to create economic values affects the job quality. This study addresses this gap by incorporating real options theory, a theory broadly used in the strategy field to account for how firms under uncertainty behave to create economic values, into the literature on job quality. I propose that firms are more likely to engage in non-standard employment rather than standard one when uncertainty elevates the value of real options embedded in non-standard employment. Furthermore, I suggest that the value of real options under uncertainty is contingent upon three factors—growth opportunity, competition, and union. Analyses of four-wave nationally representative panel indicate that growth opportunities and competition surrounding the firms weaken the effect of uncertainty on non-standard employment.

High-Involvement Work Processes, Need Satisfaction and Employee Outcomes

Author: Frank Huo; U. of South Australia

Drawing on self-determination theory, the current study tests a moderated mediation model that explains how and when high-involvement work processes lead to valuable employee outcomes (i.e. work engagement and job satisfaction). Survey data collected from 210 employees in a Chinese power generation company were analyzed

via structural equation modelling. The results show that competence and autonomy need satisfaction and intrinsic motivation serve as serial mediators transmitting high-involvement work processes into positive employee outcomes. Further, distributive justice functions as a moderator that qualifies the competence-need-satisfaction-based mediation process due to its boosting effect on the relationship between high involvement work processes and competence need satisfaction. In contrast, the autonomy-need-satisfaction-based mediation pathway is unconditionally stable. These findings help us understand the motivational features of the Chinese workforce and explain the inconsistent research evidence for the effect of high- involvement work processes on employee outcomes.

What's in a Name: How Non-Traditional Job Titles Shape Organizations

Author: **Elizabeth Eley**; John Molson School of Business, Concordia U.

Job titles are means of quickly explaining who you are and what you do in a way that is understood both within and outside of organizations. However, recent popularization of non-traditional job titles questions the value of job titles as categorization tools and status markers. Developing theory to guide understanding of the role of this emerging phenomenon, I explicate how these non-traditional job titles differ from one another in affective and cognitive social identity cues. In doing so, I distinguish between four types of titles: task-oriented, mastery-oriented, culture-oriented and prototype-oriented. I propose that non-traditional job titles shape organizations by attracting more homogenous applicants and engendering more subjective evaluations of culture fit for selection. Further, I identify a polarizing effect on employees such that non-traditional job titles can aid in positive identity construction for some individuals resulting in increased job satisfaction and extra-role behaviors, while for others, they may lead to burnout and turnover. As a whole, I contend that non-traditional job titles serve as a double edged sword – boosting motivation and creativity for self-selecting and company sanctioned employees yet potentially stifling traditionally productive employees and even abetting labor market discrimination.

Employees' Perception Bias in Firm-Specificity of Human Capital

Author: **Ilhwan Na**; U. of Kansas

Author: **Clint Chadwick**; U. of Kansas

This paper extends Raffie and Coff's (2016) pioneering study of perception bias in firm-specific human capital that can be influenced by organizational tenure, organizational commitment, and on-the-job training. Drawing on the signaling theory, we investigate the role of wage as another variable that can affect the perceptions of firm-specificity with a larger sample and a model better fitted to panel data. We also examine the interaction of organizational tenure and organizational commitment. The analyses of Korean full-time employees with random effects ordered probit models support the relationship between wage and perceived firm-specific human capital and the interaction of organizational tenure and organizational commitment but not the interaction of organizational tenure and wage. The results suggest that employees' wages can function as a signal of an employer in which employees' perceptions of the characteristics of human capital investments depend on their wages. Also, committed employees are more likely to invest in firm-specific human capital as their organizational tenure increases than are less committed ones.

Sustainable HRM: Spanning Boundaries Between Corporate Environmentalism and Work Practices (session 1337)

Businesses have come a long way in accepting corporate environmentalism as part of corporate sustainability strategy necessary for competitive advantage. Currently, businesses tend to use sustainability as a separate function which is responsible for corporate environmental strategy. The human resource management (HRM) function operates in a separate domain and it seeks to engage organizations and employees to achieve corporate sustainability. In this context, the new and emerging discipline of sustainable HRM has evolved as a boundary spanner between sustainability and HRM domains. It aims to develop work systems and organizational culture that engage employers and employees in simultaneously achieving financial, human/social and environmental sustainability outcomes. This PDW consists of four parts. In the first part, we discuss the challenges associated with implementing a sustainability strategy when HRM and sustainability functions operate separately. In the second part, we present the evolution of sustainable HRM and its role in shaping organizational work practices to implement corporate environmental strategy. In the third part, we introduce an organizational sustainability culture maturity framework to align management governance, stakeholder engagement processes, and outcomes for corporate environmentalism. In the last part, participants will engage in two discussion roundtables facilitated by the panelists. The key benefits of the workshop include boundary spanning of insights and exploring research opportunities between the field of sustainable HRM and corporate environmentalism. The workshop will also facilitate the development of cross-discipline network of scholars and practitioners interested in corporate environmentalism and sustainable HRM.

Coordinating Collaborative Supply Chain Efforts: A Focus on Rohingya Refugee Camps in Bangladesh

Author: **Arash Azadegan**; Rutgers Business School
 Author: **Muhammad Hossain**; U. of Dhaka
 Author: **Mohammad Ali**; AIUB

Much has been discussed about the importance of collaborative efforts among humanitarian organizations. However, collaborative efforts can fall short without effective coordination (i.e., alignment and direction). We focus on explaining the effects of coordination in refugee camp operations, a particularly complex and multi-layered humanitarian effort. We collect and analyze interviews from eight professionals from seven international humanitarian organizations involved in managing the 34 camps operating in Southern Bangladesh, housing over one million Rohingya refugees. We find that responsibility for coordination of collaborative efforts is contingent on the scope and level of effort taking place. At the dyadic project level, collaboration is often managed by the NGO with better knowledge or resources. At the network level, collaboration among a broad set of NGOs is often facilitated by a major NGO. At the system level, (i.e., a network of networks) coordination is handled through the host government (local or national). Results confirm and extend past studies on coordination in humanitarian supply chains.

Incentivizing Textbooks for Self-Study: Experimental Evidence from the Democratic Republic of Congo

Author: **Jean-Benoit Falisse**; U. of Edinburgh
 Author: **Marieke Huysentruyt**; HEC Paris
 Author: **Anders Olofsgård**; Stockholm School of Economics-SITE

We use a randomized field experiment to study the impact of a simple “textbooks for self-study” incentive scheme targeting primary school students in South Kivu. Students in the treatment schools scored 0.320s higher in French but did no better in math. They were more likely to take the high-stakes end-of-6th-grade national exam and to aspire to a non-manual profession.. The largest positive impact was found in schools with lower-quality teaching performance and for lower-ability students. Our results demonstrate that programs designed to intensify and diversify students’ use of existing school resources can sharply improve student achievement and career aspirations.

How Motivation Affects Volunteering Intention: The Mediating Role of Volunteering Experience

Author: **Xinxin He**; U. of Electronic Science and Technology of China
 Author: **Sai Xu**; UESTC
 Author: **Jihong Wu**; U. of Electronic Science and Technology of China
 Author: **Feng Tianli**; U. of Electronic Science and Technology of China

Despite the prevalence of volunteering around the world, sustainable participation in voluntary activities is difficult to maintain. Motivation is a good predictor of intention, but little research has examined how motivation affects future volunteering intention, especially autonomous motivation and controlled motivation. Based on

corporate sustainability. Due to information asymmetries, suppliers may deliberately engage in opportunistic behaviour; yet superior performance of the entire supply chain may be better achieved through trusting relationships. While scholars have traditionally seen the two as the opposite ends of a continuum, as espoused by the paradox theory, trust and opportunism could not only occur together but may even generate a positive complementary effect. Thus, this study investigates the effects of the coexistence of trust and opportunism through applying polynomial regression analysis and the response surface approach. The study has implications for paradox theory, stressing the importance of linear as well as curvilinear relations between the elements of a paradox. Additionally, contrary to prior literature, the study finds that the effects of paradoxical management become less visible, the longer the commercial relationship with a supplier lasts. Finally, implications on theory and practices are discussed.

The Effect of Postponement on Logistics Flexibility: An Empirical Evidence of Swedish Retailers

Author: **Hamid Jafari**; Jönköping U., School of Engineering

Author: **Mohammad H. Eslami**; Jönköping International Business School

Author: **Antony Paulraj**; U. of Southern Denmark

This article investigates the impact of postponement on logistics flexibility and how logistics flexibility effects performance in a retail setting. Drawing on a representative sample of retailers in Sweden, the paper considers postponement, logistics flexibility, and firm performance in one cohesive study. In addition, the moderating roles of logistics integration and environmental uncertainty on the relationship between logistics flexibility and firm performance were investigated. The results showed that in presence of higher uncertainty, the positive relationship between logistics flexibility and firm performance is intensified. Logistics integration, however, had a different moderating effect based on the type of firm performance measure. In case of strategic performance, logistics flexibility had a positive moderating effect on the relationship

motivation theory and cognitive theory, we conducted a two-stage survey using Structural Equation Modeling to study the mediating effect of volunteering engagement and volunteering experience between motivation and future volunteering intention. The results show that different motivations would affect future volunteering intention. Autonomous motivation positively affects volunteering engagement, while controlled motivation negatively affects volunteering engagement. In addition, the higher the level of engagement, the stronger of the meaning and skill acquisition from volunteering activities. In the end, we found that the more meaningful and skill acquisition from volunteering activities, the stronger the intention of volunteering activities in the future. These findings provide new perspectives to provide an alternative method in researching volunteer intention and to strengthen the sustainability of volunteer programs.

