Based on literature providing evidence that Afrocentric hairstyles (e.g., afros, braids, dreadlocks) of Black women working in professional settings are often associated with negative stereotypes and biases regarding competency and professionalism, we chose to examine the extent to which these biases may be influencing the hairstyle choices of Black women employed in higher education. While academic workplaces tend to be more flexible and informal than non-academic settings, we found many Black women in higher education are, nonetheless, choosing to wear Eurocentric hairstyles. However, choice of hairstyle was influenced by academic discipline, type of institution and level in the university hierarchy.

Team Diversity Beliefs and Ideology (session 1356)

A Brief Intervention to Promote Team Diversity Beliefs and Team Information Elaboration

Author: **Pisitta Vongswasdi**; Rotterdam School of
Management, Erasmus U.

Author: **Hannes Leroy**; Erasmus Research Institute
of Management

Author: **Meir Shemla**; Rotterdam School of
Management, Erasmus U.

Author: **Jasmien Khattab**; Erasmus U. Rotterdam

Despite previous research suggesting the importance of team members' perceived value of diversity (i.e., diversity beliefs) for exchange of information in teams, little attention has been paid to whether and how team diversity beliefs can be influenced. Drawing on theory and research on team diversity beliefs, we propose that team diversity beliefs result from both a promotion (compared to a prevention) focus and a personalized (compared to factual) knowledge. Results from an experiment with 175 randomly composed teams (each team demonstrating high diversity in preferred work approaches) revealed that promotion focus and personalized knowledge independently contributed to higher team diversity beliefs and, in turn, indirectly, team information elaboration. These effects further improved the team's ability to integrate opposing viewpoints (i.e., team integrative complexity). Our results help to uncover key antecedents of diversity beliefs, and add to a growing body of evidence demonstrating the pivotal role of team diversity beliefs in improving the extent to which team members share information and integrate diverse perspectives.

[view paper \(if available\)](#)

discrimination differ between women and men. We argue that the types of experiences that women vs. men view as discriminatory are different; while the majority of women's perceptions of discrimination in the workplace emerge from experiences that appear to align with patriarchal norms, the majority of men's perceptions of discrimination emerge from experiences that appear to reflect institutions' efforts to reduce discrimination against women. These differences in types of perceived discriminatory experiences give rise to divergent psychological consequences. We argue that the experience of workplace gender discrimination 1) reduces self- efficacy among women but not among men and 2) reduces the sense of belonging for both women and men. We further argue that these effects contribute to a reduction of well-being among members of both genders, with the negative effect on well-being being more pronounced among women than among men. We examine these predictions in two surveys of working adults. We discuss implications for research on the experience of discrimination and for organizations seeking to reduce the negative consequences of perceptions of discrimination.

The Unequal Burden of Positive Gender Stereotypes on Women's and Men's Sense of Autonomy

Designated as a "Best Paper" for GDO
Author: **Devon Proudfoot**; Cornell U.
Author: **Aaron Kay**; Duke U.

Seven studies (N = 3,536) examine the conditions under which individuals experience expectations about their social category as a threat to their sense of autonomy and the consequences of autonomy threat elicited by such expectations. Across both work contexts and non-work contexts, women experienced expectations associated with their gender category as more threatening to their sense of autonomy compared to men, even when expectations were positively valenced (Studies 1a-2b). This gender difference was explained by gendered expectations playing a more significant role in women's lived experiences than men's and by men tending to encounter more agentic (control-

CEO Gender, Ideology, and the Gender-Pay Gap in Top Management Teams

Designated as a "Best Paper" for GDO

Author: **Olga Kalogeraki**; U. of St. Gallen

Author: **Dimitrios Georgakakis**; U. of St. Gallen

Author: **Winfried Ruigrok**; U. of St. Gallen

How does the presence of a female CEO affect the gender-pay gap in organizational upper echelons? Drawing on social identity theory, some scholars note that female CEOs are more likely to eliminate gender-pay differences among executives. Yet, others adopt a queen- bee perspective to argue that female CEOs may rather strengthen the gender-pay gap in the executive team. In this study, we reconcile these opposing streams of thought to argue that whether female CEOs will reduce (or strengthen) top management team (TMT) gender-pay differences will depend on their political ideology. Our findings demonstrate that conservative-female CEOs are likely to promote a higher TMT gender-pay gap compared to all other CEO gender-ideology categories (i.e., male-conservatives, male-liberals and female- liberals). This suggests that hiring a female CEO does not necessarily imply that the firm will overcome gender-pay-gap tendencies. Instead, it may rather strengthen such tendencies – depending on the CEO's values and ideology.

Cultural Diversity in Top Management Teams – Review and Agenda for Future Research

Author: **Virginia Bodolica**; American U. of Sharjah

Author: **Yuliya Ponomareva**; U. Autònoma De Barcelona

In this paper, we provide a systematic literature review of extant research on TMT cultural diversity. The in-depth analysis of on the 54 articles published in 34 international peer reviewed journals between 1997 and 2019 reveals a highly fragmented state of the field providing a general platform and specific recommendations for future research. This review highlights the richness in modeling approaches as well as in the conceptualizations of TMT cultural

affording) gendered expectations than women (Study 1b). Autonomy threat explained, in part, why women experienced more negative emotions in response to, and reported lower motivation to comply with, positive gender stereotypes about their group at work than men did (Studies 2a-b). Consistent with the notion that highly agentic stereotypes provide a buffer against feelings of autonomy threat, Asian Americans responded more negatively to low agency positive stereotypes about their group than high agency positive stereotypes about their group, explained in part by how much autonomy they felt the stereotype provided (Study 3). Communal expectations felt more controlling to women when explicitly gendered (Study 4) and prescriptive rather than descriptive (Study 5). Overall, results show that women and men's feelings of autonomy are differentially impacted by society's expectations about the (positive) qualities they possess, contributing to an unequal psychological burden placed on women at work and beyond.

Individual Beliefs about the Value of Diversity and Information Elaboration Behaviors in Teams

Author: **Kendall Yamamoto**; U. of Texas at Austin
Author: **Luis L. Martins**; U. of Texas at Austin

Prior research finds that demographic diversity can benefit the performance of organizational teams through an increase in the range of cognitive resources that the teams can apply to their tasks. However, in order to produce these benefits, teams must engage in information elaboration, that is, individuals within the team must offer their unique perspectives, seek those of others, and integrate various information inputs into the team output. Explanations for information elaboration within diverse teams have thus far focused on team-level factors. In this paper, we propose that individual perspectives on why diversity is valuable to teams will affect individual likelihood of engaging in information elaboration behaviors. Using research on implicit theories and diversity management, we dimensionalize individual perspectives on the value of diversity, and develop propositions regarding how they might affect individual information elaboration behavior within diverse teams. We also discuss the theoretical and practical contributions of our research model.

Hiring Temps but Losing Perms? The Effects of Temporary Hiring on Turnover in a Dual Labor Market

Author: **Rocio Bonet**; IE Business School
 Author: **Marta M Elvira**; IESE Business School
 Author: **Stefano Visintin**; U. Camilo Jose Cela

We study the effect of hiring temporary workers on the voluntary turnover of permanent employees within the context of a dual labor market. Using a unique longitudinal dataset with individual-level monthly payroll data for an average of 60,000 individuals belonging to 278 organizations in Spain during an eight-year period, we find a positive association between temporary worker inflows and the voluntary turnover of permanent workers. We also find that recent permanent worker downsizing reduces this positive association. Thus, the costs of disruption and identity threat associated with temporary hiring seem to outweigh the potential benefits of helping hands for permanent workers. These findings suggest that the shift toward employment flexibility may have affected the mindset of permanent employees: hiring temporary workers may be changing the social contract even in a regulatory environment characterized by strong protection for permanent workers.

HR and Creativity 2 (session 1362)

The Effects of HR Systems on Employees' Distinct Types of Creativity

Author: **Jaewook Lee**; Seoul National U.
 Author: **Joo Hun Han**; Rutgers U.
 Author: **Jin Nam Choi**; Seoul National U.
 Author: **Seongsu Kim**; Seoul National U.

Extant SHRM literature has emphasized the role of cooperative aspects of HR systems on performance. However, there has been little attention to competitive aspects of HR systems in such a context. From this standpoint, we identify how employees' perceptions of competitive and cooperative HR systems facilitate radical and incremental creativity via knowledge expansion and sharing based on the insights from social comparison, social interdependence, and social exchange theory. Further, drawing on previous research on creativity and information processing, we examine whether the effects of knowledge management behaviors on distinct types of creativity vary depending on employees' intuitive and systematic work style. Analyses of data collected from 182 employees and 65 team leaders in 27 companies revealed that employees' perceptions of competitive and cooperative HR systems are positively related to knowledge expansion and sharing, respectively. Knowledge expansion was positively related to radical creativity and mediated the relationship between competitive HR systems and radical creativity. Although not significantly related to incremental creativity, knowledge sharing significantly facilitated incremental creativity when employees exhibited a higher level of intuitive work style. We provide substantial theoretical and practical insights by offering comprehensive understandings of how employees' perceptions of different HR systems affect distinct types of creativity.

The Curvilinear Effect of Perceived Market-Based HR System on Employee Creativity

therefore draw on recontracting theories (agency theory and wealth transfer theory) to assess whether leveraged buyouts (LBOs) result in lower job quality for workers. Given LBOs are heterogeneous and vary by key characteristics (outside ownership, short-term-orientation, and high leverage/ debt) we also consider job quality in different types of deals. Analyzing nationally representative matched data, overall we find workers in LBOs compared to non-LBOs do not report lower job quality (work intensity/ time pressure, job discretion, and participative decision-making), or related attitudinal outcomes (individual well-being and job satisfaction). However, we find synergies of organizational control in 'perfect storm' LBOs (with outside ownership, short-term-orientation, and high leverage/ debt) where the workforce reports higher work intensity and time pressure, although they do not report lower well-being and job satisfaction. This may highlight potential foundations for consent to work intensification during the shift from managerial to financial capitalism.

Revisiting How HRM Influences Employee Intention to Leave: Linking Both Actual and Perceived HRM

Author: **Na Fu**; Trinity College Dublin
Author: **Edel Conway**; Dublin City U.

This paper investigates the indirect influence of perceptions of HR practices on employee outcomes. It adopts a novel linkage model to examine the relationships between employees' perceptions of HRM practice implementation by line managers, experienced HRM by employees, psychological contract fulfilment and intention to leave. The model

Creativity

Author: **Qing Gong**; Georgia Institute of Technology

Author: **Dong Liu**; Georgia Institute of Technology

A firm's performance-oriented human resource (HR) system may encourage employees to adhere to workplace standards and thus meet performance expectations. Yet, can a firm's performance-oriented HR system also facilitate employee creativity, which oftentimes involves risk and deviation from conventions? To address this question, we examine the joint influence of the performance-oriented HR system and HR creativity-building orientation on line managers' tolerance of failure and further employee creativity. Analyses of multi-source, multi-phase data regarding 1086 employees in 107 high-technology companies reveal that when an organization's HR manager interprets the organization's HR practices as having a strong creativity-building orientation, a performance-oriented HR system will enhance line managers' tolerance of failure in employee's creative attempts. Moreover, managers' tolerance of failure will shape employees' creative role identity and further enhance employee creativity.

The Impact of Regulatory Focus on Turnover Intention: The Mediating Role of Network Characteristics

Author: **Han Ho Lee**; Seoul National U.

Author: **Seongsu Kim**; Seoul National U.

In this study, we examined how different self-regulation strategies, promotion- and prevention-focus, directly and indirectly influence employees' turnover intention. Using data from 206 employees, we tested how different regulatory focus and network characteristics related to their turnover intention. Promotion focus was positively associated with employees' turnover intention, whereas prevention focus negatively was. We further examined these relationships by testing four network characteristics (e.g., internal network size, external network size, internal network strength, and external network strength) as potential mediating mechanisms. Results revealed that the associations between promotion and prevention focus with turnover intention were mediated by external network size and internal network strength, respectively. Lastly, we found distinct impacts of different self-regulation strategies on constructing social networks, where promotion-focus tended to have large, heterogenous, but weak social worlds, whereas prevention-focus remained strongly tied to intra-organizational contacts. These results suggest that different self-regulation strategies should be considered in understanding the development of social networks that deter and facilitate turnover process.

Challenging Job Experiences: An Identity Perspective

Author: **Sheldon Carvalho**; ESSEC Business School

Introducing an identity perspective to challenging job experiences (CJE) research, this study examined how CJE foster leadership development at work by promoting the salience of individuals' future work selves, and, as a result, drive two forms of proactive behavior: strategic scanning and taking charge. Data were collected at 2 time points from a sample of individuals in leadership positions across a range of industries. Results revealed that CJE were positively related to strategic scanning behavior over time, partially mediated by future work self salience. However, future work self salience did not explain the relationship between CJE and taking charge. Implications of these results for theory and practice and directions for future research are discussed.

Downsizing on Voluntary Turnover: The Mixed Effects of Collective Pay for Performance Practices

Author: **Youngsang Kim**; Sungkyunkwan U.

Author: **Eun-Ji Oh**; Sungkyunkwan U.

Author: **Seung Soo Eo**; Sungkyunkwan U.

Author: **Kihwan Song**; Sungkyunkwan U.

Research on downsizing and turnover has shown that downsizing as involuntary collective turnover engaged by an employer has disruptive effect on employee motivation and quality of human capital resources, which ultimately influence voluntary turnover behaviors of survivors from downsizing events. In this study, we examine whether firm level downsizing rate relates to concurrent voluntary collective turnover and how collective pay for performance practices, such as profit sharing and employee stock ownership plans, play an important role to affect the downsizing effect on voluntary collective turnover. Using 238 firms with 1,294 firm-year observations during 2006-2016, our findings show that downsizing rate is significantly and positively related to voluntary collective turnover. Interestingly, firms with more downsizing rate have

lower concurrent voluntary turnover rate when firms use profit sharing, whereas firms with more downsizing rate and using employee stock ownership plans have greater concurrent voluntary turnover rate. Therefore, this study suggests that the downsizing-voluntary collective turnover relationship is highly contingent upon collective pay for performance practices and more research should be explored to understand the dynamics of this relationship.

Talent and Potential (session 1361)

Developing and Validating an Executive Potential Assessment Tool for Succession Planning

Author: Kevin S. Groves; Pepperdine U.

A critical succession planning challenge for organizations across industries is the identification of leadership talent in mid-management roles who are ready for executive-level positions. Despite the incredible demand for greater attention to executive succession practices and the challenges associated with unplanned executive turnover, the published research literature currently lacks a validated executive potential assessment designed for organizations competing in highly complex and volatile business contexts. To address these practical needs and important research gaps, this paper presents a multi-phased study describing the development and initial validation of an executive potential assessment. The Leadership and Executive Assessment for Potential (LEAP) is designed for identifying mid-level leaders with executive potential in turbulent work contexts that demand high levels of resilience and learning from extremely challenging job experiences. The first phase presents a qualitative study that identified the leadership competencies associated with executive potential in such work contexts. The second phase presents a quantitative study of 308 mid-level leaders and 213 of their immediate managers across four organizations in a highly complex and

Inclusiveness, Internationalization, and Innovativeness Impact on Talent Management Effectiveness

IM Division Best Paper in OB/HRM/OT Finalist
Author: **Anna Veselova**; National Research U. Higher School of Economics
Author: **Natalia Ribberink**; Hamburg U. of Applied Sciences
Author: **Liudmila Veselova**; National Research U. Higher School of Economics

The paper explores the relationship between talent management (TM) and a firm's performance mediated by absorptive capacity (AC). It examines the role of inclusive talent management strategy, a firm's degree of internationalization and innovativeness as boundary conditions to the relationship between TM, AC, and performance. We test our hypotheses on the sample of 185 Dutch firms. The findings reveal that Dutch firms committed towards the adoption of more sophisticated TM routines not only exerted higher absorptive capacity, but also performed above their industry average. Another key finding shows that the inclusive TM strategy increases AC and performance. Moreover, there is a significantly stronger effect of advanced TM practices on the firm's absorptive capacity for highly innovative firms; however, the moderating effect of innovativeness

turbulent industry. Based on a series of reliability and convergent, concurrent, and incremental validity analyses, this paper presents the 14-dimension, 44-item LEAP instrument as a psychometrically sound tool that accurately identifies mid-level leaders for executive roles. Executive teams, board members, HR professionals, and consultants may utilize the LEAP instrument for a range of practical talent review and executive succession applications.

Contract Human Capital HR Architecture: A Framework for Managing Talent in the Gig Economy

Author: **Bill Castellano**; Rutgers U., School of Management and Labor Relations

We are witnessing a structural transformation of the 21st century economy due to disruptive technologies, global competition, changing demographics, and political uncertainties. As a result, organizations are fundamentally changing how they engage and hire multiple sources of talent. Today, an increasing amount of work is performed on a project basis whereby organizations hire workers temporarily or use a multitude of electronic platforms that link contact workers with organizational needs. As organizations increase their use of contract labor, an entire new labor force is emerging in what is now called the gig economy. Contract human capital are quickly becoming a powerful force in the economy contributing to the success of many organizations, so it is vital for researchers to enhance their understanding of how organizations engage and manage this component of their workforce. The goal of this study is to propose a framework that describes how organizations employ contract workers in terms referred to as contract human capital engagement modes, along with supporting HR configurations that can positively affect the performance of contract workers. A model is proposed that describes the strategic determinants of contract human capital engagement modes, and consists of two dimensions based on the levels of interdependency and criticality of the contract work, which provides a useful two-by-two matrix of four

were found to be insignificant for the link between the firm's AC and its performance. Additionally, for regionally operating firms (as compared to global and domestic ones), the positive effects of TM practices on AC and AC on performance were found to be stronger. On the other hand, the results revealed significantly weaker effect of AC on a firm's performance for local (domestic) firms.

Author: **Truong Thi Nam Thang**; National Economics U.
Author: **Renin Varnali**; Bahcesehir U.

The aim of this paper is to renew interest and expand the relationship between organizational structure, societal culture, and its impact by focusing on distinct individual and organizational level outcomes. Drawing from the structural contingency theory, we extend previous research and propose that the alignment between power distance and structure variables of formalization and decentralization will have distinct effects on two levels of outcomes. Using multi-level data collected from 387 organizations and 7187 employees across 14 countries, we find that when structures and cultures are aligned, employees display more positive work outcomes (i.e. increased levels of engagement). On the other hand, organizational outcomes (i.e. organizational performance) in fact do not enjoy the same benefits of alignment. Our findings provide new and surprising insights to scholars that may need further examinations. Moreover, by broadening the perspectives of individual versus organizational outcomes, we highlight a key challenge for organizations to balance employee expectations and organizational performance requirements when preparing, planning, and strategizing organizational forms and practices.

The Influence of Political Capabilities and Diplomatic Relations on Innovation Offshoring (WITHDRAWN)

Author: **Omar El Nayal**; Catolica Lisbon School of Business and Economics
Author: **Joao Albino Pimentel**; Copenhagen Business School
Author: **Pierre Dussauge**; HEC Paris

Firms can derive significant benefits from locating innovation activities in foreign countries. Yet, such offshoring of innovation activities comes with notable downsides, particularly the risk of innovation misappropriation in host countries with weak intellectual property rights (IPR) regimes. Although prior research has focused on how firms attempt to manage this downside risk through innovation-specific remedies and knowledge protection strategies, the role of firm nonmarket capabilities, notably political capabilities, has thus far been largely overlooked. We argue that firm political capabilities can help protect firms from the possible misappropriation of their intangible resources in weak IPR regimes, but that this effect will only materialize when a firm's home and host countries maintain favorable diplomatic relationships. Our theorizing thus considers multiple levels of political influence that affect a firm's ability to overcome the risks associated with weak IPR regimes. We find support for our predictions in a sample of 479 innovation offshoring investments made by 102 firms from 12 home countries over the period 2003-2010.

Author: **Xiaoou Bai**; U. of Texas at Dallas
Author: **H Kevin Steensma**; U. of Washington
Author: **Wei Xia**; U. of Washington

Using a population of venture capital (VC) firms spanning the whole Chinese VC history from 1991 to 2017 and comprising 6,001,004 lead-partner VC potential dyads, and conducting qualitative interviews with VCs founding partners, we examine how the societies in which both reciprocating parties and the recipients of reciprocity are embedded influence the likelihood of reciprocity. We contribute to social exchange theory by attempting to break down the forces of reciprocity into two parts: an inherent sense of obligation, and strategic motivation hoping to create a tit-for-tat dynamic. Integrating social exchange theory and international business literature, our results indicate that reciprocity is not a universal rule. All things being equal, reciprocity will be more influential on Chinese than Western leads, whereas reciprocity will be more influential when potential invitees are Chinese (regardless of the lead's nationality). The interplay between this obligatory urge and strategic motivation has the greatest impact on a China-China dyad than a China-Western, Western-China, or Western-Western dyad.

Patent Premium for Foreign Firms Innovating in Emerging Markets

Author: **Can Huang**; Zhejiang U.
Author: **Lanhua Li**; Zhejiang U.
Author: **Yadong Luo**; U. of Miami
Author: **Zhe Qu**; -

Weak intellectual property rights (IPR) protections in emerging markets pose a critical challenge to foreign firms attempting to appropriate returns from innovations in these markets. This study investigates the extent to which foreign firms in emerging markets, if they do so at all, obtain a patent premium, defined as an incremental productivity gain from a firm's patents that it would not obtain had it not owned any patents. Drawing on theoretical insights from institutional theory and the liability of foreignness (LOF) logic, and using a panel dataset representing the performance of 32,901 firms in China's high-tech industries, we find that foreign firms do obtain a patent premium despite the country's weak IPR protection. The level of the patent premium is, however, significantly lower for foreign firms than for domestic firms, consistent with the LOF logic. We also find that a foreign firm's patent premium increases substantially with institutional development, and to an even greater extent among wholly owned foreign subsidiaries (WOSs) than among international joint ventures (IJVs). This finding offers further support for the LOF logic insofar as institutional development lowers the LOF for foreign firms, particularly for WOSs. These findings provide implications for foreign firms regarding their innovation strategies in emerging markets with weak IPR protections and for host-country governments when formulating their innovation policies.

Intellectual Property Rights and the Protection of Innovations

Author: **Alvaro Cuervo-Cazurra**; Northeastern U.

I study how weak intellectual property rights (IPR) regimes affect firms' innovation protection strategies. I build on transaction cost economics to

we argue that the construct is incomplete as it does not account for the direction and the specific characteristics of each cultural dimension. Furthermore, although cultures may not be compared in terms of better or worse, when it comes to the implication to foreign subsidiary firms, some cultural characteristics in the host country can be more or less favorable to doing business. We use panel data including foreign subsidiaries from developed countries, emerging markets and Latin America operating in 10 host countries in Latin America totaling 4226 firm-year observations and a combination of 168 home and countries. The asymmetric effects for the direction of CD are highlighted as some cultural characteristics in the host country seem to affect firms in similar ways regardless of cultural similarities between home and host countries. While firms from the region do not seem to be in advantage in dealing with CD, the positive and significant effects for the Power Distance dimension reveals the legitimate use of power attributed to developed country firms operating in Latin America. The asymmetric effects are highlighted as some cultural characteristics in the host countries can be more or less favorable for foreign subsidiary firms to do business. The study highlights important characteristics of CD and points venues for future research.

explain four strategies to address not only the weak institutional IPR of ineffective regulatory and judicial systems traditionally discussed, but also the new weak technological IPR arising from the spread of digital technologies that facilitate the unauthorized diffusion of IPR. The four innovation protection strategies are (1) Defense, which is the traditional strategy of investing in legal defense to deter imitation in conditions of strong institutional and technological IPR; (2) Obsolescence, in which firms invest to make their innovations obsolete to reduce imitation in situations of strong institutional but weak technological IPR; (3) Complexity, in which firms invest in increasing the complexity of innovations to reduce imitation in situations of weak institutional but strong technological IPR; and (4) Convenience, in which firms invest in the convenient platforms to reduce incentives for imitation in conditions of weak institutional and technological IPR. These ideas question the usual argument of weak IPR leading firms to reduce investments by proposing instead the increase in investments to induce the transformation of the lack of formal transactions between firm and imitators into formal contractual relationships.

A Multi-Level Study of Entrepreneurial Characteristics, IPR, and the Degree of Internationalization

Author: **Richard Lynch**; Middlesex U.

Author: **Zhongqi Jin**; Middlesex U.

Author: **Tianchen Li**; Middlesex U. London

An emerging topic in strategic entrepreneurial research is how institutional influences impact on entrepreneurial internationalization behavior. This paper sets out to undertake a multilevel study regarding the impact of home country IPR on the relationships among entrepreneurial self-efficacy, entrepreneurial opportunity perception, risk tolerance, and the degree of internationalization. Through a combination of the dynamic capability perspective and entrepreneurial bricolage theory, we propose a model that underpins the role of home country institutional influence, in particular, IPR during the internationalization of new ventures. Using a sample of 91 countries, we empirically test the model via multi-level logistic regression analysis

controlling micro as well as macro variables such as personal education level, gender, household income, purchasing power per capita, and GDP growth rate. Our findings suggest that higher IPR protection mechanism in the home country will strengthen the positive relationships between entrepreneurial self-efficacy and the degree of internationalization, entrepreneurial risk tolerance and the degree of internationalization. However, although the findings support the positive relationship between entrepreneurial opportunity perception and the degree of internationalization, the moderating effect of IPR protection in the home country is not supported for such relationship. Our study contributes to the literature by extending entrepreneurial bricolage theory and dynamic capability approach into international entrepreneurship research. We advance the understanding of how the protection of intellectual property in home country influences the internationalization efforts into new ventures taking consideration of the personal-level characteristics of entrepreneurs.

International Business in a Digital World (session 1373)

This symposium will discuss important research issues related to digitalization and international business, including the need to rethink and reimagine our theories, how digitalization has changed internationalization and internalization issues, the growth and management of 'instant' globalization, dealing with or becoming a digital platform, and digital eco-systems and their impact on internationalization, sources of competitive advantage in the digital economy, how digitalization can change the management and structure of the global value chain, and what firms can do to start to embrace digitalization in different aspects of the internationalization process. The panelists aim to highlight existing knowledge gaps in this domain,

International R&D (session 1372)

R&D Intensity and International Expansion - A Complex Relationship

Author: **Niron Hashai**; Arison School of Business, The Interdisciplinary Center (IDC), Israel
Author: **Ohad Ref**; Ono Academic Collage

The conventional view in international business is that, other things being equal, firms that invest more in research and development (R&D) are more likely to enter new foreign markets. In the current study, we find that this relationship is more complex than previously thought, bearing an S-Shaped relationship. From left to right on the S-Shaped curve, we show that for firms with lower R&D intensity (R&D to sales ratio) compared to their industry median, the higher their R&D intensity

and to help formulating rigorous research designs in novel settings for future high impact research.

Asynchronous

INTERNATIONAL

THEME

RESEARCH

SYMPOSIUM

ASYNCHRONOUS

becomes (but still lower than the industry median), the lower the likelihood of foreign market entry. Further along the curve, we show that firms that invest more in R&D relative to their industry median, must invest substantially more in R&D compared to their industry peers to increase the likelihood of expanding to new foreign markets. Above this point, the likelihood of expanding to new foreign markets increases with the increase in R&D intensity. Finally, we find that, at some point, for firms with extensively high R&D intensity relative to their industry peers, the likelihood of expanding to new foreign markets decreases. We further provide empirical evidence that offers plausible explanations for this counterintuitive pattern.

Intellectual Property Protection in the Global Arena - Appropriability Hazard and Competitive Threats (WITHDRAWN)

Author: **Grazia D. Santangelo**; Copenhagen Business School

Author: **Anupama Phene**; George Washington U.

We study how firms alter their intellectual property (IP) protection strategy in response to different multi-level global competitive threats that are engendered by semi-globalization. We suggest that semi-globalization yields a varying intensity of competition that reflects in uneven appropriability hazard across levels. At the macro level, firms increase the breadth of their IP protection strategy in response to a rise in the economic globalization of their home country. This is because a greater involvement of the home economy in global economic transactions makes the firm's intangibles more visible and raises the firm's perceived potential competitive threat. At the meso level, firms respond to the perceived actual competitive threat to their intangibles from global industry rivals also by increasing the breadth of their IP protection strategy, but in this case as a result of a bandwagon pressure. However, the combination of the two threats lowers the extent of the firm's breadth of IP protection strategy. This is because the firm perceives the potential threat emanating from a globalized home economy as less challenging when it has already aligned to the greater breadth of the

IP protection strategy of its global industry rivals. We test and find support for our arguments based on a sample of 1,572 world's top R&D multinationals over the period 2013-2015.

Absorptive Capacity and the Propensity for Knowledge-Seeking Acquisitions

Author: **Barclay James**; St. Mary's U. (San Antonio)

Author: **Rajeev J. Sawant**; Florida Atlantic U.

Author: **Josh Bendickson**; U. of Louisiana at Lafayette

Knowledge-seeking acquisitions (KSAs) provide significant advantages to firms with insufficiently developed knowledge bases. Yet such firms' lack absorptive capacity (ACAP), which impedes absorption of external knowledge sourced through KSAs. We take advantage of variance in acquisition motivations (e.g., KSAs, market-seeking acquisitions) to examine the propensity of such firms for KSAs. Drawing on ACAP research, we theorize that such firms direct their internal investments to develop potential ACAP (PACAP), that is, to develop knowledge identification and assimilation capabilities. Thus, such firms' greater internal research and development (R&D), increasing PACAP, increases their propensity for KSAs. Low knowledge identification costs and high knowledge assimilation capabilities reduce internal investments for PACAP and thus reduce the positive effect of internal R&D on KSA propensity. Analyses of foreign acquisitions by Taiwanese high-technology follower firms over 2001- 2008 supports our theory. We contribute to research on how firms upgrade their knowledge bases through external knowledge sourcing.

Trading Up or Trading Down? How Home Country Corruption Affects Cross-Border R&D Investments

Author: **Maximilian Von Zedtwitz**; Copenhagen Business School

Author: **Severin F. Bischof**; HSG U. of St. Gallen

Prior research has demonstrated that corruption

has largely negative effects on incoming international investments. What is less clear, however, is to what extent these negative effects are a product not of a host country's absolute level of corruption, but of the relative distance to the home country's degree of corruption. We define the Directional Corruption Distance (DCD) as the arithmetic difference between two countries' corruption levels. Avoiding distorted FDI measures, we analyze the change in Research & Development Stock (RDS) representing more than 10,000 R&D centers of 500 technology-intensive MNCs taken from the Fortune 1000 list. Qualifying earlier research employing FDI as a dependent variable, we observe that countries of lower corruption are preferred destinations (Trading Up Hypothesis), but only under certain conditions. We further show that developed countries with lower degrees of corruption tend to prefer investments in other low-corruption countries (Comfort Hypothesis). High-corruption countries, conversely, do not exhibit this behavior and appear more open towards investment in other high-corruption countries (Familiarity Hypothesis). These findings underscore the influence of contextualizing variables in the origin of investments, and suggest extended research using firm-level field data to compensate for potential bias and flaws in FDI data.

levels of English fluency seek and offer language-related advice at work in multilingual organization that adopt English as lingua franca. Extant research on language and international business highlights the generally negative impact of lingua franca on social integration in multinational organizations. We present a case study of how lingua franca positively contributes to forming ties between fluent and less-fluent English speakers, drawing on data from a Qatari multinational organization, a context where migrant- and expatriate workers outnumber (local) nationals at their headquarters and their home language is Arabic. Adopting a mixed-methods approach including participant observations, focus groups, individual interviews and social networks analyses, we find that the individuals who actively engage in LAN foster social capital (bridging and bonding) and achieve positive career outcomes - enhanced status, empowerment, and tangible rewards.

Language Diversity and Employees' Interpersonal Organisational Behaviours: An Experimental Study

Author: **Yaxi Shen**; Australian National U.

The rapid increase in international business has led to a large number of multinational corporations (MNCs) in China. Multinational corporations are usually multilingual. Different languages such as HQ language, the local language, and mixed languages are all used in Chinese organisational contexts which leads to many language diversity-related problems. Based on an experiment of 193 Chinese employees, this study explores how language diversity impacts employees' shared linguistic identity and trust over another employee, which then affects their interpersonal organisational behaviours (e.g., hiring decision, cooperative behaviour and help-seeking behaviour) towards that employee. This study contributes to the international management literature by adding knowledge to the impacts of language diversity on employees' interpersonal organisational behaviours. Through studying the mixed language, it also expands the scope of 'language diversity' in international business literature.

sharing processes. The analytical results of the multiple case study highlight a cultural embeddedness mechanism which reveals the importance of Wasta in the knowledge sharing between consulting firms and client. We discuss the theoretical and practical implications of findings for international business literature.

Consulting Market in Light of Global and Regional Trends

Author: **József Poór**; J.Selye U.

Author: **Zsuzsanna Szeiner**; J.Selye U.

Author: **Eric Sanders**; Elmhurst College

There is relatively little and accurate information on the management consulting market for interested readers. Therefore, in this article we are committed to presenting the most important global trends from different sources. We then analyze the key features of the development of the European and Central and Eastern European consultancy markets. In this chapter, we present the characteristics of the management consulting market based on marketing and business research published in various specialist literature. The sources indicate that the US consulting market is the largest and most advanced. We are convinced that management consulting providers (firms and consultants) and supply will be significantly transformed by today's and future's digitalisation / robotization and artificial intelligence.

Employees' Compliance to MNC Language Policies: Command-and-Control and Self-Regulation

Author: **Jui-chuan Hsu**; Department of Management, The Chinese U. of Hong Kong

Author: **Kevin Au**; Chinese U. of Hong Kong

Corporate language policies are argued as useful for overcoming the language barrier in multinational corporations (MNCs). However, existing empirical studies based on the command-and-control perspective give only a partial answer to why employees should comply with the policies. This study conducted a within-subjects and a between-subjects experiment to verify the command-and-control perspective and introduce self-regulation as an additional perspective. The findings lend support to command-and-control, showing that explicit implementation of policies indeed enhances employees' intention to speak the corporate language. More importantly, the findings show that employee compliance was also fostered through self-regulatory mechanism. When the choice of the corporate language is aligned with subsidiary strategic role, employees perceive the corporate language as legitimate and demonstrate higher willingness to comply with the policies. Theoretical implications on corporate language policies and practical implications for designing effective policies in MNCs are discussed.

Boundary Spanning - How to Walk the Talk with a Foreign Accent?

Author: **Carlo Brighi**; U. of Victoria

Author: **Komal Kiran Kalra**; U. of Victoria

Author: **Michal Szymanski**; EGADE Business School, Tecnologico de Monterrey

Global virtual teams (GVTs) – characterized by globally dispersed team members – are increasingly being employed to conduct projects in MNCs. Given the multilingual and multicultural nature of such teams, and the lack of physical interaction, language and communication play an important role in the

Through a consulting case study of a Chinese shipping company, this research finds that social media is preferred to ERPs for communications in supply chain IS. It was proposed that the theories of liquid communication, ubiquitous teamwork, fluid organizing and transactive memory systems explain the effect of social media compared to corporate information systems in corporate settings. Findings suggest that social media support liquid communication, the ease of shifting smoothly between multiple topics and the time allocated to communication, particularly in terms of lower time constraints. They suggest, too, that social media support teamwork, but that organization, rather than being fluid, remains structured. Most importantly, results find that social media support transactive memory systems, the understanding that each team member comes to the team with particular knowledge and skill sets and that the group trusts each team member to have those skills and to act on them. In the complexity of supply chain IS, therefore, this study shows that social media support teamwork goals and functions.

Selection and Development of Language Resources in Subsidiaries: The Case of Japanese MNCs in Asia

Author: **Heejin Kim**; Tohoku U.

Author: **Hiroshi Itagaki**; Musashi U.

Although there have been conceptual and theoretical works that describe how multinational companies (MNCs) can leverage the multilingual environment, we still know little about how MNCs deal with language diversity in their foreign subsidiaries. To address the research gap, we conducted a qualitative case study with 83 subsidiaries of Japanese MNCs in 9 Asian countries as a preliminary investigation and 34 subsidiaries of Japanese NNCs in China as a more in-depth examination. We found that in the MNCs' multilingual environment that includes parent language, local language, and English as the three main language options for the subsidiaries, the subsidiaries select their functional language based on the strategic and knowledge sourcing perspectives. The subsidiaries then mobilize and allocate managerial resources to develop distinctive language resources. Based on the findings, we developed a model that integrates strategy-oriented language selection and incremental development process of language resources in MNCs' foreign subsidiaries. The findings and the proposed model

support the view that language diversity in MNCs can be valuable resources and provide the deeper understanding about how MNCs' foreign subsidiaries develop distinctive language resources tuning to their strategic mission and knowledge source.

Ethics in Management Education (session 1375)

Cultures and Economies Apart – Similar Business Ethics Education Needed

Author: **Throstur Olaf Sigurjonsson**; full professor

Author: **Audur Arna Arnardottir**; Reykjavik U.

Author: **Hao Jiao**; Beijing Normal U.

Author: **Yunxia Zhu**; U. of Queensland

Author: **David Schwarzkopf**; Bentley U.