When Compassion Organizing Creates Suffering: Compassion Organizing as a Social Dilemma

Author: **Darcy Kathryn Fudge Kamal**; Sacramento State

We extend compassion organizing research by exploring the antecedents and consequences of organizations having low compassion competence. Viewing an organization as an interpretive system, we submit that organizations low in compassion competence can misinterpret the social environment where compassion is needed. Misinterpreting the social environment comes in three ways: limited scope of consequence, misperceived interdependence, and value asymmetry. The three ways of misinterpretation can lead to an unintentional exacerbation of suffering. We argue that organizations encounter social dilemmas through their compassionate actions, which may involve self-interested behavior by either or both the giver and recipient of compassion, driven by compassion incompetence. We resolve this dilemma by arguing for organizations to consider actions that may create harm rather than help.

between logistics flexibility and firm performance. On the contrary, if financial performance was considered, this moderating effect was negative. The contribution of this study point to the possibility of investing in competencies such as postponement to achieve higher levels of logistics flexibility which, in turn, has a strong positive effect on their performance. Also, finding a fit between environmental contingencies or logistics integration and logistics flexibility focus in relation to performance is highlighted.

Transparency in the Supply Chain: Do Firms Benefit By Disclosing Supplier Monitoring Activities?

Author: **Yanji Duan**; U. of North Florida
Author: **Christian Hofer**; U. of Arkansas
Author: **John Aloysius**; U. of Arkansas Sam M. Walton College of Business

Firms pressured to increase supply chain transparency often disclose information about their supplier monitoring activities (SMA), including both first-tier and lower-tier suppliers. To evaluate the net benefit of SMA, it is critical to not only consider the potential of such activities to reduce risk and associated costs but also the effects on drivers of revenues that accrue from SMA disclosures. We examine the effect of firms' SMA disclosures on consumer evaluations and firm value through two studies: First, a behavioral study with two experiments examines the effects of SMA disclosure and monitoring depth disclosure on consumer evaluations. Second, an archival study based on a content analysis of published CSR reports investigates the effect of firms' SMA communications on firm value. The results from our multi-method research reveal that (1) SMA disclosure increases individual-level consumer evaluations and organizational-level firm value, and (2) disclosure of SMA at a greater depth—including lower-tier suppliers—provides additional benefits at both the individual and firm levels. A supplemental analysis of Twitter data reveals that SMA disclosure also has an effect on aggregate consumer sentiment. Our findings are statistically significant and economically meaningful: In the archival study,

Public-Private CEO Wage Gap in Transitional Economies: The Role of Caste in the Market for CEOs

Author: **BIBEK BHATTACHARYA**; Indian Institute of Management, Bangalore

In the context of transitional economies such as India, astronomical differences in pay between public and private sector top executives has been a subject of much public contention. Moving beyond mere market-based explanations of such wage inequalities, social scientists across disciplines have increasingly started to acknowledge the important role of sociological forces such as institutions and social norms in shaping such market based-forces. In this article we suggest that the institution of caste—a hitherto under explored sociological force—significantly influences the executive labor market and consequently the public-private CEO wage gap. Further, we posit that the state's governance orientation (pro-market vs. pro-society) is an important contingency in this relationship.

Strategizing for Grand Challenges: Inter-Organizational and Cross- Sector Dynamics (session 376)

Making Sense of Grand Challenges Through the Design of Communicative Spaces

Author: **Madalina Stoicovici Pop**; Aarhus BSS, Aarhus U.

Author: **David Nils Seidl**; U. of Zurich

When making sense of issues, actors face the puzzle of how to balance the requisite variety demanded by problem with the equivocality that can arise due to the variety of perspectives required. This is especially problematic in the case of grand challenges due to their abundance and high interrelatedness of cues demand high levels of requisite variety leading to high equivocality. This research asks how actors use boundary work to complexify and simplify the space for making sense of grand challenges. We engage in a comparative case study of two municipalities engaged in smart city projects looking at the inter-organizational meetings and workshops that they set up to make sense of complex problems. We find that actors use different types of boundary work to simplify, complexify but also simplexify the space. We also identify different temporal patterns of boundary work that have distinct implications for the sensemaking outcomes. These findings have implications for the literatures on sensemaking, space and grand challenges.

Confronting Grand Challenges in Bureaucratic Systems: The Path Towards Open Organizing

Designated as a "Best Paper" for SAP

Author: **Gary Thomas Burke**; Aston U.

Author: **Carola Wolf**; U. of Liverpool

This study explores how practitioners in complex bureaucratic organizations attempt to escape the "iron cage" of bureaucracy and utilise open organizing to tackle complex grand challenges. Based on an in-depth longitudinal study of how a local Sustainability and Transformation Partnership (STP) implements the regulatory push towards open organizing in the UK national health care sector, we offer a longitudinal analysis of the dynamic transitioning process towards more open and collaborative organizing across organizational and professional boundaries. In contrast to the anti-bureaucratic sentiment dominant in many scholarly discussions around open organizing, our analysis suggests that bureaucracy plays a pivotal and multifaceted role in this process as bureaucratic rationality and procedures condition the adoption of openness. Furthermore, we find that bureaucracy plays an important enabling role in precipitating openness and extricating practitioners when they become trapped in webs of complexity, collective inertia and indecision.

Exploring Enablers of Open Strategy-Making in Cross-Sector Settings

Author: **Henrike Schmidt**; U. of Hamburg

Author: **Eva Maria Oppel**; U. of Hamburg

Author: **Carl Rudolf Blankart**; U. of Bern

Because meta-problems ignore man-made sectoral boundaries, solving them requires organizations to open up their strategy-making processes in order to gain access to diverse outside knowledge. Doing so, however, entails important challenges, especially in cross-sector settings that include professionals involved in divergent processes for organizing and implementing strategy-making in the public, private, and non-profit sectors. Despite evidence on the expected benefits of open strategy-making, our understanding of its enablers remains under-developed. Our paper advances this understanding by exploring enablers of open strategy-making in a setting characterized by a meta-problem: We conduct an in-depth case study of a cross-sector healthcare partnership with the aim to improve healthcare for a socially deprived population. Our findings indicate that ensuring formalization, organizing diversity, and managing resources are key dimensions for open strategy-making in a cross-sector partnership. Our paper provides a framework of enablers with more detailed insights and illustrates key dynamics between enablers. Overall, our study informs strategy and policy makers about requirements for inclusive and transparent strategy-making across market sectors.

Strategizing Through Discourse: An Analysis of Energy Industry Associations' Public Discourses

Author: **Katelynn M. Sell**; Texas A&M U.

Author: **Thomas Greckhamer**; Louisiana State U.

Industry associations represent the interests of member firms operating within an industry. Given their influence in both their industries and external environments, they are important actors for strategy research. Prior research has largely focused on the relationships between industry associations and their members as well as the benefits and dynamics that arise from this link. In this study, we investigate how industry associations represent their respective industries' interests as cultural actors through production of meaning with the aim of influencing the social and institutional environments of their industries. Based on a discourse analysis of the bodies of texts produced and disseminated by energy industry associations for consumption by relevant stakeholders and the public at large, our findings reveal how the studied industry associations' discourses establish specific problems at the industry, national, and sometimes global level while concurrently providing solutions to these problems. These findings contribute to our understanding of industry associations' roles and activities as cultural actors. We conclude the paper with a discussion of our study's implications.

'B' the Change You Want to See: Commensuration Work when Strategizing for a Grand Challenge

Author: **Fannie Couture**; U. of Sydney Business School

Author: **Jane Kirsten Le**; WHU - Otto Beisheim School of Management

This study is motivated by a theoretically interesting observation made while in the field: In the process of strategizing for a grand challenge, members of a cross-sector collaboration produced a report card in which ratings are used to assess the 'water health' of a critical river basin in the Australian iconic Great Barrier Reef region. Observations show that the report card was continuously adjusted by groups of actors pushing towards one of the Partnership's three strategic objectives, namely, to generate tangible impact, to demonstrate legitimacy, or to foster members engagement. Although this 'commensuration work' appears to coalesce into an objectified depiction of river health, a close examination brings to light how these attempts ultimately infused the artefact with a multivocal quality. Beneficial at first, multivocality eventually lead the artefact to become 'over-stretched' thus creating ambiguity around its role in attaining the Partnership's strategic goals. This study contributes to the strategizing for grand challenges literature by problematizing further the role

commensuration plays in facilitating multivocality while exacerbating strategic ambiguity. It also offers a contribution to the literature on commensuration by empirically documenting the micro-practices used by actors to commensurate a grand challenge.