We investigate the areas in which cultural differences influence managers' views of business ethics, the role of business schools in preparing students to address ethical issues, and cooperation between schools and industry. Responses from 82 Chinese and 98 Icelandic managers reveal close agreement on such issues as the need for business ethics education, the role of employers in ethics training, and the benefit of cooperation between schools and businesses. Managers diverge on the tactics suggested to achieve these aims, indicating areas where cultural differences may be affecting their attitudes. Our choice of China and Iceland highlights vividly contrasting cultures. As such, it can serve as a building block for further study into the specific areas where culture affects both managers' support for business ethics education in schools and corporate tactics for enhancing that education through training. Given business schools' global competition for students, knowing how to attain these cultural differences is likely to be crucial for student and institutional development.

Mindfulness and Personal Growth (session 1379)

A collection of studies focusing on mindfulness and personal growth.

Mindfulness in Higher Education: Students' Journey in a University Mindfulness Course

Author: **Smita Kumar**; Al Akhawayn U.

This first-of-its-kind study examined the teaching of mindfulness as a curriculum for more holistic and integrated adult learning in higher education. The study adopted an interpretive phenomenological analysis to understand how students made meaning of the mindfulness curriculum. Data was collected through weekly critical reflective journals and one face-to-face semistructured interviews of 12 students and analyzed using double hermeneutics. The study showed that teaching mindfulness as a course can provide opportunities for transformation and foster a culture of compassion in learning spaces. The curriculum approach to teaching mindfulness fostered a nuanced, authentic, and comprehensive experience and learning of mindfulness. It allowed students to experience a deeper self-awareness, greater well-being, nonjudgment, discernment, compassion for self and others, discomfort of the practices, and glimpses of wisdom and profound transformation. The study suggests that this curriculum approach to teaching mindfulness balances theory and practice and allows students to be immersed in the practices,

The Ethics of Technology in Management Education

Author: **Julia Milner**; EDHEC Business School

Author: **Peter Daly**; EDHEC Business School

Author: **Trenton Milner**; INternational Centre for Leadership Coaching

Cheating is commonplace amongst business school students and is possibly facilitated by the increase in smartphone technology. This study examines the issue of ethical perceptions of digital cheating using smartphone technology in a European Business School using a quasi-experimental methodology for two samples of undergraduate business administration students (295 & 627) before and after a creativity seminar. Participants were aware of what behaviours were considered cheating and on average partook in the intervention accordingly. Nevertheless, predefined ethics did not correlate with their reported actions and the intervention showed statistically significant changes ethical stance of participants. The study showed that the choice to cheat is different from the choice 'not to cheat' - the ethics described by the individual showed very little relationship with cheating or not, similarly smartphones were not considered pivotal in the cheating process. These findings have practical implications for the conceptualisation and teaching of ethics as well as the industry preconceptions of smartphone technology. This apparent disconnect between ethics and reported use calls for further research to address implementation of ethics in pressure situations impacted by technology.

Searching for Spiritual Intuition in Management (WITHDRAWN)

Author: **Eugene Sadler-Smith**; U. of Surrey

This paper is a search for spiritual intuition in the management literature. The amount of published work on spiritual intuition is small compared with other types of intuition (creative, expert, moral and social). This literature review and conceptual paper: (a) searched for and reviewed the research on spiritual intuition in management; (b) alighted on the work of Frances Vaughan as the primary exponent of spiritual intuition; (c) traced steps backwards from Vaughan into transpersonal psychology; (d) found evidence for spiritual intuition in the work of two of the most prominent psychologists of the 20th century, James and Maslow; (e) identified links between spiritual intuition and other types of intelligences and capabilities. A contribution of this paper is that it adds a fifth type of intuition to the four types that have already been identified and shows how this is relevant for management. The types of intuition shown to be related, but they draw on different source disciplines and have different implications for management. A framework is presented which unifies five primary types of intuition. Spiritual intuition is proposed as being at the core of this framework for 'intuitive intelligence'.

Outcomes of Mindfulness Based Coaching for Managers

Author: **Shelly Rave**; Ben Gurion U. School of Management

Author: **Nurit Zaidman**; Ben Gurion U. of the Negev

Both governments and firms face the continuous challenge to maximize utility with a limited budget, however, knowledge about the way in which these organizations go about this process is relatively unknown to students. In this article, we outline an experiential exercise, based on a contemporary health policy challenge, which illustrates the ethical, moral, and team-based difficulties inherent in making decisions in instances of limited budgets and multiple stakeholders. Drawing on literature from stakeholder theory, decision-making, and groups, this highly-adaptable exercise provides students with a concrete means of learning about these issues by placing them in the context of a territorial government that must address a virulent blood-borne disease by funding a series of initiatives and having to defend these decisions both to their fellow decision-makers and to relevant stakeholder groups. The exercise has been successfully implemented in undergraduate and graduate-level classes and encourages high-quality class discussions in a wide-range of courses focused on ethics, decision-making, and teamwork.

Clues to Fostering a Program Culture of Academic Integrity: Findings from a Multidimensional Model

Author: **Kelley Packalen**; Smith School of Business, Queen's U.

Author: **Kate Rowbotham**; Queen's School of Business, Canada

Using zero-inflated negative binomial regression we identified situational, personality and contextual variables correlated with business students' self-reported rates of academic integrity violations. The most influential predictors of increasing rates were: greater estimates of peers' violations, increasingly negative perceptions of the program's academic integrity culture, and rating questionable academic behaviours less seriously. Individual priorities, personal characteristics and social support were less influential. We then analyzed our quantitative results in light of our deep understanding of the broader context to derive richer insights from the interplay of our independent variables. Importantly, our results indicate that program-led proactive messaging designed to foster a culture of academic

The research literature exploring links between mindfulness and the effectiveness of executive coaching has little to say about coaching outcomes, or about the perceptions of coachees regarding to the utility of this training orientation. Furthermore, existing research does not explore the perceived outcomes of professional coaching, and variations therein, across time. This study analyses the assessments of 14 professional managers, working in the education system and the high-tech industry, of a 12 session coaching process incorporating mindfulness practices. The participants recorded their perceptions of coaching outcomes from each session, contemporaneously, in journals. In addition, they were interviewed at two points in time—at the end of the coaching sessions, and two years later. Generally, the study shows that when individual mindfulness practices are applied in coaching sessions, their effects are similar to that of individual mindfulness practices as applied in work organization settings. On the basis of the participants' accounts, it seems quite safe to conclude that the mindfulness practices applied in the coaching enhanced their awareness of their body, thoughts and emotions—a process linked to developing the capacity to engage with multiple perspectives and to stress reduction, both leading to positive outcomes in terms of self-development, well-being and performance.

Keeping the Wheel Turning: A Review of the Contexts, Processes, and Outcomes of Service-Learning

Author: **Nathania Ancheta Chua**; ESADE Business School-Ramon Llull U.

Author: **Josep Mària**; U. Ramon Llull, ESADE Business School

Over a decade ago, service-learning scholar Kenworthy-U'ren expressed much optimism regarding the state of service-learning scholarship and contended that that the figurative service-learning wheel does not need to be reinvented. Today, service-learning research has flourished even further in the management education literature and it is our hope as researchers to keep the wheel turning by invigorating further scholarship through our literature review. We take a systematic approach to reviewing the literature of service-learning within management education with our sample of 67 articles. Upon critical assessment of the field, we provide a characterization of the various approaches to service-learning research and identified the relevant contexts, processes and outcomes in service-learning. We offer an agenda for future research and with an exciting pathway forward, we hope that this deeper understanding of the literature encourages scholars and practitioners to guarantee the longevity of service-learning within management education.

others and decision-making discernment. This paper's contribution is to understand the actual impact of such pedagogies on students' experiences and their potential transformation. Data was available from 62 participating students of diverse backgrounds, and 19 of them were interviewed to gain deeper insights on their perceptions of these experiences and transformations. Student's observations are presented and interpreted through the lens of Transformative Learning. Findings indicate that students obtained insights into themselves and others, suggesting enhanced self awareness, regulation of emotions and improved relationships. The qualitative nature of this research provides rich information on student's experiences, though at this point difficult to generalize. This is an exploratory research and will further benefit from longitudinal and quantitative methodologies as well as being able to assess the effects single practices could have on business students.

Some Rest for the Weary? A Qualitative Analysis of Clergy Methods for Managing Demands

Author: **Jeffrey Drake Terry**; Old Dominion U.

Author: **Christopher J. L. Cunningham**; U. of Tennessee, Chattanooga

Author: **Sana Lall-Trail**; College of William and Mary

In many ways, clergy (i.e., religious leaders including pastors, ministers) are an ignored yet high-risk population. In their efforts to ensure the spiritual well-being of their congregations, clergy may neglect their own well-being. Further, little is known about how clergy perceive the relationship between their work and their well-being, the strategies they use to recover from their work, and the ways they balance work and nonwork areas of their lives. This qualitative study explores these areas to further understand the nature of clergy work and recovery from work. Clergy (N = 332) were asked to respond to a set of open-ended prompts related to their perceptions of work interference with health, and strategies at and outside of work they use to manage work and nonwork demands. The present study sheds light on recovery strategies (i.e., self-care practices) and practices clergy may use to successfully manage demands in the work and

Abusive Supervision (session 1385)

Why and When Abusive Supervision Harms Voice: A Matter of Trust and Employee Regulatory Focus

Author: **Seohyun Kwon**; Seoul National U.

Author: **Jeewon Gwak**; Seoul National U.

Author: **Sunghyuck Mah**; Seoul National U.

Author: **Jihye Lee**; Seoul National U.

Author: **Seokhwa Yun**; Seoul National U.

Drawing on social exchange theory and affective / cognitive trust dimensions, this study examined the negative relationship and the underlying mechanism of abusive supervision on employee voice. Using data collected from 283 supervisor-employee dyads, the current study found that only affective trust in supervisor substantially mediated the relationship between abusive supervision and voice. Though abusive supervision has negative impact on both affective trust and cognitive trust, a mediating effect of cognitive trust was insignificant. Damage to the two types of trust turned out to have different effects on voice. Furthermore, applying a moderated mediation model and regulatory focus theory, this study investigated that employee regulatory focus moderates the strength of the indirect effect of abusive supervision on employee voice via affective trust. Concretely, promotion-focused employees less suffer from the negative impact of abusive supervision on voice, while the moderating effect of prevention-focus was rejected. Theoretical and practical implications, and limitations are discussed.

OB

Bringing Those on the Outside In: The Role of the Organization in Reintegrating Marginalized Persons (session 1390)

This symposium explores the interface between organizations and marginalized persons by examining the role that organizations may have in reintegrating these individuals into work and society at large. We define marginalization as the social exclusion of individuals or groups who are precluded from obtaining resources and opportunities necessary for their welfare. While organizational scholarship has begun to investigate the means by which organizations may be implicated in the exclusion of disadvantaged individuals, processes for inclusion remain underexamined. In this symposium, we identify several organizational strategies for the reintegration of socially excluded persons, highlight challenges and opportunities associated with such strategies, and, on the individual level, explore the effects that inclusion may have on marginalized persons' identities and well-being.

Should I Represent You? Abusive Management and Supervisor Organizational Embodiment

Author: **Darryl Rice**; Miami U.

Author: **MaQueba Massey**; Jackson State U.

In effort to extend supervisor organizational embodiment (SOE) research, we integrate social exchange and psychological detachment theories to examine and explain how abusive management impacts SOE. Consistent with social exchange theory, we propose that when supervisors experience abusive management (i.e., middle-level supervisors being abused by upper-level managers), they reciprocate in kind negatively with an unfavorable desire to embody the organization. We also position and find support that supervisor feelings of violation (FOV) mediates the relationship between abusive management and SOE.

Additionally, supervisor turnover intentions, which are an indicator of supervisors' psychological detachment from the organization, are considered as a moderator of the influence of FOV on SOE such that high turnover intentions strengthen the negative relationship. Results from a multi-source field study support our proposed second-stage moderated-mediation model. Implications for research and practice are discussed.

Abusive Supervision and Employee Relational Reputation Maintenance: A Self-Verification Perspective

Author: **Lei Huang**; Auburn U.

Author: **Ted A. Paterson**; Oregon State U.

While the current literature has largely maintained that one's experience of abusive supervision can trigger their engagement in interpersonal deviance against coworkers, our research breaks new theoretical ground by showing such experience under certain circumstances could also produce positive prosocial outcomes. We do so by integrating self-verification theory and self-concept orientation theory to explain why and under what conditions

victims of abusive supervision are motivated to maintain their relational reputation in the work group. Using time-lagged multi-source survey data from 253 employees and their supervisors working at a large convenience store chain, we found support for our proposed model. Our findings showed that those abused employees with a stronger relational self-concept had heightened relational reputation maintenance concerns and therefore were motivated to maintain their relational reputation by engaging in more helping behaviors and less interpersonal deviance directed towards their coworkers. Our findings further showed that the positive prosocial consequences of abusive supervision were the strongest when the abused employee had stronger relational self-concept and perceived a higher level of leader reputation in the work unit. We discussed theoretical implications of our research and limitations and directions for future research.

**Why and When Managers Behave Abusively
Toward Employees in the Context of Job Insecurity**

Designated as a “Best Paper” for OB

Author: **Fu Yang**; Southwestern U. of Finance and Economics

Author: **Xiaoyu Huang**; California State U. San Bernardino

Author: **Hong Deng**; Durham U. Business School

Drawing from conservation of resources theory, we offer an alternative perspective and theorize that resource depletion acts as a novel explanatory mechanism to explain why and when managers behave abusively toward employees in the context of job insecurity. We test this model through a multi-wave and multi-source field study with data collected from 508 employees of 116 teams in 23 departments over three time periods (Study 1) and an experience sampling study spread over 5 workdays with data from 42 supervisors (Study 2). Consistent with our expectations, we found that manager resource depletion stemming from job insecurity is a proximal cause of abusive supervision. Furthermore, we found that manager job insecurity is more likely to threaten and cause resource depletion and subsequently trigger abusive

behaviors for managers with low level of trait resilience and low level of political skill in the form of social astuteness. However, this effect did not exist for managers who are high on these two individual characteristics. The implications of these findings for researchers and organizations are discussed.

Depletion and Recovery (session 1383)

When is Proactive Behavior Perceived as Depleting?

Author: **Wilken Wehrt**; U. of Mannheim

Author: **Sabine Sonnentag**; U. of Mannheim

Many organizational scholars emphasize the utility of proactive behavior because it contributes to performance without putting too much strain on employees. However, recently scholars suggested examining negative consequences of proactive behavior. Following this suggestion, we examine depletion perceptions as one negative consequence of daily proactive behavior. Further, we also focus on identifying conditions in daily work contexts under which proactive behavior may be associated with depletion perceptions, namely low job control and high self-control demands. We analyzed data from 141 employees in a two-week diary study with three daily measurement points. We consider lagged effects by investigating paths from the morning and the afternoon to depletion perceptions at midday and the end of work. Multilevel modeling showed that proactive behavior in the afternoon is negatively related to depletion perceptions at the end of work. However, when daily job control was low, proactive behavior in the morning was positively related to depletion perceptions at the end of work. Daily self-control demands did not moderate the relationship between proactive behavior and depletion perceptions. Findings put the utility of proactive behavior in perspective and point to its dangers. Moreover, the study

Implicit Measures in Leadership Research: What Leaders and Followers Really Think and Why It Matters (session 1395)

In recent years, it has been acknowledged that many phenomena of interest in organizational behavior operate outside employees' complete awareness and control. The implicit processes are intuitive, spontaneous, unintentional, automatic, and sometimes unconscious. Although leadership scholars were among the earliest to discuss implicit processes (i.e., implicit theory of leader categorization), the use of implicit measures in leadership research is quite rare. The present symposium attempts to address this gap by showcasing an array of conceptual and empirical leadership studies that advocate for or utilize implicit construct measures. Two presentations will discuss the development and validation of new implicit measures to assess ILTs and leader identity. The third presentation reports a novel use of existing implicit measure of self-concept in followers and its impact on a range of important leadership and organizational outcomes. Finally, the fourth presentation will advance a new conceptualization of leader identity within an individual's goal hierarchies. The symposium aims to inspire other researchers to consider implicit measures and provides guidance and advice on how to do so.

The Role of Recovery for Daily Cognitive Appraisal of Work Demands: A Diary Study

Author: **Anne Casper**; U. of Mannheim

Author: **Wilken Wehrt**; U. of Mannheim

This study examined the role of daily recovery for cognitive appraisal of work demands in a daily diary study. We examined if psychological detachment from work during the evening was associated with changes in cognitive appraisal from afternoon to the next morning. Additionally, we examined whether these associations are mediated by state of being recovered in the morning. We collected data from 183 employees with 3 daily measurement occasions over 2 consecutive workweeks. We analyzed the data using multilevel path modeling with latent variance decomposition into within- and between-person variance parts. Results showed that psychological detachment predicted a decrease in hindrance and threat appraisal but no change in challenge appraisal from afternoon to morning. State of being recovered mediated the relationship between psychological detachment and threat appraisal but not hindrance appraisal. Psychological detachment was indirectly related to an increase in challenge appraisal via state of being recovered in the morning. Our results provide insights on predictors of cognitive appraisal and the role of recovery for the cognitive processes taking place in the stress process.

promoting behavior, employees' role in the effectiveness of such behavior and the mechanisms underlying how such leadership behavior affects their well-being have largely been ignored. We argue that health-promoting leadership behavior is most beneficial for employee well-being (here: exhaustion and work engagement) if it is congruent with employees' expectations regarding their leaders' health-promoting support. We further propose that congruent behavior relates to better employee-rated leader-member relationships (leader-member exchange, LMX) and to more health-promoting behaviors by employees, which, in turn, positively relates to their well-being. A field study and an experimental study largely supported our hypotheses. Polynomial regression analyses revealed that incongruence between expected and actual health-promoting leadership behavior negatively related to LMX quality. Furthermore, congruence effects varied with the level of health-promoting leadership: congruence at high levels (when both expected and actual health-promoting leadership behavior were high) was more strongly associated with LMX quality and employees' self-care behavior than congruence at low levels. Our results highlight the pivotal role of employees' expectations regarding leaders' health support and help in building practical interventions with regard to leaders' health promotion.

Ambivalent Effects of Challenging Job Experience on Employee Work Behaviors

Author: **Dongwon Choi**; Ewha Womans U.

Author: **Remus Ilies**; National U. of Singapore

While the literature documents many benefits of challenging job experience (CJE) for employees, recent research has begun to show the potential negative impact of CJE on stress. To articulate both the positive and negative effects of CJE and their boundary conditions, we first adopt a dual pathway approach on motivation and stress in the job demands-resources theory. Specifically, we examine the effects of CJE on active learning, creativity, and work withdrawal, mediated by work engagement and emotional exhaustion. Second, integrating the matching principle of stress (De Jonge & Dormann,

2003, 2006; Frese, 1999), we examine the moderating role of proactive personality and leader-member exchange. We propose that proactive personality will facilitate (mitigate), whereas leader-member exchange (LMX) will mitigate (aggravate) the positive effect of CJE on positive (negative) work attitudes and behaviors.

Impression Management: Advancing Our Understanding of How and Why Applicants Succeed in Interviews (session 1389)

Impression management (IM) refers to tactics used by individuals to influence the image others have of them. Such tactics are particularly relevant in situations where making a good impression is crucial, such as job interviews. Extant research has uncovered individual differences associated with IM use, the existence of various types of IM tactics, and the potential impact of IM on interview performance ratings. Yet a number of critical questions remain unanswered. For instance, there have been calls for more research on antecedents of IM use, the differences between authentic and inauthentic (i.e., honest and deceptive) forms of IM, the relative effectiveness of various IM tactics, the cross-cultural implications of IM, or the role played by technology. This symposium includes four papers and a discussant that address these calls and thus advance our understanding of the intricacies of IM, its antecedents, and its outcomes. The present symposium makes three main contributions. First, it uncovers new important but under-researched antecedents of applicant IM use and effectiveness, such as how interviewers describe the job during the interview and the use of technology-mediated interview formats. Second, it emphasizes the important role played by cultural values in the way applicants engage in IM, the way IM is judged by interviewers, and ultimately, how IM impacts interview outcomes. Lastly, this symposium not only confirms existing empirical evidence about the weak

New Frontiers in Teamwork: The Power and Potential of Studying Invisible Structures in Teams (session 1397)

The purpose of this symposium is to promote research that represents the new frontiers of teamwork. Specifically, we bring together research that examines “invisible” structural elements in teams, with the aim of starting a dialogue about how to study these structures. Structures may be invisible because they are extremely novel and therefore uncommon, or because we currently lack frameworks to “see” them. We hope that by bringing together cutting edge team research on topics such as Temporal Brokerage, Team-Level Algorithmic Control, Hierarchical Flexing, and Collective Emotion Culture Crafting, we can 1) establish a need for “seeing” invisible structures, 2) encourage the study of novel structural phenomena, and 3) reinvigorate the broader full-cycle OB research paradigm.

Aliens on Board: The Effect of Intergroup Contact on Political Ideology at NASA

Author: Thomas John Fewer; PhD Candidate, Drexel U.

Author: Murat Tarakci; Erasmus U.

Organizations are major social settings in which interactions between individuals with differences in political ideologies take place. Does interacting with outgroups shape individuals' political ideologies? To answer this question, we draw from the contact hypothesis, which argues that intergroup contact leads to favorable intergroup attitudes. We go one step further and hypothesize that intergroup contact influences individuals' political ideologies. We test our theory in NASA's manned space missions from 1967-2019, which offer a unique, confined, and isolated setting to examine the effects of intergroup contact. Our findings support the notion that positive intergroup contact leads to a shift towards a liberal political ideology.

approximately 2.25 million Q&A tasks in a Chinese online health Q&A platform across half a year and illustrations from a preliminary study with approximately 240-hour observation and 43 semi-structured interviews, the results significantly support these hypotheses. Overall, these findings offer insight into the evolving challenges that traditional organizations face in dealing with the transformation of work from traditional work to the new world of work caused by the digital revolution.

Development and Validation of a Scale to Measure Cognitive Demands of Flexible Work Organization

Author: **Roman Prem**; U. of Graz, Austria

Author: **Bettina Kubicek**; U. of Graz, Austria

Author: **Lars Uhlig**; U. of Graz, Austria

Author: **Vera Baumgartner**; U. of Vienna

Author: **Christian Korunka**; U. of Vienna

With globalization, digitalization, and the spread of information and communication technologies, rules regulating work have been softened or completely abolished. As a consequence, employees face additional cognitive demands to plan, structure, and coordinate their work. In order to capture these demands of contemporary work, we constructed and validated the Cognitive Demands of Flexible Work (CODE) scale. The scale comprises four subscales (i.e., structuring of work tasks, planning of working times, planning of working places, and coordinating with others). We validated the scale in three independent samples (N = 1129) in both English and German. Confirmatory Factor Analyses supported the four-factor structure as well as the metric invariance of the different language versions. Moreover, the subscales showed convergent validity with related constructs such as requirements for problem solving or autonomy. Criterion validity for emotional exhaustion, engagement, and problem-solving pondering suggests that cognitive demands of flexible work organizations can be construed as challenge stressors. However, relationships with emotional exhaustion only showed when autonomy was controlled for. Overall, the CODE scale was shown to be a reliable and valid instrument to measure cognitive demands of flexibly organized work.

Multi-Level Considerations in Executive Organizational Transfer

Author: **Kip Kiefer**; Rollins College

Author: **John A. Martin**; Wright State U.

Although the domain of executive mobility has received considerable scholarly attention, researchers have paid comparatively less attention to the drivers and outcomes of executive mobility, despite anecdotal evidence that board members, employees, shareholders, customers, suppliers, communities, and pundits all closely track and critically assess the movement of executives. Cognizant of the disconnect between the perceived importance of executives by stakeholders and the relative lack of explanatory executive mobility frameworks, this paper takes important steps to identify and define the challenges associated with executive organizational transfer (EOT). Our multi-level analysis of EOT enhances and extends human-capital theory by building an explanatory model of how stakeholders' beliefs about the transferability of individual-level and firm-level reputation, attractiveness, and power impact the inter-organizational movement of executives. Critical to this process is the moderating effect of political skill, which executives can employ to manage the complex web of stakeholder relationships. Our framework offers a much-needed integration of the varied mechanisms that influence successful or unsuccessful EOT and offers a roadmap for future research.

A Conceptual Analysis of Social and Self-Centered Obligations Resulting from Idiosyncratic Deals

Author: **Franziska M. Renz**; U. of Texas at El Paso

Idiosyncratic deals (i.e., i-deals) theory was founded on social exchange theory which remains the predominant theoretical basis to explain the associations of i-deals. Yet, conflicting and inconclusive research findings demand scholars to broaden their sight and explore alternative theoretical foundations to move i-deals research forward. In this study, i-deals are conceptually examined through the lens of psychological ownership theory. A basic assumption of i-deals theory is challenged – i.e., organizations benefit from the employee who has received an i-deal (i.e., i-dealer). Scholars' established perspective of i-deals as creators of social obligations is questioned and redirected towards a perspective of i-deals as creators of self-centered obligations. Self-centered and social obligations interact and are moderated by relative i-deals. Organizational citizenship behavior, psychological ownership, territoriality, and overconfidence are discussed as desired and undesired outcomes of i-deals originating from the i-dealer. Future research opportunities are presented at the end.

Exploring Types of Telecommuters: A Latent Class Analysis Approach

Author: **Arne Vanderstucken**; The Open U., Netherlands

Author: **Irina Nikolova**; U. of East Anglia

Author: **Jeroen De Jong**; The Open U., Netherlands

Author: **Monique Ramioul**; KU Leuven

In the current study we explore how different reasons for telecommuting tend to co-occur within an individual, i.e., which types of telecommuters exist. A Latent Class Analysis uncovered three distinct types: the job requirement class (telecommuting because one has to), the efficiency class (telecommuting to cope with deadlines and pressure) and the work-life balance class (telecommuting to have a healthy balance between

beneficial thus far, it may be inconsistent with the realities that most individuals face in organizations. Rather, we suggest that individuals' sense of power changes, even within a given day. Thus, we introduce the concept of power fluctuation to better explain the phenomenon that one's sense of power varies over time. We position power fluctuation as a form of micro-role transition and draw from the social distance theory of power to posit that such fluctuation throughout the day has both positive and negative consequences. Specifically, we suggest that daily power fluctuation increases perspective taking and contribution to team performance, but those benefits come at an emotional cost (i.e., frustration and emotional exhaustion). The results of our multilevel experience sampling study of 845 matched-responses from 103 employee-coworker dyads largely support our predictions of the manifestation and consequences of power fluctuation. The implications of power fluctuation for theory and practice are discussed.

How and When Leader-Member Exchange Leads to Followers' Deviant Behaviors: A Power Perspective

Author: **Weipeng Lin**; Nankai U.

Author: **Jingjing Ma**; Hong Kong U. of Science and Technology

Author: **BAOYI FENG**; -

Author: **Xiao Jun Zhan**; professor at J.X. U. Finance & U.

Although leader-member exchange (LMX) has been widely studied, little is known about its potential effects on employees' deviant behaviors. Drawing on the power perspective, we develop a multi-level moderated mediation model to examine how and when LMX might affect employees' destructive and constructive deviance behaviors within a team context. Using a sample of 467 employees working in 115 teams from 9 companies, we found that a team member's within-group relative LMX (RLMX) was positively related to his/her psychological power. Psychological power, in turn, had a positive relation with destructive deviance for employees with low moral identity and employees under low levels of team monitoring. This relation did not emerge for employees under high levels of team

work and family/leisure). Follow-up analyses showed that employees belonging to the same class also tend to share a certain context (in terms of job characteristics such as speed of work and autonomy). Furthermore, the telecommuting motive classes predicted outcomes six months later: whereas employees in the job requirement class didn't experience any outcomes, employees in the efficiency class reported more vigor and less emotional exhaustion, and employees in the work-life balance class reported more vigor, less emotional exhaustion and more job satisfaction. Implications for theory and practice are discussed.

Resilience and Psychological Capital (session 1388)

Psychological Capital and Performance: Roles of Thought Self- Leadership, Engagement, and Feedback

Author: **Bindu Gupta**; IMT Ghaziabad

Author: **Rakesh Singh**; Institute of Management Technology, Ghaziabad, India

Author: **Sandeep Puri**; Asian Institute of Management

Author: **Pankaj Rawat**; Maruti

The purpose of this study is to examine the effect of sales employee's psychological capital (PsyCap) on performance through the interplay of work engagement and performance feedback. It also advances the agenda of examining thought self-leadership (TSL) as an antecedent of PsyCap. A hypothesized model was tested using survey data collected from salespeople from different industries in India. A structural equation model was used to test the hypotheses. The results demonstrate that TSL drives PsyCap in salespeople. The results also suggest an interesting interplay between a salesperson's PsyCap and his/her sales performance through work engagement as a mediator for PsyCap

Self-Regulation and Proactive Behavior (session 1384)

From 'Adaptor' to 'Aggrieved': Examining Physical Workspace Transitions as a Self-Regulatory Process

Author: **Sarah Bankins**; Macquarie U.

Author: **Maria Tomprou**; Carnegie Mellon U.

Physical workspaces are increasingly dynamic, requiring employees to adapt to newer, more open, and more flexible physical environments. While there is significant research on the relationship between physical workspace and aspects of employees' working lives, such as their interactions, performance, and satisfaction, we still know little about the factors shaping individuals' experiences of workspace changes. We utilize self-regulation theory to examine daily adjustment processes and the behavioral and cognitive responses individuals employ throughout a workspace adjustment. We do so by conducting a longitudinal mixed method field study, situated within an organization space change. It comprised a seven-day diary study during the change, plus pre-move and post-move surveys, complemented by two waves of in-depth interviews with employees before and after the transition.

and sales performance. The results for the moderating effect of positive and negative feedback on the effect of PsyCap on work engagement were not significant. The research suggests that a salesperson's PsyCap relates positively to sales performance through work engagement. It also suggests that TSL strategies strengthen the salesperson's PsyCap. The results suggest that organizations should invest in training to enhance TSL which will lead to enhanced performance through effective personal resources such as PsyCap. The results of the study enrich the extant information on PsyCap and sales performance linkages by suggesting mediation mechanisms and proposing an integrated framework with work engagement

The Contagion Effect of PsyCap: A Review and Future Directions

Author: **V Venkatanagarajan**; Department of management studies, Indian Institute of Technology Madras

Author: **T J Kamalanabhan**; Department of management studies, Indian Institute of Technology Madras

The idea of psychological capital spreading and becoming contagious has garnered a great deal of curiosity from scholars and practitioners alike. Yet, the exact nature of PsyCap contagion, and when and how it operates upward, downward, and laterally are far from clear. This paper presents a systematic review of the extant literature on PsyCap's contagion effects with the twin-goal of clarifying the state of knowledge in the field and outlining an agenda for future research. Drawing broadly from the intersection of positive organizational behavior and contagion literatures, we propose a definition of PsyCap contagion and call for scholars to identify the underlying mechanisms through which PsyCap spreads and explore possible factors that may promote or hinder its contagion effects at multiple levels of analysis. We conclude by offering a roadmap for researchers to further the advancement of the field.

[view paper \(if available\)](#)

Quantitative findings showed daily adjustment efforts (identity marking) positively related to daily goal progress and work engagement, but daily job crafting was negatively related to these outcomes. However, both forms of adjustment efforts (marking and crafting) positively related to overall feelings of effective space adaptation two months post-move. Interview findings further unpack these results, highlighting the dynamism, but also potentially depleting nature, of self-regulatory processes during a space change. By generating a typology outlining categories of adaptation, we highlight the varied ways in which employees adapt or resist a workspace change and the factors that lead some employees to spatially adjust better than others. Research and practical implications are discussed.

The Role of Mindfulness in the Enactment of Disruptive Impulses at Work

Author: **Konrad Senf**; andré media group

Author: **Erik Dietl**; Loughborough U.

Mindfulness captures two key components of self-awareness that are relevant to self-control. Present-moment attention is necessary to detect discrepancies between higher-order goals and the present moment in order to deal with disruptive impulses. When awareness of disruptive impulses leads to negative cognition, non-judgmental acceptance may help reduce negative effects by diminishing the need to engage in emotion regulation, thus supporting the continued focus of one's attention on a given task. Considering the severe consequences of self-control failure at work, we examined whether both facets of mindfulness relate negatively to the enactment of disruptive impulses (i.e., impulses that interfere with one's higher-order goals). In an experience-sampling study assessing multiple episodes of disruptive impulses per day over two workweeks, we found that both mindfulness facets negatively predicted the enactment of disruptive impulses. Moreover, non-judgmental acceptance buffered the relationship between strong perceptions of disruptive urges and their enactment. Our findings contribute to the understanding of the relationship between mindfulness and self-control at the workplace.

Individual and Team Resilience: An Integrated Perspective

Author: **Adam J. Vanhove**; James Madison U.

Author: **Chelsea LeNoble**; Embry Riddle Aeronautical U.

Author: **David Fisher**; U. of Tulsa

The topic of resilience has attracted much attention in the organizational sciences as applied to both individual- and team-level functioning. However, these two major foci of interest in relation to resilience (individual and team) have been largely examined in separate streams of literature. This undue separation is problematic, as such an approach fails to address the inherent interrelatedness of resilience at both levels. Furthermore, to the extent that the literatures on individual and team resilience continue to accumulate in isolation, opportunities and efforts aimed at reconciling these separate perspectives may become increasingly scarce and challenging. To rectify this, we aim to integrate theory from the individual and team resilience literatures to promote a more holistic treatment of the construct. We first present a common framework for conceptualizing resilience at both the individual and team levels. This is followed by consideration of the interrelation between individual and team resilience, which we characterize in terms of cross-level effects. Ultimately, the integrated perspective that we describe advances the resilience literature by offering insight towards resolving fundamental theoretical issues that have long plagued the separate individual and team resilience literatures.

Why Taking Charge Needs More Inclusive Relationships

Author: **Amjad Younas**; U.of Science and Technology Beijing, Donlinks School of Economics and Management

Author: **Daoping Wang**; U.of Science and Technology Beijing, Donlinks School of Economics and Management

Author: **Basharat Javed**; NAMAL College Mianwali

Based on the tenet of social cognitive theory current research investigated the effect of relational mode of leadership (i.e., inclusive leadership (IL)) on taking charge with mediating role of creative self-efficacy (CSE) and moderating role of domain-relevant skills (DRS). Data were collected using separate sources (supervisor- subordinate dyads) from 301 employees of 123 work teams working in different small and medium size enterprises (SMEs) in Pakistan. Using structural equation modeling the results revealed the positive relationship between IL and taking charge and CSE was found as significant mediator in this relationship. The results further confirmed that DRS moderated the relationships between IL-taking charge, IL-CSE, and the indirect effect of IL on taking charge via CSE. Implications for research and practice are also discussed.

It's a Matter of (the Right) Fit: The Effects of Leader-Follower Complementary Fit

Author: **Juliana Arcoverde Mansur Kopp**; FGV EBAPE

Author: **Filipe Sobral**; EBAPE/FGV

Author: **Urszula Gabriela Lagowska**; NEOMA Business School

Based on the complementary fit research on person-environment (P-E) fit, the present study relies on the idea that leadership is an environmental supply that followers use to satisfy their psychological needs. Specifically, we examine follower regulatory focus as an expression of

stressors (i.e., time pressure, job complexity) on employee resilience. Specifically, this paper provides insights into potential explanatory mechanisms (i.e., learning, cognitive irritation) for how challenge stressors influence resilience. A two-wave time-lagged design was applied to examine the influences of challenge stressors and explanatory mechanisms on employee resilience after 2 months. Data from 385 participants (48.6 % male) were used for analysis with a Bayesian structural equation model. Results indicate that time pressure and job complexity are negatively related to employee resilience via cognitive irritation. In contrast, a positive indirect effect of job complexity and resilience via learning was found. Neither time pressure nor job complexity showed an overall total effect on employee resilience 2 months later. This paper contributes to existing occupational resilience and stress research by highlighting underlying mechanisms that explain relationships of stressors on employee resilience. Moreover, the results help us to gain a deeper understanding of which factors foster or drain employee resilience.

followers' psychological needs and assess leaders' behaviors (paternalistic vs. empowering leadership) as environmental supplies to investigate the effects of person-supervisor fit effects on followers' psychological states, in-role performance, and creativity. Consistent with our predictions, the results from three experimental studies (including two business simulations) suggest that paternalistic leadership fulfills the needs of prevention-focused followers, whereas empowering leadership fulfills the needs of promotion-focused followers. Further, we find the effects of complementary fit are directly related to psychological safety and performance outcomes, being mediated by the former. Moreover, we show that the effects of complementary fit on follower outcomes cannot be explained by leader-follower regulatory fit.

Shame at Work: Multiple Conceptualizations of Shame and its Impact on Individual Outcomes (session 1393)

The role of shame in organizations is an increasingly interesting topic of study for scholars with high relevance to practitioners. Commonly defined as the feeling associated with self-criticism following failure, shame is likely a pervasive emotion in organizational environments. This is important because research suggests that shame relates to a number of outcomes - both adaptive and maladaptive - that relate to organizational life. Despite this, the study of shame in organizations is still in its infancy and a number of questions remain unanswered. We present four papers that each represent different contemporary approaches to

OB

The Management of Identity-Based Conflicts: New Directions in Justice Research (session 1392)

This symposium explores a recently intensifying phenomenon of how actors manage their public identities in the #MeToo era - an era that highlights the tensions among those seeking distributive justice, due process, accountability, and endorsing psychological safety. We explore this phenomena through the lens of organizational justice, thereby broadening its application and relevance by raising new research questions and domains of study. In particular, we explore how one's social identity shapes the aftermath of organizational conflicts, including how harshly (and why) actors' actions may be judged and whether actors may (or may not) be forgiven, redeemed, and reintegrated. Three papers speak to these topics. Most of the symposium will

studying shame. For example, across these papers we conceptualize shame as an element of organizational culture, an individual difference, and as a felt emotion resulting from one's own behavior (direct shame) as well as from the behavior of someone else (vicarious shame). In addition, two of the papers seek to add clarity to the shame construct, specifically by developing a new measure and by differentially testing dimensions of an existing measure. Finally, these papers address both the antecedents to, and outcomes of, shame. Taken together, we believe that this session presents a well-rounded view of the state of shame research and will hopefully foster rich discussion on the role of shame in organizations.