How to Access the Spiritual Reading of What Leaders Do? Deciphering Through Singularity (session 372)

Raison d'être of the workshop. The question of identity has long questioned the field of strategy, and if we know that work on identity is fundamental to ensuring an alignment of the actions of the members of the organization, we know less how to access this black box of identity. The workshop proposes to explore a method implemented by a consultant (Gautier, Voynnet-Fourboul, 2019) in order to provide the means to decrypt what remains stable whatever the circumstances, both in the organization and for the individual (Gagliardi, 1986; Gioia et al., 2000). The participant at the end of this workshop will have been introduced to a method that he will have experienced about himself. For a teacher, it can be interesting to have their students work on the issue of identity both with regard to organizations and also with regard to individual identity. This workshop proposes to make available to research professors the practice of a consultant in order to discover methods clarifying the problem of identity on these two levels. As a researcher, it can be interesting to situate the place of identity in relation to spirituality. The workshop also offers a concrete approach to theoretical knowledge in the spirituality-identity relationship (Sheep & Foreman, 2012) and from the point of view of spiritual leadership (Fry, 2003).

That is So Me/Us (or Not): Exploring the Intersection of Values and Identity (session 374)

Despite a commonly recognized link between values and identity, exactly how values and identity are connected remains rather ambiguous. Also, values are often discussed in the abstract. In contrast, a leading values model (Schwartz, 1992; Schwartz et al., 2012) suggests that values entail specific motivational goals that vary in compatibility with each other and would be expected to guide interpretations, judgments, and behaviors in unique ways, including relative to other values. Specific values, therefore, likely have unique implications for identity and derivative concepts (e.g., identity threat, identification, identity elasticity, identity change). By tapping into the insights of leading scholars on values and identity, this symposium aims to begin the process of clarifying the relationship between values and identity and exploring the likely far-reaching implications of that relationship.

Entrepreneurial Pivoting: New Perspectives and Paths Forward (session 375)

Finalist for the OMT Division Best Symposium Award

This symposium explores the emerging phenomenon of entrepreneurial pivoting. Whereas pivoting is widespread among entrepreneurs and the business press, scholars are only starting to devote attention to it, leading to limited understanding about this important phenomenon. This symposium intends to shed light on pivoting to enable rigorous theorizing of this fundamental process. To this end, the Symposium brings together

leading scholars who will reflect on pivoting from different perspectives (identity, strategic change, framing, strategic reorientation, and dynamic adaptation) and explore its implications for key organizational domains (technology ventures, cleantech and energy firms, social enterprise). The Symposium intends to spur research on this important phenomenon by offering multiple perspectives on it and identifying research opportunities. Containing an introduction to pivoting, insights from panelists, discussant comments, and a Q&A, this Symposium intends to provide participants with an understanding of the phenomenon, key theoretical approaches to it, and fruitful perspectives for future research.

Business as Unusual: Preserving Radical Ecological Criticism While Scaling Up Biodynamic Production

Author: **Claire-Isabelle Roquebert**; U. of Lausanne, HEC Lausanne

Author: **Jean-Pascal Gond**; Cass Business School, City U. London

Although prior research suggests that ambitious corporate efforts at addressing ecological concerns are likely to become business as usual, little is known about how radical approaches to ecology can be mobilized within organizations. Using the economies of worth framework, we analyse the coexistence of reformative and radical critiques from the 'green world' and how they relate to other approaches to the common good within organizations, with the aim to explore how 'ecological radicality' can be embedded and maintained within organizations. The unique case of a biodynamic small farming business confronted with the pressures to increase its scale of production enabled the identification of two mechanisms explaining the maintenance of ecological radicality: 'inspiring ecological embeddedness' and 'eco-systemically networking stakeholders'. Our results advance organizational studies by theorizing how the normative foundations of ecological radicality can be maintained through these two social mechanisms, by showing how nature's materiality is directly involved in the management of tensions related to ecological concerns, and by documenting 'green connexionism' as an organizational response to ecological challenges.

Arrested Development: Organizational and Entrepreneurial Sensemaking in a Maker Space

Designated as a "Best Paper" for ENT

Author: **Brian James Bergman**; Indiana U. - Kelley School of Business

Author: **Jeffery S. McMullen**; Indiana U., Bloomington

Entrepreneurial sensemaking – the process by which entrepreneurs determine and refine both the nature of their offering and the model through which they will distribute that offering – is difficult. To facilitate the process, entrepreneurial support organizations (ESOs), like incubators and accelerators, have emerged all over the world. Yet, entrepreneurial success stories emanating from ESOs have been conspicuously few. In a two-year-long inductive, grounded theory study of a maker space – the latest iteration of ESO, focused on shared access to tools, collaboration, and the development of technical capabilities, we identify three orientations entrepreneurs use to relate to maker spaces. Two of these are reinforced by the maker space, while the third is not. Concerning the latter, the unexpected mismatch between individuals enacting this orientation and those reinforced by the maker space encumbers entrepreneurial sensemaking, eliciting doubt within them as to whether they can succeed as entrepreneurs and/or whether their ventures can succeed in the market. This leads to a cycle of self-defeat and withdrawal. However, the two orientations that are reinforced by the maker space are no guarantee of success either. In these cases, ventures become dependent on the maker space through the cost advantages its resources provide, creating a cycle of entrenchment that makes it difficult – if not impossible – for the business to ever leave the maker space. Ultimately, our study contributes to theory development on both entrepreneurial action and sensemaking, while informing the phenomenon-based literature on maker spaces and offering a process-based explanation for the few entrepreneurial success

Management, U. of Ottawa

While there is a great sense of urgency in the scientific community to act now in order to slow the imminent negative effects of global warming, most organizations continue to run their operations as though the external context has not changed significantly. For one industry in particular, the banking industry, radical changes have been especially slow to materialize as most institutions continue to fund unsustainable business practices. Despite this slow progress, variance in climate change (CC) responses do exist. This paper takes an exploratory comparative case study with field research at four banks, investigating the mechanisms that have led to, or prevented these organizations from integrating CC in the banks' corporate strategies. We find that the CC response repertoire in the banking industry is dependent on a number of factors including: the initial interpretation of the CC issue, the language that is subsequently used to advocate (or not) for CC and the communication/attentional governance structures that are being invoked (or not) to spread attention to CC within the bank and to external constituents. This study therefore contributes to the research on corporate CC (in)action by developing a multi-stage process model of corporate climate change integration in a low salience industry.

Proactive Environmental Strategy, Corporate Venturing, and Firm Performance (WITHDRAWN)

Author: **Jinxin Liu**; Xi'an Jiaotong U.

Author: **Chengli Shu**; Xi'an Jiaotong U.

This study investigates how corporate venturing activities, including domestic venturing and international venturing, moderate the links between two types of proactive environmental strategies (PESs)—green management and green political influence—and firm performance. The results obtained by analyzing a multi-informant dataset reveal that green management has a stronger positive impact on firm performance than green political influence does. Moreover, the impact of green management on firm performance is enhanced by international venturing, whereas the insignificant direct effect of green political influence

stories coming out of ESOs.

Learning in Collectives: How Maker Spaces Encourage Entrepreneurship and Innovation

Designated as a "Best Paper" for ENT

Author: **Russell E. Browder**; U. of Oklahoma Price College of Business

Maker spaces have emerged as resource-rich learning environments for innovators attempting to design, prototype and produce new artifacts with commercial potential. This study examines the conditions under which participation in maker space organizations increases the entrepreneurial and innovative activities of individuals and firms. Through a longitudinal multiple case study design, this theory- building research explores empirical examples of these conditions at work in physical maker spaces. The results identify sources of variance for participants in collective learning environments according to the locus of entrepreneurial action as well as activities and outcomes related entrepreneurship and innovation. Implications for the learning and innovation literatures are discussed.

Don't Go it Alone: Firm Survival, Funding, & the Influence of Entrepreneurial Support Organizations

Author: **Paige Clayton**; Georgia Institute of Technology

This paper finds a positive association between participation with entrepreneurial support organizations (ESO) and start-ups' receipt of funding and survival. Findings suggest start-ups most benefited by participation are those that do not have redundant university support, have female co-founders, and already occupy network brokerage positions. The paper matches on pre-startup observables to create a control group with the universe of start-ups from the Research Triangle's life science industry, which holds constant regional

on firm performance becomes positive when domestic venturing is extensive but turns negative when a firm engages in international venturing activities. This study enriches the corporate venturing and PES literatures by offering a more nuanced framework for explaining when distinct types of PESs and corporate venturing activities when combined enhance or hinder firm performance.

Mobilization Models for Electric Power Grid Decarbonization

Author: **David Foord**; U. of New Brunswick

This article examines World War II mobilization programs for use in formulating policy for the acceleration of electric system decarbonization. Previous work has considered the appropriateness of the wartime analogy, as well as select cases, such as British civilian rationing programs. What has not yet been studied are specific mobilization programs to increase wartime innovation and scale-up of production. To assess the appropriateness of the analogy and implications for policy I examine US World War II programs for industrial production of synthetic rubber and carbon black. While wartime mobilization does not provide a ready-made model for the present, there are elements of the mobilization analogy that should be considered in the design new policies for climate change adaptation and mitigation. These include the use of government programs to purchase new industrial products and services for decarbonization of electric power grids.

The Intimacy with Founding Members and the Effect on Entrepreneurs' Construal Level

Author: **Zhi Yang**; School of Management, Huazhong U. of Science and Technology

Author: **Jinglan Yang**; School of Management, Huazhong U. of Science and Technology

Author: **Jun Zhan**; California State U., Northridge

How will internal relationship within founding teams affect entrepreneurs' cognition? Taking construal level theory, this study shows a fresh aspect of entrepreneurs' intimacy with founding members and the effects on cognition of ongoing venturing projects. We argue that stronger intimacy with other founding members will shorten the perceived psychological distances between the entrepreneur and the ongoing project, thus lower down the entrepreneur's construal level. Using survey data from 162 Chinese founding teams, we found that the stronger the intimacy with other founding members, the lower the construal level is, and this relationship is weaker when team size is large and the customer feedback acquisition is high. The findings may advance the understanding on why and how founding with friends will affect the venturing business strategy and behavior from the construal level theory perspective, and call for attention that need to be paid on internal relationship in founding teams research. This study also provides important implications for the entrepreneurs in selecting venturing partners and getting along with them.

OBHDP & Big Data - Single Paper (session 373)**A Longitudinal Look at OBHDP Using Big Data Analytics: Domain Representation Integration & Influence**

Designated as a "Best Paper" for OB

Author: **Kurt Norder**; U. of Delaware

Author: **Dustin J. Sleesman**; U. of Delaware

Author: **John E. Sawyer**; U. of Delaware

Author: **Aman Sawhney**; U. of Delaware

As a leading academic journal for the scientific study of work behavior, Organizational Behavior and Human Decision Processes (OBHDP) has published cutting edge work across multiple domains in the field. Yet there has been persistent perceptions of separate camps in need of greater integration. Through this lens, we use big data analytics to map the ontology of the field of organizational behavior (OB) and judgment and decision making (JDM) to assess the relative representation and integration of domains across its 53 year life within the journal. We also examine the evolution of relative impact from each domain as well as the impact from integration of multiple domains within articles. The results show that early balance between the domains is re-emerging, particularly as JDM matures. Subsequently, integration of multiple domains rather than single domain specificity tends to yield higher two-year impact factors with the exception that shifting the perspective for a single domain can still provide tremendous impact.

Professions in Health Care: Equity, Hierarchy, and Changing Expectations (session 1360)

Professional Re-Stratification and the (Defensive) Adaptation of Status Hierarchy

Author: Ian Kirkpatrick; U. of York Management School

Author: Alessandro Zardini; U. of Verona

Author: Gianluca Veronesi; U. of Bristol

Over thirty years since Eliot Freidson's seminal account of re-stratification and the emergence of administrative elites in professions, we still know little about how far this process has been associated with changes in the criteria for determining seniority and authority. Have new criteria emphasising proven management competency for advancement in professional management hierarchies displaced those of professional status, and if so, under what conditions? In this paper, we investigate this matter focusing on senior medical management roles in English public hospitals. Drawing on a mix of administrative data sources and applying fsQCA, we highlight both change and continuity in the prevailing status hierarchy of medicine. Our findings reveal the continued influence of externally derived professional status criteria for access to the highest-ranking professional manager roles. Additionally, the configurational approach shows how, in situations where hospitals have achieved greater formal autonomy (corporatisation), different criteria emphasising management competency have also been influential.

Economic Inequality: Implications for Society and Organizations (session 1377)

In this symposium, we present some of the latest research findings in regard to economic inequality and the ways in which it is shaping beliefs and behaviors, both at the societal and the organizational levels. These findings are timely and relevant, as the consequences of economic inequality are heightened by current trends, and the effects for society and organizations are of great consequence, as demonstrated by the work presented in this symposium. In the first presentation, Ongis and Davidai discuss the antecedents of a destructive thinking pattern known as zero-sum thinking, i.e., the belief that in order for one group to win another one has to lose. More specifically, they explore the belief that wealth is zero-sum, such that one's economic gains must also come at the expense of another's loss. Their work reveals a surprising factor that leads to zero-sum thinking: the experience of personal relative deprivation. In the second presentation, Waldfogel, Kteily, Sheehy-Skeffington, Ho, and Hauser explore the ways in which social dominance orientation (SDO), an inequality-relevant ideology, predicts the extent to which people notice the presence of economic inequality. Their work shows that social egalitarians pay more attention to inequality relative to anti-egalitarians, noticing it to a greater extent. In the third presentation, Kakkar et al. contend that the relationship between social class and unethical behavior depends on the immediate economic environment an individual resides in. While for high SES individual's the propensity to behave unethically reduces with the worsening of their economic environment, for low SES individuals the tendency to behave unethically increases as the economic environment worsens. Their work shows that this is driven by comparing similar others as points of reference to gauge one's own social standing. In the fourth and final presentation, Goya-Tocchetto, Kay, and Payne discuss the effects of economic inequality on perceptions of the fairness of organizational processes and outcomes. They show that, when it comes to economic inequality, it is impossible to

of the profession are adapting and responding to changing organisational, societal and political pressures. To date, studies examining doctors in leadership roles have sought to understand the influence and adaptation of identity as doctors' transition into and enact leadership roles and how they integrate, claim and use management and leadership logics. There is little research examining how medical professionals who hold the most senior positions in organisations may craft their jobs in response to their own and colleagues' expectations. This study sought to understand how medical directors interpret, experience and craft their jobs, specifically in response to their own and senior leader expectations. Findings from 21 interviews with medical directors, chief executives and chairs in the NHS in one UK country found three different categories of medical director job crafting- active, pragmatic and limited. These categories describe medical directors' approach to and engagement in the role, particularly in relation to job crafting. Interviews with senior executive and non-executive colleagues suggest their perceptions and expectations impact on medical directors' experience and enactment of the role (and possibility their desire and ability to job craft). This research contributes to our understanding of how medical professionals engage with and enact senior leadership roles and the contribution of executive and non- executive colleagues in providing both opportunity and support. The main contribution of this research is to the literature on hybrid professionals and job crafting.

Physician Dominance in the 21st Century: Examining the Rise of Non-Physician Autonomy

Author: **Scott Feyereisen**; Florida Atlantic U.

Author: **Neeraj Puro**; Florida Atlantic U.

Author: **William McConnell**; -

Author: **Clayton Thomas**; Indiana U.

Theories of the medical profession are a key contribution of medical sociology to the study of healthcare, but these theories must be revisited in light of ongoing changes in medicine. In particular, as non-physician specialists like nurse practitioners grow in number and acquire more autonomy, the

disentangle the fairness evaluation of processes versus outcomes. More specifically, their work reveals that inequality aversion exists not only when unequal outcomes are the result of unfair processes, but also when people realize that unequal outcomes are inter-temporally undermining the landscape of opportunities for income generation.

RESEARCH

SYMPOSIUM

ASYNCHRONOUS

increasing differentiation of the medical profession complicates traditional theories of physician dominance. After examining theories of the profession to evaluate their explanations for occupational differentiation, we conduct a state-level quantitative analysis of nursing policies in the U.S. The rise in non-physician autonomy has been inconsistent across places and specialties; we use this variation to identify conditions associated with weak or strong physician dominance. We construct our dependent variable, nursing autonomy, using state-level advanced practice nursing policies adopted from 2001-2017 in all U.S. states. Using an ordered scale, we code nurse practitioner, nurse anesthetist, nurse midwife and clinical nurse specialist practice and/or prescription policies according to each policy's level of autonomy. We then use panel ordered logistic regression to examine theory-driven predictors of nursing autonomy. Our results show that there are defined yet differential patterns of policy adoption, indicating that the erosion of physician dominance is not uniform. Whereas physicians maintained dominance in relatively prestigious, education-gated specialties (e.g., anesthesiology), dominance declined in other areas subject to stronger market demands (e.g., primary care). Examining ongoing professional differentiation in medicine illustrates how professional dominance depends on shifting social and professional contexts.

The Mixed Role of Career Adaptability in Turnover Intention: A Multi-Path Moderated Mediation Model

Author: **Yanjun Guan**; Durham U.

Author: **Ying Xu**; Renmin U. of China

Author: **Fuxi Wang**; U. of International Business and Economics

Author: **Xinyi Zhou**; Durham U.

Author: **Alexander Haase**; U. of Kassel

To manage adversity in the best possible way, firms seek to become resilient. To achieve these needed high resilience levels, the research into organizational resilience has agreed on the necessity for firms to be able to both plan and improvise if they are to become truly resilient. Yet, despite recommendations on how to best become resilient, organizations tend to focus on one or the other, instead of focusing on both simultaneously, thereby lowering their behavioral response repertoire and their resilience potential. Guided by this gap between scientific advice and de facto organizational behaviors, we conceptually investigate why the decision-makers in firms unconsciously reduce their firms' resilience by focusing on either planning or improvising. Our work is guided by the assumption that decision-makers view planning and improvising as competing demands because of their biased cognition. We consult the literature on competing demands in order to examine what kinds of competing demands, if any, planning and improvising may represent. We conclude that these two key components of resilience constitute a duality. Dualities, when not recognized as such, can decrease rather than increase an organization's resilience owing to wrong conclusions drawn by organizational actors on how to deal with crises. Thus, the greatest challenge for those responsible for a firm's resilience is that decision-makers recognize that the relationship between planning and improvising is not contradictory at all – it just seems to be.