Creativity and the Alignment between Chronotype and Time of Day (WITHDRAWN)

Author: **Jana Kühnel**; U. of Vienna

Author: **Ronald Bledow**; Singapore Management U.

Author: **Markus Kiefer**; Ulm U.

We examine the influence of chronobiological processes on creativity, specifically the influence of a person's chronotype. Chronotype refers to the setting of a person's biological clock that gives rise to a distinctive pattern of sleep habits and preferred diurnal activity. We propose a synchrony effect and predict that people display peaks in creativity during a work day when the external clock is aligned with their internal, biological clock. According to our model, positive mood and creative self-efficacy act as affective and cognitive mechanisms of this synchrony effect. We present a one-day experience sampling study with 339 employees to test our theorizing. In support of our hypothesis, we find peaks in creativity when employees' biological clocks and the time of day were 'in sync'. Early chronotypes showed peaks in creativity in the morning, while late chronotypes showed peaks in creativity in the late afternoon. The study further demonstrates that positive mood and creative self-efficacy are parallel mediators of the synchrony effect. We discuss the theoretical and practical implications of these findings against the background of an embodied cognition perspective on creativity.

Fast or Slow: How Temporal Work Design Shapes Time Perception and Job Performance

Author: **Helen Hailin Zhao**; U. of hong kong

Author: **Hong Deng**; Durham U. Business School

Author: **Rocky Chen**; Hong Kong Baptist U.

Author: **Wei Zhang**; U. of hong kong

Time perception, the extent to which employees perceive the passage of time as being fast or slow, is a fundamental aspect of workers' job experience that has been overlooked in work design theory. We identify two novel work characteristics that can speed up employees' time perception: low temporal expectancy and high time segmentation. Low

The Other Side of Being Trusted: Joint Effects of Cognitive and Affective Trust on Work Performance

Author: **Jeeyoung Kim**; Ewha Womans U.

Author: **Myung-Ho Chung**; Ewha Womans U.

This paper examines the effect of being trusted (i.e., trustee's, not trustor's perspective) on individual task- and proactive performance. In particular, we develop a theory of trust networks, which refers to the whole sum of trust relationships around an individual (trustee). Beyond dyadic-level trust relationships, we shed a new light on individuals' centrality in two dimensions of trust networks, cognitive-trust centrality (CT) and affective-trust centrality (AT), and examine the joint effects of the two types of trust centrality on employee performance. Drawing on social network theory and conservation of resources (COR) theory, we argue that a central position in trust networks is a double-edged sword for individual performance. Using two-wave survey data from 122 employees in Korea, we found the differential positive effects of trust centrality, which means that different performances require different trusts. Further, we also found the joint effects of two trust relationships. Specifically, individual performance is higher when two types of trust centrality are incongruent (high CT-low AT or low CT-high AT) than when two types of trust centrality are congruent (high CT-high AT or low CT-low AT). We discuss the theoretical and practical implications of these findings.

Partners and Strangers: How the CEO Deals with the Tension Between Trust and Control in the TMT

Author: **German Cespedes**; IPADE Business School

Author: **Monica Franco**; Cranfield School of Management

Author: **Patrick Reinmoeller**; IMD

Author: **Julian Sánchez**; IPADE Business School

By interviewing 50 members of the Top Management Teams (TMT) of six top Mexican corporations, we explore how the CEO balances the relationship between control and trust. The

temporal expectancy means the job is organized such that employees do not need to wait for something to happen in the uncertain near future. High time segmentation occurs when a large chunk of work time is divided into shorter time segments. These work characteristics divert employees' attention away from thinking about time, such that time seems to pass more quickly and employees can focus and perform more effectively. We tested this theory in three studies. First, in a serendipitous field study (N=221), we showed that these work characteristics exist and shape time perceptions as hypothesized. Second, in two laboratory experiments, (N = 116 and N = 112), we manipulated temporal expectancy and time segmentation, respectively, to affect employees' time perception and task performance. Third, in a time-lagged design (N=284), we showed that time perception mediates the relationships between temporal work characteristics and job performance.

Multi-Teaming: An Opportunity or a Threat for Team Creativity? A Temporal & Informational Exploration

Author: **Mayssa Rishani**; Erasmus U. Rotterdam

Author: **Inga Jasmin Hoever**; Erasmus U. Rotterdam

Author: **Dirk Van Dierendonck**; Rotterdam School of Management, Erasmus U.

The pervasiveness of multiple team membership in organizations that prioritize team creativity raises the important question of how multi-teaming affects creativity? Unfortunately, prior research on multi-teaming and creativity is limited to a few studies at the individual level. Knowing that the benefits and costs of multi-teaming are not homologous across levels of analysis, we address this question at the team level. We specifically examine key temporal (i.e., time pressure) and informational (i.e., information acquisition from other teams) mechanisms that underlie this relationship. We posit that the effect of multi-teaming on team creativity via time pressure is contingent on focal team synchronicity, and via information acquisition is contingent on focal team information usefulness. Our findings uncover a negative indirect effect of multi-teaming on team creativity via time pressure

complement-substitution tension is jointly affected by "what" forms of control are applied in conjunction with "how" those forms are applied. We explore the potential choices that a CEO leader face to solve this tension: how to reach a final decision (outcome control), how to facilitate a discussion (a form of process control), and how to structure a debate (process design).

Trust Consensus Within Culturally-Diverse Teams: A Multi-Study Investigation

Author: **Bart De Jong**; Australian Catholic U.

Author: **Nicole Gillespie**; U. of Queensland

Author: **Carol Gill**; Melbourne Business School

Author: **Ian O. Williamson**; Victoria U. of Wellington

Despite tremendous progress towards understanding trust within teams, research has predominately conceptualized team trust as a shared group construct, focusing almost exclusively on trust magnitude (i.e., mean level of trust) while ignoring trust dispersion (i.e., within-team differences in trust). Furthermore, the emerging literature on trust dispersion has mostly treated it as a construct of secondary importance, by focusing on its role as a moderator of trust magnitude. As a result, we know little about this critical property of team trust, its determinants, and independent impact on team outcomes (beyond trust magnitude). We address this limitation by examining 'team trust consensus' – a configural group construct capturing the extent to which team members share their levels of trust in the team – as a variable of theoretical and empirical interest in its own right. Cross-sectional data from a multi-organizational team sample (Study 1, N = 120) provide initial support for our propositions that national culture diversity negatively impacts trust consensus, and that trust consensus positively impacts team performance. Expanding on these findings, we propose a contingency model in which the negative impact of national culture diversity is mitigated by team virtuality and collective leadership. Multi-wave data from an MBA team sample (Study 2, N = 95) offer support for these propositions and replicate the positive direct effect of trust consensus on team performance. Our

when the team communicates mostly in a synchronous manner. The informational path proved to be more complex. Though multi-teaming promoted information acquisition, this information resource did not facilitate team creativity when information usefulness is high. However, exploratory analyses revealed distinct effects on creative outcome novelty and usefulness. Our theoretical model was tested using time-lagged surveys in a sample of 92 teams based on 509 students in a university in the Netherlands.

The Role of Time in Time Pressure: Dual Pathways Between Time Pressure and Engagement

Author: **Xinxin Lu**; U. of Illinois at Chicago

Author: **Donald H. Kluemper**; U. of Illinois at Chicago

The study of time pressure in organizations has yielded inconsistent findings in the extant literature. We posit that these seemingly inconsistent results can be understood through dual mediating mechanisms and by accounting for different temporal dynamics. Integrating the transactional model of stress with temporal theory, the present research seeks to explore the short-term nature of dual cognitive and emotional mechanisms underlying the time pressure-engagement relationship. In a diary study (N=192, 5 consecutive days), LGM results indicated that at the episodic level, challenge stress appraisal and anxiety sequentially and positively mediate the effect of time pressure on work engagement, while hindrance appraisal and hope negatively mediate the effect of time pressure in sequence. In contrast, at the chronic level, challenge appraisal and hope in sequence positively mediate the effect of time pressure on work engagement, while hindrance appraisal and anxiety negatively mediate the effect of sequentially. This research provides evidence that time pressure simultaneously exerts challenge and hindering effects and sheds light on key temporal boundaries of the transactional model of stress.

The Double-Edged Sword of Serving: Servant Leadership, Motivational Climate, and Small Firm Performance

Author: Therese Egeland Sverdrup; NHH Norwegian School of Economics

Author: Alexander Madsen Sandvik; NHH Norwegian School of Economics

Author: Vidar Schei; NHH Norwegian School of Economics

Author: Claudia Buengeler; Kiel U.

Servant leadership has been linked to a large number of organizational outcomes. However, little is known about the mechanisms that explain the servant leadership-outcomes relationship. This study examines whether perceived motivational climate explains the link between servant leadership and small firm performance. Perceived motivational climate has two components: a mastery climate, in which cooperation, development, and effort are rewarded, and a performance climate, in which competition and rivalry are rewarded. Given servant leadership's focus on learning and growth, we hypothesized that servant leadership would stimulate a mastery climate and hinder a performance climate. We tested these assertions in a multi-source, time-lagged study of 120 small accountancy firms. The results show that servant leadership was positively related to mastery climate, which in turn was positively related to firm-level helping behavior. Servant leadership was negatively related to performance climate, which in turn was positively related to financial performance. Thus, servant leadership comes as a double-edged sword; it positively relates to a mastery climate and thereby stimulates firm-level helping behavior but negatively relates to financial performance through suppressing a performance climate.

Examination of Employee Motivation in Public Organizations

Designated as a "Best Paper" for OB

Author: **Mohammed Laid Ouakouak**; Gulf U. of Science and Technology

Author: **Michel Zaitouni**; Gulf U. for Science and Technology

Author: **Bindu Arya**; U. of Missouri, St. Louis

Motivation constitutes a central topic for business management, because of its critical impact on job performance. Therefore, understanding the dynamic mechanisms that organizations can use to promote and maintain employee motivation is of great interest for both scholars and practitioners. This study accordingly investigates how ethical and emotional forms of leadership might influence employee motivation and thus job performance. A survey-based study includes 607 employees working at public organizations, and the results of the structural equation modeling procedure indicate that both ethical and emotional leadership enhance employee motivation. In turn, employee motivation has a positive impact on job performance. The results also show that job performance exerts a negative effect on quitting intentions. Finally, interest in the private sector moderates the job performance–quitting intentions relationship. These findings provide theoretical contributions to extant literature, as well as important practical implications for managers.

Moral Self-Reflection and Leaders' Virtuous Behaviors (WITHDRAWN)

Author: **Mengying Xie**; Rutgers U., Newark

Author: **Danni Wang**; Rutgers Business School

Self-reflection, defined as the extent to which a person inspects and evaluates his/her thoughts, feelings, and behaviors, has been considered as part of self-consciousness in philosophy and the psychological self-regulation literature. We seek to extend the knowledge on self-reflection and behavioral ethics by adding an explicit moral component to self-reflection and by examining its effect on the leaders' virtuous behavior. Building on the conceptions of moral self-reflection in Confucian

and Western psychological research, we propose that moral self-reflection consists of self-introspection on the morality of intentions, habits, and the adherence to community norms. We further propose that moral self-reflection increases the leaders' humble behaviors and ethical leadership but inhibits abusive supervision by providing other-oriented cognition (leader other-benefiting accountability). We use a mixed design of qualitative and quantitative studies for testing the theoretical model, which consists of 1) professional and manager interviews to generate items of moral self-reflection, 2) exploratory and confirmatory factor analyses to validate the moral self-reflection measure, and 3) a field study of managers and their subordinates.

Interactional Justice and Cognitive Rumination Explain Effects of Empowering Leadership on Home Life

Author: **Minseo Kim**; Griffith U., Brisbane, Australia

Author: **Terry A Beehr**; Central Michigan U.

Author: **Arpana Rai**; Indian Institute of Management, Udaipur

The present study examines a serial mediation model based on resources theories, in which empowering leadership predicts the nature of work-home interfaces via organizational justice and work rumination. The study's examination of work rumination extends prior research on work-home interfaces and allows for testing the potential effects of organizational resources (i.e., empowering leadership and organizational justice) on non-work life. Two waves of data with a one-month interval were obtained from 195 full-time Korean employees. Structural equation modeling assessed mediation first by two forms of organizational justice (interpersonal and informational) and then by two forms of work rumination (positive and negative). The results generally supported the mediation model, showing that empowering leaders helped subordinates' work-home enrichment, because they enhanced feelings of both interpersonal and informational justice, resulting in positive work rumination about their work experiences. Empowering leaders also helped reduce subordinates' work-home conflict through

Decoding Digital Transformational Outsourcing: Role of Service Providers' Capabilities

Author: **SUDIPTO MAZUMDER**; Indian Institute of Management, Indore

Author: **Swapnil Garg**; Indian Institute of Management, Indore

The shift in value creation activities from the client to the service provider and pervasive digital penetration is disrupting the Information Technology enabled Services (ITeS) outsourcing industry. In comparison to the extant traditional model, which primarily focused on operational effectiveness driven through labor arbitrage benefits, the outsourcing service providers (OSPs) now play significantly larger roles in the new Digital Transformation Outsourcing (DTO) scenario. OSPs now need a uniquely different set of capabilities to deliver the new value propositions, as they adapt to handle complete business functions on behalf of their clients and become partners in delivering integrated digital solutions with strategic business outcomes. We study twenty-six of the largest global ITeS providers taking the dynamic capability view, and we theoretically identify the important capabilities in the DTO scenario. Using fuzzy-set Qualitative Comparative Analysis (fsQCA), we explore recipes for OSP success and failure in the DTO context by analysing a novel firm capability dataset that we created using firm-level information

from industry analyst reports and databases. We find the capability recipes to vary by the narrow/broad scope of OSPs.

The Changing Value of Enterprise Architecture Capability Maturity

Designated as a "Best Paper" for OCIS

Author: **Andrea Carugati**; Aarhus U.

Author: **Lapo Mola**; SKEMA Business School

Author: **Joao Cunha**; -

Author: **Walter Fernandez**; U. of New South Wales

In the past two decades, enterprise architecture (EA) has become progressively more popular. However, despite increasing interest, enterprise architects still struggle to clearly demonstrate the value of their work. Indeed, the EA value frameworks described in the literature propose a static idea of value and do not consider the evolution in maturity of EA capabilities in organizations. In this article, the goal is to explore how EA value evolves with the maturity of EA capability. We do so using an in-depth case study that was conducted at GMEM, a global electronics manufacturer with multiple years of experience with EA. On the basis of the case analysis, we show that the business value of EA is multidimensional and that it changes as a concept because it changes as organizations gain more experience with EA. We develop a framework for EA business value that matches the evolution in maturity of EA capability.

Identity Projection for Growing Digital Venture: An In-Depth Study of a Chinese Short Video Venture

Author: **Shiyuan Liu**; Warwick Business School

Author: **Ola Henfridsson**; U. of Miami

Author: **Joe Nandhakumar**; U. of Warwick

Identity, a holistic organization definition of what they do and who they are, is pivotal to help make sense and explain actions in organizational practices. In digital venture context, identity presents unique features of continuous and rapid

change which deeply resonates with growth strategies of organization. However, the role of identity shift in facilitating digital venture growth remains relatively unexplored. We report on a longitudinal study of a Chinese short video venture called Douyin, and we focus on how four times of identity re-projecting are shaped to facilitate venturing growth in terms of user acquisition and user activation over two years. Drawing upon von Hippel and von Krogh's (2015) and Gioia et al.'s (2017) conceptualization of dynamic need-solution design pairing, we develop understanding of digital venture identity as a both purposeful and emergent process that is co-shaped by reflective and evolving innovation actors over time. Dynamically re-projected identities serve as an "elastic filter" that on one hand guides to identify and select viable growth strategies related to user acquisition (value intensity increase and user channeling) and user activation (value scope expansion and user seeding) in a patterned way, and on the other hand allows for developing corresponding dynamic capabilities to cope with a fluid and open-ended digital innovation space.

How Can Teaching Cases Improve IS Theory and Practice?

Author: **Janis Gogan**; Bentley U.

Teaching cases are helpful pedagogical products. Here, we propose they also support some scholars' theorizing, through their discussion. Inclusion of teaching cases in a scholar's portfolio might indicate the scholar values both discussion-based learning and discussion-based theorizing. Inclusion of the same case-specific companies and situations in the scholar's teaching cases, practitioner papers and scholarly papers might indicate that their practical and scholarly theorizing was informed by discussing teaching cases with MBA students, executives, and/or colleagues. We report on a six-case study, examining the career journeys (their work practices and outputs) of three systematically-selected double-impact management scholars (Sumantra Ghoshal, Kathleen Eisenhardt and Michael Tushman) and three systematically-selected double-impact IS scholars (Mark Keil, Jeanne Ross, and Rajiv

Sabherwal). The findings indicate that inclusion of teaching cases in one's portfolio, and discussing them with executives helps some double-impact scholars achieve efficiency of effort, impactful theorizing, and useful practitioner guidance. After discussing strengths and limitations of this exploratory multiple-case study, we call for further research to investigate whether and how teaching cases – particularly those designed to elicit both rational and emotional reader/discussant responses -- positively influence IS scholars' theorizing and impacts.

Who Benefits from Organizational Diversity Efforts? Evidence from Silicon Valley Firms

Author: **Prasanna Parasurama**; NYU Stern

Author: **Anindya Ghose**; NYU Stern

Author: **Panos Ipeirotis**; NYU Stern

We study the heterogeneous effects of race and gender on hiring and sourcing outcomes in the context of organizational diversity efforts. Despite the growing prominence of organizational efforts to increase workforce diversity in tech companies, how such efforts affect the outcomes of different demographic groups remains an open question. We address these questions in this study using two novel, large-scale datasets: Applicant Tracking System data from 8 Silicon Valley firms and a LinkedIn dataset containing 300 million LinkedIn profiles. We estimate the effect of applicants' race and gender on receiving a callback using a matched sample analysis based on a rich set of job and applicant controls found in applicants' resumes and LinkedIn profiles. We further develop and train a text-mining model to control for applicants' high-dimensional skills and competencies. We find that women are 7-10% more likely to receive a callback compared to men, while Black, Hispanic, and Asian applicants are 6-11% less likely to receive a callback compared to White applicants. We also find that these outcome gaps do not cancel-out in the later stages, as female and White applicants are more likely to receive an interview and offer. These results highlight how diversity efforts may not categorically benefit all underrepresented minorities.

Platform Ecosystems (session 1399)

Innovation Awareness – A Case Study about Psychological Distance to Digital Innovation Platforms

Author: **Victoria Reibenspiess**; German Graduate School of Management & Law (GGS)

Author: **Andreas Eckhardt**; German Graduate School of Management & Law (GGS)

Author: **Heinz-Theo Wagner**; German Graduate School of Management & Law (GGS)

Digital innovation platforms involve employees in the organizational innovation ecosystem and allow them to engage in the process of innovation development. Even though the incorporation of employees in the ecosystem and the associated adoption of platforms frequently fails due to differences between management's objectives and employees' point of view (i.e. lack of awareness of being responsible for creating innovation), the effect of the implementation of a new platform on employees' innovation awareness (IA) is mostly overlooked. Thus, we conducted a qualitative study within the innovation ecosystem of an IT organization to explore how psychological distance to a platform's implementation influences employees' IA. Using construal-level-theory and interview data from 54 employees we create a research model suggesting that IA can be raised by lowering different forms of distance (temporal, spatial, social, or hypothetical) towards the implementation of a new platform. Hereby, we offer a new perspective on employees' adoption of voluntary Information Systems (IS) in organizations.

Managerial Identity Work in the Co-Consumption of Management Ideas: A Narrative Approach

Author: **Hannele M J Seeck**; Uni of Helsinki, Faculty of Social Sciences

Author: **Suvi Satama**; U. of Turku, School of Economics

Author: **Marjo-Riitta Diehl**; EBS International U.

Applying a narrative approach, this paper examines the intra- organisational consumption of management ideas through the lens of managerial identity work. Drawing on the co-consumption and managerial identity work literatures, we ask the following: how do top managers practice identity work amidst the co-consumption of new management ideas in their organisations? We conducted 35 semi- structured interviews with the top managers of four multinational corporations (MNCs) and collected archival material, including personnel magazines and annual reports of the MNCs. Based on our analysis, we formed three complementing narratives through which the top managers practised managerial identity work when consuming new management ideas, namely, stability, depreciation and disguise. Further, by examining how managers position themselves in the narratives, we expand the existing literature on co-consumption. We postulate that the personal growth stories of the top managers are entwined with the co-consumption of management ideas. Our findings have wider relevance for how we understand the role of managerial identity work in the co-consumption of management ideas, which has not been addressed in previous research. Keywords: co-consumption, managerial identity work, management ideas, narrative approach, top managers

[view paper \(if available\)](#)

Author: **Shuting Ada Wang**; City U. of New York, Baruch College

Author: **Brad Greenwood**; George Mason U.

Managers of social media platforms are increasingly competing over users in order to stimulate user generated content on their sites. In this study, we delve into one tactic of this competition which has become increasingly popular, but has received limited attention, the extension of character limits. Despite its popularity, the impact of changing these limits on user behavior is uncertain. On the one hand, increasing limits might yield more low quality and rambling posts, thereby alienating the users who favor microblogs for their streamlined and efficient content. On the other hand, increasing limits might give users the freedom they need to more effectively communicate ideas. We delve into this tension by exploiting a natural experiment, the phased rollout of length limit extensions on the Chinese microblog, Weibo. Findings from more than 7,000 users suggest, as one might expect, that extending length limits increases the average length of posts. However, results indicate that the magnitude of that effect is infinitesimal (only 2 characters). Further, results indicate that extending length limits significantly increases user engagement by enticing users into posting more actively. Finally, it appears that accessing the platform through tethered or mobile connection strongly moderates these effects; inasmuch as the observed changes to post length and volumes are only observed for PC users (versus mobile-only users). This suggests a potential risk in extending length limits by shifting the platform away from mobile-only users.

Author: **Erika Valderrama**; London School of Economics and Political Science

This paper focuses on boundary-making in platform ecosystems. We conduct a longitudinal case study of TripAdvisor (2000-2019) to investigate the mechanisms of boundary-making that the platform

Up in Smoke? Towards a Theory of Community Identity Work

Author: **Matthew C. Lyle**; U. of Colorado, Colorado Springs

Author: **Ian Walsh**; Bentley U.

Author: **Ashley Hockensmith**; U. of Massachusetts Amherst

Scholars have developed rich theories explaining how entrepreneurship spurs changes to the central and distinctive features, or identities, of geographic communities. However, less attention has been paid to the means by which entrepreneurship variably affects these identities, or why members of some communities perceive widespread changes when they are inhabited by new ventures while others remain relatively unchanged. Through a multiple case study, which included two communities in Massachusetts that played host to entrepreneurs seeking to found legal cannabis dispensaries, we developed a theory of community identity work, defined as the process through which a community's central and distinctive features are maintained or altered. Qualitative analyses of various data sources, including interviews, community meetings, observations and archival materials revealed how communities with identities rooted in history are more resistant to change than those with more tenuous ties, and that these differences will affect entrepreneurs' strategies, regional complementing and, ultimately, the degree to which new ventures become central to how members understand their communities.

Staying the Same: Organizational Identity Endurance as a Subjectivation Process

Author: **Geneviève Élise Renaud**; HEC Montreal

Author: **Linda Rouleau**; HEC Montreal

Until now, organizational scholarship has mainly focused on the processes of organizational identity change, while identity endurance still remains under-explored. This paper seeks to address this gap by unravelling the organizational identity

uses to orchestrate relations with its external environment. Our empirical narrative recounts the story of the many mechanisms (i.e. partnerships, acquisitions, commercial agreements, “plug-and-play” solutions) with which TripAdvisor has been able to establish, govern and grow its now rich ecosystem. The case documents the technologies used as boundary resources and examines the role of such technologies in shaping drivers and mechanisms of boundary-making. Our findings unravel the variety of boundary-making mechanisms and drivers in platform ecosystems and point to the fact that technology has a much greater role in shaping boundary-making strategy and in accelerating change in the ecosystem configurations. Drawing from a richer theoretical account of how platform organizations interact with their environment, we expand on the role of technology in boundary-making and we illustrate how it changes both drivers and mechanisms of control. Looking at the role of technology in boundary-making we argue, contributes to the understanding of platform ecosystems’ evolution.

Beyond Access: Reconceptualizing Digital Identification and Inclusion Through the Case of Aadhaar

Author: **Atta Addo**; Surrey Business School

Author: **PK Senyo**; Southampton Business School

India’s Aadhaar biometric identification system—the world’s largest digital identification scheme which provides unique identification to over 1.2 billion people—has become a vibrant archetype of the pursuit of inclusion through technology. However, the notion of inclusion appears to be taken for granted in various studies of Aadhaar, with little problematization of technology’s role in realizing its multiple facets. Against this backdrop, we survey conceptualizations of inclusion in the discourses on Aadhaar to understand its facets and underlying assumptions. Drawing on a literature review of studies that link the Aadhaar to inclusion, we show that the dominant discourse equates inclusion to the potential for accessing welfare provisioning, services, or other socioeconomic benefits through the instrumentality of technology. We critique this

meaning struggles that go on between organizational members on a daily basis. Drawing on Foucault’s concepts of discursive practices and subjectivity, it illustrates how particular understandings of identity become naturalized as the organization’s hegemonic self. We have conducted an ethnographic study of the Cinematheque quebecoise, an organization recognized for its enduring identity. The analysis reveals that members attempt to preserve their organization’s identity by engaging in discursive practices that have power effects on their peers’ subjectivity. Through self-victimization, recontextualization, and disciplinarization, members legitimize their behaviours in a way that is consistent with the current interpretation of the organizational identity. Such discursive practices can exert control over meaning construction, and over time, are likely to contribute to the endurance of organizational identity.

Understanding Inter-Organization Travail Variance during Organizational Identity Change Process

Author: **Ziyi Li**; UIBE

Author: **Yijie Min**; Guanghua School of Management, Peking U.

Author: **Wang Nanxuan**; UIBE

Although we know much about organizational identity change process, few attentions are paid to unveil why some organizations experience greater travails than others during change process. Our discussion is based on TMT abnormal turnover, as one of the major organizational travail types, after lone-founder firm’s familization announcements, which is a firm life-cycle based identity change. Under institutionalist tradition, we argue top managers’ knowledge are biased to their own industries thus top managers understand comparable familization announcements in different ways. Decided by a materiality-legitimation paradox, industry-level family firm prevalence plays an inverse-U shaped moderation effect on the relation between familization announcement and TMT turnover. Such that, the main effect would be weaker in industries where family firm prevalence is low or high; while be stronger in industries with

dominant position of inclusion as narrow, by drawing upon the body of work on social inclusion and human development. We suggest a reconceptualization of digitally enabled social inclusion that attends to higher-level processes and outcomes beyond access—such as participation, transformation, empowerment, and emancipation—and articulates technology implications beyond technical-rational instrumentality. We contribute a conceptual framework of digital inclusion that has relevance for other developing countries undergoing digital identification initiatives for inclusion.

Creative vs. Pragmatic Variety: On the Tradeoff between Professional and Market Logics in Platforms

Author: **Gorkem Turgut Ozer**; U. of Maryland, College Park

Author: **Sirkka Jarvenpaa**; U. of Texas at Austin

Digital multisided platforms and peer-to-peer marketplaces are increasingly attracting attention from scholars, with a significant amount of work examining the role of complementors. Yet, despite such focus, limited work has investigated the implications of complementor choices about what products to offer, particularly in platforms for creative products. In this study, we investigate the role of the tradeoff between the professional and market logics in performance, as reflected by the product offerings of designers in a platform for creative products. Leveraging a rich panel data set from a platform for creative products, Ravelry, we find that designers achieve superior performance by following the logic of the market and responding to existing consumer demand (pragmatic variety). However, by following the logic of the market, designers are more prone to diminishing returns to their product offerings as the platform grows and other designers join, compared to those who follow the logic of the profession (creative variety). That is, the logic of the profession shields designers from negative effects of crowding. Further, results indicate that the logic of the profession and that of the market conflict with each other.

medium-level family firm prevalence. Our findings contribute to organizational identity change studies by add inter-firm comparison.

Accentuate the Emotional: Effects of Scripts, Rhetoric, and Clusters on Outcomes (session 1411)

Rescripting Client Action: Emotion Work and the Boundaries of Professional Jurisdiction

Author: **Mathieu Bouchard**; CHUM Research Center, Innovation Hub

Author: **Steve Maguire**; U. of Sydney Business School

Author: **Luciano Barin Cruz**; HEC Montreal

This paper addresses a major gap in the study of professions, which is the absence of clients in research on the boundaries of professional jurisdiction. To do so, it shifts the standard analytical focus in two important ways: from inter-profession relations to the professional?client relationship; and from a profession-centered perspective to a client-centered one. Numerous empirical studies of client movements in professionalized fields such as health care, education and religion show that clients organize in many ways to redraw service arrangements and the boundaries of professional jurisdiction. Yet, one wouldn't learn much about this phenomenon by reading existing organizational research on professionalized fields, which largely explains service arrangements and jurisdictional boundaries as resulting from inter-professional struggles for epistemic control over domains of activity, while all but ignoring client action. Building upon insights from Hirschman's exit, voice, and loyalty framework, Mannheim's theory of ideology and utopia, and organizational research informed by Goffman's idea of an "interaction order", we develop a six-part typology of client action scripts. We then elucidate how different forms of emotion work carried out in framing contests between 'incumbent' professionals and 'challenger' clients can evoke distinct felt emotions that, in turn, rescript client action toward different boundary projects.

Anticipation in Organizations: Temporal Frames, Foresight, and Future Selves (session 1410)

Hold Your Horses: Negative Anticipatory Impression Management and its Motivations

Author: **Owen Nelson Parker**; UT Arlington

Author: **Cole Evan Short**; Pepperdine Graziadio Business School

Author: **Varkey Titus**; U. of Nebraska, Lincoln

An emergent stream of research shows that managers engage in various impression management strategies to manage external perceptions by placing their firms in the best possible light. Drawing from this work, we develop theory around when and why managers may choose to engage in a novel form of preemptive impression management—negative anticipatory impression management (NAIM)—to recalibrate stakeholder expectations. Specifically, we posit that managers use actions and communications that deliberately convey pessimism to reduce the liability of inflated expectations. We then propose two factors—media coverage and the manager's regulatory focus—that act as moderators. This underscores how managers use negative information to their advantage and further grounds the relevance of executive personality in impression management decision-making.

Entrepreneurial Clustering and the Development of Positive Psychological Capital

Author: **Andac T. Arikan**; Florida Atlantic U.

In this paper, I explore the core idea that geographical clustering may provide entrepreneurs with psychological benefits - a type of benefit that is not yet recognized in the literature on clusters. Specifically, I develop a theoretical model along with testable propositions where I argue that entrepreneurial clusters have the potential to develop into 'communities' which provide clustered entrepreneurs with varying degrees of psychological sense of community. A strong psychological sense of community in turn helps entrepreneurs develop positive psychological capital through processes of social comparison, social influence, perceived social support, increased participation inside the cluster community, and emotional sustenance. Higher levels of positive psychological capital helps entrepreneurs deal with the psychological pressures associated with starting and managing a small business and thereby leads to improved venture performance, albeit up to a threshold level of psychological capital after which higher levels of psychological capital may hurt venture performance. Contributions to the literatures on clusters, entrepreneurship, and psychological capital are discussed.

Public Enemies: Reputation, Celebrity, and Scandalizing Organizational Misconduct

Author: **Jung-Hoon Han**; U. of Missouri-Columbia

Author: **Tim G. Pollock**; U. of Tennessee, Knoxville

Author: **Srikanth Paruchuri**; Pennsylvania State U.

Considering that scandals result from the disruptive publicity of transgressions, we examine how social evaluations such as reputation and celebrity influence why some transgressions are publicized and not others. Extending current knowledge about the effects of social evaluations on publicity, we

This inductive study of UK pension funds examines how pension fund trustees and their investment experts organize time and attend to the intertemporal tensions between the short- and long-term within investment strategies that are inherent to business and investment sustainability. Grounding our insights in theorization about time through narratives, we use insights from 22 in-depth, semi-structured interviews with pension fund trustees and their investment experts to highlight the significance of embedded legacy and path dependency by revealing how temporal frames of the past become embedded in the present and perpetuated into the future. We also find an intertemporal tension where pension fund trustees separate and favour short-term funding pressures at the expense of the long-term intergenerational equity. We argue that omission of the past and legacy from most strategic management continues to contribute to short-termism, which is the blight of sustainability. We conclude by drawing out some implications for policy and practice, as well as directions for further research.

The Conceptual Future of Foresight: Rethinking Foresight as an Emergent Process

Author: **Florian Andresen**; Helmut Schmidt U.

Author: **Benjamin Schulte**; Helmut Schmidt U.

Author: **Hans Ulrich Koller**; Helmut Schmidt U.

Strategic foresight, as the capacity to recognize emerging environmental changes, is increasingly viewed as a distributed capability comprising multiple internal as well as external agents on different organizational levels. This recent turn towards more distributed and open approaches of strategic foresight, however, lacks a common theoretical foundation as scholars draw on different perspectives in their explanations. In light of this, the current paper conceptualizes the notion of foresight-as-emergence by drawing on and synthesizing insights from a practice lens and complexity theory. The integrative framework of foresight-as-emergence unpacks the concept of foresight space, linking the dynamics of how new insights into the future evolve from organization members' everyday situated practices (i.e., local

argue that while reputation and celebrity burden firms by directing media attention to their transgressions, the sociocognitive content of these evaluations further provides nuances into how different transgressions are scandalized differently. Because of audiences' tendencies towards rational and deliberate information processing when evaluating high-reputation firms, reputation attracts significant publicity to a transgression due to the transgression's high relevance to firms' value creation potentials. In contrast, while celebrity also attracts publicity due to its emotion-laden sociocognitive content calling for the media's attention to the emotionally devastating nature of transgressions, it also interferes with the media's processing of transgression characteristics (e.g., severity and recency) as to amplify the impact of the characteristics when they fit the emotional frame of celebrity, and attenuate when not, on the media's publicizing decision. We tested our arguments in the context of data breaches involving publicly traded U.S. companies.

Does Nationalist Rhetoric Help Politicians Raise Campaign Contributions?

Author: **Murad A. Mithani**; Stevens Institute of Technology

Author: **Ipek Kocoglu**; Kean U.

Although research has paid significant attention to organizational reactions to formal political pressures, it remains to be understood how organizations react to political influence that is wielded through informal institutions. We argue that regulatory constraints on formal institutions increase political attention to informal institutions: social norms that facilitate the trading of favors. Politicians elicit informal favors from organizations through the use of nationalistic rhetoric. However, the social nature of informal institutions makes political influence more critical for firms that are strongly embedded in the local environment, yielding a distinction between the responses of domestic and foreign firms. A longitudinal state-wise examination of 476 firms in India showed that when institutional formalization encouraged political contests, there was an increase in corporate

emergence) with the processes of how they become dispersed and adjusted throughout the organization (i.e., global emergence). In doing so, the framework provides a theoretical foundation for strategic foresight in high-velocity environments comprising both micro and macro levels.

Community Solidarity and Dilemmas (session 1407)

Solidarity All Around: How Spatial Context Influences Perceptions of Organizational Solidarity

Author: **Matt Cummins**; Stanford Graduate School of Business

More than seventy years of research in social networks and microgeography have shown that spatial proximity offers individuals opportunities to interact and form social ties, aggregating up to a structural influence of the arrangement of space on social networks among organization members. But space has the power to do more than structure opportunities for individuals to interact directly. Spatial design also structures opportunities to observe others' interactions, an extra-network information channel that may influence social perceptions, and consequently the way individuals relate to their organization. One important way in which individuals relate to their organization is the degree to which they perceive it as a strong 'community', where their colleagues are mutually supportive and socially cohesive, best captured by the long-established concept of social solidarity. Social solidarity has largely been conceived of as arising from social interactions and social network structures among workers. We present an extra-network information theory of spatial arrangement's influence on individual perceptions of

Coordination and Control Through Hierarchy and Roles (session 1405)

Filling the Void: How Occupational Authority Emerges from Curating Learning Algorithms

Author: **Lauren Waardenburg**; Vrije U. Amsterdam
Author: **Anastasia Sergeeva**; Vrije U. Amsterdam
Author: **Marleen Huysman**; Vrije U. Amsterdam

The data-driven, statistical, and opaque nature of learning algorithms makes them distinct from previous technologies. They are speculated to be consequential for work and organizing, but how they are reconfiguring work practices is not yet fully understood. Building on a 31-month ethnographic study of predictive policing, a learning algorithm to predict crime chances, we find that its implementation was associated with the unexpected growth in authority of an occupational group ("intelligence officers"). Our process analysis finds that this change in authority was triggered by the knowledge gap that emerged between the algorithmic outputs and the police work domain. Because intelligence officers could not open the blackboxed algorithm, they instead tried to bridge the knowledge gap by means of "algorithmic curation" practices, thereby offering their own predictions and backgrounding the learning algorithm. This approach to "fill the void" reinforced the knowledge gap and kept management assuming that the predictions were made by the algorithm,

social solidarity in their organization. Testing this theory in the context of a North American financial technology company, our results suggest that there is indeed an influence of spatial arrangements on perceptions of social solidarity. This apparent influence of spatial context is not mediated via the social network among workers, suggesting that spatial design may be able to directly influence the way in which workers relate to their organization.