This paper examines why some top CEOs not only invest significant time and resources in a "serious leisure" non-work interest but also freely

Author: **Zhuolin She**; Tsinghua SEM

Author: **Zhimei Wang**; Central U. of Finance and Economics, Beijing, China

Author: **Yanzhao Bi**; Nanjing U. of Aeronautics and Astronautics

Extant empirical research tends to focus on the negative effect of career adaptability on turnover intention, which is often explained by career construction and social exchange theories. This study aims to enrich and challenge existing understanding of this important relationship based on job embeddedness and boundaryless careers perspectives. A multi-path mediation model (career satisfaction, affective commitment, job embeddedness, internal employability and external employability as mediators) integrating the above perspectives was tested using a sample of 202 Chinese employees in a three-wave survey study. The results show that when these mediators are put together, affective commitment serves as a significant mediator for the negative indirect effect from career adaptability to turnover intention, yielding support for the social exchange perspective. Importantly, this study reveals a novel positive indirect effect from career adaptability to turnover intention through the mediation of external employability, which is more salient when employees perceive more external opportunities. In addition, the mediation role of job embeddedness is only significant when employees perceive few external opportunities. These findings reveal a more comprehensive and dynamic view for the mixed role of career adaptability in employee turnover intention, which carries important implications for career adaptability and career mobility research.

Career Empowerment: Developing and Validating a Scale for a New Construct

Author: **Mirit K. Grabarski**; U. of Western Ontario

Author: **Duckjung Shin**; Chung-Ang U.

We developed a construct of career empowerment that represents individual perceptions of control over one's career. Careers are increasingly understood to be agentic, but the explicit conceptualization of the issue of control and agency is still limited. As such, we conducted scale

communicate about it. We investigate this phenomenon in a two-stage study: first by analyzing media mentions of serious leisure for CEOs of S&P 500 companies, the largest listed US corporations, and second by interviewing 15 CEOs of S&P 500 or comparable companies who have a passionate nonwork interest. We first discover that CEOs assign their serious leisure identity an important role in shaping who they are as leaders and how they are perceived, and we further unpack how this shaping process occurs. Our findings challenge the traditional view of leaders' work and nonwork lives as separate worlds as well as the common perception that CEOs portray themselves as exclusively dedicated to their leader role. We open for discovery a little-explored area at the intersection of the leader identity work and the nonwork-to-work enrichment literatures, specifically the role of a serious leisure identity in leaders' identity work. Our findings suggest that nurturing a serious leisure interest may prove a valuable asset for leaders' lifelong development. Keywords: leader authenticity; serious leisure; leader identity work; CEO.

Accepting, Justifying, and Resisting Identity Separation: Disidentification Processes During Layoffs

Tuesday Coolness: Creative Presentations on Innovative Topics

Author: **Riitta Ronnqvist**; Aalto U.

Author: **Timo Olavi Vuori**; Aalto U.

Author: **Niina Nurmi**; Aalto U. School of Business

While organizational identity change has for long generated interest among researchers, the process of individual-level organizational disidentification remains largely an unexamined topic. Through a longitudinal interview study, we examine how Nokia layoff victims disidentified themselves from the organization during an assisted layoff process. We conducted an in-depth longitudinal study. Analysis Based on interviews of 20 assisted layoff victims (and additional 100 single interviews to be incorporated reveals), we identify four distinct paths of disidentification paths (accepting, justifying, ambivalent, and resisting) and that explain how

development and validation of a measure to capture the construct. The results of the factor analyses reflected the multidimensional nature of the construct, which consists of seven factors: self-determination, competence, impact, meaning, focus, growth, and relationships. We also demonstrated the convergent and discriminant validity of the measure, linking it to concepts such as career adaptability, job satisfaction, and turnover intentions. Practical and theoretical implications of these findings were discussed.

Development and Validation of the Career Resources Questionnaire – Adolescent Version (WITHDRAWN)

Author: **Julian Marciniak**; U. of Bern

Author: **Claire Johnston**; U. of Bern

Author: **Madeleine Haenggli**; U. of Bern

Adolescents need to develop career preparedness to successfully transition from school to work. Many factors represent career preparedness, which are difficult to measure comprehensively and economically. To address this, we adapted and validated the career resources questionnaire for in-school adolescents to measure 12 distinct aspects of career preparedness. In Study 1, we demonstrate the reliability, factor structure, content validity, and convergent validity of the new measure among 186 adolescents. In Study 2, we applied a person-centered approach with latent profile analysis among 820 adolescents to determine whether subgroups with distinct career preparedness profiles exist. We identified three distinct career preparedness profiles (high, medium, and low). Further, a proactive personality, conscientiousness, and self-esteem predicted membership in the career preparedness profiles four months later. Both studies indicate that the assessment can be used by researchers and practitioners to reliably and economically assess several key indicators of career preparedness.

Debiasing Decision Making Through Observational Learning

Finalist for MOC Division Best Submission with Practical Implications for Organizations

Author: **Haewon Yoon**; Indiana U. - Kelley School of Business

Author: **Irene Scopelliti**; Cass Business School, City U. London

Author: **Carey Morewedge**; Boston U.

We find that observational learning, indirectly acquiring attitudes, norms, and skills by observing others, can be an effective debiasing intervention. Participants in a three-hour laboratory experiment (Experiment 1; $N = 277$) who received an observational learning-based training intervention exhibited a large reduction (overall $d = 1.86$) from pretest to posttest in their propensity to exhibit three cognitive biases--anchoring, overgeneralization of the representativeness heuristic, and social projection--more than did controls and participants who received an information-based intervention. Participants in an online experiment (Experiment 2; $N = 494$) who received an observational learning-based training intervention exhibited greater improvements in judgment and advice taking ($d = .24$) than did controls, and no less than did participants who received an information-based intervention. The combination of both observational learning and information-based debiasing interventions had a larger debiasing effect than either intervention alone, suggesting that observational learning can have unique debiasing effects.

Implications of Individual Boundary Spanning Behaviors for Team Performance: A Bottom-Up Model

Tuesday Coolness: Creative Presentations on Innovative Topics

Author: **Chu-Ding Ling**; Remin U. of China

Author: **Wu Liu**; Hong Kong Polytechnic U.

Author: **Xiaoyun Xie**; Zhejiang U.

Organizational teams increasingly engage in boundary spanning activities. Although substantial evidence links boundary spanning behaviors and team performance, we know little about how and when the information and knowledge acquired by an individual team member's boundary spanning

behaviors is disseminated within teams and further integrated into team performance. To address this issue, we draw on the framework of team receptivity to personnel movement and develop a bottom-up model. Using two-wave survey data from a sample of 60 teams in a financial company, we proposed and found that an individual Member A's boundary spanning behavior was positively related to another Member B's team work reflexivity; and this positive relationship was stronger when Member B's perception of Member A's pro-team motivation was higher. Furthermore, we argued and revealed that the mutually stimulated team work reflexivity among team members (i.e., higher density of team work reflexivity among team members) contributed to a better team performance. The theoretical and practical implications of this study are discussed in this paper.

When Embedded Professionals Must Restore Fidelity to their Organization or Profession

Tuesday Coolness: Creative Presentations on Innovative Topics

Author: **Jeffrey Bednar**; Brigham Young U.

Author: **Gabby Cunningham**; U. of Oxford

Author: **Kurt Sandholtz**; Brigham Young U.

Most professionals are hired to use their professional expertise to serve an organization's objectives. Because of their simultaneous membership in a profession and an organization, organizationally embedded professionals may be asked to perform tasks that benefit the organization but threaten their professional sense of self. This study examines how organizationally embedded professionals reconcile the torsion that can arise between these two valued bases of identity. Across three Fortune 200 organizations, we interviewed 100 engineers (and 26 support staff) in four engineering workgroups faced with organizational work demands that were viewed as incompatible with their professional mandate. Different workgroup responses— compliance, resistance, or selective compliance—prompted identity torsion between the engineers' professional and organizational bases of membership that were resolved through unique reconciliation strategies. These reconciliation

strategies at the individual level support the workgroup's response to organizational directives, while allowing individuals to restore fidelity to their profession and/or organization.

Perceived Effort Outshines Natural Talent When Sharing Expertise

Tuesday Coolness: Creative Presentations on Innovative Topics

Designated as a "Best Paper" for MOC

Author: **Nuria Tolsa Caballero**; U. College London

Author: **Chia-Jung Tsay**; U. College London

In services where expertise is shared (e.g., teaching, training, mentoring), instructors whose mastery in the domain is believed to be primarily the product of effort ("strivers") are perceived as more effective than instructors whose mastery is believed to be the product of natural talent ("naturals"). Our implicit beliefs about effort and natural talent appear to lead learners to perceive strivers as more effective, clear, and motivating instructors. Using a multi-method approach that included both archival data from the largest publicly available dataset of student evaluations, and experimental studies, we find consistent results in both traditional teaching environments and organizational settings. Quantitative and qualitative analyses suggest that the higher overall ratings of strivers may be mediated by beliefs about their superior clarity and ability to motivate learners, ruling out self-identification, a halo effect and perceptions of warmth and competence as alternative mechanisms.

Divergent Perspectives and Fluid Responses: Multiplexed Framing in Incumbent Responses to Disruption

Tuesday Coolness: Creative Presentations on Innovative Topics

Designated as a "Best Paper" for MOC

Author: **Jack Lewis Fraser**; Cambridge Judge Business School

Research applying a socio-cognitive lens to disruptive innovation has often focused on overall incumbent response. This relies on the notion of binary frames and specialised framing distributions within an organisation where members of a particular unit hold similar frames. Such a conceptualisation fails to account for intra-firm and intra-unit heterogeneity in the framing of a disruptive innovation. To explore the framing processes involved, we conducted an in-depth case study of the response of Insurecorp plc – a UK based General Insurance provider – to the rise of online aggregator platforms between 2002 and 2007. We map different frames across three separate framing dimensions: Challenge Type, Response Urgency and Firm Heritage, to develop a multiplexed model of framing. Although framing has often been seen to be homogenous across an organisation, we suggest that frames are multiplexed and holographically distributed such that conflicting frames can be held by members of the same organisational department or group. While previous research has suggested that multiple, divergent frames may result in conflict and organizational inertia, we demonstrate that it allows for more agile and fluid responses through the pursuit of equifinality. That is, managers can leverage the ambiguity generated by multiple, non-binary frames to select the same response strategies for different reasons. We propose that multiplexed frames can enable an organisation to trial and adaptively switch back and forth between different strategic responses to disruptive innovation as circumstances change.

Time Judgment During a Crisis

Tuesday Coolness: Creative Presentations on Innovative Topics

Author: **Cana Karaduman**; Tilburg U.

Author: **Leon Oerlemans**; Tilburg U.

Forming accurate judgments is vital for management in general, and crisis management in particular. Despite its fundamental role in an organizational context, time judgments were not yet studied in a crisis context. Building on attentional-gate theory, we hypothesized that when decision-

makers are under high information load, they can suffer from less accurate retrospective (i.e. recalled) time judgments. Furthermore, we expected this effect to be enhanced if stress and ego network diversity were also at higher levels. We tested our hypotheses in a within-subject experimental design (information load: low vs. high) where participants (N= 34) role- played a disaster-response management team. We found that participants had less accurate and underestimating time judgments when information load was high, and this effect was more evident when stress levels were higher. Contrary to our expectations, the effect of information load on time judgments was not observed when ego network diversity was high, whereas a low level of diversity was associated with less accuracy under high information load. Our findings contribute to our understanding of the antecedents and boundary conditions of retrospective time judgments for crisis management.

Comparing Thinking Fast and Thinking Slow: Interventions, Individual Differences, and Rules

Tuesday Coolness: Creative Presentations on Innovative Topics

Author: **Matthew Asher Lawson**; Fuqua School of Business, Duke U.

Author: **Richard Paul Larrick**; Duke U.

Author: **Jack Soll**; Duke U.

Research on judgment and decision making has suggested that the System 2 process of 'thinking slow' can help people to improve their decision making by reducing well-established statistical decision biases (including base rate neglect, probability matching, and the conjunction fallacy). In a large (N = 1709) pre-registered study, we compare the effects of individual differences and behavioral interventions to test the relative benefits of thinking slow compared to a control condition, a thinking fast condition, an incentive condition, and a condition that combines fast and slow thinking. We also draw on the rule-based reasoning literature to examine the benefits of possessing a simple form of a rule needed to solve a specific focal problem. Overall, we find a large cost from thinking fast and a small benefit from thinking slow or from pursuing

accuracy incentives. The difference in performance between interventions to think fast and think slow is comparable to a one-scale point difference on the 4-point Cognitive Reflection Test (CRT). Inferential rules contribute unique explanatory power and interact with specific conditions and individual differences to support the idea that System 2 benefits from a combination of slower processes and appropriate task knowledge.

Found Out or Psyched Up: How and When Workplace Impostor Thoughts Breed Mastery at Work

Tuesday Coolness: Creative Presentations on Innovative Topics

Author: **Basima Tewfik**; MIT Sloan School of Management

Mastering one's work responsibilities is integral for professional success. Although a consequence of job mastery is that employees may come to embrace their new identities as masters of their work, we have little understanding of how identity is involved in the development of mastery. Accordingly, I seek to account for an overlooked identity-based influence: workplace impostor thoughts. Workplace impostor thoughts capture an employee's belief that others see her as more competent than she sees herself. Building on the core ideas underlying cognitive dissonance theory, I articulate a model that outlines how, why, when, and for whom workplace impostor thoughts encourage job mastery. I test my model in a two-time-period field study of 196 Reserve Officer Training Corps cadets and a three-time-period study of 161 employees of an investment solutions company. I find that workplace impostor thoughts are related to job mastery through the competing mechanisms of introjected motivation and a fear of being found out. Whether one responds with fear or motivation depends on one's helping behaviors at work and one's growth mindset. Taken together, my results suggest that having workplace impostor thoughts may be both a boon and a bane for mastery at work.

Linguistic Cues of CEO Personality and its Effect on Performance

Tuesday Coolness: Creative Presentations on Innovative Topics

Author: **Johannes Brunzel**; Technische U. Braunschweig

Chief Executive Officer (CEO) personality belongs to the most important constructs to understand strategic change and performance of companies but its measurement remains a major obstacle.

Therefore, I study whether freely available, large-scale corporate documents reveal linguistic hints about CEOs' personality dimensions (Big-5) by applying a validated, closed based approach developed by Yarkoni (Journal of Research in Personality, 44, 2010) to a sample of FORTUNE 500 companies. I compare the results with validated, machine-learning trained open-based results from a specifically developed tool of 3000 CEOs of S&P 1500 firms obtained from conference calls (Harrison, Thurgood, Boivie, & Pfarrer, Strategic Management Journal, 2019). In order to provide a basis of comparison, I supplement these linguistic personality profiles with a sample of convicted criminal CEOs that provide an archetype of linguistic extreme cases. In addition, these linguistic profiles are complemented with a subsample of actual personality orientation, using the "positive" leadership attribute of CEO humility identified via a video metrics approach. Finally, after controlling for commonly used content analytical constructs (e.g., entrepreneurial orientation, market orientation) to capture CEOs' cognitive state, I link these cross-sectional linguistic profiles to longitudinal firm-level performance data. The analysis indicates that linguistic manifestations of CEO personality explains in conjunction with observable individual, industry and firm-level data a great share of firm performance. While there appear complementarities between open-based and closed based language approaches, the analysis also indicates that the open-based linguistic trait of neuroticism is negatively related to various measures of firm performance. In particular, these measures appear to be more robust against genre effects and language that is unique among CEOs (self-selection effects). The video 2 metric approach

confirms the importance of certain linguistic personality markers, in particular neuroticism. Hence, the approach sheds light on the important role of validation procedures in the realm of computer-aided-content-analysis (CATA) as well as the conducive and detrimental effects of CEO personality cues on firm performance. The paper discusses practical implications for share_x0002_and shareholders wishing to infer personality cues of key decision makers from large-scale corporate documents as well theoretical implications for the advancement of the upper-echelon_x0002_research.

When (and Why) Expressing Uncertainty Affects Perceptions of Competence

Tuesday Coolness: Creative Presentations on Innovative Topics

Author: **Joel Levin**; U. of Pittsburgh

What do we infer about others' when they express uncertainty? A broad literature on this question has yielded results that appear contradictory. In prior work, expressing more (versus less) certainty has been associated with being perceived as being both more and less competent. In this paper, I propose and test a theory to reconcile these findings. I argue that people make inferences about others on the basis of fit between the amount of certainty that those others express and their own beliefs about the epistemicness (predictability) of the environment. Fit between expressed certainty and perceived epistemicness suggests calibration and in turn competence. I find support for this account across four experimental studies involving both real and hypothetical communication. In each study, I manipulate two factors: the amount of certainty that an advisor or teammate expresses and a characteristic that affects the epistemicness of a given prediction or estimation. Participants display a preference for others who express more certainty in more epistemic environments, but this preference attenuates (S1a, S1b) or reverses (S2, S3) in less epistemic environments. This pattern is explained by participants' perceptions of the epistemicness of each environment.

Silence Climates in the Boardroom

Tuesday Coolness: Creative Presentations on Innovative Topics

Author: **Marilieke Engbers**; Vrije U. Amsterdam

In this study, we seek to capture how boards, through silence, manage the paradox between cohesiveness and cognitive conflict. In this abductive study, we analyze how four silence climates shape four different levels of cohesiveness and cognitive conflict and thus board effectiveness. We propose a board climate is characterized by how a board - through different silence strategies - maintains a dynamic equilibrium between cohesiveness and cognitive conflict. Our data reveals that since a cognitive conflict always risks eliciting a relationship conflict, boards constantly adjust through voice and silence when encountering conflicts. Our study shows how temporal shifts in silence climate are required to manage the paradox and also shows that a structural shift in climate is elicited. We combined tape-recorded data from 37 meetings of 17 boards, and from 119 interviews with board members present during the observed meetings. With our study we extend prior research on board governance and contribute to the further development of the organizational silence theories.

Shannon Cheng; Rice U.

Brook Lu; Rice U.

has attracted substantial research attention, we see two gaps in the current literature. First, little is known about the very experience of being discouraged, which is surprising given that discouragement carries psychological loading. Second, and on a related note, most studies start to research discouragement without understanding its earlier antecedents. Comparatively few studies have probed into the process that ultimately leads to discouragement. Understanding this process is critical when the aim is to act upon first or later signs of discouragement. Accordingly, this symposium aims to increase understanding of the experience of discouragement and the underlying process. Our objectives are to probe the very notion of discouragement and the psychological process of becoming discouraged, including an account of why individuals stop investing in their career and how individuals cope with this process of discouragement.