Trapped in a Community Dilemma: The Consequences of Normalizing Private Social Media Use at Work

Author: **Stefanie Habersang**; Leuphana U. Lüneburg

While previous research in the field of social media studies has primarily focused on enterprise social media and their implications for organizations, this paper examines a neglected and so far narrowly understood phenomenon: the illicit use of private social media in the workplace and its long-term consequences. I use an affordance perspective to explain how the illicit use of private social media became normalized through three interrelated mechanisms: collective rationalizing, team socializing, and individual strategizing. The distinct temporal interplay of these mechanisms produced unintended consequences and eventually trapped organizational members in a community dilemma. The contribution of this study is twofold. First, this paper shifts the debate from enterprise social media to private social media use in the workplace. This is important because the illicit and informal nature of private social media implies different consequences for organizations than enterprise social media use. Second, the findings of this study contribute to a better understanding of the dynamic interplay of affordances. As such, this study advances our knowledge how the affordances of social media can shift over time.

Boundary Work and Contextual Demands: Micro-Strategies in Interprofessional Collaboration

Author: **Christian P. Kortkamp**; U. of Goettingen

Author: **Clarissa E. Weber**; U. of Goettingen

Author: **Indre Maurer**; U. of Goettingen

Research on boundary work in the context of professions has studied how professional groups and their members engage in actions to expand or defend their profession's jurisdiction. We argue that individual professionals not only engage in boundary work for reasons serving the professional group as a whole, but also in consequence of the very plain contextual demands of individuals that arise from their everyday work. Drawing on prior research on professionals' boundary work and taking a micro-lens on interprofessional collaboration (IPC), we investigate the micro-strategies of individual professionals in IPC when faced with contextual demands that lead to conflicting subgoals. To do so, we build on fieldwork in German nursing homes, analyzing IPC between geriatric nurses (GNs) and general practitioners (GPs) that is strongly determined by differing contextual demands and subgoals. Our findings show a broad scope of micro-level strategies that GPs and GNs deploy when dealing with contextual demands at the boundary. Furthermore, we show how power and trust are core determinants of these micro-strategies, and develop a comprehensive theoretical framework on micro-level boundary work under conditions of contextual demands.

Negotiating Provisional Role Structures in the Shadow of Hierarchies

Author: **Olga Khessina**; U. of Illinois at Urbana-Champaign

Author: **Cameron Verhaal**; Tulane U.

Author: **Stanislav D. Dobrev**; U. of Wisconsin, Milwaukee

Although we know that product names influence audience evaluations of producers and their offerings, mechanisms behind the effect remain undertheorized. We propose that a classic psychological stimulus-and-response process is at play. Emotional contagion – ego's propensity to experience emotions triggered by contact with alters or objects – suggests that product names that convey certain emotions to the consumers of these products will influence their evaluations. While the process is psychological, social context shapes the strength and valence in the stimulus-and-response relationship. We predict that the anti-mass production ideology and oppositional identity of contemporary craft markets (rooted in avid rejection of pecuniary motivation, template marketing, serial production and the like) produce reverse emotional contagion: Positively charged product names lead to negative evaluations of products and negatively charged ones lead to positive evaluations. We also predict a second-order effect of product name emotionality on appeal by way of perceived product authenticity which itself drives appeal in craft markets: Positive emotionality decreases authenticity perceptions and negative emotionality elevates them. We find empirical support for our conjectures in analyses of the U.S. craft beer industry between 1996 and 2012.

Permeability Alongside 'Sense of Community' in Open Contemporary Work Organization—Coworking-Spaces

Author: **Mahmood Aslam**; U. of Bayreuth

Author: **Yixin Qiu**; U. of Bayreuth

Open, entrepreneurial, and collaboratively organized work forms are proliferating worldwide. A prominent form is coworking-spaces, run by specialized coworking-space providers or incumbent firms. Coworking-spaces host collocated work of individuals, often from diverse professional

Author: **Clark Bernier**; New York U.

Emergent coordination has been studied primarily in environments where generalized role structures and occupational communities are well-established. How individuals coordinate work in less-institutionalized or more rapidly-changing environments is less understood. I use a combination of participant observation and interview data collected in a medium-sized startup, GuestInn, to develop theory about the ways that people coordinate work when roles are more ambiguous. GuestInn management uses an institution, locally referred to as "ownership," to foster commitment in employees. Lacking developed role relations, employees of GuestInn continually negotiate provisional role relations for coordinated work using the same institution, "ownership." The analysis contributes to our understanding of emergent coordination by showing how it works when role structures are less developed. It also refines our understanding of normative control to consider how it shapes employee-employee coordination. It also refines theory on the role of formal hierarchies in organizations with distributed authority rights: people's ability to negotiate lateral coordination without deep shared understanding of one another's work is facilitated by the shadow cast by vertical membership rights over negotiations, without directly involving nominal superordinates. Finally, I introduce the concept of generalized authority rights to describe authority rights that are decoupled from official position and nominally granted to all employees.

Shepherding Situational Authority: Dealing with the Paradox of Radical Delegation in Hierarchies

Author: **Lauri Pietinalho**; Aalto U.

Managers who wish to empower and delegate authority counter a governance paradox: how to foster proactive judgment and collaboration of employees but maintain adequate control and alignment? Prior literature primarily suggests dealing with the paradox by clearly formalizing the scope of delegated authority to shield employee

backgrounds. Initial empirical insights indicate that coworking-spaces portray a sense of community among users and independent professionals. Based on an inductive case study from four distinct coworking-spaces, we introduce permeability an organizational characteristic of open contemporary work in coworking- spaces. Insights from the case study further support to model three levels of permeability: spatial permeability, procedural permeability and relational permeability. We develop mechanisms of how permeability functions and identify outcomes on individual-level (job satisfaction, learning, work efficacy, and innovacy) and organization-level outcomes (team and project, innovation, and venture performance).

motivation from managerial interferences and managers for overindulgences of employee discretion. However, the more radical delegation is attempted involving also organizational matters, the more unavoidable the overlap of formal and delegated authority becomes. Utilizing internal discussion forum logs and interviews, I explored the organizational dynamics of formal and delegated authority in three mid-sized software services companies that had principally abandoned traditional manager-subordinate structures for broad employee autonomy but where a handful of top managers remained. I discovered that the studied organizations presented a contrast to scholarship: Employees enjoyed from an a priori undelineated encouragement to drive their own and company matters. Instead of a formalized system, decentralized authority was balanced by cross-mediation of managerial interventions, and, respectively, social scrutiny of managerial involvement. These social practices centered around, what I denote as, an attempt to shepherd situational authority so that what makes sense for the whole and who decides would get to be evaluated situationally rather than based on fixed authority. My findings contribute by extending the current understanding of the radical delegation of authority in companies with formal authority asymmetries.

Why So Few? The Gender Representation Gap in Academic STEM Fields: A System Dynamics Approach

Author: **Carla Carolina Rúa Gómez**; U. della Svizzera Italiana

Author: **Jessica Arias-Gaviria**; U. Nacional de Colombia

We use a simulation approach to study what factors influence the under-representation of women in STEM (Science, Technology, Engineering, and Mathematics). In particular, we focus on understanding why, despite the increased representation of women in graduate programs and assistant professorship positions, we still observe a small proportion of women in tenured positions. To do so, we build a dynamic feedback model of women representation. According to the model, the gender representation gap – i.e., the lack of women in tenured professorship positions - is driven by gender bias and women's perceptions of the workplace. We show that the behavior of this model is consistent with previous studies focusing on persistent gender gaps in knowledge-based organizations. Finally, we explore the behavior of the model under different experimental conditions.

[view paper \(if available\)](#)

How organizations, including project-based organizations (PBOs), pursue multiple goals is a central theme in research on the behavioral theory of decision making. We develop two competing approaches, balanced and imbalanced, to understand the responses of PBOs. The balanced approach suggests that PBOs may simultaneously achieve multiple performance goals, whereas the imbalanced approach contends that organizations can only focus on one goal at the expense of the other. We then identify a series of boundary conditions, including individual factors (i.e., leadership capacity) and organizational factors (i.e., interorganizational collaboration and resources), which may help organizations balance multiple goals. We examined our theory in the context of the Chinese film industry, where artistic acclaim and commercial success are both important performance goals. We found negative relationships between artistic acclaim and commercial success of films, supporting the imbalanced approach. Our three boundary conditions under which PBOs may pursue the balanced approach are also largely supported. Our study contributes to the behavioral theory of decision making and provides important implications for managers.

Feedback in Creative Processes: Toward a Communicative Action Perspective

Author: **Michael Hartmann**; Coburg U. of Applied Sciences and Arts

Author: **Jochen Koch**; European Uni Viadrina, Frankfurt (Oder)

Author: **Matthias Wenzel**; Leuphana U. Lüneburg

Research on creativity highlights the role of feedback as a contextual factor that fosters creative performance. However, it advances a rather mechanistic understanding of communication that obscures the specific practices in feedback interactions and their constitutive power in shaping creative performance. In this paper, we develop a framework that conceptualizes how organizational actors interact in communicative feedback processes on creative ideas. By drawing on the theory of communicative action by Jürgen Habermas

From Exception to Exceptional: How Gender and Tenure Impact Sponsor Effectiveness

Author: **Elizabeth Campbell**; Carnegie Mellon U. - Tepper School of Business

Author: **Rosalind M. Chow**; Carnegie Mellon U.

Author: **Brandy Aven**; Carnegie Mellon U.

The important role that referrals play in the hiring process, particularly for those contending with negative stereotypes and biases, is well documented in the literature. However, how these negative stereotypes and biases impact the efficacy of individuals providing referrals (i.e., sponsors) is largely missing from prior work, overlooking the additional effects that characteristics of the sponsors can have on the candidate's (i.e., sponsees) outcomes. We take a multi-methods approach and provide evidence for differences in male and female sponsors' efficacy, such that greater tenure increases the effectiveness of female sponsors but not male sponsors. Study 1 uses archival data on the U.S. Supreme Court law clerkship hiring process and provides initial evidence that sponsor gender and tenure interact to influence the probability of the sponsee being selected for a top-tier position. Study 2 replicates and extends these findings in an experimental setting and provides evidence for a causal relationship between sponsor gender and sponsor effectiveness. This study shows greater tenure confers credibility to female sponsors and this, in turn, increases female sponsors' effectiveness, but that great tenure does not influence male sponsors' efficacy.

Auto-Tuned and R-Squared: Quality Evaluations and Organizing Creativity

Author: **Elizabeth Long Lingo**; Worcester Polytechnic Institute

Author: **Hille C. Bruns**; Groningen U. (RuG)

While navigating the subjective and differing quality evaluations of a range of actors has been identified as a fundamental feature of creative processes, how audience perceptions of quality are navigated in the creative process remains under-theorized. We examine this question through a comparative ethnography of two settings where big data brings audience quality evaluations to the fore—Nashville music production and systems biology cancer research. We find that actors encounter a fundamental tension between the perfection and authenticity of creative outcomes that manifests in two competing standards of quality: the raw, empirically grounded, and authentic versus the technically processed, improved and refined. We show how these standards are negotiated vis-a-vis three different audiences – internal peers, extended community, and external reviewers – and identify implications for the literatures on collective creativity as well as audience evaluations.

The Cyclic Organization of Festivals as Temporary Events: The Critical Role of Spatial Practices

Author: **Omid Omidvar**; Aston Business School

templates, defined as codified series of prototypical founding tasks, can provide such knowledge and motivate women to initiate pre-entry activities. In a field experiment design in rural India, we randomly selected a sample of unemployed women for exposure to customized start-up templates, and then observed their decision to initiate pre-entry activity through their sign-ups for a paid enterprise training program. We find that 50% more women sign up when they are exposed to start-up templates as compared to the control group. We further investigate whether this effect is influenced by the template's description of actions and resources for carrying out the founding tasks. We find that the rate of sign-ups is 24% higher when the start-up templates emphasize the use of social connections, as compared to relying on individual selves. This paper provides causal empirical evidence of how templates can provide entrepreneurial knowledge required for reducing uncertainty and increasing the likelihood of entrepreneurship.

Exploring Routine Interdependence: Fluid Boundaries and Adaptive Patterning

Author: **Jan Hoekzema**; U. of Hamburg

Author: **Daniel Geiger**; U. of Hamburg

This paper advances theorizing on routine interdependencies and related methodological challenges. We aim to challenge the implicit assumption within cluster or ecology-based conceptualizations of routine interdependence that routines are clearly distinguishable processes interrelated via interfaces and/or people. Building on an ethnographic longitudinal case study of routine change within a manufacturing firm, we develop a framework that explains routine interdependence beyond clusters or ecologies.

addressing industry threats by environmental activists in one of the most competitive industries, the Alberta oil sands. Our in-depth analysis of the formation of this industry alliance over three years reveals a model of paradox intensification. Whereas scholars have described how challenges of navigating such paradoxical tensions diminish over time, we find the opposite. As the collaboration grew in scale and in specificity, the tensions between collaborating and competing grew in quantity and challenge. We find that in addition to requiring formal structures, effectively addressing such intensifying paradoxical tensions required informal interactions by individuals, who we describe as champions, who built the alliance through fostering personal relationships and trust. This model of paradoxical intensification advances the growing literature on the paradoxes of co-competition by unpacking the challenges and responses to navigating the tensions between cooperation and competition over time.

Making the Impossible Possible: Paradoxical Processes of Reconstructing a Grand Challenge

Author: **Paula Jarzabkowski**; City U. London

Author: **Rebecca Bednarek**; Victoria Management School

Author: **Konstantinos Chalkias**; Birkbeck, U. of London

Author: **Eugenia Cacciatori**; Cass Business School, City U. London

Advancing the promise of paradox theory to address large-scale complex social problems, or grand challenges, necessitates focus on paradox at the interorganizational level. We contribute to this by developing an empirically-grounded framework explaining how distributed organizational actors work through multiple paradoxes to address a grand challenge. We draw on a global qualitative study of a grand challenge: how to improve the speed of low and middle-income countries' financial response in the immediate aftermath of natural disasters. We focus specifically on initiatives that bring together government, market and development actors to ensure rapid capital flows for immediate disaster response. Three paradoxes

Thereby we contribute to routine inter-dependence research in three ways: First, routine boundaries are blurry and dynamically shift-ing rendering it difficult to identify them ex-ante and ex-post. Second, as a result the coordination of routine interdependence occurs between dynamically, reciprocally interrelated action steps rather than at the interface between routines. Third, these insights raise important methodological questions of granularity, which have significant implications for our interpretation and study of routine stability and/or change. Stability and/or change thus become a matter of different levels of analysis which need to be taken into account when comparing routine inter-relations as either clusters or ecologies.

Organizational Routines and Adaptability: The Effects of Routines in Building TMS

Author: **Jerry M. Guo**; Aarhus BSS, Aarhus U.

Organizational routines are ubiquitous stores of knowledge in organizations. Although routines enable consistent performance on tasks over time, routines might hinder adaptability by promoting inertia and rigidity. In this dissertation, I develop how routines could facilitate adaptation in organizations and foster successful performance on novel tasks. I argue that teams are changed in the process of using routines. I develop and test theory arguing that routines can facilitate the development of transactive memory systems (TMS), collective systems for encoding, storing, and sharing knowledge. I propose that routines provide a structure within which team members can learn about one another's skills. Thus, routines can build a team's TMS, which can improve performance on novel tasks. I use a mixed-methods design to both develop and to test theory. In Study 1, I performed 30 semi-structured interviews with United States Marine Corps officers. Based on interview findings, I hypothesize that teams that use routines will develop stronger transactive memory systems than teams that do not. Consequently, I hypothesize that teams that use routines will perform better on novel tasks due to the TMS they have developed. In Study 2, I developed a laboratory study in the cybersecurity context to test the hypotheses. Two

permeate our grand challenge: whole-part; long-short; and developmental-financial. By focusing on critical incidents, we show how: (a) distributed actors work through paradoxes by situated focusing: foregrounding one pole in order to achieve the other; (b) paradoxical poles are entangled in a process of situated knotting; (c) localized actions arising from situated focusing and situated knotting contribute to an expanding repertoire of possible actions for addressing the grand challenge globally. We advance paradox theorizing on paradox salience, multiplicity, and the dynamics of shaping paradox equilibrium. We also further understanding of how grand challenges evolve within the fragmented interests of distributed actors.

How to Stay Weird – The Normative Subordination of Profits in a Firm Striving for Sustainability

Author: **Ignas Bruder**; Freie U. Berlin
Author: **Julia Bartosch**; Freie U. Berlin

Humanity faces an unprecedented urgency to act in order to achieve sustainable development. Against this background, firms play an ambivalent role, since they have great potential to contribute to sustainable development, but their common normative focus on profit maximization leads to increasing rather than decreasing sustainability problems. Whereas integrative and paradox research on sustainability breaks away from the instrumentalism underlying profit maximization, research still lacks a theoretical account of firms enacting sustainability more radically, even at the expense of economic success. With an in-depth ethnographic study, this paper investigates a natural cosmetic producing firm that normatively superordinates ecological and social considerations over profits in its practices. We take a practice-based approach and unearth how firms are able to maintain a radical focus on sustainability in several practices through a recursive, tension-mitigating mechanism spiraled by highly sustainability-oriented selling and supplier management practices. This paper contributes to research on sustainability in organization and management studies by discovering approaches that enable firms to superordinate ecological and social ends over

hundred and thirteen participants in 71 teams were randomly assigned to perform a task with a routine or without a routine, and then perform a novel task. Results provide evidence to support the hypotheses.

Granularity Matters! Towards a Methodological Framework for Routine Studies

Author: **Jan Hoekzema**; U. of Hamburg
Author: **Waldemar Kremser**; Radboud U. Nijmegen
Author: **Daniel Geiger**; U. of Hamburg

This paper introduces the concept of granularity into routine dynamics studies. To establish levels of granularity we develop a phenomenological perspective on action, the central category of routine dynamics studies. By conducting an extensive literature review we show that routine dynamics scholars have at least unconsciously applied diverging levels of granularity in their empirical studies. We argue that side-stepping questions of explicitly addressing granularity significantly impedes the comparability of studies since different levels of granularity bring different aspects of performing and patterning processes into focus. Following this, we develop a methodological framework that allows scholars to establish and report on the level of granularity in their study. Finally, we sketch out some implications of taking granularity seriously for writing up research on routine dynamics.

Coordination of Search: A Processual Approach

Author: **Olivier Dupouët**; Kedge Business School
Author: **Pierre-Jean Barlatier**; EDHEC Business School

Coordination of search by several agents when interdependencies and uncertainty characterize the environment is a difficult yet critical task. The core difficulty, compared to search by a single agent, is for each agent to take into account the other's actions and choices in her own learning process. A well-known solution to this problem is building a

profits in multiple practices and thereby contribute to the urgent radical shift towards sustainability.

Organizational Learning of Cultures: The Spawned Culture Effects in the U.S. IT Industry.

Author: Yeonsin Ahn; INSEAD

Scholars often compare new ventures to babies, but most founders are experienced and enculturated even if their startups are young—a paradox of new ventures. New ventures start in a cultural void, but their founders are often already enculturated to the parent organization’s cultural codes. This study investigates whether founders fill the cultural void with the cultural repertoires of their parent organization. Founders enculturated in prior employment are more likely to adopt familiar cultural repertoires, resulting in a spawned startup becoming culturally similar to its parent. This spawned culture effect is stronger when founders are more socialized (have longer tenure), when the parent culture is more legitimate (less atypical) and coherent (has high cultural congruency). Finally, this study explores which cultural repertoires predict better performance and whether those are more likely to be inherited by spawned startups. If less likely to be inherited, this implies that organizational culture can be a source of a firm’s competitive advantage. These ideas are examined in a longitudinal analysis of 3,570 startups in the U.S. IT industry from 2008 through 2019. Implications for the study of organizational learning, organizational culture, and entrepreneurship are discussed.

Status Costs and Outcomes (session 1406)

common knowledge. Common knowledge provides a complete framework in which each agent can make sense of the problem at hand and of the other’s actions. Yet, several recent case studies evidence that coordination of search is possible even when building common knowledge is impossible. These studies show that adopting a processual approach to coordination, i.e. varying the behavior of agents over time, permits efficient search without common knowledge. We resort to a computational model to investigate the conditions under which a processual coordination of search can be successful. We vary over time two key dimensions: the nature of agents’ cognitive effort (i.e. whether they explore or try to converge towards a common solution) and interactions (i.e. the extent to which they are tolerant to errors). Our results show that a processual coordination of search is efficient when agents first only explore with a maximum tolerance to errors and then purely converge towards a common solution while progressively reducing their tolerance to errors. The key to the success of the multiagent search is that, from one agent perspective, the others’ behaviors are stabilized so that they can be handled in conducting one’s own learning process.

The Management of the Firm: Ethics, Identity, and Stakeholders (session 1402)

The Cost of Forgoing Status Rewards: Major League Baseball Teams and the Free Agent Market

Author: Karen Nicholas; Boise State U.

Author: Curtis Sproul; Georgia Southern U.

Status provides organizations with privilege rewards including being able to gain discounts on resources. However, if organizations take advantage of status rewards, there is a risk of status loss based on the external perception of lower quality. The study asks if organizations will seek to take advantage of available status rewards or if the goal of status accumulation will predominate. Using a sample of Major League Baseball (MLB) free-agent contract signings, this study finds that high-status teams pay more for resources than their lower-status counterparts, regardless of the quality or status of the players. Implications for researchers address the cost of status may be ignored based on status goals, while practitioners can understand how the quest for social approval may be driving up the cost of their resources.

Risky Business: Status and Costs in the Market for Audit Services

Author: Amanda Sharkey; U. Of Chicago

Author: Amandine Marie Ody-Brasier; Yale School of Management

A large body of research in sociology and management presumes that lower costs are one of the most significant advantages that high-status firms enjoy. Although prior research provides some support for this argument, the evidence is limited and largely indirect. In order to better understand the relationship between a firm's status and the costs it incurs, we analyze fees paid by clients in the \$60 billion U.S. market for audit services. Contrary to the predictions of existing theory, we find that high-status firms tend to pay more than their peers, even after controlling for the complexity and riskiness of the audit. Our analyses suggest that the most likely explanation centers around the role of status in attracting disproportionate attention; auditors seem to charge their high-status firms more in anticipation of the increased attention that they suspect such firms will garner in cases of

Nexus Theory as a New Perspective of the Management Norm

Author: Richard Michael Robinson; SUNY Fredonia

It was recently argued that an ethically-complete normative theory of the firm requires a vision of a "nexus of imperfect duty" that complements the contractual vision of Coase, i.e. the latter being a nexus of perfect duty. It is shown here that this complete normative vision provides the foundation for an insightful explanation of the evolutionary development of the management team. This evolution is founded on an extension of the "unity theory" of virtue ethics as applied to the management team in the form of a "balanced development" theory. The impetus for this managerial team evolution is the maintenance of a type of balance in the nexus of dispositions towards imperfect duty (or virtues) as the unity theory suggests for the virtues of individuals. Methods for reinforcing this balanced evolution are also reviewed here. This nexus of imperfect duty approach poses an ethical norm for management that offers a fresh vision for managerial theory and analysis. It organizes insights into the interrelatedness of management functions, and the development of the managerial team. In this imperfect duty context, firm development is shown to be built upon efforts that "go beyond" expectations of management creativity.

Identity Consistency as a Signal of Resource Autonomy in Acquisitions

Author: Rui Yang; U. of California, Riverside

Drawing on market signaling theory, this paper examines whether the market positively reacts to acquisitions when firms express a consistent organizational identity. We theorize that identity consistency signals a firm's autonomy in utilizing resources to pursue economic profits. Such a market signal reduces investor perceived uncertainty in management activities and boosts market confidence in the capitalization of acquired resources. The signaling effect is also found to be stronger under a positive earnings surprise and a stable industry environment.

Social Attribution of Collaborative Outcomes: A Study of Status Dynamics in Jazz Music Industry

Author: **Chunhu Jeon**; Arizona State U.

Author: **Heewon Chae**; Arizona State U.

This study examines how social recognition of collaborative outcomes affects status gain of actors. While research on status dynamics suggests that actors may enhance their status by producing desirable outcomes or by collaborating with high-status actors, understanding the influence of collaborative outcomes is problematic because actors in a collaborative relationship take varying status positions and gain only partial credit for their collaborative outcomes. Drawing from attribution theory, we suggest that while desirable outcomes and collaborating with higher-status actors tend to increase a focal actor's status individually, collaborations with higher-status actors result in gaining less credit for the desirable outcomes because audiences tend to attribute the desirable outcomes more to the higher-status collaborators and less to the lower-status actor. Analyzing collaboration networks among jazz musicians between 1950 and 2004, we found the negative moderation effect of collaborator status on gaining status from desirable collaborative outcomes; musicians gain less status from receiving positive ratings from critics and from creating novel repertoires when they collaborate with actors who have higher status than them. This finding highlights the audiences' credit allocation to the contributors in status evaluation and reveals underexplored processes in status dynamics.

Two Experts are Better Than One: Reaping the Rewards of Specialization Through Better Communication

Author: **Kevin Du**; U. of Southern Denmark

Author: **Jinzhao Du**; U. of hong kong

The successful management of firm knowledge ensures that useful consumer knowledge is communicated effectively to inform product design decisions. This study analyzes how the use of a common organizational language can enhance communication between a marketing analyst and a product engineer. The use of a common language is shown to increase the probability of knowledge transfer; however, its dependence on learning effort from both parties makes it beneficial only when the cost of learning is not too high and each party can capture an adequate share of the firm's value. Distortions arise when the engineer, initially uncertain about the demand for its own product design, must determine the mode of communication with the marketing analyst to obtain information on consumer preferences. If the engineer is given the power to choose whether to implement a common language system and how much equity to allocate to the marketing analyst, the common language will be both under-used and under-exploited when it is adopted. The deviation of the engineer's actions from the firm optimal decision has managerial implications for the role of intermediation to resolve communication issues between disparate parties within an organization.

A Strategy-as-Practice Perspective on Stakeholder Management

Author: **Pushpika Vishwanathan**; U. of Amsterdam

Author: **Siri Nordland Boe-Lillegraven**; Amsterdam Business School, U. of Amsterdam

Stakeholder management is part of the day-to-day activities of managers. Yet, we currently know much more about stakeholder management outcomes

Public recognition is a powerful strategic tool for motivating individuals. Yet because high status recognition derives its desirability from scarcity, public recognition inevitably invites social comparisons. Since status recognition commonly corresponds with performance and accompanies tangible rewards, it is challenging to isolate pure social comparison costs. Leveraging a natural experiment in a large multinational organization, I provide novel evidence that employees are distinctly sensitive to status recognition beyond any material, career, or reputation concerns. When denied status recognition, employees are much more likely to exit the organization, despite receiving higher monetary rewards as recompense for nominal under-recognition. This study demonstrates the serious risks of using status recognition as an employee performance motivator. The analysis has broad implications for the strategic decisions organizations face when trying to motivate employees through nonmonetary reward systems.

than how managers actually consider and balance stakeholder needs. Drawing on an inductive analysis of mixed-methods data from 353 Dutch philanthropic organizations, this paper unpacks the practice of stakeholder management. Informed by a strategy-as-practice lens, which has fruitfully advanced other branches of strategy research, it unpacks what stakeholder management practices look like, how and why managers enact them, and the consequences for stakeholders in terms of prioritization versus harmonization of their needs. We contribute to stakeholder theory by developing a new descriptive and empirically informed understanding of how managers deal with stakeholder demands. By identifying distinct ways in which managers deal with stakeholders, while moving beyond opposite cultural or moral pre-configurations as the foundational explanation, we take important steps towards explaining variation within as well as across stakeholder management approaches.

Decolonizing Nature-Culture Dualism: The Economies of Worth at the Test of Ecological Imaginary

Author: **Claire-Isabelle Roquebert**; U. of Lausanne, HEC Lausanne
Author: **Gervaise Debucquet**; Audencia Business School

Facing the rise of sustainability issues in Western contexts, the major focus on compromising-processes tends to favour business as usual or reformist approaches, while the ecological issue would require fundamental changes. Our research aims at filling this gap by challenging the pragmatic sociology through the analysis of Biodynamics, a radical ecological method in agriculture. In order to

SBMs relate to results achieved – taking into account the social, environmental and economic outcomes – by focusing on firms certificated as B Corps. We perform an analysis on original survey data on B Corps located in Italy, Spain and the UK. Findings confirm the variety of business model innovations adopted by sustainable firms, which are driving to different results. Specifically, important sustainable outcomes are achieved both by firms implementing environmentally-oriented BMs and socially-oriented BMs. Two clusters of firms emerged based on outcomes (high/low performance in all the three outcomes considered). Business models focused on substituting with renewables and natural processes, maximising material and energy efficiency, adopting a stewardship role and on encouraging sufficiency are more likely to be associated with firms with better economic, social and environmental results.

A Micro-Foundational Perspective of Shareholders' Influence on Firms' Environmental Proactivity

Author: **Manuel Bueno García**; U. of Granada

Author: **Juan-Alberto Aragon-Correa**; U. of Granada

Author: **Blanca Delgado-Marquez**; U. of Granada

Divergent findings regarding an upcoming shareholders' interest on environmental issues have emerged from management literature. Institutional scholars focus on external pressures to predict shareholders' preferences, whereas agency studies highlight that such preferences internally face to managers' priorities. This paper makes a bridge through emerging microfoundations perspective by arguing that different shareholders' orientation yields different consequences on a firm's environmental strategy and that internationalisation moderates such relationship. Specifically, our results show that a large presence of strategic shareholders at the firm level positively drives environmental proactivity in a longitudinal sample of 2,247 observations between 2007 and 2017 from 277 US firms in 11 industries. Meanwhile, a large presence of financial shareholders is positively related to a firm's environmental proactivity only for high levels of a firm's internationalisation, but negative for low levels of internationalisation. Our results contribute by simultaneously considering micro-level shareholders' different interests and macro- level

analyse the integration of non-human beings and ecosystems in moral issues, we bridged the Economies of Worth framework developed by Boltanski and Thévenot (Boltanski & Thévenot, 2006 [1991]) and the literature on imaginaries through a qualitative analysis of this radically alternative ecological imaginary. Our results reveal the limits of nature-culture duality to found ecological justice and uncover how ecological – 'non-dualist' – ontology surpasses and challenges the Economies of Worth framework. Our research induces that morality is based on ontological categorisations that can be challenged during social conflicts, such as the western separation between human and non-human beings. It contributes to decolonize the 'dualist' basis of the Economies of Worth framework and to extend the framework by proposing a theorization of ecological ontology.

A Place for Sustainable Development: Managing Place-Based Resources on the Tibetan Plateau

Author: **Haitao Yu**; Ivey Business School

Author: **Pratima Bansal**; U. of Western Ontario

Author: **Diane-Laure Arjalies**; Ivey Business School

Sustainable development requires businesses to manage finite resources to ensure that both present and future generations can meet their needs. However, the demand for resources has outstripped the planet's ability to regenerate them, and nowhere is this more concrete and salient than in local places. Our study explores "how do organizations manage limited local resources for sustainable development in a globalizing world?". We answer this question through a qualitative inductive study of LuxuryYak -- a luxury textile enterprise that uses local resources on the Tibetan Plateau and sells its products to global fashion houses. We conducted a three-month ethnography in which we took considerable field notes, conducted 51 in-depth interviews, engaged in 45 informal discussions, and collected about 2,000 pages from the company archives. In this paper, we develop the concept of place-based resources to discriminate them from placeless resources. Place-based resources are coupled with the local place-based ecological and social processes, and critical for local sustainable development. Place-based

institutional pressures.

Perceived Corruption and Environmental Performance of SMEs in Ghana

Author: **Diego Alfonso Vazquez**; Portsmouth Business School

Author: **Samuel Adomako**; U. of Bradford

Author: **Irene Chu**; Bradford School of Management

Author: **Obi Berko Damoah**; U. of Ghana

Environmental concerns continue to increase its prominence in developing countries' policy and business agendas. Accordingly, a growing stream of literature investigates the factors influencing corporate environmental performance in developing countries. While such research has largely focused on large local firms and multinational corporations, recent debates are turning attention to small and medium enterprises (SMEs), given their potential impact in economic and environmental aspects. However, the literature is scarce and inconclusive with respect to how perceived corruption – a critical issue in many developing economies - is related to SMEs' environmental performance, and what factors influence such relation. We use a survey of Ghanaian 242 SMEs to address this gap. We found that perceived institutional corruption is negatively related to environmental performance and such negative relation is increased by financial slack (i.e. potentially utilizable resources that can be diverted or redeployed for the achievement of organizational goals) and institutional networking efforts (i.e. an entrepreneur's connections to governmental and public policy officeholders). However, pressures from primary and secondary stakeholders can decrease the negative effect of perceived corruption on environmental performance

Rediscovering the Bucolic Tale: The Role of Place Embeddedness in Fostering Sustainable Practices

Author: **Lucrezia Nava**; U. Ramon Llull, ESADE Business School

Author: **Jorge Chiapetti**; jo1812

Author: **Rui Barbosa Da Rocha**; U. Estadual de Santa Cruz

Author: **Maja Tampe**; ESADE Business School

Based on a mixed-methods study of agricultural producers, this article examines whether and how the embeddedness in the natural and social environment surrounding the organization (i.e. place embeddedness) affects the implementation of sustainable practices. Theoretically, the study draws on practice theory to understand how the different elements of practices (competence, meaning and material) are shaped by each the constituents of place embeddedness. In the empirical analysis, the article derives and tests a model that shows three trajectories through which these effects occur. First, through a higher knowledge and awareness deriving from cohabitation with the elements of the place, affecting the competence element of sustainable practices. Second, through an identification with the elements of place that leads to emotional attachment and higher care, shaping the meaning associated with sustainable practices. Finally, attachment to place influences the access to the natural elements and resources, ultimately affecting the material element of sustainable practices. What emerge from our analysis is that place embeddedness affects practices through shaping simultaneously each of the three elements that need to be present for practices to be enacted. The article concludes with the implications of our study for both the place-oriented and the practice-oriented literature in the sustainability field.

compensation contracts, thereby tying CEO compensation directly to social and environmental performance. However, empirical evidence on the effectiveness of CSR incentives in improving social and environmental performance is mixed, finding both evidence in favor of and against its effectiveness. Using an eight-year sample consisting of 2,579 firm-year observations with manually collected compensation contract data, I zoom in on determinants of the adoption of CSR targets in CEO compensation and its effects on subsequent environmental performance. First, I show that both internal normative pressure and external mimetic pressure serve as a conduit for the adoption of environmental control mechanisms in executive compensation contracts. Further, I also show that not all types of pressure lead to substantive implementation of targets. That is, I document that internal normative pressure mainly results in substantive implementation, as internal pressure is associated with a subsequent increase in environmental performance. Mimetic pressure, on the other hand, does not automatically lead to improved environmental performance, suggesting that mimetic pressure might drive a symbolic commitment, potentially aimed at enhancing social legitimacy and acceptance.

Product and Service Innovation (session 1415)

Innovation in Performing Arts Organizations: An Empirical Study

Author: Soheil Sadeghi K.; RESEARCH ASSISTANT

Author: Sara Hajmohammad; Telfer School of Management, U. of Ottawa

This study aims to expand the Operations Management field's discourse to recognize the idiosyncrasies of not-for-profit performing arts organizations (PAOs) and how they can survive and achieve their ultimate goal, i.e. providing

relationship performance. Therefore, this study analyzes whether relational governance has an optimum level with regard to relationship performance and whether the optimum level is different in relationships with different characteristics. Survey data from 228 firms in China are used to test the hypotheses. The findings imply that relational governance is not always effective and it has an optimum level with regard to relationship performance, which varies according to the relationship's characteristics. The optimum level of relational governance, with regard to relationship performance, is higher for relationships with high trust and transaction specific investments. Our finding reconciles previous debates, which in turn, deepens our understanding of relational governance. In addition, the study is an initial explorative attempt to reveal the moderating effects of relationship characteristics from different lens that has both dedication and constraint aspects. The findings answer the question of when relational governance is really good for performance, and contribute to the dedication-constraint framework seen in the marketing literature as well. Given the bright and dark side, managers should be prudent in the use of relational governance and develop relational governance according to the characteristics of their buyer-supplier relationships.

A Dynamic Model of Buyer-Supplier Conflict Processes

Author: **Meriem Bouazzaoui**; School of Management, U. of Bath

Author: **Brian Squire**; U. of Bath

Author: **Wendy Tate**; U. of Tennessee

Studies examining the temporal dynamics of buyer-supplier conflict are scarce despite emphatic calls for investigating conflict as a dynamic process. This research takes an initial step and examines the trajectory of conflict towards functional or dysfunctional outcomes, by specifically investigating the interplay between task and relationship conflict. Towards this end, dyadic case studies each with multiple respondents were used. The interviews were semi-structured and paired retrospective data from both sides were collected. We propose a

products/services to improve and benefit a community and the broad public interests. In doing so, we consider innovation as a strategic weapon in addressing PAOs' increasing need for improvement in their operating structures and performance outcomes. Particularly, we determine the drivers of innovation in today's PAOs and explore how innovation in both products and services can affect their financial, artistic, and social performance. Drawing on the theory of dynamic capabilities and based on a systematic literature review, four major internal capabilities are identified that can enhance PAOs' level of product and service innovations: Environmental Intelligence, Internal Integration, Core Operational Capability, and External Partnerships and Collaborations. A survey targeting top managers from a random sample of North American orchestras is conducted to empirically validate our conceptualization of the PAO Innovation and examine the proposed conceptual model. The results indicated that every capability significantly enhanced at least two innovation dimensions. Moreover, product and delivery innovations were positively influential on artistic performance and ultimately, financial performance.

Green Integration and Moderating Effects of Absorptive Capacity on Eco-Innovation in Supply Chain

Author: **Xiaomei Li**; Tianjin U.

Author: **Andrea Appolloni**; U. of Rome Tor Vergata

An increasing number of firms are implementing green supply chain management strategies to encourage environmental protection and to demonstrate their corporate social responsibilities. How to integrate internal and external resources to improve eco innovation to get the sustainability of the core companies attract more and more attentions. The research was built upon contingency theory by analyzing the relationships between internal green integration and external green integration with eco-innovation in companies, and by introducing firm-level absorptive capacity as a moderator to test the importance of internal fit, using a hierarchical linear regression model tested in a cross-national study of machinery, electronic,

phase-based model of conflict process, wherein conflict moves from a conflict initiation state, to a conflict spiral phase where task and relationship conflicts impact each other in a continuous feedback loop until a conflict tolerance threshold, and then to conflict outcomes. We propose mechanisms that trigger the transition among phases (interphase) and mechanisms leading to dynamics within phases (intrapphase). In formulating a dynamic model of buyer-supplier conflict process, this paper offers new insights by incorporating a temporal perspective into the study of conflict. Our findings suggest that conflict unfolds over time and is more complex than originally recognised in the literature.

Boundary Spanning for Supplier Development

Author: **Martin Norlyk Jørgensen**; Aarhus U.

Author: **Chris Ellegaard**; Aarhus U.

Author: **Hanne Kragh**; Aarhus U.

Motivated by a growing reliance on suppliers, buying firms often engage in supplier development efforts to improve supplier performance. The benefits that both parties can enjoy from supplier development are well established. However, existing literature has tended to conceptualize supplier development as a meso-organizational level behavior typically directed towards a single performance improvement area often assuming that the buying firm has all the required expertise internally. Further, supplier development has primarily been studied within the confines of a single buyer-supplier relationship. Using a qualitative case method, we take a micro level perspective and explore how boundary spanning managers from an OEM attempt to develop a key supplier in multiple performance areas simultaneously. Although our primary focus is on the development efforts towards a specific supplier, we also uncover how efforts vis a vis competing suppliers affect efforts relative to the core supplier. We highlight the boundary spanning challenges that emerge when managers with different and at times conflicting orientations and interests are involved in multiple supplier development initiatives at the same time. Based on our analysis, we identify four boundary spanning mediation roles and make a theoretical contribution

and transportation component's industries in China and Europe (Germany and Italy). The results of this empirical study showed that internal green integration, supplier green integration and customer green integration all have positive effects on radical eco-innovation in companies in China and Europe samples. Absorptive capacity positively moderates the relationships among internal green integration, supplier green integration and eco-innovation in the Chinese and European samples. However, the positive effects of customer green integration on eco-innovation was weakened as absorptive capacity increases in the case of European firms, while this relationship was not supported in the Chinese companies.

Contracting for Innovation in Public Services: Capabilities, Institutions and Intermediation

Author: **Kostas Selviaridis**; Lancaster U.

Management School

Author: **Martin Spring**; Lancaster U.

Contracting for innovation in the public sector is challenging due to a shortfall of related capabilities of buyers and suppliers, and institutional constraints impeding innovation sourcing and adoption processes. In this context, innovation intermediary organisations intervene to tackle some of these challenges. This paper seeks to develop middle-range theory regarding the mechanisms underpinning the contribution and impact of innovation intermediaries in settings of public sector innovation sourcing. We uncover two key mechanisms. First, intermediaries contribute innovation contracting know-how by brokering connections and innovation-related interactions, providing access to different types of know-how and helping to bridge indirect capability gaps of buyers and suppliers. Second, intermediaries leverage their institutional know-how to facilitate innovation sourcing and adoption processes by exposing institutional constraints at play, forming relationships with and lobbying relevant stakeholders, and shaping change in innovation- and procurement- related institutions. Intermediaries' contribution of innovation contracting know-how and institutional know-how

that sits in the intersection between boundary spanning and supplier development.

Upstream or Downstream? Suppliers-Customer CSR Performance Links

Author: **Maretno Agus Harjoto**; Pepperdine Graziadio Business School

Author: **Robert Lee**; Pepperdine Graziadio Business School

Author: **Michael Thomas Paz**; Cornell SC Johnson College of Business

This study examines corporate social responsibility (CSR) performance between suppliers and customers within supply chain networks. Based on the spillover and stakeholder pressure theories, we argue that there is a spillover of CSR performance between suppliers and customers as well as downstream-upstream pressures to satisfy stakeholder demands for stronger CSR performance. Using a sample of 5,451 suppliers and 2,520 customers of U.S. firms from 1993 to 2013, we find evidence to support our hypothesis. We find that CSR performance in downstream (customers') CSR influences the CSR performance of the upstream (suppliers') supply chain partners but not vice versa. While extant literature in the supply chain has examined the suppliers-customers' research and development innovations, our study extends this literature to suppliers-customers' social innovations by establishing a link between suppliers and customers CSR performance through supply chain networks.

Unpacking the Interplay Between Process Improvement Approaches and Product Innovation

Author: **Rima Al Hasan**; U. of Jordan

Author: **Pietro G. Micheli**; U. of Warwick

This paper explores how organizations manage the interplay between process improvement (PI) approaches, such as lean, Six Sigma and total quality management, and product innovation. Using a qualitative multiple-case study method, four different configurations for managing the interplay between PI and innovation - "strategic and holistic", "facilitating and empowering", "operational", "project-based" - emerged from the analysis and their associated mechanisms were identified. In the organizations considered, the interplay between PI and innovation was managed primarily through integration in the "facilitating and empowering" and "strategic and holistic" configurations, and through separation in the "operational" and "project-based" ones. Additionally, PI was found to enable innovation if loosely integrated in the innovation process. On the contrary, if PI is tightly integrated in the innovation process, it might constrain radical innovation. The findings of this research go beyond a single view of PI and provide empirical evidence on the varied and sometimes paradoxical uses of PI in either triggering or hindering different degrees of product innovation.

to exist, and the code of ethics is not sufficient to end these practices. Thus, this paper analyzes the effect of nonconscious ethical priming as a way to increase ethical decisions by purchasing agents. We elicited the ethical subconscious priming using self-concept maintenance and the Reynolds' neurocognitive model. In addition, we tested the wrongdoing environment's influence on the ethical decision-making process as the Cialdini effect: "when a lot of people are doing something, it is the right thing to do". We applied two experimental studies. Our results showed that nonconscious ethical priming increases ethical decisions, and wrongdoing environment engages dishonest acts. These findings provided potential managerial features to engage ethical decisions when codes of ethics do not always work.

How Organizational Power and Affective Experience Shape Identity

Author: **ByeongJo Kim**; California State U., Chico
Author: **Jonghwan Eun**; Korea National Open U.

While the effect of organizational prestige on members' organizational identification has been overestimated, the potential role of individual experience stimulating positive affect has not been well-explored. The present study examines the effect of perceived satisfaction with interpersonal relationships as an individual-level affective antecedent on organizational identification among government employees. We also investigate the agency power of public organizations as an organizational-level determinant of members' identification with the organization. A multilevel modeling analysis using government employee data from forty-one departments in the South Korean national government demonstrates a significant

Interplay of Digital Visualizing Tools and Frontline Employees' Strategy Work

Author: **Bijan Azad**; American U. of Beirut
Author: **Fouad Zablith**; American U. of Beirut

The research on the role of visualization in strategy work is maturing. However, the emphasis has been on strategy making by the top management and the role of visualization artifacts as a whole in that process. The study of digital visualizations and the role that their specific features play especially within strategy realization work of frontline employees is less common and largely an open question. We draw on a qualitative interpretive case study of how digital visualization tools were employed by frontline employees within an university in order to implement strategic turnaround by transforming its curriculum to reverse quality drift, stop enrollment decline, and gain international accreditation. The

association between an affective antecedent (i.e., relationship satisfaction) and organizational identification. However, using an exogenous measure of organizational power (i.e., public agency power), the well-known association between organizational power and members' organizational identification appeared to be insignificant; only moderating effect was significant with small effect size. We discuss the theoretical and practical implications of the findings.

Evolution of Employee Performance Management in the U.S. Federal Agencies

Author: **Hyung-Woo Lee**; Hannam U.

Author: **Peter J. Robertson**; U. of Southern California

Despite the prevalent pessimism about the effectiveness of performance management in the public sector, U.S. federal government have endeavored to improve the implementation practices of employee performance management. Drawing from the organizational change perspective, this study examines whether the perception of appraisal fairness and feedback quality has improved over the last ten years. Also, it investigates if the impact of employee performance management on work effort has increased. Analyzing the Federal Employee Viewpoint Survey from 2010 to 2019, it is demonstrated that the perception of appraisal fairness and feedback quality has gradually improved over the last decade and so does the effect size of employee performance management on work effort.

How Governance Paradigms and Other Drivers Affect Public Managers Acceptance of Innovation Practices (WITHDRAWN)

Author: **Alberto Peralta**; U. of Alcalá (Spain)

Author: **Luis Rubalcaba**; U. of Alcalá (Spain)

Author: **Javier Carrillo-Hermosilla**; U. of Alcalá (Spain)

With this research, we integrate the determinants

study findings show how digital visualization tools (i.e., four Linked Data visualizations representing curriculum maps) and the associated features (i.e., incorporating non-narrative, network depiction and adaptive interface functionalities) contributed to the realization phases of strategy understanding and strategy enactment. In particular, the study shows that, the interpretation of strategy appeared to be aided by three affordances affectivity, relationality and interactivity of visualization tools/features. Our study further shows that frontline employees work on strategy enactment was shaped both via legibility affordances (aiding enactment of strategy consistent with the original intent) as well as enunciability affordances (enabling enactment of strategy beyond originally intended). We contribute to the literature by proposing a framework that highlights how visualizations/features can (1) lubricate the strategy interpretation within the understanding phase of strategy realization; and (2) either guide frontline employee participation via legibility affordances or spark re-thinking of strategy via enunciability affordances within the enactment phase of strategy realization.

A Theory of Practice Beyond the Human: From Doings with Things to Doings as a Tendency of Things

Author: **Yassine Talaoui**; U. of Vaasa

Author: **Marko Kohtamäki**; U. of Vaasa

The treatment of the material in practice theory either follows a post-Wittgensteinian 'human/material' asymmetry, a Latourian 'human-material' symmetry, or a Baradian (human material) entanglement. Practice scholars suggest three views of the material: a passive knowable, a mediator enacted when used, or a protean entity with humanlike characteristics. Their accounts challenge any exploration of the interrelationships of the material and the human in the reproduction of social orderliness and reality without sloughing off representation or material agency. In response, we aim to rehabilitate the status of the material in practice theory by developing a theoretical view of materiality as a semiotic process that provincializes language and decolonizes representation from the

driving the decisions of public managers towards opting for an innovation practice to achieve public goals. After our exploratory analysis dealing with those determinants on a sample of 227 Spanish public managers, we formed a behavioral model that can answer to a large extent – $R^2: .85$ – the question what influences the use of a more conventional, linear innovation practice, or a more complex, circular, collaborative practice to change, update or create public services. Using parametric and non-parametric tests we can see for the first time how the connection of determinants like Governance Paradigm, Effort Expectancy, Habit or Performance Expectancy work and influence managers and innovators behavior. Also, we present what dynamics influence Behavioral Intention and Usage and how different manager groups – more prone to conventional practices or leaning towards citizen involvement – behave towards the acceptance and use of innovation tools. Still, this is an exploration of this very novel field, and our analyses have detected certain determinants that are not relevant for every managerial group in the public innovation context when they should be, most specifically social influences.

realm of human language. We term our ontological exploration a theory of practice beyond the human and show its merit through an illustrative review of 197 articles on the practice of strategizing and big data analytics. Our analysis reveals two absent forms of big data analytics that produce social orderliness in the practice of strategizing: the distribution of aggregate data describing the context of strategizing and the flow of social consequences reshaping the doings of strategizing. We build on these insights to theorize the doings of practice, namely strategizing, as a tendency of things and offer suggestions to reach the full potential of the material turn in practice through an ontology beyond the human.

The Place of the Material for Organizational Practices

Author: **Maja Tampe**; ESADE Business School

How does materiality shape organizational practices and vice versa? While this question has garnered increasing attention from scholars of practice theory and of strategy-as-practice, it remains unclear how materiality and practices become intertwined. To better understand this process, I use concepts from practice theory to trace their relations, drawing on data collected between 2014 and 2019 from over 100 interviews and participant-observation with agribusiness organizations in Brazil. A prospective finding is that practices and material arrangements are connected through a practice of articulating materiality, through making meaning of materiality and taking actions that open a space for future possibilities intended to be aligned with meaning making. This practice is meant to get material arrangements back on track when there is a breakdown. Specifically, for an example of water management, the practice entails to make present apparent solutions to a water crisis and thus to mitigate materiality. For an example of waste management, the practice entails to make waste absent and thus to purify materiality. Importantly, the situated use of this articulation practice brings forth different material arrangements. Overall, this paper contributes the concept of an articulation practice to a small, but growing stream of work on

Civil Society and Markets (session 1419)

Roles and Dynamics of State Actors and Civil Society Organizations in Company-Community Conflicts (WITHDRAWN)

Author: **Chang Hoon Oh**; Simon Fraser U.

Author: **Simon Pek**; U. of Victoria

Author: **Jiyoung Shin**; Groningen U. (RuG)

Drawing on resource dependency, stakeholder management, and social movement literature our study identifies how the orientation of state actors and involvement of civil society actors affect conflict intensity between mining companies and communities. We also examine how vertical and horizontal inequalities can worsen power imbalance and increase conflict intensity. By using a hand-collected multi-source dataset of 453 global mining conflicts between 2002 and 2013, we found that state actors' pro-social orientation lowers the conflict intensity while their pro-development orientation increases the conflict intensity when combined with the involvement of civil society organizations. Findings also show that societal horizontal and vertical inequalities increase the conflict intensity when both civil society organizations and state actors are involved because inequalities will weaken collaborations among parties.

Hybrids and Hybrid Organizing for Sustainability (session 1421)

It is notable to see how management scholars have started to investigate sustainability issues. With regard to the history of management research, this phenomenon is very recent and, thus, there is much to investigate. In particular, we do not know how organization and management theories can help to address the grand challenges of modern times. Reversely, it is still unclear how sustainability issues question and help improve managerial practices and theories. At the intersection of these two questions, this symposium aims to start a discussion on the role of hybrid organizations in the context of sustainable development, and on the strategies making hybrid organizing work. Hybrid organizations are part of new organizational forms that replace "or" by "and", create bridges and outreach traditional organizations that prove their failure to meet social and environmental requirements. This symposium brings together theoretical and empirical researches reflecting the diversity of grand challenges with data from renewable energy cooperatives, local food hubs, microfinance organizations, social entrepreneur coworking spaces, cooperative platforms and public-private partnerships. They not only critically examine the concept of hybridity in various empirical contexts but also highlight in how far hybrid organizing may contribute to develop solutions for sustainability challenges of modern times, and where this analytical framework needs to be improved.

The Restoring of Institutional Logics and the Engagement of Grand Challenges

Ali Aslan Guemuesay; U. of Hamburg

Laura Claus; U. College London

Author: **Qaiser Rafique Yasser**; Preston U., Pakistan

This study investigates the effects of institutional qualities on Corporate Social Responsibility (CSR) engagement from a global perspective. We examine CSR engagement across 83 developed and developing economies focussing on four potential institutional drivers: (a) the rule of law, (b) economic financial development, (c) human capital formation and, (d) exposure to international trade. We find that the level of human capital formation and exposure to international trade is positively associated with CSR engagement in both developing and developed economies. However, the rule of law was only associated with CSR engagement in developing economies while the level of economic financial development was only associated with CSR engagement in developed economies. We conclude that improving the level of human capital formation and encouraging international trade is important for the overall social well-being of all economies while developing economies can further encourage CSR engagement by enhancing their rule of law.

The Consequences of Creating Markets to Address Social Problems

Author: **Diana Jue-Rajasingh**; U. of Michigan

The use of venture philanthropy to address social problems has become an increasingly popular model of international development. This study examines the efforts and consequences of venture philanthropists that are working to promote the adoption of products that address complex problems. Through an inductive study consisting of qualitative archival data, interviews, and field observations, I document the emergence of an emerging market in East Africa and present evidence of how actors (entrepreneurs, intermediaries, and national governments) are affected by the institutional model of venture philanthropists. I then comment on how this has altered – or stifled – the trajectory of the emerging market.

In Search of a Western Relational Management Paradigm: Past Research Paths and Future Directions

Author: **Audrey-Anne Cyr**; HEC Montreal

Increasingly, researchers and prominent consulting firms call for the adoption of a relational approach to management in western organizations to reach out with eastern businesses and cope with eastern growing economies. An imposing number of articles published lately in management, organizations and strategy fields suggests already the existence of a relational approach to management in the Western world. In that respect, before adopting a relational approach to management adapted to eastern business, an introspective reflection must be done to understand the western relational nature of management. In search of a western relational paradigm, this literature review synthesizes how management scholars have problematized, conceptualized and represented relational issues in management studies for the last 20 years. Two forms of paradigms are identified based on two different sets of assumptions of human beings and economic life embodied in Granovetter's view of embeddedness and Polanyi's substantivism perspective.

Where the Work Gets Done – The Effects of Committee Composition on Firm Performance

Author: **Simone Maria Eulitz**; LMU Munich

Author: **Felipe Calvano Da Silva**; U. of Missouri, Columbia

Author: **Karen Schnatterly**; Virginia Tech

Author: **Manfred Woelfle**; Ludwig Maximilian U. of

The influence of mass media sentiment on newly listed firms' IPO performance has received increasing attention in management research. However, prior literature assumes the positive role of media sentiment in investors' evaluation of the IPO firm. It overlooked the potential downside of the excess level of positive media sentiment. Based on social cognition theory, we contribute to this growing body of research by theorizing and testing a curvilinear relationship between media sentiment and firms' IPO performance. Further, from a social cognitive perspective, we argue that this curvilinear relationship is being moderated by external information cues such as IPO market conditions. Drawing a representative sample of newly listed U.S. initial public offerings from the year 2010 to 2018, we found supports for the proposed inverted U shape relationship between media sentiment and IPO performance. However, such a relationship is being moderated by IPO market conditions. Our framework and findings highlight the complexity and dynamics of media influence on IPO performance.

The Role of Champion Metaphors in Business and Stakeholder Relationships: An Exploratory Case Study

Author: **Elisabet Garriga**; EADA Business School

Based on an exploratory case study, we describe the role of metaphors in specific business and stakeholders relationships, which have never been researched before. Especially we focus on one type of metaphors, the champion metaphors those that following Rorty's definition promote social progress and social hope. As a result of the case study in Specialisterne, we found that the champion metaphor, the dandelion metaphor, helped to promote a change in all not only for stakeholders' perceptions but also for the Specialisterne' stakeholders have themselves in turn integrated people with autism or any other socially excluded groups into society. Several examples for each stakeholder have been provided such as suppliers, like Lego, who have launched new product lines for groups that were socially excluded, children with

Munich (LMU)

There is an emerging consensus that the work of the board is done in committees (Kolev, Wangrow, Barker III, & Schepker, 2019). There are different types of committees on boards with differing charges. Yet there is sparse evidence as to how and how well these committees work. Investigating board committees from an attention-based view (Ocasio, 1997), we argue that committee heterogeneity is a powerful means to focus director attention on the specific task of a committee. By differentiating between tasks where directors need to be able to broadly scan the environment for opportunities and board tasks where directors need a very domain specific kind of knowledge we argue that firms whose committee composition is reflective of the requirements of the committee's task, where the attention of the members is appropriately focused, will see positive firm performance. Based on an analysis of board committees, our results suggest that committee heterogeneity has varying effects on firm performance depending on whether a committee is required to focus attention on one domain specific task or whether a committee needs to distribute attention widely to meet the requirements of broad and complex tasks.

Save the World but Ignore the Fellows? Selective Engagement in CSR of Celebrity CEOs

Author: **Jiangyan Li**; Sun Yat-Sen U.

We attempt to provide a novel view of the antecedent of selective engagement between external and internal CSR of firms. Specially, we investigate the influence of becoming a celebrity (e.g., winning a CEO award) on the CEO's intention to conduct corporate philanthropy (i.e., external CSR) or employee-related CSR (i.e., internal CSR). We find that, after becoming a celebrity, CEOs will conduct more corporate philanthropy because they attempt to maintain their social status among the social audience; and CEOs will do less employee-related CSR after becoming a celebrity because winning an award has already established their legitimacy inside the firm so that they feel unnecessary to do employee-related CSR. Furthermore, the media coverage strengthens the effects of CEO celebrity on corporate philanthropy and employee-related CSR. Findings from this study contribute to CEO social acclaim research and CSR literature by proposing the role of CEO celebrity in triggering firms' selective engagement in CSR.

Tipping Points: When are Little Things Just Little Things?

focus. Yet, the impact of these optional committees and the importance of their composition has largely remained unexplored. In this paper, we explore the technology committee because of its rise in popularity and the growing need for firms to be innovative. Drawing upon the attention based view and upper echelons theory we explain how the formal structure of a technology committee focuses the attention of its members and improves firms' innovation outcomes. Further, we examine the composition of the technology committee—the inclusion of board members with the ability to focus on technology-related issues (e.g., technology experts) and those with the need to focus (e.g., busy directors)—on the committee's influence on the firm's innovation. Our results indicate that firms that adopt technology committees experience higher subsequent innovation. Moreover, the structure of a technology committee provides a necessary focusing mechanism for busy directors who might otherwise be distracted; busy directors on a technology committee are positively associated with subsequent innovation. Surprisingly, however, technology experts' membership on a technology committee is not always advantageous and is contingent on commitment of firm resources to the innovation processes. Overall, our findings highlight the importance of optional board committees and offer a practical guide to structuring boards in ways that result in greater innovation output.

Author: **Patrick Joseph McHugh**; Brown U.

Author: **August Guang**; Brown U.

Author: **Andras Zsom**; Brown U.

The definition of a “tipping point” suggests a moment in time when a series of small changes creates a disproportionately large effect. In its original scientific reference, a tipping point implies a change that is irreversible and beyond our control - such as the spread of an epidemic. Following Gladwell’s popular book “ The tipping point: How little things can make a big difference” (2000), the phrase has become a catch-all sensemaking device to reference complex social phenomena that trigger our epidemiological imagination – from the idea that something is “going viral” to innovative changes in business models. In this article, we seek to better understand the defining features of the phenomena that individuals perceive as tipping points in social science. We conduct an experiment with 178 subjects analyzing 32 potential tipping points; we utilize advanced machine learning methods as we enlighten the dynamic relationship between the characteristics of the perceiver and their perceptions of the phenomena in defining when a tipping point is believed to occur. This is the first empirical study to the authors’ knowledge designed to investigate the concept of tipping points and what they mean to the individuals who perceive them. The implications of this preliminary effort conclude this article.

Outside Director to Executive: A New View of the Resource-Provision Role of Directors

Author: **Inn Hee Gee**; Texas A&M U.

Author: **Albert Cannella**; Texas A&M U., College Station

Our study examines how and why outside directors of firms sometimes accept senior executive roles in those firms, thus converting from outside directors to inside directors. We approach this research question from two levels of analysis: the firm level and the director level. At the firm level, we develop theory to predict that boards utilize outside director appointments when there is a dearth of inside candidates and when firm performance is poor. At the director level, we predict that ongoing executive service in another firm is negatively associated with the conversion, while former executive experience is positively associated with the conversion. Similarly, not-for-profit executive experience is negatively associated with the conversion, while private firm executive experience is positively associated with the conversion. We describe the conversion from outside director to executive as a new way of fulfilling the board’s resource provision role. In addition, we describe how boards manage information asymmetry during selection processes by integrating resource dependency theory and agency theory. Using all outside director appointments in BoardEx, we contribute to strategic leadership research by exploring the role conversion from outside director to executive.

Evolution and Implications of Organizational Structure (session 1425)

Developing a Model of Antecedents to Middle Managers' Strategic Role Conflict

Author: **Hector R. Flores**; California State Polytechnic U., Pomona

Strategic role conflict has been identified in the literature as a hindrance, even an impediment, to effective middle-management involvement in strategy. Despite a growing body of theoretical work by scholars on the strategy process, there has been limited empirical research of the antecedents of strategic role conflict. This study explored the effects of middle managers' demographic characteristics, the nature of their position within the organization, the quality of their relationships with top management, and the extent of dissimilarity of environmental perceptions between the middle manager and their top manager on the middle manager's experience of strategic role conflict. A large, global manufacturing company based in the United States participated in the study. Survey data was collected from 249 middle managers at four organizational levels within two divisions. Two structural models were tested. Data showed that the more parsimonious model was not supported while the less parsimonious model was supported. Results indicated that key predictors of middle manager's strategic role conflict were the amount of boundary spanning that middle managers engage in as part of their jobs, the extent of disparity in their perception of the products and factors markets vis-à-vis top management, the frequency of their direct communication with their top manager, the amount of mutual trust between the top middle manager and the top manager, and the amount of disparity in the feelings of mutual affect between the middle manager and his/her top manager.

Knowledge Integration Across Industry Boundaries: Which Firms Leverage Other Industry Experience

Author: **Nachiket Bhawe**; U. of North Carolina Pembroke

Author: **Shaker A. Zahra**; U. of Minnesota

In the modern 'gig economy', firms increasingly develop innovative new products using temporary one-off project teams that comprise individuals with intra-industry and cross-industry knowledge. Drawing on the knowledge integration literature and using an extensive database spanning two industries, we show that the type of firm experience (complementary vs. own industry experience) and the role structure of project teams influences the development of innovative new products. Greater experience in a complementary industry intensifies the effect of cross-industry knowledge on the development of innovative games, when firms employ 'boundary spanning' roles in their project teams. Meanwhile, firms' greater "own industry" experience increases the effect of intra-industry knowledge on the development of innovative games, primarily for those firms that rely on hierarchical roles in their project teams. Keywords: Knowledge integration, Firm experience, Innovation, New product development, Project teams, Gig economy

Strategic Partial Misting: The Linkages Between Modularity, Value, and the Mirroring Hypothesis

Author: **Nicholas Burton**; Northumbria U.

Author: **Peter Galvin**; Edith Cowan U.

The mirroring hypothesis suggests a correspondence between product, firm and industry architectures, however, empirical support to date has been mixed. We suggest that the inconsistent results can be attributed to whether mirroring studies utilized a 'weak' or 'strong' test of mirroring and which organizational tie is used to measure its presence or absence. Drawing upon a study of the UK pensions industry, we break new ground by examining mirroring across time, for different types of product architecture, and using three different organizational ties. Given the 'misting' literature has almost exclusively highlighted technological contingencies, we observe that 'value' characteristics at the product component or sub-system level of a product create a contingency that sees firms either choose to mirror or strategically break the mirror ex-ante. Our longitudinal study highlights how product and industry architectures change over time according to different stimuli and that mirroring similarly evolves in response to strategic choices.

Pluripotent Digital Ventures and Their Paths to Product-Market Fit in New Markets

Author: **Shi Ying Lim**; National U. of Singapore

Author: **Douglas Hannah**; Boston U. Questrom School of Business

Ventures are pluripotent in their early years. Pluripotentiality refers to the absence of fixed developmental potentialities (i.e. ventures can take multiple paths to different outcomes).

Entrepreneurs have to coordinate many choices across multiple domains to find product-market fit (PMF). While PMF has been discussed in the practitioner literature, it is not clear how ventures coordinate the market and product choices to find PMF in the early years. This is important given the degrees of freedom but limited resources early

the possibility of abuse. Does unlimited vacation actually benefit firms? If so, how? And what are the contingencies based on organizational conditions? I explore the phenomenon in three empirical settings. Setting 1 provides background on macro-patterns of unlimited vacation adoption based on qualitative online benefits reviews. Setting 2 illustrates what unlimited vacation does to employees in a large high-tech company through a difference-in-differences design. I find that the perk leads to more vacation time and higher subjective productivity; the latter effect is much larger in close-knit teams but becomes negative in teams with weak interpersonal relationships. In Setting 3, I conducted a randomized controlled trial with two experiments and hired online workers for a month-long job to cleanly examine the effects of unlimited vacation on firms by itself (n=631). In Experiment 1, I varied worker type (high- vs. low-performers), work contract (unlimited vacation, capped vacation, or a choice between the two), and firing threat (strong vs. weak). In Experiment 2, I introduced additional treatments to separate out the vacation feature from other typically bundled practices in the unlimited vacation contract. I find that unlimited vacation leads to higher overall labor efficiency through three channels: (1) attracting more high-performers during recruitment, (2) increasing worker productivity in the performance stage, and (3) inducing extra work from more engaged and happier workers. A strong firing threat conditional on performance reduces the slacking rate. A performance-oriented bundled system strengthens the performance gains, but unlimited vacation also improves productivity by itself. This paper demonstrates how managers can create a highly skilled, productive, and motivated workforce through the perk of unlimited vacation. It further highlights the contingencies based on social dynamics, bundled HR practices, and the culture for punishing under-performance.

Hierarchy to Self Management: How Unmoored Managers Cope with Transformation of Organizational Form

Author: **Eleunthia Wong Ellinger**; La Salle, U. Ramon Llull

Self-management has become an attractive option in the range of available organizational structures for companies seeking innovative and entrepreneurial outcomes. Thus, some firms existing previously as hierarchies are converting to more non-hierarchical structures whose core tenet is self-management. A yet unanswered question in the literature on post-bureaucratic organization is: How do managers, as a significantly impacted category of organizational actors, cope with this organizational transformation to self-management? We conducted an in-depth field study in a large US-based IT firm undergoing such transformation. Our results reveal a range of emergent behaviors of managers “unmoored” by the organization’s conversion to self-management. We detail these emergent behaviors and build a temporal process model. Our findings have implications for researchers investigating self-management phenomenon and practitioners seeking effective self-management implementation.

Networks, Industries, and Alliance

Academic scientists develop deep topic knowledge in highly specialized niches. However, they also develop extensive skills used to carry out advanced research in their fields. The literature has typically focused on a generalist-specialist distinction in topic knowledge when seeking to understand how firms benefit from hiring scientists from academia. In this paper, I propose an alternative distinction between two dimensions of scientific human capital: topic knowledge and scientific research skills. I build on prior literature on scientific careers and the logic of scientific inquiry to analyze how each dimension can provide value to firms in corporate research. I argue that, relative to academia, firms will value flexibility in applying scientists’ human capital and eschew projects with greater potential divergence in commercial and scientific value. This, in turn, will shape the relative returns to topic knowledge and scientific research skills in firms’ human capital strategies. I test my arguments empirically using longitudinal data on U.S. scientists working in stem cell research. I show that academic scientists transitioning to industry employment have more conceptually diverse subsequent research output. This is consistent with industry placing a higher value on the scientific research skills of academic hires in their human capital strategies. It contrasts with a view in which firms hire experienced scientists with the primary intention of exploiting their highly specialized, but narrow, topic knowledge for commercial purposes. I also use my findings to draw implications on how the division of scientific labor between industry and academia affects knowledge accumulation in ‘Pasteur’s Quadrant’ where basic science and use-inspired research overlap.

Non-Market Strategies and the

Formation (session 1423)

The Effects of Supply Networks on Firm Competitive Behavior

Author: **Mengge Li**; U. of Texas at El Paso
Author: **Xiaojin Sun**; U. of Texas at El Paso
Author: **Yang Yang**; U. of Texas at El Paso

This study bridges strategic management and supply chain management domains by examining how firms' structural characteristics in supply networks influence competitive dynamics. We theorize causal relationships between a firm's network centrality and its competitive aggressiveness. We then extend the theory to the dyadic level and theorize that interfirm competitive dynamics can be explained by the differential network structure between rival pairs. Findings show that: 1) firms with both low and high centrality in supply networks tend to take more but simpler competitive actions compared to those with moderate centrality; 2) when a pair of rivals occupy network positions with similar centrality, they compete more intensely using similar actions.

The Impact of Outside Partnering Opportunities on Alliance Termination Decisions

Author: **Nina Hampl**; Alpen-Adria U. Klagenfurt, Austria
Author: **Werner Helmut Hoffmann**; WU Vienna U. of Economics and Business
Author: **Tobias Knoll**; WU Vienna

Nascent scholarly work has found support for the negative impact that alternative partnering opportunities exert on the stability of established alliance relationships. Still, little is known about how the characteristics of both the existing as well as the alternative partner influence a firm's propensity to switch alliance partners. Drawing on a dataset of 2,400 hypothetical decisions made by 120 alliance executives, we show that relational embeddedness and partner-specific investment in an established alliance act as cohesive forces and thus decrease the propensity to terminate the alliance and pursue an outside partnering opportunity. The effect of

Hazards of Probity: The Comparative Assessment of Governance

Author: **Joseph T. Mahoney**; U. of Illinois at Urbana-Champaign
Author: **Jiayue Ao**; U. of Illinois at Urbana-Champaign
Author: **Eva Christina Anguiano-Herbolzheimer**; U. of Illinois at Urbana-Champaign
Author: **Hyeonsuh Lee**; U. of Illinois at Urbana-Champaign

Despite widespread use of private firms to deliver correctional services in the United States, little is known about the relative benefit of contracting in this context. This paper uses transaction cost economics to consider the provision of public goods by private firms when hazards of probity are high. We submit that writing and enforcing contracts to operate prisons in the public interest is challenging due to divergent incentives, and we highlight how private firms affect correctional outcomes. Preliminary results from both quantitative and qualitative analyses suggest that contracting out correctional services leads to quality shading, resulting in higher recidivism rates compared to public prisons. We provide an avenue for future research by reviewing existing empirical studies on the comparison between public and private prisons.

Direct vs. Indirect Corporate Political Activity: Political Contributions and Government Financing

Author: **Ivana Naumovska**; INSEAD
Author: **Vikas A. Aggarwal**; INSEAD
Author: **Wan Wongsunwai**; Chinese U. of Hong Kong

Prior research offers mixed empirical evidence on the performance benefits of corporate political activity (CPA). We offer a mechanism that can partially explain and disentangle these mixed findings— specifically, the reputational concerns of the political targets of such activity. Focusing on the particular context of campaign contributions to politicians, we argue that the efficacy of political

relational embeddedness is, however, attenuated in highly dynamic and complex industries, as decision makers seem to favor flexibility over commitment if environmental uncertainty is high. The implications for research on contextual factors in alliance termination decisions are discussed.

Exogenous Shocks as Enablers of Peripheral Firm Entry

Author: **Leonardo Corbo**; U. of Bologna

Author: **Raffaele Corrado**; Department of management, Bologna U.

Author: **Simone Ferriani**; U. of Bologna

We study how exogenous disruptions create entrepreneurial opportunities for peripheral firm progression toward the industry center. Following negative exogenous shocks, we argue that firms often modify their collaborative behavior in an effort to overcome the temporary shortcomings associated with shocks. Such shocks, we argue, create greater incentives to form alliances with partners that complement rather than replicate firms' existing resource pool. In this scenario, we contend that distantly-located (i.e. peripheral) firms can deploy specific relational tactics that, if successful, can ultimately lead these firms to advance closer to the industry center. Drawing on almost a decade of data on the global airline industry, we illustrate the process of peripheral firm advancement towards the industry center by considering the 9/11 terrorist attacks as a turning points that shaped the opportunity structure and the trajectory of the airline industry. Our findings confirm that exogenous shocks influence and enable peripheral firm entry.

contributions (from the perspective of the donating firm) can be explained by both the willingness and ability of the recipient political candidate to engage in quid pro quo actions benefiting the donating firm. Heterogeneity in willingness arises from the threat to the recipient of misconduct perceptions that can arise due to third-party monitors, while heterogeneity in ability arises from the position of the political recipient in networks of influence in decision-making or governing bodies that control resources of value to the focal donating firm. Taken together, our arguments highlight the varying implications of direct versus indirect channels of political influence. In particular, indirect channels, which are more opaque, can be more effective. We test our arguments in the context of the Small Business Innovation Research (SBIR) program, a government-run program in the U.S. that provides early-stage financing to start-ups in the form of financial grants.

Who Creates the Norm?: In Case of Corporate Philanthropy in Contentious Social Issues

Author: **Haram Seo**; U. of Minnesota

While the influence of institutional norms has been well documented in the CSR and corporate philanthropy literature, the question of where such norms come from and who creates them in the first place remains unanswered. In this paper, I develop an initial answer to this question by exploring the possibility that ideology-driven actors may act as institutional entrepreneurs in the market of corporate giving. Results from a uniquely detailed data on corporate advocacy giving by US firms from 2003 to 2015 support my theory; firms with stronger ideological intensity give more, while their pattern of giving is less sensitive to that of others. Such initial investments of ideological actors, which are driven by intrinsic benefits unique to themselves, are closely followed by other, non-ideological actors in the field.