Social Fatigue in Incompatible Institutional Logics on the Transition to Peace

Author: **Jacobo Ramirez**; Copenhagen Business School

Author: **Claudia Vélez-Zapata**; U. Pontificia Bolivariana

We examine the case of management education in Colombia, where an exogenous, fast-moving political change for a transition to peace was implemented that facilitated scholarships for ex-combatants and individuals displaced by war. Based on a qualitative study at a private university in Medellín, we found that institutional complexities resulted from incompatible institutional logics among students rejected and excluded in the context of the stigma Colombians placed on scholarship recipients. This phenomenon is explained based on the different cognitive and normative orders involved in slow-moving institutional change. This study presents the following alternative conceptualization to study institutional change in armed-conflict contexts: social fatigue in peacebuilding. We define social fatigue in peacebuilding as individuals' psychological surrender to the belief that peace will not be reached despite political change targeting social transformation. Understanding the antecedents of institutional complexities might assist in implementing peacebuilding strategies in armed conflict contexts to implement long-term integration policy by which students receive emotional support

Narratives that Matter: #MeToo and Performative Narrative Identity Construction

Author: **Henrika Franck**; Arcada U. of Applied Sciences

Author: **Paul Savage**; Aalto U. School of Business

The study of narrative identity has provided a strong empirical basis for management and organization studies, but we still lack understanding of how narratives might matter and make a real difference in people's lives. We argue that the crux of the issue is performativity, which remains a poorly understood aspect of narratives and storytelling. In this paper we present and analyze a unique case inspired by the #MeToo movement and a collective mobilizing of people's narrative accounts. Drawing on both Paul Ricoeur and performativity theory we show how narratives matter, and how multiple others, when they form a shared narrative, affect our decision to act or to remain passive in a situation – to speak or to be silent. Performative narratives are powerful in their emancipatory effect on individual and collective identities. Our findings show that the narratives have strong performative power, and the narrative identity is constructed and reconstructed in the process.

A Risky Endeavor? Effects of Employee Voice on Speakers' Social Relationships

Author: **Birgit Pauksztat**; Uppsala U.

Although employee voice, or speaking up about problems encountered at work to colleagues and supervisors is generally assumed to be a risky endeavor, little is known about the actual effects of voice for speakers' social relationships with other members of their organization. The purpose of this study is to examine the consequences of employee voice for the quality of speakers' relationships both with the recipients of voice and with third parties (i.e., those not involved in a particular voice event), and to test how the effects of voice are moderated by the type of voice (making suggestions; pointing out problems) and the prior quality of the relationship. Data came from panel surveys in eight medium-sized public and private sector organizations in Finland (n = 260), and were analyzed using stochastic actor-oriented modeling. The results suggested that making suggestions had positive effects on speakers' social relationships with recipients and third parties. For pointing out problems, the effects were positive but became non-significant when controlling for making suggestions. Further, the effects of voice depended on the quality of the prior relationship: both types of voice increased recipients' and third parties' likelihood of maintaining existing ties with a speaker; in addition, making suggestions increased the likelihood of creating new ties between speakers and third parties.

Signaling Gender and Managerial Profiles in Science and Technology TED Talks: An Interpretive Study

Author: **Heidi Gautschi**; Haute Ecole Pedagogique de Vaud

Author: **Gianluigi Viscusi**; Imperial College Business School

In this article we investigate some of the questions surrounding a specific digital venue for science communication: TED. As the TED archive contains hundreds of talks, we have chosen to focus specifically on science and technology TED talks. We investigate what these talks are signaling to the public and especially to businesses interested in new ventures and new managerial profiles for their research and development. What formulations of science are performed in top ranked TED talks? How this may impact on corporate strategic activities, especially resources allocation and selection of innovation initiatives as well as changes in corporate level staff? In particular, we take a close look at gender representation of scientists (and technologists) in the TED talk sphere. To this end, we focus on the most popular talks given by women and men in an attempt to discern whether, or not there is a difference between what women and men talk about.

What's Gender Got to Do with It? Entrepreneurial Learning & Gender in a Venture Accelerator Context

Author: **Heather-Jean MacNeil**; U. of Massachusetts

Author: **Mary Schoonmaker**; Western New England U.

Previous research has shown that entrepreneurial learning is critical to business growth and longevity (Smilor, 1997; Harrison and Leitch, 2005). Despite these findings, the role of gender in entrepreneurial learning processes lacks investigation. This paper applies a social feminist perspective and uses qualitative research methodology to examine the early-stage female founder learning experience

Author: **Leander De Schutter**; Rotterdam School of Management, Erasmus U.

Author: **Jeroen Stouten**; KU Leuven

In today's competitive work environment, organizations have to continually adjust their usual ways of working. These modifications organizations have to make to survive are often referred to as transformational change. Despite the information available on how to initiate change, transformational changes have often failed to be successful, as most change initiatives do not pay sufficient attention to the impact transformational change has on the supervisor. Organizations often wrongly expect that supervisors welcome change at any time. In two multi-source survey studies and one experimental study we show that transformational change is associated with supervisors' hindrance stress, and that supervisors' hindrance stress negatively affects their relationship with their employees in terms of abusive behavior.

Linking Task Conflict to Turnover Intention

Author: **Hyunjoo Lee**; Sungkyunkwan U.

Author: **Jiseon Shin**; Sungkyunkwan U.

Conflict is inevitable in groups and organizations because of complex and interdependent organizational life. Drawing on conservation of resources (COR) theory (Hobfoll, 1989), this study investigates why and how task conflict can relate to turnover intention. This study aims to find the mediating effect of emotional exhaustion on the relationships between task conflict and turnover intention. Moreover, we propose that professional identity buffers the emotional exhaustion that can reduce turnover intention in the workplace. Survey data were collected from 281 employees in a mid-sized professional service company located in South Korea. The findings of this study were that task conflict is positively related to emotional exhaustion and employees' turnover intention. For employees with high professional identity, the relationship between task conflicts and emotional exhaustion and the indirect effect of task conflict on turnover intention via emotional exhaustion were weaker, compared to employees with low professional

within a venture accelerator context. Bandura's (1977) self-efficacy framework is used to analyze study data in the areas of: vicarious learning, mastery learning, social persuasion, and the reduction of stress. Initial findings show that although women benefit from participation in an entrepreneurial cohort common to the accelerator model, there are ways that their learning experience is negatively impacted by a male-dominated learning environment, normative startup culture and bias within the mentoring process.

Political Modalities of Learning in the Context of Organizational Transformation

Author: **Alexandra Bristow**; The Open U. Business School

Author: **Leah Tomkins**; The Open U. Business School

Author: **Jean Hartley**; The Open U. Business School

In this paper we explore tensions and dynamic complexities of the politics of learning through the dialectical approach to power relations. We draw on an empirical study of a major city police organization in the midst of an organizational transformation. From this research, learning emerges as an inherently political activity that is embedded in complex and contradictory ways within the power relations constituting organizational change. Analysing this complexity, we identify four interdependent political modalities of learning: empowering, coercive, insurgent, and palliative, and explore tensions and asymmetries between them. We note that, whilst mainstream and critical literatures tend to focus on organizational learning as, respectively, empowering and coercive, and to a lesser extent insurgent, much of the politics of learning in our study converges in the palliative modality, where the emphasis is on learning-to-cope

Careers and Performance (session 1357)

Effects of Racial Diversity Congruence Between Senior Management & Middle Management on Performance

Author: **Orlando C Richard**; U. of Texas at Dallas

Author: **Mary Triana**; Owen Graduate School of Management Vanderbilt U.

Author: **Mingxiang Li**; Florida Atlantic U.

We introduce the middle echelons concept to the management domain by examining how matching levels of racial diversity in middle management and senior management (i.e., upper echelons) impacts firm performance. In a sample of high tech firms, we found evidence supporting knowledge-based view perspectives on the racial diversity congruence-firm performance relationship. Specifically, congruence between senior management racial diversity and middle management racial diversity positively impacts firm performance. Furthermore, organizations with high levels of racial diversity in both senior and middle management (i.e., high-high racial diversity congruence) realized superior performance compared to organizations with low levels of racial diversity in both senior and middle management (i.e., low-low racial diversity congruence). Results also revealed differences across levels of racial diversity incongruence between senior management and middle management (i.e., asymmetry effects) whereby firms with a more racially diverse senior management than middle management outperformed firms with

(rather than learning-to-thrive, learning-to-comply or learning-to-resist). We show that the palliative modality of learning is in many ways an outcome of the dynamic and complex engagement between the other three modalities in the context of organizational change. We discuss the implications of our findings for a more nuanced understanding, both theoretically and empirically, of learning as political, and of the relationship between organizational learning, power and change.

Giving Voice with Performative Research Methods: A View Inside Austrian Immigration Detention

Author: **Katharina Miko-Schefzig**; WU Vienna U. of Economics and Business

Author: **Mark Learmonth**; Durham U.

Author: **Cornelia Reiter Reiter**; WU Vienna U. of Economics and Business

Author: **Karin Sardadvar Sardadvar**; WU Vienna U. of Economics and Business

Over the last few years, the worldwide significance of immigration detention has increased substantially. Yet, immigration detention centres remain under-researched places, even though their role is highly controversial and deeply debated. In this article, we report on our study of Austrian immigration removal detention centres, where asylum seekers with a negative asylum decision are detained prior to their deportation. We focus on one specific participatory method used, the so-called vignette-based focus group. By referring to Judith Butler's linked concepts of performativity and vulnerability, we analyse the relationship between the two main groups within the centres: the detainees and the police. We show how the method of vignette-based focus groups can be understood to be performative in the sense that the research process itself changed the empirical situation. In this case, the mutual exchange of perspectives between the police officers and the detainees that took place in the focus groups altered the attitudes of both groups to one another, by highlighting their mutual reliance on one another on the level of everyday interaction. In this respect, our study is an example of the potential for performative research – not merely for investigating power asymmetries but also

a more racially diverse middle management than senior management. A supplemental study of Fortune 500 firms enhanced generalizability, as the pattern of findings was very similar to the high tech study. The study implications are discussed as well as a call for future research that considers the upper echelons' and the middle echelons' joint effects.