Walking the Sustainability Talk (session 1428)

Talking the Walk or Talking the Talk? Institutional Constrains, Aspiration, and CSR Decoupling

Author: **Kewen Wang**; Qingdao U.

Author: **Weihuan Wang**; Qingdao U.

Firms’ CSR reports may misalign with CSR performance. But less is known about why firms implement CSR decoupling facing tight institutional constrains. From the lens of risk seeking and risk averse argument of the behavior theory of the firm, we construct and test a framework which emphasizes the interaction between institutional

indicators calculated for the period from 2006 to 2017. It introduces supplier concentration as a moderator, to investigate the impact of corporates' strategic responses on their sustainable growth. The results show that the firms adopt a conservative corporate strategy in the presence of higher suppliers-concentration while aggressive strategy significantly improves the firms' sustainable growth. Results also show that higher supplier-concentration has a drag effect on a firm's growth sustainability as it weakens the positive relationship between corporates' business strategy and sustainable growth. The investigation of moderating impact of supplier concentration enriches the literature on corporates' business strategy, and provide valuable insights for corporates' sustainable growth. Our results are robust to time and industry fixed effects as well as alternate proxies of sustainable growth.

Search Heuristics and Market Entry: The Impact of Policy Availability on Novel Market Entry

Author: **Holmer Kok**; Stockholm School of Economics

Author: **Nora Balogh**; U. of Liverpool Management School

Whereas prior research highlights that firms rely on competitors' actions and market resource munificence in market entry decisions, the effect of policy availability remains overlooked. In this study, we explore the direct and indirect effects of policy availability on the likelihood of novel market entry. Grounded in the behavioral theory of the firm, we hypothesize that policy availability in a novel market: (1) increases the firm's likelihood of entry into this market and (2) positively moderates the inverted U-shaped relationship between the number of competitors active in this market and the likelihood of entry into it. Analyzing rich data on the market entry activities of 134 wind turbine manufacturers over a 25- year time period, we largely find empirical support for our predictions. Our study offers new theoretical insights about how search heuristics, and policy availability in particular, influence market entry decisions.

[view paper \(if available\)](#)

pressures and firms' performance relative to the historical aspiration. We test the framework using Chinese listed firms and find that firms facing tight institutional constraints are less likely to implement CSR decoupling, but the effect is weakened by the distance between performance and historical performance. Our findings not only contribute to institutional theory, the antecedents of CSR decoupling, but may also inspire future research in this field.

Strategic Determinants of CSR: Analysis of Internal Markets of Business Groups for Intangible Assets

Author: **Anish Sugathan**; Indian Institute of Management, Bangalore

Author: **Sai Chittaranjan Kalubandi**; Professor, Indian Institute of Management Bangalore

Author: **Rama Mohana Turaga**; Indian Institute of Management, Ahmedabad

We posit the existence of an intra-group internal market for the exchange of strategic resources and competencies generated by CSR engagements of business group affiliate firms. We show that due to this group-wide sharing of the benefits of CSR, on average the business group affiliated firm spends less on CSR relative to standalone firms for achieving similar outcomes. We analyze the transferability of the resources generated by CSR spending and affiliate structural factors – strategic centrality and appropriability by owner – to explain the intra-group distribution of CSR spending. We test the model using a unique 14 year long panel data-set of firms in India and find broad support for the salient predictions of the model.

Political Leaders' Decision-Making Strategies During Democratization

Author: **Neringa Kalpokaite**; assistant professor
Author: **Ivana Radivojevic**; IE Business School

When a country embarks upon the transition from an autocratic regime to a democracy, political leaders' have to make important decisions despite prevailing uncertainty. The present study analyzed the decision-making strategies of four political leaders from two countries that peacefully consolidated a democracy: Spain and Lithuania. In-depth interviews were conducted with 65 people involved in their respective transitions, including the main leaders themselves (King Juan Carlos I, Adolfo Suárez, Algirdas Brazauskas, and Vytautas Landsbergis). These political leaders tended to make decisions in a consultative manner, and their decision-making was guided by their vision to peacefully establish a democracy and bring power to the different groups involved; this meant that sometimes leaders also took seemingly paradoxical decisions to ensure the changes towards democracy. This paper contributes insights on how political leaders may make dynamic decisions during periods of political change and uncertainty.

Process Model of Consensus-Building: The Role of Political Heuristics

Author: **Ntorina Antoni**; Eindhoven U. of Technology
Author: **Sharon Dolmans**; Eindhoven U. of Technology
Author: **Christina Giannopapa**; European Space Agency
Author: **Isabelle Reymen**; Eindhoven U. of Technology

Consensus is required for every new strategic initiative. Although politics can contribute to consensus-building, politics have also been associated with undermining the effectiveness of strategic initiatives. Our findings show how managers use heuristics to circumvent the adverse effects of politics in order to enhance consensus and

influence of legitimacy pressure, less attention has been paid to legitimacy pressure originating from internal firm attributes. We develop a framework wherein environmental reporting is viewed as a reaction to intangible resources, the value of which is susceptible to uncertainty and tension created by potential environmental concerns surrounding the firm. We apply our framework to environmental disclosures made by US-headquartered firms listed in NYSE and Nasdaq closely followed by financial analysts and disclosure content—environmental favorableness and value relevance—and find support for our framework. Our study contributes to the literature on ESG disclosure by uncovering the impact of legitimacy pressure arising from internal firm attributes and advance research on legitimacy theory by identifying a specific decoupling mechanism.

improve the effectiveness of strategies. Based on a longitudinal case study in a large intergovernmental, aerospace organization in Europe, we show that effective consensus-building is enabled by the application of three distinct 'political heuristics' that we coin inception, delimitation, and validation. These three types of heuristics ensure the effectiveness of the strategic initiative and the consensus required. Consensus is achieved by the applications of these heuristics during formal-informal interactions across three phases of strategy development: initiation, content development, and consolidation. Hence, the three aforementioned heuristics mitigate the negative implications of politics and thereby enhance the effectiveness of the strategic initiative. Our findings offer insight into organizational politics and the micro-foundations of strategy, by showing at the micro level how heuristics enable effective and positive application of politics for consensus-building in organizations.

To Stand Out or Blend In? The Role of Expert Type in the Funding Decisions of Innovation Projects

Author: Lun Li; School of Economics and Management Tsinghua U.

Is optimal distinctiveness the moderate distinctiveness? We argue that the answer to this question depends on the audience's experience. In this paper, we explore the effects of distinctiveness on the funding decisions made by different types of experts, namely, the business experts and technology experts. We found that the relationship between distinctiveness and business experts' ratings exhibits an inverted-U shape, supporting the

ambiguity of their initiatives. Recombination of categories is a double-edged sword for entrepreneurial projects because it highlights a tension between generating confusion and arising curiosity. We hypothesize that the use of category labels is associated with more resource acquisition, and that the degree of category spanning is associated with more resource acquisition. We finally hypothesize an inverted U-shaped relationship between the creativity of category label recombination and the level of resource acquisition. We find support for our hypotheses using the descriptions of 26,967 crowdfunding projects presented on Indiegogo and Kickstarter from 2010 to 2017.

Gaining Organizational Adoption: Discovering New Uses for Existing Innovations

Designated as a "Best Paper" for TIM
Author: **Rebecca Karp**; Boston U.

Scholars have shown how the introduction of innovations, often developed by entrepreneurs, depend or potentially threaten an adopting organization's work practices. While much research considers why organizations adopt novel innovations, less research investigates the role entrepreneurs play in fostering adoption of their innovations. How do entrepreneurial actors gain organizational adoption of their innovations? I explored how 54 founding teams in two cohorts of a digital health accelerator varied in how they struggled to gain adoption for innovations that could potentially disrupt work practices. I show that when entrepreneurs pursued a problem-oriented process, they attempted to understand adopting organizations' work environments; dedicated resources to repurposing their existing innovations; and developed new uses for their innovations which in the short run supported the work practices of adopting organizations, but, in the long-run could displace them. When entrepreneurs prioritized a solution-oriented process, they decomposed existing innovations; leveraged split teams to rearchitect their existing innovations, and developed new uses for their innovations which purported to disrupt existing organizational work practices. Only

market value logic held by business experts; however, the relationship between distinctiveness and technology experts' ratings is positive, supporting technology advancement logic held by technology experts. Moreover, our paper evidenced the moderating role of competitive intensity and institutional endorsement played in the relationship between distinctiveness and experts' ratings. These findings are integrated into a discussion of the implications for research on optimal distinctiveness.

Innovation - Light or Shade? The Signaling Effect of Innovation on Credit Ratings

Author: **Kathrin Haubner**; Otto von Guericke U. Magdeburg

Extant research has highlighted the relevance of innovation for a firm's long-term success and survival. However, innovative behavior, especially concerning radical innovations, does not only offer chances but also significant risks and potential challenges to overcome. For a deeper understanding of the risk assessment of innovations in terms of quantity and degree of radicality, this study explores the effect of firm innovation on credit ratings and more particularly, to what extent firms can use the announcement of innovations to send a signal towards rating agencies. Our analysis is based on secondary data of U.S. firms in the manufacturing industry and accounts to 1,768 firm-year observations. We show that radical innovation imply an U-shaped relationship with credit ratings, while incremental innovations indicate a positive relationship. Additionally, we find implications that credit agencies' assessment of innovations strongly depends on the considered industry with its respective product specifications.

Entry into Misfit Markets: Evidence from the Solar Photovoltaic Industry

Author: **Mara Guerra**; Imperial College Business School

Prior literature on technology commercialization has highlighted the key role of identifying the right market for bringing a technology to market and has assumed that targeting multiple markets leads to positive outcomes of value appropriation and wealth creation. However, it has largely neglected the qualitative difference among markets and that technologies are evaluated differently among markets as pointed out by the literature on demand heterogeneity. As technologies do not fit all markets equally and choosing the wrong environment can lead to failed commercialization and resource misallocation, we explore under which conditions entrepreneurial ventures choose to enter markets with poor technology-market fit. We explain this seemingly counter-intuitive choice exploring the role of social factors and prior experience of the venture. We test our hypotheses on a unique dataset covering all the entrepreneurial ventures entering the global solar photovoltaic industry. Our findings show that social events such as investment waves in the industry create conditions regarding market information that increase the likelihood of choices with poor fit. On the contrary, ventures with prior experience in the industry possess superior information about demand heterogeneity that lead them to markets with better fit, especially during times of investment waves.

[view paper \(if available\)](#)

Firms have incentives to make a positive impression on externals, such as investors or customers. Prior research assumed that firms pursue impression management isolated from competing firms. However, firms may not necessarily strive after making the best possible impression. What matters instead is the relative comparison with their competitors. In this paper, we argue that firms manage impression relative to their competitors and they time their negative disclosures, such as product recalls, depending on competitors' disclosures. Using data on product defects and recalls in the US automotive industry, we find evidence that firms seize competitors' negative disclosures as an opportunity to bury their own negative news.

Committed to Whom? Stakeholder Laws and General Technological Investments

Author: **Raffaele Conti**; Católica Lisbon School of Business and Economics

Author: **Elena Novelli**; Cass Business School, City, U. of London

Stakeholders make relation- and firm-specific investments, and face the risk of these investments losing their value if firms change their strategy. Firms, by investing in general technologies, become more flexible and make the risk faced by stakeholders more salient. Hence, the more a company is stakeholder oriented, the less general the technological assets in which it invests. This negative effect will be amplified in uncertain industries, where firms are more likely to change their strategy; and attenuated in competitive industries, where stakeholders are less likely to make firm-specific investments. We test our hypotheses exploiting a quasi-natural experiment provided by the constituency statutes enacted in 34 U.S. states during the period 1976–2000 that induced managers to consider the interests of stakeholders when making decisions.

Open Business Model Innovation – The Impact of Depth, Breadth and Freedom of Collaboration

Designated as a “Best Paper” for TIM

Author: **Sebastian Brenk**; RWTH Aachen U.

In today's digital age, firms are increasingly contingent on external sources of knowledge for generating new and creative ideas for business model innovation (BMI). However, the literature on BMI has so far offered little insight into how companies can innovate and effectively change their business models in an interconnected and dynamic business environment. According to the knowledge-based theory and creativity literature, this paper investigates the collaboration mechanisms of depth, breadth and freedom that influence BMI. The paper findings show quantitative evidence based on survey research that the depth of collaboration has a direct positive effect on BMI. The breadth of collaboration itself has no significant effect, whereas the interaction between breadth and freedom of collaboration is positively associated with BMI. This study adds to the BMI literature by integrating creativity and knowledge-based concepts of collaboration as important perspectives from which to study the innovation and change of established business models. Moreover, the research findings reveal two advantageous governance mechanisms for open BMI in ecosystems: (1) collaboration depth for close knowledge exchange, and (2) the combination of freedom and breadth of collaboration for knowledge brokerage in open business networks.

The Dark Side of Incremental Innovation: Age, Role Seniority, and Cohesiveness in R&D Teams

Author: **Tali Hadasa Blank**; Hadassah Academic College

We examine the impact of digital technology on product proliferation. We theorize that as firms digitize their products, they will increase the number of products in their existing product categories. We expect the level of proliferation is greater among firms that have higher marginal cost of production and face more binding distribution constraint in the physical product channel. We also predict greater proliferation in product categories that have higher customer preference heterogeneity. Evidence from the Amazon Kindle e-book ecosystem supports our hypotheses. Additional analyses on the proliferation strategy implementation reveal that firms tend to introduce new products that require research and development investment as opposed to unbundling their existing products, a finding that suggests the firms' strategic intent behind the proliferation activities is not just to take advantage of the digital technology efficiencies, but also to shift the source of differentiation advantage from physical product attributes to intellectual contents. Our study contributes to the literature by showing how firms adjust and execute their differentiation strategy in the digital age.

Perceived Firm Innovativeness: Innovation is in the Eye of the Customer

Author: **Seidali Kurtmollaiev**; Kristiania U. College / NHH Norwegian School of Economics

Author: **Line Lervik-Olsen**; BI Norwegian Business School

Author: **Tor Andreassen**; NHH Norwegian School of Economics

Although customers are the final judges of innovations, they are rarely asked about their opinion about their firms' innovation efforts. Existing research largely focuses on the opening the black box of innovation from the firm side (e.g., success factors in new product development), whereas understanding of what happens between launching a new product or process and getting financial results is limited. Our study is one of the first attempts to open the black box of innovation from the customer side. We investigate how customers react to various innovations, and how these reactions influence the customers' perceptions of

This study examines the influence of team members' age, role seniority on incremental innovation in the high-tech industry, and the effect of team cohesiveness on that relationship. Based on 108 research and development (R&D) teams operating in six high-tech organizations, its results indicate that age and role seniority each exert a different influence on incremental innovation. Specifically, results demonstrate that team age is negatively related to incremental innovation, whereas role seniority shows the opposite tendency. They also reveal that the negative association between team members' age and incremental innovation can diminish when role seniority is high. In addition, the study shows that these relationships are strengthened by team cohesiveness. The study demonstrates that the negative association between team members' age and incremental innovation is stronger for teams with high levels of cohesiveness. At the same time, it suggests that high levels of team cohesiveness strengthen the positive association between team members' role seniority and incremental innovation. These findings advance the innovation literature and have important implications for managers and team leaders in high-tech organizations.

Zooming In or Zooming Out: Entrants' Product Usage Breadth in the Nascent Drone Industry

Author: **Anavir Shermon**; Kenan-Flagler Business School, U. of North Carolina at Chapel Hill

Author: **Mahka Moeen**; U. of North Carolina, Chapel Hill

Faced with demand uncertainty in a nascent industry, entrants need to strategically consider which customer segments to serve, and what specialized product features can address customers' preferences. While high product usage breadth implies addressing preferences of a wide range of customers, low product usage breadth indicates inclusion of market-specific features that are specialized to particular customers. We suggest that when entrants have experience in contexts that are potential users of a new product, their products are likely to exhibit low usage breadth. The relationship is moderated by whether they are startups or diversifying entrants, and the cumulative number of customers that adopted the industry's product before the time of each entrant's product introduction. The empirical context is the U.S. commercial drone industry.

The Influence of Team Continuity and Prior Experience on the Success of Innovative Projects

Author: **Carsten Kaufmann**; Technische U. Darmstadt

Author: **Christian Resch**; Technische U. Darmstadt

Author: **Alexander Kock**; Technische U., Darmstadt

This study focuses on sequences of projects as a way to address the challenges of ambidexterity. We investigate the performance influence of team member continuity and domain experience across projects dependent on the projects' novelty. We propose that a moderate level of team continuity and a higher degree of domain experience leads to higher project success for high project novelty. We test the hypotheses on a sample of 3,122 movie projects from the Hollywood film industry. This research setting allows to uniquely differentiate between team member's previous experience, social ties, and project novelty. We applied topic modeling on movies' plots to measure experience and project novelty. The results indicate that team continuity has a positive but decreasing influence on project success. This influence further decreases for higher novelty. Surprisingly, the results show that higher domain experience is hindering work performance for high levels of novelty. A lower level of domain experience is more favorable for the team to perform more successfully. This study offers contributions to the literatures on teams, knowledge, project management, and social network theory by offering new insights into the consequences of team composition for project sequences in innovative contexts.

Author: **Chintan Kella**; Tilburg U.

Non-conventional approaches to innovation are spreading among firm's innovation strategy. They arise from innovation for low-income environments and are typically defined with various titles (Frugal Innovation, Low-end Innovation, Bricolage Innovation and others), and all of them share the same goal: re-engineering an existing product through the simplification of existing design or reducing non-essential features in order to deliver the same value. We demonstrate through a model tested with a computer simulation that those innovation approaches lead to an overall final improvement of the product even though the removal of non-essential product features.

A Fear of Failure Fallacy? How Team Innovation Beliefs and Performance Relate to Fear of Failure

Author: **Natasha Ouslis**; Western U.

Author: **Audra Grace Quinn**; Ivey Business School

Author: **Natalie Allen**; U. of Western Ontario

Design project teams work together to create new ideas, products, and services. To encourage innovation, companies like Google, TATA, and P&G reward their teams' failures. However, there is little empirical evidence for the principle that fearing failure is related to individuals' or teams' confidence in their ability to innovate or that fearing failure is directly related to innovative performance. To address this research gap, we measured fear of failure, innovation efficacy, and performance over the lifecycle of 114 design project teams. Interestingly, having higher fear of failure was not related to individual or team innovation efficacy as predicted. Fear of failure was related to overall performance for engineering trainee teams, however, it had no significant relationship with team ratings of innovation quality. These results support existing research that performance-avoid goal orientation, or fear of failure, is negatively related to sales performance (Porath & Bateman, 2006; Silver et al., 2006), academic performance (Elliot & Church, 1997), and work performance (Cellar et al., 2011), but may undermine commonly held assumptions about how a fear of failure relates to innovation. The findings should be of great interest to any organization that aims to innovate.

Intelligent Machines and Teamwork: Help or Hindrance?

Designated as a "Best Paper" for TIM

Author: **Bei Yan**; U. of California, Santa Barbara

Author: **Kyle Lewis**; U. of California, Santa Barbara

Author: **Patrick Figge**; U. of Passau

Author: **Andrea Hollingshead**; U. of Southern California

Author: **Kristen Steves Alexander**; U. of Southern California

Author: **Young Ji Kim**; UC Santa Barbara

Author: **Chengyu Fang**; U. of California, Santa Barbara

Intelligent machines are being deployed as human assistants in a variety of corporate, military, and healthcare settings. Research has generally examined how intelligent machines affect individual human behavior, but very few studies explore how intelligent machines impact teams and teamwork. We examine the performance and processes of teams using an embodied intelligent personal assistant (EIA) to complete a collaborative task. We expected that EIA use would enhance team performance on an intellectual task but interfere with the development of a transactive memory system (TMS). A TMS is a collective memory system that, once developed, has strong positive effects on sustained team performance. Our findings show that under some conditions EIA use may be helpful to team performance initially, but harmful to the eventual development of a TMS. We highlight the need for new theorizing about the generative and destructive impacts of intelligent machine use in teams.

Muslim Women's Entrepreneurship in Conflict Zones: Religiosity, Culture, and Gender Egalitarianism

Author: **Doaa Althalathini**; Oxford Brookes U.

Author: **Haya Al-Dajani**; MBSC

Author: **Nikolaos Apostolopou**; Neapolis U. Pafos

Whilst the role and impact of culture upon women's entrepreneurship have been acknowledged within the entrepreneurship literature, the interplay and nuances of Islamic religiosity and gender egalitarianism as cultural indicators of Muslim women's entrepreneurship in conflict-ridden countries remain understudied. Within this study, we contribute to this special issue and bridge this

most important engines for regional development. However, these demands are not accompanied by a greater availability of resources. Universities are struggling to carry out their teaching and research activities simultaneously, alongside technology transfer efforts. In this study we argue that due to the scarcity of resources and because of different strategies with regard the three core missions (teaching, research and technology transfer), the assessment of universities' performance should acknowledge this reality. Accordingly, we propose the use of qualitative comparative analysis to do so. More specifically we investigate the portfolio of technology transfer activities (including patents, spin-offs and R&D contracts) relaxing the traditional constraint that universities should conduct all types of technology transfer activities. Instead, our model allows universities to concentrate in the activity in which each university performs best. Data from the Spanish public higher education system is used. Two points of time are compared: 2008 and 2015.

The Interplay of Licensing and Technology Transfer Office Staff Experience

Author: **Dolores Modic**; Nord U. Business School

Author: **Jana Suklan**; Newcastle U.

Addressing the knowledge gap regarding individual level factors influencing technology transfer outputs, we focus on three dimensions of successful licensing at university technology transfer offices: speed, efficiency and total generated revenue. Our aim is to test factors connected to IP Coordinators' experience, which is conceptualized multi-dimensional. We employ data from administrative records of a Japanese university including 849 transfer cases for the period from 1998 to 2016. By focusing on coordinators' experience, i.e. of time, scope and networks, we detect several coordinators' characteristics that play a significant role. Results from regression analysis show that all three measures have a significant impact on the speed and efficiency of technology transfer, but not on revenue generation.

[view paper \(if available\)](#)

gap by analysing the interplay between Islamic culture and Muslim women's entrepreneurial behaviours and strategies in Afghanistan, Iraq and Palestine, as all three contexts continue to experience decades of intense and protracted political and violent conflict. Our qualitative data collected from 16 Muslim women entrepreneurs operating their businesses in these contexts shows how their Islamic religiosity plays a powerful role in guiding entrepreneurial behaviours and strategies in multiple ways within precarious structural conditions and failed states. Indeed, the women's Islamic religiosity influenced the launch, operations and growth of their enterprises, and anchored them within the chaotic and dangerous void within their failed states. In addition, this study shows that Islamic gender egalitarianism embedded within Islamic principles is promoted by the women entrepreneurs as they utilise their entrepreneurship as an expression of Islamic feminist activism challenging the prevailing stereotypes of Muslim women under patriarchal cultural contexts, and creating awareness about women's rights to engage in entrepreneurship under Islamic law.

Gender Attitudes and Business Venturing: A Case Study of Egypt and Jordan

Author: **Muntasir Shami**; Aston Business School

Author: **Bach Nguyen**; Aston Business School

This study investigates the relationship between individuals' gender attitudes and the likelihood of creating new business ventures. We employ social feminist theory and institutional theory and argue that people holding egalitarian attitudes towards sex roles are more likely to be involved in entrepreneurial activities. We further posit that the facilitating effect of egalitarian attitudes is more salient for the educated, the older and females. The empirical analysis uses Egypt and Jordan as the context provides some initial evidence about the positive impact of equalitarianism on new business venture creation. The study adds to research on gendered entrepreneurship.

The Roles and Involvement of Innovation Supporting Actors: Influence of IPR Ownership and IP Nature?

Author: **Anders Brantnell**; Uppsala U.

Author: **Enrico Baraldi**; Uppsala U.

Innovation supporting actors (ISAs), such as technology transfer offices (TTOs) and incubators, can play important roles in university-based innovation processes, e.g., handling patenting issues and providing business advice. However, few studies have provided theoretical explanations to ISA roles and involvement. In this study, we focus on the roles and involvement of ISAs in the medical field and explore how the roles are connected to two theoretical aspects, intellectual property rights (IPR) ownership and intellectual property (IP) nature. We select four cases based on theoretical sampling in terms of IPR ownership and IP nature. We conduct a proposition generating multiple case-study and develop five propositions stating, among others, that the number of ISA roles is more connected to IP nature than to IPR ownership, the types of ISA roles are more connected to IPR ownership than to IP nature, and ISA involvement in an innovation process is more connected to IP nature than to IPR ownership. The findings contribute to the literature on commercialization of science, technology transfer and innovation by demonstrating the influence of IPR ownership and IP nature on ISA roles and involvement. We end with policy and managerial implications.

Conceptualising Competitive Advantage in Coethnic Minority Micro-Businesses

Author: **Muhibul Haq**; U. of Huddersfield

Individual Human Factors (IHF) are an important source of Sustained Competitive Advantage (SCA). However, little is known how they influence micro-businesses' ability to achieve SCA because entrepreneurship literature has historically focused on large organisations only with scant attention to Small and Medium Enterprises (SMEs) and almost no attention to micro-businesses. We extend the Resource-based View of the firm (RBV) to bridge this research neglect and conceptualise the contribution of IHFs in ethnic minority micro-businesses. Underpinned by semi-structured cross-sectional interviews with founder-, owner-, and employee-managers, we developed the Culture-induced Entrepreneurship Model (CIEM). This model explains that while IHFs play important roles in achieving SCA, they are embedded in and shaped by the

experienced exponential growth, with over 1500 articles over 10 years. This paper aims at providing an objective, systematic, and comprehensive review of the literature based on detailed bibliometric analysis. Our review identifies seven key themes and provides a critical review of the underlying research streams, while noting their interconnectedness. We conclude the review with the limitations and future research opportunities regarding the Entrepreneurial University.

Effectuation and Bricolage 2 (session 1348)

Ineffectual Orders: Habituated Effectuation in a Scaling Social Enterprise

Author: **Bruce Carruthers Martin**; Thompson Rivers U.

Author: **Lucia Walsh**; Dublin Institute of Technology

Author: **Andrew Keating**; U. College Dublin

Author: **Susi Geiger**; U. College Dublin, Smurfit

The institutional complexity and economics of worth literature are largely silent on the potential for conflict between particular orders of worth—meta-cognitive conventions for making and justifying decisions—to become intractable. The entrepreneurship literature is largely silent on the potential for effectuation—a meta-cognitive process informing decision-making under uncertainty—to become habituated. Our ethnographic study of a globally scaling, inclusivity social enterprise brings together these disparate literatures to show that effectuation and its alternative, causation, can act as catalysts for conflict among orders of worth, and when habituated among focal actors, hold the potential to turn a globally scaling social enterprise into a failed organization. Insights for theory and practice in hybrid organizations and entrepreneurship are provided.

Contextual Constraints of Bricolage: Post-Redundancy Entrepreneurial Ventures' Resource Strategies (WITHDRAWN)

Author: Heli Helanummi-Cole; U. of Oxford

Although entrepreneurship relies on bricolage, the application of combinations of resources at hand to new problems and opportunities (Baker & Nelson, 2003: 333), the constraints in the reuse of resources acquired in non-entrepreneurial contexts is less well understood. To explore the constraints that context can place on entrepreneurs' resource strategies, I conceptualize entrepreneurial communities as strategic action fields. This conceptualization helps to bring into focus the variations in the opportunities that entrepreneurs have for repurposing and recombining resources accumulated in non-entrepreneurial contexts. Studying 36 ventures that originated from an accelerator operated by Nokia Corporation in Finland, I find that entrepreneurs' community context shapes their opportunities for resource repurposing. I further show that entrepreneurs' community position shapes their opportunities for resource recombinations. The findings contribute to the knowledge of entrepreneurial resource strategies by highlighting the contextual boundaries of resources. Implications for entrepreneurship practice and policy are discussed.

Entrepreneurs' Adaptive Toolbox: The Relationship Between Structure and Decision-Making Logics

Author: Sonia-Cristina Codreanu; U. College London

Author: Gorkan Ahmetoglu; U. College London

In the early stages of new venture creation, entrepreneurs have to make decisions in a variety of functional areas within the emerging firm, including hiring, marketing, and financial planning (Shepherd, Williams, & Patzelt, 2015). These decisions are highly heterogenous both in their content, as well as their structure, such as the number of perceived options. In this study, we investigate elements of decision structure as potential antecedents of effectual,

causal, and hybrid decision-making logics. We analyze 290 critical decision events across 41 ventures. Our results suggest that two elements of decision structure — decision complexity and the costs of experimenting with different options — explain significant variability in dominant logics adopted by entrepreneurs across distinct decision domains. For decisions that involve high levels of complexity and low costs of experimenting with options entrepreneurs prefer effectual logics, for decisions that involve low levels of complexity and high experimentation costs entrepreneurs tend to use causal approaches, whereas for decisions that are high in both complexity and costs of experimentation, entrepreneurs tend to mix effectual and causal heuristics within their approach. We discuss these findings in relation to how effectual and causal heuristics fit the cognitive demands of decisions combining these two elements of decision structure.

The Co-Existence of Causation and Effectuation in Entrepreneurial Network Development

Author: **Joanne Jin Zhang**; Queen Mary U. of London

Author: **Charles Baden-Fuller**; Cass Business School, City U. London

Author: **Jing Zhang**; Old Dominion U.

While prior research signals the co-existence of causation and effectuation logics in entrepreneurial network development process, our understanding of when and why either or both logics may dominate the process is limited. Using an in-depth case study, we unpack different types of entrepreneurial contexts, and explore the dynamics of network development and the role of advisor in resolving uncertainty and shaping network development path. We identify two types of advisors and a variety of networking paths among causal, effectual and a combination of both logics. The study contributes to the literature on the intersection between effectuation and entrepreneurial networking development.

Funding Teams Similar to One of Us: The Impact of Observed Similarity on Venture Funding Decisions

Author: Xirong Shen; Cornell SC Johnson College of Business

Author: Heeyon Kim; Cornell U.

Author: Jizhen Li; Tsinghua U.

It has been long observed that investors are more willing to invest in venture teams which are similar to themselves. Yet less is known about how the dyad-level similarity affects funding decisions made in groups. Using data on 4,980 evaluations of early-stage venture teams in an entrepreneurial funding competition in China in 2017, this paper shows that dyad-level similarity between a minority of an investment group (similar members) and a venture team on an observable attribute (the similarity attribute) does lead to a group-level bias in favor of the team. We further theorize and empirically tested a novel group-level mechanism that generates the group-level bias: the observed dyad-level similarity between the similar members and the venture team elevates the visibility and appeal of the similarity attribute for the dissimilar members, thereby leading them to favor the venture team. By showing that observable dyad-level similarity leads to bias in group funding decisions and providing an explanation for it, we extend existing research on similarity bias in venture funding which focuses primarily on dyad-level explanations. Our theorized mechanism also has implication for the literature on evaluation of firm value with multiple and ambiguous signals.

How Family Firms from Emerging Economies are Responding to Inward Foreign Direct Investments

Author: **Arindam Mondal**; XLRI-Xavier School of Management

Author: **Somnath Lahiri**; Illinois State U.

Author: **Sougata Ray**; Indian Institute of Management, Calcutta

Author: **Ramachandran Kavil**; Indian School of Business

Family firms abound in emerging markets and they often compete with foreign MNCs for growth and sustenance. Despite years of scholarly interest in understanding the dynamics of family firms two important questions remain unaddressed: (a) how do family firms in emerging markets respond to competition arising from foreign MNC investments, and (b) what factors cause variation in such response? In this study we begin to address these questions. Drawing on international business and family firm literatures and employing willingness and ability framework (De Massis et al. 2014, 2015, 2018), this study empirically examines a large sample of Indian family firms over a six-year time-period. Results suggest that family firms increase their outward FDI (OFDI) in response to inward FDI announcements by foreign MNCs. Results also demonstrate that OFDI-growth response varies across firms and is shaped by heterogeneity in management type (professional/family-based), extent of foreign institutional ownership (high/low), and family CEO's international exposure (possessed/not possessed). These findings are new to the literature. We conclude by discussing the theoretical and managerial implications of our findings and highlighting fertile avenues of future

Author: **Hana Milanov**; TUM School of Management, Technische U. München

This study seeks to elucidate resource mobilization mechanisms in early-stage technology ventures in penurious environments of extreme resource scarcity. We conducted an inductive, multiple case study analysis on a sample of eight health technology ventures in Uganda. Our study reveals three archetypes, each characterized by a different configuration of resource seeking and bricolage. Ventures with high focus on either resource seeking or bricolage accomplished higher outcomes than those engaging in resource seeking and bricolage alike. Besides, our evidence suggests that early-stage technology ventures' resource mobilization is affected by external stimuli—benefitting from outside recognition or an influx of resources. Specifically, these ventures are prompted, first, to increasingly seek resources and reduce bricolage and, second, to systematize resource seeking. Our results have implications for resource mobilization theory—adding to research on performance implications of resource seeking and bricolage—as well as the study of entrepreneurial processes in the early stages.

Investor Ideology and the Heterogeneous Stakeholder Approaches of New Firms: A System Justification

Author: **Ileana Maldonado-Bautista**; Baylor U.

Author: **Peter G. Klein**; Baylor U.

Author: **Kendall Artz**; Baylor U.

Instrumental stakeholder theory proposes firms that manage stakeholder relationships on the basis of social fairness unlock additional potential for attracting investors. Yet, some firms are successful by simply retaining investors' willful participation in the firm's productive activities. We address this puzzle, at the earliest stages of firm development, by exploring why investors differ widely in the degree to which they are cognitively aligned to firms that hew closely to an arms-length approach versus an all-stakeholders approach. Empirical evidence from social psychology suggests that investors inject their ideological leanings in their decision-making,

research.

New Venture Formalization and Resource Acquisition: Evidence from Funding Outcomes

Author: **Wei Yang**; George Mason U.

Author: **Suho Han**; Syracuse U.

Prior research examining organizational structure in the context of new ventures focuses largely on the internal implications and outcomes of structure. In contrast, we explore the possibility that the organizational structure of new ventures has external implications. We do so by examining how the structure of a new venture, namely its degree of formalization, influences its ability to acquire resources from key external resource providers such as equity investors. Drawing from the literatures on investor decision making in entrepreneurial settings and organizational structure, we argue that the level of formalization serves as a salient cue to investors that conveys the internal efficiencies regarding the use of resources of a new venture that in turn, increase the likelihood of funding. We also argue that this relationship is moderated by two additional cues investors rely on, slack resources and performance volatility, where slack serves as a reinforcing cue while volatility acts as an attenuating cue. We test our hypotheses using detailed longitudinal data of 4,928 randomly sampled U.S. new ventures from the Kauffman Firm Survey that allowed us to obtain detailed measures for both formalization and funding outcomes. The results strongly supported our arguments. Overall, our study contributes to the literature on organization structure and entrepreneurial financing by exploring the link between the internal formalization process of new ventures and their acquisition of external resources while also shedding light on how external resource providers

"I'm the Boss, Salesman, Negotiator...Fixer..." – Roles Entrepreneurs Enact in Resource-Acquisition

Author: **Frances Chang**; Macquarie Business School,
Macquarie U.

Author: **Robert Graham Jack**; Macquarie U.

Author: **Cynthia M. Webster**; Macquarie U.

In seeking resources, entrepreneurs need networks but more than that they need the motivation and ability to enact different roles to capture network resources. We investigate the experiences of nine entrepreneurs by integrating qualitative in-depth, face-to-face interviews and quantitative social network analysis. We examine the network structures in which entrepreneurs are embedded, we identify one default role of Boss, three core roles of Ambassador, Co-creator and Mediator and five specialist roles of Expert, Orchestrator, Trader, Negotiator and Gatekeeper. Default and core roles are enacted by virtue of the entrepreneurs' position as top executive of their ventures. We find that network characteristic are less important when enacting default and core roles while structural network characteristics influence the enactment of specialist roles as specialist roles are purposefully enacted with clear desired outcomes. Our study is one of few to integrate network structure with entrepreneurs' role enactment in their pursuit of resources. Our empirical findings suggest that understanding how network structure and actor agency intersect may assist resource-constrained entrepreneurs to be more strategic in seeking effective access to network resource opportunities. Networks provide resource opportunities, but the acquisition of these opportunities requires entrepreneurs' ambitions and ability to enact

leverage structural cues to evaluate new ventures under high uncertainty.

Organizational Innovation and Resource Constraints in Institutionalized Industries

Author: **Joaquin Cestino**; joaquin.cestino@ju.se

Author: **Ted Baker**; Rutgers U.

Using a multiple-case, inductive longitudinal study of eight new ventures in the written news industry, we explore how divergent novelty emerges in resource-constrained firms in a highly institutionalized context. Our findings describe a process model of how this happens. In these organizations, resource constraints do not obstruct commitment to projects but instead, consistent with prior work on entrepreneurial bricolage, they direct the attention of actors to freely available but non-standard inputs. Divergent novelty emerges as these disparate resources are enacted in the creation of novel solutions. Our model identifies precursors to the emergence of bricolage processes as well as the emergence of organizational novelties that may feed processes of institutional change in highly institutionalized industries.

All the World's a Stage: Relational Identity and the Entrepreneurial Performance

Author: **Ace Beorchia**; U. of Tennessee

Past research has focused on personal identity ("who am I?"), role identity ("what do I do?"), and social identity ("who are we?") in the entrepreneurial context. In this paper, we introduce a new conceptualization of relational identity ("who am I in relation to you?") and develop a theoretical model of (1) the relational identity formation process, and (2) the impact of relational identity on individual and firm outcomes. Specifically, while past research has defined relational identity as "the nature of one's role relationship," we expand this definition by including personal, social, and role identities as key components of the relational identity. By including the audience as an active and critical player in the identity process, we fill the missing interpersonal component in entrepreneurial identity. Additionally, we introduce a related concept, the entrepreneurial performance, as a metaphor that describes the relational identity process. The entrepreneurial performance and proposed theoretical model of relational identity offer a compelling narrative through which scholars can better understand when, why, and how entrepreneurs navigate the complicated process of identity formation and the impact this has on the entrepreneurs and their firms.

How the Interplay Between Identity Work and Opportunity Development Influences Spin-Off's Commercial

Author: **Xiaohua Li**; Tsinghua U.

Author: **Xudong Gao**; Tsinghua U.

Through an inductive, qualitative study for 27 academic entrepreneurs, we explore how the interaction of a founder's identity work and opportunity development jointly shape academic

Despite the increasing importance of open innovation endeavors, the process through which firms select partners for open innovation and build relationships with them is not well understood. We aim to fill this gap in the literature by investigating this process using a qualitative approach. We base our findings on data from ten case studies, expert interviews, and secondary data. We conducted 53 interviews, 40 with members of the case study organizations and 13 with open innovation experts. We find that to perceive fit and enter a collaboration, firms have to balance similarity and complementarity between themselves and their partner. As similarity and complementarity by definition contradict each other, firms must overcome a similarity-complementarity dilemma. We find that while all firms use mechanisms of trust and control to address this dilemma, firms substantially differ in their propensity to engage in open innovation. This propensity not only influences the process but also – together with other factors – determines the open innovation strategy a firm chooses. We present and discuss four prototypical types of open innovation strategies.

The Paradox of Reputation for Innovation

Author: **Fei Li**; Arizona State U.

In recent years, reputation for innovation has been acknowledged as a distinct resource and an important predictor of market premium. However, our theoretical understanding of reputation for innovation is underdeveloped on several important fronts. First, although scholars have acknowledged that reputation for innovation can be decoupled from innovative activity or performance, the origin of reputation for innovation remains a mystery. More importantly, there is even anecdotal evidence that a firm's track record, which typically is thought of the foundation of organizational reputation, can even hamper the degree to which a firm earns a reputation for innovation. Furthermore, little is known about the potential downsides of this reputation. The purpose of this paper is to provide a general theory that systematically explores the antecedents, initial effects, and nature of reputation for innovation. By integrating research from

spin-off's commercialization speed. While entrepreneurs adopted decoupling, aggregating and deleting identity approaches to manage their hybrid identities, we found that, after experiencing identity process, some entrepreneurs reinforced their scholar role by reaffirmation mechanism, building spin-offs to drive disruptive innovation. In contrast, by employing deleting approach, other entrepreneurs redirect their attention and motivation, as well as expand scope of opportunity focus by weakening, even abandoning commitment to technology advancement, building spin-offs to satisfy consumer side. We propose that these identity works contribute to commercialization speed in a manner that reconfigure directions of opportunity development and business model. And thus, we establish a theoretical framework exploring how a founder's identity can influence venture performance.

Shared Identity, Says Who? How Diverse Organizations Interact in Entrepreneurial Ecosystems

Author: **Jonah Zankl**; Cambridge Judge Business School

Author: **Matthew Grimes**; Cambridge Judge Business School

Entrepreneurial ecosystems are comprised of a diverse and interacting set of organizations which aim to support and develop new ventures and their surrounding regions. Although prior research has celebrated the diversity of these support organizations as a necessary enabler of entrepreneurial capacity in a region, such diversity can at times introduce liabilities given different motives and interests. In this study, we explore how different organizations orient toward such diversity, thereby enabling or constraining the capacity for collaboration across ostensible divisions. Through an inductive case analysis of 15 organizations, we surface an inductive model of how leaders' perceptions of a regional ecosystem identity combine with their organizations' identity orientation to influence their interactions across the ecosystem. Based on this model, we propose a typology of organizational sponsorship, which

corporate reputation and innovation, I unpack several important implications for building and maintaining such a reputation. I further conclude that reputation for innovation has a paradoxical nature since it is easy to manipulate but hard to sustain. In doing so, this paper contributes to innovation, entrepreneurship, and reputation literatures.

Where Should Geese Lay the Golden Eggs: Employees' Decisions to Innovate In-House or Independently

Author: **Maya Kumar**; IE Business School

Author: **Daniel Richard Clark**; IE Business School

In an exploratory qualitative study of 22 individuals, we study employee motivations to build and launch a prototype, shed light on factors that influence whether innovation activity may take place, and if so, where – within the organization, through independent entrepreneurship, or in an incubator. We find three dimensions that influence employee innovation decisions. While the offerings from an organization such as recognition or rewards, support, and an openness to innovation facilitate innovation among employees, individual employees have personal innovation goals and loyalty to the company that also influence their innovation decisions. This research highlights the complexity of factors that influence different stages of employee decision-making when considering innovation in an organization, explores how work experience moderates different dimensions of an individual's perspective on corporate entrepreneurship, and indicates that employees prefer corporate entrepreneurship as the path of least resistance for innovation. Finally, we suggest that in a corporate environment, the intersection of the individual, the opportunity, and the organization requires attention. Not only are the individual's actions impacting whether they come across an opportunity, but it is also the organization, both in terms of the opportunity context, as well as the benefits it offers that enables the opportunity to be acted upon by the individual or others.

characterizes organizations as either builders, partners, participants, or bridgers. This model and typology extends our understanding of the differences between organizational sponsors within entrepreneurial ecosystems, while bridging the study of organizational identity, categories and ecosystems.

Network Perspectives 2 (session 1350)

How Entrepreneurs Navigate and Create Networking Arenas to Build Social Capital

Author: **Rand Gerges Yammine**; Imperial College London

Author: **Anne L.J. Ter Wal**; Imperial College Business School

Author: **Namrata Malhotra**; Imperial College London

Entrepreneurs engage in networking to build social capital for their venture. Yet there are divergent perspectives portraying entrepreneurial networking. On the one hand, it is perceived as a strategic endeavor involving deliberate tactics while, on the other hand, as a passive-reactive process in which individuals accumulate connections through influences largely outside their control. In this qualitative study, we examine how 22 technology entrepreneurs navigated the networking environment in London's entrepreneurial ecosystem in pursuit of social capital. We distill a dynamic model of entrepreneurial networking for social capital building to reveal three theoretical insights. First, we show that entrepreneurs interweave spontaneous personable with strategic intentional behaviors to navigate unbounded, expansive networking arenas. Second, we argue that these behaviors – rapport building, visibility building, and strategic filtering – trigger referrals and set in motion a relational snowballing mechanism that

New Drivers (session 1351)

Are Government Employees More Likely to Venture? (WITHDRAWN)

Author: **Mengli Zhao**; Xi'an Jiaotong U.

Author: **Shibin Sheng**; U. of Alabama, Birmingham

Author: **Yuan Cheng**; School of Economics and Management, Tsinghua U.

Although the new venture creation by government officers is ubiquitous, whether they are intended to entrepreneurship is poorly understood. According to the pull logic, government officers are more likely to form entrepreneurial intentions due to the benefits they can reap more easily whereas the push dynamic offers the contrasting explanation since government officers are pushed away from entrepreneurial activities as a result of high benefits, whether peculiar or non-peculiar, that government posts provide. Building on the pull-push theory, this study examines the pull and push mechanism, entrepreneurial alertness and life satisfaction respectively, in shaping entrepreneurial intentions for government employees. Besides, we also examine the interactive role between individual-level pull and push factors and macro-institutional factors in entrepreneurial intentions. We test our conceptual model by employing multilevel-modeling techniques with three archival data sources. Our findings reveal the competing mediation role of these two motivational factors in generating entrepreneurial intentions of government employees. Moreover, the role of these two motivational factors is conditioned by political

facilitates entrepreneurs' transition from expansive arenas to more bounded – either selective or self-created – arenas. Third, we highlight how the transition to bounded arenas enables entrepreneurs to engage with more like-minded individuals, triggering experience sharing and emotional bonding mechanisms that accelerate social capital building. Taken together, our model reveals how entrepreneurs grow their social capital incrementally by first combining spontaneous with strategic networking in unbounded arenas to gradually pave the way to deeper more focused relationships in bounded arenas.

Imprinting Effect of Initial Networks on Subsequent Network Status: A Replication and Extension Study

Author: **Forough Zarea Fazlelahi**; Queensland U. of Technology

Author: **Martin Obschonka**; Queensland U. of Technology

Author: **Henri Burgers**; U. of Queensland Business School

Author: **Per Davidsson**; Queensland U. of Technology

This article replicates and extends Milanov and Shepherd's ground-breaking study (Strategic Management Journal, 2013, 34, 727-750) of a positive imprinting relationship between a newcomer's first partners' reputation and its future network status over and beyond the current affiliations. Their analysis also showed this effect to be stronger for the newcomers whose initial partners formed a more cohesive network. This is while the predominant view to network emergence in the prior literature focuses on path-dependent mechanisms with immediately preceding network structures contributing to current network positions. The present study utilizes longitudinal data of 257 new mining firms (consisting of 118 de novo and 139 spinoff firms) to test such long-term imprinting effects in a different industry and with a novel focus on the parent-spinoff context. Using Milanov and Shepherd's model specifications, our results partially parallel theirs: we find a positive effect of the new firm's first partners' reputation in both our samples

institutions.

Born to Compete? Sibling Rivalry and Self-Employment

Author: **Taiyuan Wang**; China Europe International Business School (CEIBS)

Author: **Rachida Justo**; Institutu

Author: **Fan ZHANG**; China Europe International Business School (CEIBS)

Drawing on Social comparison and resource dilution theories, this study posits that sibling rivalry affects peoples' decisions to enter self-employment through two mechanisms. First, sibling rivalry fosters individual competitiveness, which triggers people to choose occupations that involve competitive behaviors such as self-employment. Second, by diluting parental resources, sibling rivalry negatively influences educational attainment. This, in turn, can affect self-employment in a non-linear fashion; people with lower education may lack the cognitive ability needed for self-employment, while those with higher education may find it more economically attractive to pursue wage jobs. We also argue that these two mechanisms—educational attainment and nurturing competitiveness—are moderated by the gender of the focal individual as well as by the gender composition of her siblings. We find evidence for these mechanisms by analyzing data from a survey of 4,086 individuals in China.

Do Non-Humans Engage in Entrepreneurial Action? Inquiry in Entrepreneurship's Socio-Biological Roots

Author: **Daniel Lerner**; IE Business School

Author: **Avery Ortiz-Hunt**; Baylor U.

This paper relaxes the assumption that entrepreneurial action is solely a human endeavor. We do so to extend and enhance research regarding the biological origins of entrepreneurship. As an initial foray into this conceptually and empirically elusive domain, we also present an exploratory, observational examination of entrepreneurial action

but no significant moderating effect of past cohesion. Moreover, extending Milanov and Shepherd's study, we find a positive effect of new spinoff firm's parent's reputation on its future status. This supports and extends the prior claims about the importance of founding conditions on new firm's subsequent organizational outcomes beyond the intermediate network conditions.

[view paper \(if available\)](#)

When Do Entrepreneurs Network? The Effects of Failure Threat and Self-Efficacy on Social Networks

Author: **Xi Chen**; U. of Nottingham, China

Author: **Bat Batjargal**; Oklahoma State U.

The extant research illustrated that social networks are crucial for entrepreneurial resource acquisition and success. However, few studies have investigated what situations lead entrepreneurs to engage in networking behavior and develop social networks. Building on resource allocation theory, we propose that networking behavior consumes cognitive attention and time resource, and entrepreneurs are more likely to engage in networking behavior when they face salient failure threat and hold low confidence in addressing such threat. With an experiment with 155 entrepreneurs in China, we found that failure threat increases entrepreneurs' networking behavior, and this effect is attenuated by self-affirmation. A longitudinal survey of 153 entrepreneurs in China showed that contingency of entrepreneurs' self-worth on business success, which amplifies the impact of failure threat, is associated with social networks rich in structural holes and low in density in the short term, whereas these effects are attenuated by entrepreneurial self-efficacy. In the long term, low self-efficacy and contingency of self-worth leads entrepreneurs to develop dense network. Overall, entrepreneurs' networking behavior is aligned with their dynamic needs, and the need to acquire information and resources is prioritized over the need to seek social support. The findings contribute to social capital theory, strategic view of entrepreneurial behavior, and psychological research on network activation.

Why Do Generalists Become Entrepreneurs? Revisiting the Jack of All Trades Theory

Author: **Danny Chung**; Ivey Business School

Author: **Simon Parker**; Ivey Business School

Pursuing entrepreneurship is commonly thought to involve performing a wide range of tasks. Accordingly, there is ample evidence that generalists with a broad range of skills and experience are more likely to enter entrepreneurship. However, the theoretical mechanism behind the sorting of generalists into entrepreneurship remains unclear, with candidate theories including 'jack of all trades'; 'taste for variety'; and 'necessity entrepreneurship'. Based on the assumptions underlying each theory, we argue that the theories lead to different predictions regarding how the relationships between the number of tasks performed and 1) income, and 2) job satisfaction, differ for entrepreneurs, employees of young firms, and employees of incumbent firms. Using the data from the National Survey of College Graduates, we find that entrepreneurs are more likely to be driven by taste for variety, while employees of young firms are more likely to be driven by their jack of all trades productivity. We discuss implications for research as well as for individuals and policymakers concerned with promoting entrepreneurship.

The Effects of Business and Social Networks on Entrepreneurial Ecosystem Factors in Australia

Designated as a “Best Paper” for ENT

Author: **Sumedha Weerasekara**; Charles Sturt U.

Author: **Ramudu Bhanugopan**; Charles Sturt U.

The notion of entrepreneurial ecosystems has evolved with the advancement of theoretical research and empirical studies. Previous researchers have explained the importance of incorporating entrepreneurial ecosystems within a single framework to examine the functionality of the whole system. A single framework enables better understanding of the interaction between entrepreneurial actors and factors. Some researchers argue that the literature on clusters underplays the role of entrepreneurs and entrepreneurial management in creating and co-creating organizations, markets, and supporting ecosystems. This study seeks to contribute to the body of knowledge on entrepreneurial ecosystems to better explain how business and social networks together with entrepreneurial ecosystem factors impact the financial performance of small and medium-sized enterprises (SMEs). We collected data from 12 regional ecosystems and developed a model based on a set of entrepreneurial ecosystem factors. By identifying the impact of entrepreneurial ecosystem factors on SME financial performance, we found that business and social networks mediated the relationship between entrepreneurial ecosystem factors and SME financial performance. This study augments the existing body of knowledge by proposing ways that entrepreneurial ecosystem factors can be strengthened. These findings have theoretical and practical implications for the development of entrepreneurial ecosystem research and regional entrepreneurship development policies.

The Re-Enchantment of Collegiality as a Governance Practice for Social Enterprises

Author: **Florian Koehne**; U. of Edinburgh business school

Author: **Sarah Ivory**; U. of Edinburgh

In this working paper, we explore the re-enchantment of collegiality as a deviating form of organizational governance practice that contradicts the predominant institutional logic of teleological organizational rationalization in a capitalist system. We seek to understand when and how collegiality governance practices can be integrated into an organizational context and develop a neo-collegial framework for social enterprises. Using an institutional theory approach, we couple a post-Weberian understanding of the collegiality concept with social entrepreneurship and organizational governance research. Derived from empirical investigations in two case organizations, we found that a re-enchantment of collegiality in a social enterprise context requires a certain set of collegiality governance enablers on the micro, meso, and macro level, that allow for a transcendence of traditional collegiality principles from the political and institutional sphere into the organizational context of social enterprises.

How Social Entrepreneurs with a Migrant Background Create Opportunities for their Own Community

Author: **Asma Naimi**; ESADE Business School / Ramon Llull U.

Author: **Lisa K. Hehenberger**; ESADE Business School

Author: **Sophie Catherine Bacq**; Indiana U. - Kelley School of Business

Author: **Jill R. Kickul**; USC Marshall School of Business

Social entrepreneurs from marginalized communities who are at the center of the issues they aim to address are engaging in opportunity creation processes to tackle large scale societal challenges. This qualitative study explores how social entrepreneurs with a migrant background create opportunities to address migration issues and how their actions relate to their identity. We found that their approach towards opportunity creation and their identity are entangled with and emanate from three main problems, namely adversities that migrants face, exclusion from solutions, and the stigma associated with the label "migrant." The social entrepreneurs develop three interrelated mechanisms that are mutually reinforcing: navigating multiple systems by accessing resources through adaptive perseverance and by having an interconnected view; including the excluded by building bridges with an insider understanding and by having an empathic comprehension; and empowering their own community by elevating the status of the migrant community and by reclaiming their own identity. Our study shows how opportunity creation is influenced by and in turn influences the entrepreneur's social identity contributing to the entrepreneurship and social entrepreneurship literatures by building on concepts that have viewed entrepreneurship as a form of necessity and by developing our understanding of social entrepreneurs' opportunity creation process.

(Social) Entrepreneurship by Refugees

Author: **Marlies Koers**; U. of Groningen Centre for Entrepreneurship, The Netherlands

In a sample of 36 nascent refugee entrepreneurs, we examine the influences of personal unmet needs and prior knowledge on (social) opportunity recognition processes. We also examine how these entrepreneurs utilize their

networks and the types of barriers they experience in doing so. We answer the following research questions: To what extent do personal experiences and prior knowledge influence refugees in becoming (social) entrepreneurs in a host country, 2) what barriers can we detect, and 3) what are their networks' roles in this? We use a case study design with a mixed-method approach, combining in-depth interviews (n = 7) and descriptive survey data (n = 36). We collected data from two entrepreneurial training programs in the Netherlands. We find that prior knowledge, personal unmet needs, and specific prosocial motivations influence how a (social) entrepreneurial opportunity is recognized and perceived. In contrast to what was expected, prior knowledge hinders these refugees in starting up their businesses. We also find substantial barriers that hinder refugees from acting on their business ideas, such as language barriers, lack of knowledge of the cultural, legal, and political context as well as a lack of knowledge about the institutional system. Refugees often have little knowledge about their network, which they should utilize in establishing their business. We find that many refugees feel pushed into entrepreneurship and may be considered as necessity-driven entrepreneurs. When this happens, this influences the growth potential and success of these (nascent) ventures over time. Our research contributes to the literature on refugee entrepreneurship by examining the drivers and barriers that entrepreneurial refugees experience. Stimulating refugee entrepreneurship will increase integration, and can positively affect a host country's economy. It also increases refugee self-reliance. Our research also makes a practical contribution by providing a better understanding of how to empower and support (nascent) refugee entrepreneurs in integrating into their host country.

Institutional Voids and Social Entrepreneurship: How are Social Entrepreneurs Developing Unique Strategies to Cope with Institutional Voids?

Author: **Charles Amoyea Atogenzoya**; U. of Ca Foscari

Author: **Makafui Kwame Kumodzie-Dussey**; U. Ca' Foscari of Venice

A firm's performance is shaped by its ability to effectively manage the institutional context of its operations. With the institutional settings of developing countries varying greatly from those of developed countries, institutional voids are expected to impact social enterprises (SEs) differently due to their hybridity, in comparison to their western counterparts as well as their local counterparts (traditional for-profit businesses). Thus, whilst developing strategies to cope with institutional arrangements is important everywhere, it is more critical for SEs in particular, and entrepreneurs in general, operating in developing countries due to the underdeveloped institutional regimes that those entrepreneurs face. Yet theories and findings have been dominated by observations of, and insights derived from, developed market contexts with the few conducted in developing countries focusing largely on MNEs. Relying on an exploratory multiple-case study approach, this study seeks to strengthen and deepen our understanding of "social entrepreneurship" in and around institutional voids such as those found in developing countries. Specifically, the study explores how social entrepreneurs are developing unique strategies to cope with formal market institutional voids. Through a multiple case study of nine social enterprises, this paper theorizes a model, herein referred to as the Creative action-Connection-Capability-building and education model (3C model) that depicts the three key strategies that social entrepreneurs rely on in order to achieve their aims while overcoming institutional voids. The study contributes to the literature on institutional strategizing by illustrating how micro and small firms respond to formal market voids.

Entrepreneurs' Political Connections and Well-Being

Author: **Feng Xu**; South China Agricultural U.

Author: **Xueru Yang**; South China Agricultural U.

Author: **Xiaogang He**; Shanghai U. of Finance and Economics

Political connections are considered as individual-level social network, but little is known about the associations between political connections and personal outcomes (e.g., well-being) and its underlying mechanisms. Utilizing a sample of Chinese rural entrepreneurs, we aim to examine how political connections can shape their cognitive evaluation of subjective well-being (life and job satisfaction) by taking into consideration of mediating effects of rent seeking and institutional trust. Multilevel analyses reveal that political connections are positively associated with life and job satisfaction. Rent seeking and institutional trust function as mediators explaining the associations. Our study bears important theoretical implications for institutional influences on entrepreneur well-being as well as inspires policy makers relative to entrepreneurship.

Entrepreneurship and Well-Being: Accounting for the Heterogeneity of Entrepreneurs

Author: **Evelien PM Croonen**; U. of Groningen

Author: **Florian Noseleit**; U. of Groningen

Author: **Michael Wyrwich**; U. of Groningen

Entrepreneurship research has predominantly highlighted autonomy as the central source of the well-being bonus that entrepreneurs receive compared to employees. However, an important complementary explanation of entrepreneurs' well-being has received less attention: entrepreneurship as a source of benevolence. We contribute to research on entrepreneurship and well-being by combining self-determination theory (SDT) with Schwartz's value theory to develop a novel framework that (i) introduces benevolence as a relevant psychological need in addition to autonomy, and (ii) includes heterogeneity in both need strength and perceived need fulfillment regarding autonomy and benevolence in explaining individuals' entrepreneurial choices and ultimately their well-being. Using individual-level European Social Survey (ESS) data comprising 32 countries over the time period 2002 to 2016, our analysis reveals heterogeneity in individuals' need strengths regarding autonomy and benevolence and different effects on their entrepreneurial choices (i.e. being an entrepreneur in a commercial or social sector). Furthermore, we find that the perceived fulfillment of both needs have different effects on well-being depending on individuals' choices for entrepreneurship in social or commercial sectors.

Entrepreneurship, Coping, and Eudaimonic Well-Being

Designated as a "Best Paper" for ENT

Author: **Boris Nikolaev**; Baylor U.

Author: **Michael Lerman**; Iowa State U.

Author: **Brandon Mueller**; Iowa State U.

Using data from wave 2 and 3 of the National Study of Midlife in Development in the United States (N=3669), the present study investigates the link between entrepreneurship and eudaimonic well-being (purpose, growth, self-acceptance, autonomy, mastery, and positive relations) by examining two categories of coping strategies (emotion- and problem-focused strategies) as possible mediators. The results suggest that entrepreneurs experience significantly higher levels of eudaimonic well-being relative to their non-entrepreneurial counterparts. These well-being benefits accrue almost entirely because entrepreneurs are more likely to use problem-focused coping (e.g., positive reinterpretation, active coping, and planning) as opposed to emotion-focused coping strategies (e.g., venting, denial, and behavioral disengagement). These positive psychological benefits are more likely to benefit entrepreneurs who manage and supervise others. The results are robust even after accounting for genetic and shared environmental factors in a sub-sample of twins (N=1006).

The Happy Entrepreneur? A Meta-Analysis of Entrepreneurship and Well-Being Considering Context

Author: **Ute Stephan**; King's College London

Author: **Andreas Rauch**; U. of Sydney Business School

Author: **Isabella Hatak**; U. of St. Gallen

Entrepreneurs' wellbeing is receiving increasing attention in research and practice, but uncertainty remains whether entrepreneurs experience higher wellbeing than non-entrepreneurs, which contingencies drive potential differences. To date, theory and empirical evidence offer conflicting predictions and findings, using different indicators of wellbeing and largely ignoring the context in which the entrepreneurs are embedded. We introduce the component view of wellbeing to entrepreneurship research and theorize how the components of wellbeing (cognitive wellbeing, positive and negative affective wellbeing, stress-related mental health problems) are differently sensitive to dissonance and stressor-strain processes associated with entrepreneurship. The results of our meta-analysis comprising 251 independent samples from 96 studies indicate no differences in negative and positive affective wellbeing between entrepreneurs and non-entrepreneurs. We find that entrepreneurs are more satisfied with their work and life but also experience more stress-related mental health problems. The strength of the associations of cognitive wellbeing (satisfaction) and mental health problems with entrepreneurship is contingent upon country contexts that enable choice and trigger dissonance processes versus those that increase constraints and stress for entrepreneurs. We also find differences between opportunity and necessity entrepreneurs. In sum, our findings nuance the dominant narrative of entrepreneurship as a 'happy occupation'.

It's Not Just You! Let's Have an Honest Conversation about Failure (session 380)

Dealing with failure is one of the most common challenges scholars face in their academic careers. Failure might concern the publication process, one's career path, or ability to disseminate knowledge to students and the broader society. In general, scholars encounter more failures than successes; yet in public, we mainly talk about successes, and often form narratives of negativity around failure. In this Professional Development Workshop (PDW), we aim to rebalance this discussion and to add nuance to the stories of success by bringing into the spotlight experiences of failure. This PDW provides an opportunity to hear from a diverse and distinguished panel of scholars about their failures, ranging from dry-spells in publishing to the acceptance of the 'wrong' job and much more. Through these personal stories from our panel members, this PDW aims to (a) normalize failure and initiate an open and honest discussion about it, (b) illustrate how to ask for help if one needs it, and (c) offer ways to overcome or even embrace failure sometimes. The panel presentations are followed by interactive roundtable discussions and dialogues. Each roundtable is led by panelists and panel-organizers. The roundtable sessions allow participants to share ideas and become more comfortable in talking about failures in a safe environment.

Positive Relationships Across Difference: Emerging Lenses on the Minority Experience (session 384)

Finalist for MOC Division Best Symposium Award

In recent years, researchers have paid increasing attention to relationships across difference (RADs), or interpersonal relationships between coworkers who have different cultural identities (e.g., gender, race, ethnicity, disability, sexual identity). Much of the research has emphasized that RADs, such as cross-race relationships, involve significant challenges such as prejudicial interactions, intergroup anxiety, and identity threat. The papers in this symposium complement previous research on challenges associated with RADs by also investigating key variables involved in positive relational dynamics in RADs. Although previous research has suggested that a learning approach is critical for positive relationships (Davidson & James, 2007), more research is needed to understand variables involved in relational dynamics that foster learning, especially in RADs. The papers in this symposium identify important factors that may affect learning in RADs, such as mindful correcting, sharing struggles, generative emotions and diversity cultures, and role models.

The Interactive Influence of CEO Relative Compensation and Risk Propensity on Firm Innovation

Author: **Andres Felipe Cortes**; Sacred Heart U.

Author: **Younggeun Lee**; Cal State, Los Angeles

Author: **Pol Herrmann**; Iowa State U.

We develop a contextualized theory that explains how CEOs' relative compensation perceptions shape how small- to medium-sized firms (SMEs) engage in exploratory innovation efforts. While both underpaid and overpaid CEOs are likely to search for exploratory innovation opportunities, we suggest that the relationship is increasing for underpaid CEOs and decreasing for overpaid CEOs. We also follow recent suggestions in strategic leadership research to integrate compensation and dispositional predictors of executive behavior (i.e. person-pay interactions) and hypothesize how CEOs' compensation perceptions interact with CEOs' risk propensity to explain SMEs' engagement in exploratory innovation. Our results from a sample of 381 SMEs in Colombia highlight the importance of studying compensation perceptions as predictors of strategic choices in specific contexts. We also show the relevance of studying executive compensation in conjunction with executives' personal dispositions (i.e. risk propensity), as they can both shape strategic actions. We discuss implications for strategic leadership in SMEs.

CEO Narcissism and Innovation Strategy: Evidence from CEOs Successions

Author: **José Mata**; U. of Lausanne, HEC Lausanne

Author: **Umair Khan**; Faculty of Business and Economics (HEC Lausanne), U. of Lausanne

We build on insights from upper echelon theory and personality psychology, to suggest that the personal need for attention and admiration of highly narcissist CEOs leads them to take aggressive innovation strategies. We hypothesize that highly narcissist CEOs undertake aggressive innovation strategies by investing in R&D, doing more technological acquisitions, hiring more scientific/technological executives, and introducing new products to market at a faster rate than less narcissist CEOs. We test these hypotheses using CEO succession events in innovative industries including drugs, medical devices, hardware, and semiconductor from 1998 to 2008. Results provide considerable support to our hypothesis and highlight the importance of executive narcissism in the pursuit of aggressive innovation strategies. Our study makes contributions to literature on executive personality and strategic decision making and has implications for managers and corporate boards.

Toward a Taxonomy of Innovation Leadership on the C-Level

Designated as a "Best Paper" for TIM

Author: **Fabian Reck**; U. of Bamberg

There is broad evidence for the impact of senior executives on organizational innovation. Still, research lacks

insight what top managers “actually do”, i.e. by which behaviors they promote innovation in the firm. Drawing on strategic leadership theory and configuration theory, this paper develops a taxonomy of innovation leadership on the c-level. I first draw on research literature to subsume four different leadership behaviors that cover the major ways of how top managers get involved in organizational innovation. Second, I employ cluster

analysis on survey data from 411 senior executives in German manufacturing firms to classify different innovation leadership “styles”, i.e. how top managers combine those four innovation leadership behaviors. Third, I conduct discriminant analysis to explore if variables discussed in strategic leadership theory such as demographics, professional background, personality, and job characteristics predict in which innovation leadership behaviors top managers engage. As a result, eight different types of top managers and innovation leadership “styles” are identified: (1) Lightweight; (2) Inventor; (3) Hands-on Innovator; (4) Entrepreneur; (5) Headcoach; (6) Gardener; (7) Evangelist; (8) Superhero. Furthermore, discriminant analysis demonstrates that for each of these eight types a distinct profile of observable experiences, personality traits, and job characteristic exists.

The Effects of Hierarchy on Learning and Performance in Business Experimentation

Designated as a “Best Paper” for TIM

Author: **Sourobh Ghosh**; Harvard Business School

Author: **Stefan Thomke**; Harvard U.

Author: **Hazjier Pourkhalkhali**; Optimizely, Inc

Do senior managers help or hurt business experiments? Despite the widespread adoption of business experiments to guide strategic decision-making, we lack a scholarly understanding of what role senior managers play in firm experimentation. Using proprietary data of live business experiments from the widely-used A/B testing platform, Optimizely, this paper estimates the influence of senior managers on learning from experiments and their performance outcomes across industries and contexts. Our findings suggest that senior management’s impact is mixed. On the one hand, senior managers’ involvement associates with bolder experiments that create more statistically significant learning signals aiding in the exploration of new strategic directions. On the other hand, their involvement may undermine parallel testing and cause-and-effect learning that is instrumental to optimization and performance improvements. Our results contribute to a burgeoning literature on experimentation in strategy, while helping articulate limits that organizational design might place on data-driven decision-making. Furthermore, we articulate different experimental learning modes in the formation of strategy, offering important implications for how managers can modulate search and performance outcomes.

CAR

Resilience, Specialization, and Perspective Taking (session 382)

Specializing Generalists: Job Rotations, Managerial Learning, and Promotions

Arnon Reichers Best Student Paper Award Nominee
Designated as a "Best Paper" for CAR

Author: **Olga Ivanova**; HEC Paris

Author: **Roxana Barbulescu**; HEC Paris

We examine the effect of cross-functional lateral transfers on managers' advancement within an organization. We suggest that job rotations influence managerial development and as a result career progression through two distinct elements – functional diversity and skills specialization. While cognitive complexity and adaptability require diverse experience and could be learned through dealing with novel situations, many other managerial skills, such as people management or negotiation skills take time to develop and therefore need a certain level of concentration on performing similar tasks. Job rotations create opportunities for the former but may undermine the development of the latter. We test our hypothesis using personnel data from the Russian branch of a large multinational pharmaceutical company. We find that in general managers with experience in multiple functions achieve higher grades in the organizational hierarchy than those whose experience is concentrated in one function. However, functional diversity seems to create career benefits only when an individual has achieved a middle management level and has the opposite effect earlier in career. We also find that those managers who specialized in performing certain types of managerial activities throughout their career have improved chances to achieve senior organizational levels. The findings have implications for research on managerial development, as well as literature on labor mobility and career studies.

ODC

ODC Distinguished Scholar Presentation: Andrew Van de Ven (session 385)

We are delighted to honor Professor Emeritus Andrew Van de Ven, University of Minnesota, as the recipient of the 2020 ODC Distinguished Scholar Award. Professor Van de Ven's seminal work on innovation and change as well as on engaged scholarship is foundational to the mission and values of our ODC Division. Over the years, his outstanding work has provided an insightful set of ideas generating dialogues between rigor and relevance that has been diffused over the world. Indubitably, Professor Van de Ven has, and still is, "broadening our sight!" Professor Van de Ven's address is entitled: "Broadening our sights on ODC".

Resilience Does Matter: A Meta-Analysis of Trait Resilience Outcomes in the Organizational Setting

Arnon Reichers Best Student Paper Award Nominee

Designated as a "Best Paper" for CAR

Author: **Mehri E. Baloochi**; U. of Manitoba

Trait resilience is defined as assets or strengths helping resilient individuals to adapt in the face of

adversity. In this study, I investigate the effect of trait resilience on work and life outcomes and the boundary conditions of these effects in the organizational setting by conducting a meta-analysis of 104 independent samples (including 30,959 workers). The results indicate that resilience is moderately linked with life outcomes (psychological wellbeing, $r = .37$; physical wellbeing: $r = .24$) and work outcomes (burnout: $r = -.37$; job satisfaction: $r = .32$; organizational commitment: $r = .34$; turnover: $r = -.34$), however it is not significantly associated with job performance ($p = .07$). As all relationships exhibit a heterogeneous distribution of effect sizes, I also investigate four potential moderators of these effects. I find that while individual variables of age, gender, and occupation do not significantly moderate these effects, the type of stressor experienced seems to explain some of the heterogeneity. Further, an explanatory model is suggested to describe the mechanisms through which trait resilience is linked to these outcomes. The implications of these findings and directions for future research are discussed.

The Role of Perspective Taking on Supervisor Off-Work Privacy Violations: A Three Study-Replication

Careers Division Best Overall Paper Award Nominee
Designated as a "Best Paper" for CAR

Author: **Jacob Albert McCartney**; Michigan State U.

Author: **Samantha Jordan**; Florida State U.

Author: **Jennifer Franczak**; Pepperdine U.

Author: **Wayne Hochwarter**; Florida State U.

Author: **Angela Hall**; Michigan State U.

Constant connectivity, aided by smartphones and email, is an increasingly prevalent reality of modern workplaces. Most research has emphasized the negative effects of this connectivity including employee stress (Barber & Santuzzi, 2015; Richardson, 2017) and anger (Butts et al., 2015). However, benefits of staying connected to work including flexibility (Kossek & Thompson, 2016) and perceived positive career outcomes (Boswell & Olsen-Buchanan, 2007), point to a more nuanced picture. Our study proposes a moderator to explain this variance; perspective taking. Perspective taking is a resource which allows individuals to understand

the viewpoint of others (Ng, Hsu, & Parker, 2019). Within the context of supervisor off-work privacy violations (SPV), we propose that employee perspective taking can dampen the negative effects of SPV, through providing context for why these violations have occurred. Across a three-study constructive replication, we find evidence that employees who are both high in SPV and high in perspective taking have better outcomes including lower depressed mood at work, lower job tension, higher job satisfaction, higher job performance, and more OCBs. As such, our study presents preliminary evidence that perspective taking can ameliorate the negative effects of SPV while allowing workers to benefit from its positive components.

Potential, Performance, and Succession (session 383)

Succeeding at CEO Succession Planning: Linking Expertise, Board Attention, and Planning Activities

Designated as a "Best Paper" for HR

Author: **Andre Havrylyshyn**; Darla Moore School of Business, U. of South Carolina

Author: **Donald Joseph Schepker**; U. of South Carolina

While formalized succession planning activities by boards can help with CEO succession outcomes and directors recognize their importance, there remains considerable variance in the degree to which boards actually conduct such activities. Drawing upon the attention based view of the firm and information processing theory, we propose that boards which have individual directors who possess relevant professional expertise related to CEO succession are more likely to be consistently engaged with CEO succession planning. As a result, we suggest that boards with directors who have backgrounds suggesting CEO succession planning expertise will be more likely to conduct formalized CEO succession planning activities. Thus the positive relationship between individual CEO succession expert directors and formalized succession planning activities by the board is partially mediated by the board's attentional engagement with CEO succession planning. We identify two kinds of directors, those with professional experience working in human resources and those directors who are retired (outside) CEOs, who qualify as directors with CEO succession expertise. We test our hypotheses utilizing a sample of 354 firm-year observations from large North American firms across three years (2013-2015).

Performance Management and Innovation: A Human Capital Perspective

Designated as a "Best Paper" for HR

Author: **Junhyok Yim**; Texas A&M U.

Author: **David Walter Sullivan**; Texas A&M U.

Author: **Deidra J. Schleicher**; Iowa State U.