Contextual Effects of Family and Work on Bridge Employment for Men and Women

Author: **Justin Marcus**; Koç U.

Author: **Gorkem Aksaray**; Koç U., College of Administrative Sciences and Economics

Drawing upon lifespan and social role theory, we tested the influences of sex, work, and family contexts on bridge employment decisions. A random sample of N = 12,108 Turkish retirees over 4 years, representing k = 32,640 distinct respondent-year observations, was utilized. The interactive effects of sex and work (job level) and family contexts (marital status, having dependents) were regressed on the probability of entering bridge employment, either full- or part-time, and in a job that is either similar or different to ones' career job. Respondents' years since retirement, age, household income, education, health status, and year/region fixed effects were controlled. Female retirees were overall less likely to enter bridge employment and less likely to enter bridge employment in a different occupation. Family context variables had larger effects than job level in bridge employment for women but not men. However, these contextual effects were overall more influential for male retirees. Married men were more likely to enter bridge employment (both full- and part-time) than unmarried men. Men holding higher-level jobs were more likely to enter bridge employment, and more likely to hold that employment in a job similar to their career job, than men in elementary jobs. Findings are discussed.

Why Do I Suffer? Making Emotions Critical to Institutional Work within Oppressive Institutions

Author: **Snehanjali Ashish Chrispal**; PhD Student at U. of Melbourne

Author: **Vanessa Pouthier**; U. of Melbourne

Author: **Susan Ainsworth**; U. of Melbourne

What role do affective dynamics play in the reproduction and destabilization of oppressive institutions? Through a qualitative study of the emancipatory journeys of 14 abused Indian women benefiting from the support of a local organization aiming to disrupt institutionalized gendered violence, we found that apathy aggregates over time through the repetition of abuse, the suppression of grief and compassion towards their suffering, the prospect of shame and anger on the part of the familiar and powerful others, and the cultivation of false hope. Systemic power thus seems to operate through the social cultivation of both hopelessness in the powerless and a form of righteous indignation and affective numbness in the privileged, which all participate in normalizing violence against women. Our analysis, however, reveals that the seemingly vicious cycle of oppression, apathy and powerlessness can be disturbed by bottom-up affective intrusions, such as love and fear for one's children, or the love and courage of a known stranger and familiar others. The organization played an important role in facilitating those mundane affective emancipatory politics, through which these women could regain their right to feel and struggle to develop more life-affirming realities for themselves and their children. In surfacing and unpacking those affective pathways to emancipation from institutionalized gendered violence, we contribute to both scholarship on critical institutional work to disrupt inequalities, which tend to neglect the efforts of the disenfranchised, as well as recent conceptualizations of the role of emotions in the maintenance of oppressive institutions, which has yet to recognize and explore the critical,

Socio-Professional Trajectories of Refugees in France: The Nature of Loss and Psychological Capital (WITHDRAWN)

Author: **Shiva Taghavi**; NEOMA Business School

Author: **Hedia Zannad**; NEOMA Business School

This qualitative study aims to understand the socio-professional integration process of refugees from Afghanistan, Syria, Palestine, Russia, Rwanda, and Iran in France. Our findings suggest that refugees follow different socio-professional trajectories and adopt different acculturation strategies, depending on the nature of loss from which they suffer most and the amount of psychological capital they accumulate and deploy. We identified three socio-professional trajectories- 'whatever it takes', 'entrepreneur', and 'stationary'. The nature of loss differs in each trajectory, between loss of citizenship privilege, loss of status, and loss of belongingness. Refugees adopt different acculturation strategies within these trajectories, respectively assimilation, integration, and marginalization/separation. Finally, psychological capital substantially helps refugees counterbalance their loss, adopt an acculturation strategy, and follow a socio-professional trajectory.

Power, Boundaries, and Total Institutions: An Analysis of Supervisor- Subordinate Use of Humour

Author: **Jenna Pandeli**; UWE Bristol

Author: **Rafael Alcadipani Da Silveira**; FGV-EAESP

Drawing on a ten-month ethnographic study of a UK prison this paper considers the negotiation of humour within complex power dynamics, asking the question: How is humour negotiated between supervisors and their subordinates? In exploring the day-to-day interactions and relationships between prisoner and their workshop instructors we identify three ways that humour is used between these two groups. Humour is used to 'Remove Boundaries', to 'Maintain Boundaries' or to 'Shift Boundaries'. In Removing Boundaries, humour is used to build relationships between those in power and the subordinate, in Maintaining Boundaries humour is used to preserve professional distance, in Shifting Boundaries those in positions of power change the accepted use of humour to reinforce power. This paper contributes to an understanding of the relationship between authority and humour at the micro level where humour becomes a power strategy that acts as a boundary maker in supervisor-supervisee relationships.

Disruptive Technology and the Future of Skills: A Gendered Analysis (session 1355)

Around the world, governments have prioritized strategies around "future skills". However, discussions about the impacts of globalization,

GDO

Gender, Technology, and Science (session 1359)

More Tweets, More Money? Gender Differences in Harnessing Social Media for Crowdfunding Campaigns

disruptive technology, and demographic shifts on employment are not new. Despite this intense interest generated in the “Future of Work” and “Future Skills,” discussions of the impacts on women or other diverse groups were noticeably absent. Extant research on women in workplace has mostly focused on wage gaps, not on the impact of trends such as increased automation, prioritization of STEM over other disciplines, or new emergent forms such as gig and contingent work. There are currently a number of considerations about the reasons for the precarious situation women face in the job market. Currently, women are found in more repetitive and generalist (requiring less creativity) occupations, which are at higher risk of automation; paralleling this overrepresentation is women’s underrepresentation in sectors such as ICT, where automation would complement their work. In this panel symposium we are going to address the risks women will face in the future, the reasons for those risks, and how we can mitigate those risks in the future.

SYMPOSIUM

ASYNCHRONOUS

Author: **Kourosh Shafi**; U. of Florida

Author: **Susana Correia Santos**; Rowan U.; ISCTE-IUL

Author: **Xaver Neumeyer**; U. of North Carolina, Wilmington

Crowdfunding has the potential to democratize access to financing, especially among women entrepreneurs. This paper examines whether social media activity provides an advantage for women entrepreneurs in raising funding from crowds. The results of our study, based on tracking the daily fundraising and social media activity for a sample of 11409 campaigns launched in Kickstarter, show that social media is beneficial in crowdfunding efforts for all entrepreneurs, even more so for women entrepreneurs. Our theoretical discussions implicitly attribute this finding to the role of social media in broadening the social connections of women entrepreneurs and also in diffusing electronic word-of-mouth information that alters investors’ perceptions about legitimacy of women entrepreneurs, which views entrepreneurship as a masculine-typed endeavor that women are incapable of successfully undertaking. The broader implications of this research are to address the influence of social media in helping mobilize resources for entrepreneurs.

The Instantaneity of Gendered Voice Assistant Technology and Manager Perceptions of Subordinate Help (WITHDRAWN)

Author: **Hannah Weisman**; London School of Economics and Political Science

Author: **Niranjan Srinivasan Janardhanan**; London School of Economics

Voice assistants are interactive technologies that supply information and perform tasks in response to voice commands from human users. The past decade has seen a rapid rise in the usage of voice assistants for work. However, the implications of these technologies for workplace outcomes remain poorly understood. In this paper, we examined how the usage of these instantaneous, gendered technologies influenced managerial perceptions of subordinate helping behaviors. We conducted our examination across three studies—a qualitative pilot

study, an experimental study in the lab, and a workplace scenario study in the field. In our pilot study, we learned how managers used voice assistants, and developed a novel task for manipulating voice assistant usage in the lab. Across our lab study (Study 1) and workplace scenario study (Study 2), we found consistent evidence that female voice assistant usage biased perceptions of helping behaviors by female subordinates. In the short-term, individuals expected more immediate help and communicated more immediacy in their requests for help from female versus male subordinates. In the long-term, individuals communicated more impersonally with female versus male subordinates, and penalized female versus male subordinates more harshly when they failed to provide help. Male voice assistant usage did not induce the same consistent bias against male subordinates.

In spite of increasing numbers of vacancies for highly-skilled jobs in innovative sectors of the economy, highly-skilled migrants are often discriminated against their qualifications. In this study, we specifically focus on the case of highly-skilled migrant women having a background in male-dominated fields, namely in STEM. Adopting an intersectionality approach, we illuminate the macro-, organizational-, and individual-level barriers that prevent highly skilled migrant women finding a job that is up to their qualification level and sector, and the resources available to them to overcome these barriers. We draw on extensive qualitative data gained from in-depth interviews and focus groups with women from different countries and STEM qualifications. By highlighting the complexities of being a woman, a migrant, and a STEM professional, we identify relevant areas for policy intervention to valorize migration in support of innovation and