Author: **Heidi Marie Baumann**; Bradley U.

Author: **Lorenzo Lucianetti**; U. di chieti e pescara

Author: **Xenophon Koufteros**; Texas A&M U.

Recent debates on the effectiveness of performance management (PM) have prompted questions on whether and how PM affects organizational outcomes. Addressing recent calls in the literature regarding the need to identify additional drivers of innovation, we examine an important, yet underexamined, question: when and how does PM lead to firm innovation and performance? We focus on a specific type of PM (e.g., learning and innovation PM focus) as well as the agility of the PM system. First, we argue that a learning and innovation PM focus and PM agility both have a positive relationship with firm innovation and performance, via the key human capital mediators of knowledge sharing and employee motivation. In addition, testing the congruence hypothesis within systems theory, we hypothesize that the effect of a learning and innovation PM focus is strengthened when the organization espouses a more innovative strategy. Moreover, we argue that both mediators of knowledge sharing and motivation are necessary to maximize innovation and firm performance. We test our model with a sample of 201 Italian firms, where multi-source and longitudinal data were collected, and results show support for our hypotheses. Overall, our investigation advances knowledge about what PM systems should look like to best drive innovation in organizations.

More than Just the Market: How Changes in Pay Policy Affect Organizations' Performance Outcomes

Winner of HR Division Best Student Paper Award

Designated as a "Best Paper" for HR

Author: **Hanbo Shim**; Rutgers U.

Author: **Xueqing Fan**; Rutgers U.

Author: **Michael Sturman**; Rutgers U.

Author: **Mark Brown**; Bradley U.

In this study, we propose a new theoretical framework integrating economic perspectives with psychological theories and the human capital emergence model to investigate the unique nature and dynamic function of pay level change over time above and beyond the static effect of pay level on organizations' operational and financial performance outcomes. Analyzing the longitudinal sample of nurses from 227 hospitals over 13 years, we show that the extent to which pay level changes entail unique effects on organizations' performance outcomes after controlling for the absolute pay level. In so doing, we extend the existing theory from static view of economic perspectives to the dynamic view of pay level changes over time at the firm level. Moreover, we use the latent change score models as a new analytical approach in compensation research to systematically examine the dynamic effects of pay level changes above and beyond the absolute pay level on both operational and financial outcomes. The results of our research provide important managerial implications for the effective design and implementation of a firm's pay policy over time while offering directions for future research to examine the dynamic effects of changes in other components of compensation systems.

Antecedents and Performance Consequences of High-Potential Scheme Use

Designated as a "Best Paper" for HR

Author: **Benjamin Philipp Krebs**; U. of Paderborn

This study investigates antecedents and performance consequences of high-potential schemes, which are at the core of exclusive, workforce-differentiation based approaches to talent management. Drawing on competitive- and culture-based contingency logic, I theorize that firms are more inclined to employ a high-potential scheme and benefit to the largest extent from developing their most valuable and unique employees by such means when this practice fits their competitive and cultural environment. Using a cross-national sample of private firms from 23 countries to test my hypotheses, the results on the antecedents of high-potential scheme use generally support a contingency perspective, but show a complex pattern of practice adoption. The findings highlight the importance of differentiating between firms' decision to implement a high-potential scheme and the decision concerning the extensiveness to which such a scheme is used for the development of high-potential employees. The relationship of high-potential scheme use with organizational performance was found to be significant and positive, but contrary to expectations, did not vary as a function of competitive and cultural contingency factors.

MNE Space and Subnational Location Choice

IM Division GWU-CIBER Best Paper on Emerging Markets Finalist

Designated as a "Best Paper" for IM

Author: **Yong Wang**; Xi'an Jiaotong U.

Author: **Yi Tang**; U. of hong kong

Author: **Xiaotao Yao**; Xi'an Jiaotong U.

Author: **Shu Yu**; City U. of Hong Kong

Multinational enterprises (MNEs) tend to invest less in countries or the regions of a country that have weak institutions to avoid high risk and high uncertainty. However, their sensitivity to institutional development may vary with their experience in host countries. This study theorizes that the geographic dispersion of an MNE's subsidiaries, the so-called MNE space, in a host country will substantially alleviate the MNE's concerns about weak institutions in the host country. To test our idea, we measure MNE space by the relative structural position in the network formed by the MNE's existing subsidiaries in the host country. A large space helps MNEs develop a diverse institutional knowledge base which can mitigate the risk associated with weak institutions in a subnational region. Therefore the negative relationship between weak institutions and MNE location choice will be weakened with an increase in MNE space. Such an effect is stronger for MNEs with richer prior experience in the host market and with a larger home-host institutional distance. An analysis of the sequential location choices in China made by 288 Fortune Global 500 MNEs during 1997-2009 renders strong support to our predictions.

Academic Spin-Off Resource Mobilization and Performance: The Role of Social, Economic & Hybrid Goals

Designated as a "Best Paper" for ENT

Author: **Raj Krishnan Shankar**; Nord U. Business School

Author: **Seyed Hooman Seyed Abootorabi**; Syracuse U.

Author: **Einar Rasmussen**; Nord U. Business School

Despite a growing interest in hybrid goals and blended value creation in entrepreneurship, most empirical studies assume that new ventures are created with a pure profit motive. It is increasingly acknowledged that new ventures often pursue both economic and non-economic goals. Still, we know little about how such diversity in organizational goals influence the behavior and performance of new ventures. The goal of creating societal impacts is particularly salient in academic spin-offs (ASOs) seeking to commercialize scientific research. Based on the behavioral theory of the firm we hypothesize that the initial goals of ASOs will influence both resource mobilization and performance. We use a unique longitudinal dataset of 374 ASOs in Norway and used business plans to code their initial goals. By combining several data sources, we could follow a sample of 275 ASOs longitudinally. We find that initial goal orientation is a strong predictor of resource mobilization behavior and ASOs which have balanced goals end up raising more capital overall and performing better than ASOs with either economic or societal goals alone. These findings have substantial implications for how scholars conceive and theorize about hybrid goals and blended value creation in entrepreneurship, and for the development and performance of ASOs in particular.

Human Capital and Spinout Growth: Linking Relatedness, Redeployment, and Performance

Author: **Horatio M. Morgan**; Ryerson U.

Author: **Sui Sui**; Ryerson U.

Author: **Shavin Malhotra**; U. of Waterloo

Immigrant-owned SMEs primarily export to their owners' country of origin. However, conflicting findings suggest theoretical ambiguity in how their country-of-origin export strategy influences their financial performance. Adopting a contingent perspective, we theorize how socially embedded immigrant owners derive superior performance from an intensive country-of-origin export strategy. Based on a sample of 6,319 immigrant-owned SMEs, we find that SMEs led by immigrant owners with longer length of stay in the country of residence, and whose country of origin is geographically proximate to their country of residence, generate superior financial performance from an intensive country-of-origin export strategy.

Corporate Governance and Foreign IPO Underpricing: A Configurational Approach

IM Division CGIO Best Paper in International Corporate Governance Finalist

Author: **Zhihan Shen**; National School of Development at Peking U.

Author: **Igor Filatotchev**; King's College London

Author: **Ryan Adam Krause**; Texas Christian U.

Drawing on a configurational approach fuzzy-set Qualitative Comparative Analysis (fs/QCA), the study investigates different bundles of governance mechanisms that can mitigate information asymmetry surrounding foreign IPO firms in the U.S. capital market, thereby affecting their IPO performance. With a focus on relatively unexplored role of debt governance in the context of foreign IPOs, we examine how debt interacts with various governance practices and changes effective configurations of equity-based governance mechanisms. Finally, the empirical results demonstrate multiple governance bundles coexist that can effectively mitigate information asymmetry in the U.S. capital markets and lead to low underpricing, i.e. equifinality; and the constellations of governance mechanisms that lead to high underpricing are fundamentally and qualitatively

Author: **Christopher Albert Sabel**; BI Norwegian Business School

Author: **Amir Sasson**; BI Norwegian Business School

Established firms use spinouts as corporate venturing strategy to build-up novel businesses. For that end, they redeploy resources such as equity and human capital to the newly founded entities. Prior studies analyze the effect of resource redeployment on spinout performance with parent-spinout relatedness as a proxy, however come to conflicting results. Using unique microdata of the population of firms and employees in Norway from 2005 to 2015, we disaggregate the relationship between knowledge relatedness, human capital redeployment and spinout performance. Relying on resource-based theory and the knowledge-based view of the firm, we find that there is a positive and direct effect between relatedness and redeployment, as well as between redeployment and spinout performance. However, we do not find evidence for a direct effect of relatedness on performance. We further find that parents' majority ownership of the spinout moderates the likelihood of human capital redeployment negatively and redeployment's effect on performance positively. Similarly, moderate parent-spinout social ties the effect of human capital redeployment on spinout performance positively. Our results contribute to resource redeployment theory by testing novel boundary conditions of human capital redeployment and to research on spinout performance elucidating the link between relatedness, resource redeployment and performance.

Contingent Signaling Effects of Anti-Mafia Interventions of MNEs' Acquisitions in Italy (2000-2015)

IM Division Georgetown Best Paper in International Business and Policy Finalist

Author: **Himanshu Bhatt**; ESSEC Business School

Author: **Elisa Operti**; ESSEC Business School

Extant research on cross-border acquisitions argues that foreign firms' ownership choices reflect signals about the quality of local institutions, in a way that a 'positive' signal is typically associated with a higher likelihood of majority ownership. In this paper, we challenge the common assumption that foreign firms univocally interpret such signals as positive or negative. We propose that MNEs may interpret the same signals differently depending on the consistency between the signal and the recipients' mental models about the underlying phenomena. We test these conjectures in the context of government-sponsored institutional actions against mafia operations in Italy, using a dataset comprising 3,924 foreign acquisition deals in Italy in the period 2000 - 2015. Our findings indicate that MNEs' ownership level increases as a response to anti-mafia institutional actions only when the acquirer is rooted in contexts (sectors or countries) that make the signal salient. Adopting a signaling theory perspective, our results contribute to international business research by placing a unique emphasis on signal interpretation. We also bring a more nuanced understanding of how the continued rise of organized crime as an important economic actor presents a grand challenge to a rule-based society.

Spin-Outs' Knowledge Legacies and Parent Hostility: A Competitive Dynamics View

Designated as a "Best Paper" for ENT

Author: **Sascha G. Walter**; U. Wuerzburg

This study adopts a competitive dynamics perspective to illuminate how and when different types of knowledge transferred by a spin-out trigger parent hostility. Specifically, we propose based on the awareness- motivation-capability framework that (1) transfers of market-related and technology-related knowledge will yield hostility and that (2) market commonality, resource similarity, and competitive intensity will exacerbate this effect. Findings from 207 spin-outs support several of our hypotheses. The study contributes to the extant literature by providing a more nuanced view on knowledge legacies, in particular regarding their interplay with a spin-out's strategic positioning and resulting competitive reactions on part of the parent.

Rethinking Capitalism: Exploring Systemic Responses to the Crises of our Times (session 393)

What is capitalism? One of humanity's greatest inventions, and the greatest source of prosperity the world has ever seen? A menace on the verge of destroying the planet and destabilizing society? Or some combination of the two? Should capitalism be reformed or revolutionized? We need a systemic way to think through these questions. Are the systems that we currently use to govern the activities of private corporations still adequate in the face of the enormous problems we face? What kinds of reform might enable capitalism to overcome these problems? If revolution is needed, what should replace it? And whether the path is reform or revolution, how do we get from here to there, given the enormous pressures that corporations are under every day? In this symposium, we propose to discuss these issues from a number of contrasting perspectives.

Celebrity CEO and Earnings Management: Interplay between CEO-CFO Similarity and External Monitoring

Designated as a "Best Paper" for STR

Author: **Gilsoo Lee**; Oregon State U.

Author: **Jonathan D. Arthurs**; Oregon State U.

Author: **Eun Kyung Lee**; La Trobe U.

Author: **Samyul Cho**; Oregon State U.

This paper examines how CEO celebrity status affects earnings management. Using CEO award data from 1997-2011, we find that celebrity CEOs use discretionary accruals more to manage reported earnings than non-celebrity CEOs. Furthermore, we suggest that CEO-CFO demographic similarity and analyst coverage interact to determine the CFO's willingness to comply with the celebrity CEO's request for earnings management. Our results provide supporting evidence for the three-way interaction: the use of discretionary accruals is more pronounced at firms where CFOs share greater demographic similarity with celebrity CEOs but this tendency is

reduced when the firms are closely monitored by financial analysts. By considering how CFOs' compliance to leadership may act as a boundary condition for celebrity CEOs' engagement in earnings management, this study provides a more nuanced explanation on the influence of CEO celebrity status on a firm' earnings management as well as practical insights on corporate governance, especially to boards of directors who are most responsible for TMT selection: boards should carefully consider the level of demographic fit between CEO and CFO, particularly when the CEO is a recognized celebrity and ensure that sufficient external monitoring by financial analysts is maintained to further improve CFO independence.

Stakeholder Dependency and Female CEO Succession

Designated as a "Best Paper" for STR

Author: **Huy Nguyen**; Montclair State U.

Author: **Zhiang Lin**; U. of Texas at Dallas

What makes certain firms more likely than others to appoint a female CEO? Departing from the shareholder-centric approaches often seen in succession research, we draw on instrumental stakeholder theory and network cognition research to examine the influence of non-shareholding stakeholders on female CEO succession. Specifically, we theorize that a firm's dependence on non-shareholding stakeholders in value creation may shape directors' succession choice via two cognitive processes: (1) their anticipation of future strategic challenges (anticipatory mechanism), and (2) their perception of existing stakeholder relationships (network cognition mechanism). Both these cognitive mechanisms may increase the likelihood that directors will perceive a female leader to be a better match for their stereotypical leadership expectations, thereby improving the career prospects of female CEO candidates. Additionally, we explore the social context in which directors choose an incoming CEO of the female gender by considering the moderating influence of non-shareholding stakeholder concentration, shareholder concentration, the clarity of the focal board's internal status hierarchy, and the density of the board's external interlocking network. Overall, our study offers a unique theoretical alternative that provides novel insights into the impact of gender stereotypes on gender leadership practices across organizations.

The Impact of Actual and Perceived Human Capital Diversity on Board Process and Performance

Designated as a "Best Paper" for STR

Author: **Sabina Nielsen**; Copenhagen Business School

Author: **Alessandro Minichilli**; Bocconi U.

Author: **Alessandro Zattoni**; Luiss Guido Carli U.

Author: **Morten Huse**; BI Norwegian Business School

This article builds upon team effectiveness and governance theories to explore the mediating role of board processes in the relationship between board job-related diversity and board strategic involvement. Empirical tests based on primary survey data from the largest Italian firms show that board human capital diversity is a valuable resource enhancing board strategic involvement and subsequent firm performance. Our results illustrate that both perceived and actual board diversity can contribute to board strategic involvement by influencing board processes such as effort norms, use of knowledge and skills and cognitive conflict. However, while actual board human capital diversity influences perceived human capital diversity, both types of diversity have differential effect on board process and performance. We discuss implications for practice and future

research.

Busy Directors and The Occurrence of Corporate Environmental Misconduct

Designated as a “Best Paper” for STR

Author: **Michael A. Abebe**; U. of Texas Rio Grande Valley

Author: **Carla Jones**; Sam Houston State U.

Author: **Keshab Acharya**; U. of Texas Rio Grande Valley

The occurrence of corporate misconduct is a significant organizational event that adversely affects not only the firm’s performance but also its relationships with key stakeholders. Corporate directors are pivotal in the prevention and management of organizational misconduct. In this study, we focus on the phenomenon of “overboarded directors” (those serving on three or more corporate boards). Specifically, we propose that busy directors are less likely to be effective in monitoring environmental misconduct given the substantial cognitive overload and a limited sense of alertness associated with multiple directorships. We propose that firms with busy directors are more likely to have environmental misconduct if they are led by a powerful CEO, do not have a superior ethical reputation, or are experiencing financial distress. We examine these predictions using a panel data on environmental violations among S&P 500 firms (2007-2016). The findings suggest the presence of busy directors is associated with a high likelihood and frequency of environmental violation. This relationship is stronger among firms experiencing financial distress, and weaker among those with superior ethical reputation. Overall, this study sheds light on the organizational consequences of overboarded directors as it relates to environmental misconduct.

Trust and Supervisor-Related Outcomes: Examining Supervisor Organizational Embodiment as a Moderator

Designated as a "Best Paper" for OB

Author: **Émilie Lapointe**; BI Norwegian Business School

Author: **Alexandre Morin**; Concordia U.

Author: **Christian Vandenberghe**; HEC Montreal

Author: **Gary Schwarz**; Queen Mary U. of London

We examine supervisor organizational embodiment (SOE) as a moderator of the relations between trust in the supervisor and supervisor-related outcomes. Based on research on identity, we argue that when SOE is high, supervisors are viewed as being trustworthy in performing supervisory roles on behalf of the organization while, when SOE is low, supervisors are viewed as being trustworthy as persons. We examine this hypothesis in two studies. Study 1 draws on a sample of 221 Chinese employees who completed questionnaires twice over a period of five months, and tests of latent interactions. Results indicate that the relation between trust in the supervisor and affective commitment to the supervisor, and the indirect associations between trust in the supervisor and citizenship behavior and self-sacrifice directed at the supervisor as mediated by commitment, are stronger at low (vs. high) levels of SOE. Study 2 relies on a sample of 212 short-tenured employees from European/North American organizations, growth curve modeling and tests of latent interactions. Results show that the positive effect of the initial level of employees' trust in their supervisor on the trajectories of change in affective commitment to the supervisor and perceived leadership effectiveness is weaker when SOE is low (vs. high).

What Drives Employees' Trust at Work? A Meta Analysis of Antecedents Across Referents and Culture

OB Division Best Paper with International Implications Award

Author: **Yi Wang**; Pennsylvania State U.

Author: **Zitong Sheng**; Curtin U.

Author: **Hanyi Min**; U. of Central Florida

The present meta-analysis was set out to replicate, extend, and integrate existing theoretical frameworks on the antecedents of individual trust at work. Cumulating evidence from 536 independent samples, this meta-analysis examines whether trust is influenced by trustee trustworthiness (i.e., ability, benevolence, and integrity), trustor's trust propensity, trustor-trustee interactions (i.e., leadership, shared characteristics, and communication), and situational characteristics and processes (i.e., human resource management [HRM] practices and work design characteristics). Results showed that all meta-analytic effects were positive. We observed large effects for ability, benevolence, integrity, and leadership; medium-to-large effects for communication, HRM practices, and work design; a medium effect for trust propensity; and a small effect for shared characteristics. All antecedents made meaningful and unique contributions to explain the variance in trust. Meta-analytic structural equation models showed that antecedents that reflect dyadic interactions and situational characteristics influenced trust indirectly through benevolence and integrity. Finally, trust referents and cultural dimensions were examined as possible moderators on the effects of ability, benevolence, and integrity. Our findings contribute to a better understanding of the roles of various antecedents in building individual trust at work. Theoretical and practical implications of these findings and future directions are discussed.

The Gender Pay Gap in Medicine: A Systematic Review

Designated as a "Best Paper" for HCM

Author: **Timothy Hoff**; Northeastern U.

Author: **Do-Rim Lee**; Northeastern U.

Women are becoming doctors in greater numbers. Despite this, there is evidence of women doctors' continued differential treatment compared to their male counterparts. This study's aim was to review systematically the extant literature on the gender-based pay gap in medicine across time, different medical specialties, and different countries of clinical practice. A systematic search was performed of three databases using the Preferred Reporting Items for Systematic Reviews and Meta-Analysis (PRISMA) guidelines. A total of 46 articles published since 2000 contained a gender-based finding related to physician pay. Thirty-two of these 46 articles presented either adjusted or unadjusted means comparisons (or both) comparing pay between male and female physicians. Eighteen of the 46 articles controlled for one or more variables in examining pay between the two groups. Across almost all studies women doctors earn significantly less than men, often tens of thousands of dollars less annually, despite similar demographic and work-related profiles. This earnings gap is persistent across time, medical specialty, and country of practice. The gender-based pay gap is an ongoing crisis within medicine that must be addressed. Future research should focus on understanding better the specific factors that drive this gap, and include more international and longitudinal studies.

Managing the Performance of Health Systems: An Agency-Stewardship Dance

Designated as a "Best Paper" for HCM

Author: **Jenna M. Evans**; McMaster U.

Author: **Jennifer Im**; U. of Toronto

Author: **Agnes Grudniewicz**; U. of Ottawa

Author: **Greg Richards**; Telfer School of Management, U. of Ottawa

Author: **Jeremy Veillard**; U. of Toronto, Institute of Health Policy, Management & Evaluation

Despite a mixed evidence base, health systems continue to implement large-scale public policies aimed at managing the performance of organizations and networks using contracts, targets, scorecards, and incentives. Most studies of performance management (PM) use quantitative methods to evaluate a single type of intervention with a focus on its formal and technical aspects. However, in practice PM interventions co-exist and are enacted through social and political relationships. Studying how PM ecosystems 'work' from multiple stakeholder perspectives using a relational lens may help explain why PM succeeds or fails. We conducted a case study of an exemplar PM ecosystem used by Cancer Care Ontario (CCO) to manage 39 networks. The aim was to characterize the role of CCO, the function and impact of its PM ecosystem, and the nature of the governance relationship between CCO and the networks using interviews, document analysis, and observation. Interviews were conducted with 59 CCO representatives and 88 representatives from 30/39 (77%) networks for a total sample size of 147 individuals. We used agency and stewardship theories post-hoc to explore complexities in the data. We found that CCO's PM ecosystem operates as an agency-stewardship "dance" with CCO simultaneously acting as a coercive watchdog and a supportive mentor. We present three angles on this paradox related to (1) goals of PM ("accountability in service of improvement"), (2) behaviours CCO uses to enact

PM (“exercising control with a coaching tone”), and (3) unexpected network responses to PM (“requesting controlling behaviours”). The results contribute to efforts to move beyond either/or thinking in PM and can inform the design of PM public policies.

But Who Will Help Them? The Effect of Ethical Leadership on Bullying, Burnout, and Turnover

HCM Division Best Theory to Practice Paper

Author: **Jason R. Lambert**; Texas Woman's U.

Author: **Lee Warren Brown**; Texas Woman's U.

Author: **Caleigh Torres Nava**; Texas Woman's U.

In this paper, we examine the role that ethical leadership plays in the effect of bullying on burnout and turnover intentions of nurses. Nurses are in a unique position within the organization, having to answer to multiple hierarchies causing systemic stress in a role that is inherently stressful dealing with sick and injured patients. We surveyed 184 active nurses. Our findings suggest that organizations that have ethical leaders in the role of nursing managers can mitigate the negative effects of bullying on burnout and increase nurses' intentions to stay. This research may help managers understand ways to reduce turnover among nurses in the healthcare field.

Family Firm: Strategies, Growth, and Change (session 394)

Time Perspective and Entrepreneurial Orientation in Family Firms: Some Theoretical Propositions

Author: **Ludvig Levasseur**; Indiana U., Bloomington

Author: **Daniel T. Holt**; Louisiana State U.

Author: **Nadine Kammerlander**; WHU - Otto Beisheim School of Management

In this theoretical article, we highlight the central role of an important dimension of psychological time related to individual experiences and perceptions of the past, present, and future—time perspective (or TP)—in influencing the entrepreneurial orientation (EO) of family firms. To do so, we draw on the TP, entrepreneurship, and family business literatures and provide insight into how a CEO's TP influences family firm engagement in entrepreneurial activities. Family firm specifics also play important roles in the TP-EO relationship. We propose that (1) the positive TP of the family firm CEO (i.e., past-positive, present-hedonistic, and future TP) has positive effects on family firm EO; (2) the negative TP (i.e., past-negative and present-fatalistic TP) has negative effects on family firm EO, but these effects are mitigated by family firm specifics; and (3) the effects of EO on the subsequent TP of the CEO (and other family members) are based on previous TP and are likely to be moderated by the feeling of being instrumental and positive affect, family support, and perseverance. Last, we discuss some implications for theory and research.

Does Capital Foster Growth Opportunities? A Real Options Perspective on Newly Public Family Firms (WITHDRAWN)

Author: **Tobias Schori**; U. of St. Gallen

Despite significant organizational challenges, risk of failure and dilution of family control, many private family firms decide to go public with founding families retaining family control, thereby accepting a loss of noneconomic wealth. We argue that family firms may go public and accept such an initial loss of noneconomic wealth but use the proceeds to allocate funds in strategic investments that create more growth opportunities in the future, thereby financially compensating for their loss of noneconomic wealth. Building on real options theory, the aim of this study is to gain insights on the effects of new capital on growth option value in newly public firms and to develop an understanding of the family firm as a source of firm heterogeneity in real options theory. The empirical analysis of 590 IPOs in the United States lends support to our theoretical expectations and shows that family firms have a distinct effect on growth option value, particularly under conditions of highly uncertain environments.

Strategic Change in Family Firms: The Influence of Familiness on the Strategic Change Process

Author: **Moritz Belling**; Technical U. Berlin

Author: **Ulrich Pidun**; Boston Consulting Group

Author: **Dodo Zu Knyphausen-Aufsess**; Technical U. Berlin

The temporal development of family firms is a key research area owing to the longevity and transgenerational vision of the family. Throughout their development, firms transition through strategic change episodes with

potentially significant impact on their performance and survival. In this article, we combine family firm with strategic change research to show how familiness supports or limits mechanisms along the strategic change process. More specifically, we identify three tendencies from specific strengths of family firms that turn against them in radical change contexts. First, familiness creates an overemphasis on the cognition of gradual change triggers, which limits the cognition of radical change triggers. Second, familiness creates a tendency to inappropriately scope and dimension strategic change in the context of radical change triggers in order to protect the value of legacy resources. Finally, familiness supports endurance during strategic change implementation but also creates a tendency of being too slow or stubborn when implementing an insufficient change decision. Falling victim to either of these tendencies may have a negative impact on firm performance and survival.

Social Innovation in Family Business: An Empirical Analysis in the UK

Author: **Ahlam Bendar**; U. of Brescia

Author: **Giovanna Campopiano**; Lancaster U. Management School

Social innovation is rapidly developing all over the world, with new institutions and tools, with increasing confidence and evidence of impact. There is a growing interest among corporate players and industry leaders - supported by a growing recognition that innovation within the private sector is changing. Businesses are responding to the growing importance of social sectors in the economy. Emphasis on reputation, local embeddedness, and long-term orientation make family firms the type of organization that could engage in social innovation to a higher extent than other businesses. Indeed, pursuing social innovation generates benefits through exposure to various external stakeholders, co-developing innovations with partners and creating inter-partner synergies. This exploratory paper introduces a measure of social innovation for private business, borrowing and adapting existing models for public enterprises, and tests the effect of family involvement on the adoption of social innovation practices. Our results indicate that family involvement in management positively affects social innovation, while family involvement in governance has a negative impact on it. Moreover, multigenerational involvement positively moderates the relationship between family involvement in management and social innovation, while having the second generation in control negatively moderates the relationship between family involvement in governance and social innovation.

IM Division Award Winning Papers 2 (session 395)

Expatriate Work Role Engagement: A Conditional Crossover and Spillover Perspective

IM Division Best Paper in OB/HRM/OT Finalist

Designated as a "Best Paper" for IM

Author: **Mihaela Dimitrova**; WU Vienna

Author: **Sebastian Reiche**; IESE Business School

Author: **Mina Westman**; Tel Aviv U.

Author: **Shoshi Chen**; Tel Aviv U.

Author: **Olivier Wurtz**; U. of Vaasa

Author: **Mila Borislavova Lazarova**; Simon Fraser U.

Author: **Margaret A. Shaffer**; U. of Oklahoma

Drawing on crossover, spillover and conservation of resources theories, we investigate the dynamics of how experiences in the family domain influence the work sphere in the context of expatriation. Specifically, we conceptualize how partner family role adjustment predicts expatriate work role engagement through crossover and spillover. We also examine whether some expatriates are better than others at buffering potentially negative or leveraging potentially positive influences from their families. Using data from multiple sources and different time points, we establish that the personal resource of general self-efficacy is a boundary condition for both crossover and spillover. We find that the crossover of partner family role adjustment to expatriate family role adjustment is weaker when expatriate general self-efficacy is high. Meanwhile, when general self-efficacy is high, there is positive spillover from expatriate family role engagement to the attention dimension of their work role engagement, and when self-efficacy is low, negative spillover occurs. Our results suggest that the way in which the family domain influences expatriate work role engagement is largely dependent on general self-efficacy. We contribute to the literatures on expatriation and the work-family interface.

What Happens Abroad, Stays Abroad? Reputation Risks of MNE Irresponsibility in Home and Host Markets

IM Division Best Paper in Corporate Social Responsibility and Sustainability Finalist

Author: **Irina Minodora Surdu**; Warwick Business School

Author: **Giulio Nardella**; Loughborough U., School of Business and Economics

Multinational enterprises (MNEs) are increasingly accused of behaving irresponsibly both at home and abroad. Accordingly, public disclosure of corporate social irresponsibility (CSI) is understood to be significantly damaging to the reputation-based firm-specific advantages of MNEs. By applying behavioral perspectives – egocentric biases and expectancy violations – we examine whether and how different types of CSI can damage the reputation-based firm-specific advantages of MNEs, with a particular focus on the moderating effect of CSI location. By exploring the egocentric biases of reputational assessors, we advance the literature on firm-specific advantages and identify the circumstances that render some reputation risks to be location-bound, leading to FSA erosion. We explain which causes of CSI violate stakeholder expectations and evoke egocentric biases. Our longitudinal analysis, consisting of 1,861 CSI events associated with 476 U.S. MNEs between 2005 and 2012, confirms the strong effect of the type and location of CSI on changes in MNE reputation.

The Role of Distinct Organizational Learning Types in Value Chain Fine-Slicing Decisions

Douglas Nigh Award Finalist

Author: **Carlos Adrian Rodriguez**; INCAE Business School

Author: **Russell Seidle**; Suffolk U.

While the progressive development of an organization's international footprint has been described as a major learning process in which firms follow different stages as they progress on their international commitments, few studies have analyzed how organizations combine particular learning mechanisms as they enter new geographies. We address this lacuna by examining two particular learning types – experiential and vicarious – for their influence on firm-level fine-slicing value chain activities. Findings from an analysis of 660 sourcing implementations undertaken by firms headquartered in 17 countries and operating in 57 host countries provide broad support for our hypotheses. Specifically, experiential learning has a differential effect on fine-slicing decisions depending on whether such first-hand knowledge has previously been obtained from general foreign experience or in the focal country in question. In contrast, our results suggest that firms use vicarious learning processes as a mechanism to reduce uncertainty about the operation in a given country, and allocate entire processes rather than discrete tasks, when they are following the path of a leading firm in their sector.

New Insights into Health Information Technology and Data Sharing (session 1457)

Clinicians' Lived Experiences on Impact of Electronic Health Records (EHR) on Quality and Safety

Author: **Soumya Upadhyay**; U. of Nevada Las Vegas
 Author: **Han-fen Hu**; U. of Nevada, Las Vegas

Electronic Health Record (EHR) implementation in healthcare facilities is intended to assist with clinicians' activities, such as evidence based decision making, streamlining providers' workflow via efficient coordination of patient care. However, there have been mixed findings about clinicians' perceptions of EHR. While several clinicians agree that EHR improves the quality and efficiency of care, others perceive that EHR interrupts the routine workflows, increases documentation load, and takes away clinicians' time from patients. This study aims to explore the lived experiences of clinicians who regularly use EHR, to assess the role of EHR in improving quality and safety of healthcare. A qualitative study design based on the grounded theory approach was used. Different groups of clinicians (physicians, hospitalists, nurse practitioners, nurses, and patient safety officers) were interviewed using a semi structured interview. Organizations represented were trauma hospitals, academic medical centers, medical clinics, home health centers, and small hospitals. After examining 652 quotes and phrases, 10 major domains emerged. Our study found mixed results, which are consistent with extant literature. Overall, the participants confirmed that EHR improves patient safety by offering reminders, notifications, and alerts. Some respondents found training to be superficial, and of insufficient duration. Participants also thought that EHR can be an interference in clinical activities especially when different EHRs in a multi-system hospital are not integrated well. Some respondents indicated concern about the associated long term costs, including the dependence on technologies and the need to keep up with evolving technologies. Future qualitative and mixed method

Exploring Faulty Expectations: How We Limit Ourselves and Others (session 1473)

Existing research has established the prevalence with which people form expectations of others based on limited information. These expectations, however, can often lead us astray. This symposium combines four presentations that highlight instances of people making influential judgments based on limited information and the consequences of faulty expectations. The presentations consider the implications of expecting that female experts know less than they do, expecting difficulty leading subordinates, expecting difficult conversations with people with whom we disagree, and expecting that goals are not as important to certain groups of people. In all of these instances, expectations also serve as limitations - holding us back from enjoyable conversations and advancing our careers and holding others back from helping us perform our best and achieving their goals.

EWOM Behavior in the Healthcare Sector – The Case of a Hospital's Facebook Page

Author: **Sebastian Martin**; U. of Applied Sciences Upper Austria

Author: **Birgit Grüb**; Johannes Kepler U. Linz

Patients frequently use Facebook for health-related reasons, like seeking of information or the recommendation of practitioners or hospitals. In this way, Facebook provides a powerful communication platform for electronic word-of-mouth (eWOM). The present explorative study provides detailed information regarding eWOM behavior on the Facebook page of an Austrian hospital. Data of the hospital's Facebook page was gathered and analyzed with NodeXL. Reactions towards the different types of postings were analyzed by counting emojis, the number of shares and comments. Within the study, there was an in-depth evaluation of communication data (313 posts of the hospital, more than 14,000 eWom actions by 3,327 women, men and organizations). The study shows how heterogeneous users are in their eWOM behavior and that a variety of topics on the Facebook page stimulates electronic recommendations. One major finding is that a significant part of the eWOM is done by only a few users. According to this, a so-called Intensive WOM Behavior (IWB) can be identified. Users of the IWB-group behave heterogeneously. Most react either with an emoji, a comment or a share. By providing first insights into the existence of IWB-users as well as their eWOM-behavior, this study offers new insights to eWOM in Facebook.

SYMPOSIUM

ASYNCHRONOUS

Author: **Erin Sullivan**; Suffolk U.

Electronic Health Records (EHRs) and other Health Information Technologies (HITs) pose significant challenges for clinicians, administrators, and managers in the field of primary care. While there is an abundance of literature on where HIT fails in primary care, in the practices where it succeeds there seems to be a black box hiding the 'how' behind the screen. Using a combination of qualitative methods including cross-case analysis, discourse analysis and qualitative comparative analysis, we examined case study data across six exemplary primary care organizations. We aimed to a) understand how exemplary practices in the field of primary care conceptualized data and HIT use in their care delivery, and b) describe mechanisms that support and promote data and HIT use in daily care delivery. We identified three key processes that underlie data and HIT conceptualization and use: data audience identification, defined data purpose, and structures for participation in both maintenance and design phases. These findings have clear implications for managing data and EHR/HIT use, and attainable implementation pathways for other US-based primary care organizations.

Two-Sided Privacy Awareness: A Field Experiment on Health Data Protection in Underserved Communities (WITHDRAWN)

Author: **Marie Gabel**; WWU Münster

Author: **J. Nils Foegel**; WWU Münster

Author: **Stephan Nüesch**; Westfälische Wilhelms-U. Münster

Health information systems in developing countries support the political vision of promoting equity in access to health services. However, these data-driven advancements raise severe privacy issues due to the lack of awareness about privacy risks and counteracting measures in most developing countries. Drawing on social cognitive theory and the Antecedents-Privacy Concerns-Outcomes model, we combine two mutually complementary theoretical lenses to argue that positively and negatively framed privacy awareness-raising measures influence individuals' data protection

through the two channels privacy self-efficacy and privacy concerns. To test our theorizing, we conducted a randomized controlled field experiment in collaboration with a non-governmental organization working on health information systems in West Africa. Our results provide in-depth and context-sensitive insights into how privacy awareness influences privacy behavior. We show that even simple awareness-raising measures increase individuals' privacy protection when framed in a solution- focused positive instead of a risk-focused negative way.

Identifying Hospital Reported Challenges in Sharing Data with Public Health Agencies

Author: **Daniel M. Walker**; Ohio State U.

Author: **Valerie Yeager**; Indiana U. / Purdue U., Indianapolis

Author: **John Lawrence**; Ohio State U.

Author: **Ann Scheck McAlearney**; Ohio State U.

Improving the health information technology (HIT) infrastructure of the public health system is critical for public health activities and population health management. Evidence suggests that Meaningful Use (MU) incentives improved hospitals' public health reporting capabilities; however, evidence also demonstrates that barriers remain. Improving clarity of the specific issues that hospitals face can inform approaches to improve public health reporting capabilities. Using data from the 2017 American Hospital Association Annual Survey and Information Technology Supplement, we qualitatively coded reported challenges by type (i.e., technology, organization, or environment), responsible or affected party, and the specific challenge described. We then used multivariate logistic regression to identify the characteristics of hospitals associated with experiencing any challenge. Our results show that the majority of hospitals experience challenges reporting health data to public health agencies, and the majority of those reported organizational issues at public health agencies, specifically the technical capacity of public health agencies. Hospitals with more advanced EHRs and with HIE were more likely to experience challenges. Our findings highlight opportunities to address barriers, specifically

improving data standards, increasing funding for public health agencies to improve their technological capabilities, offering workforce training programs, and providing clarifications for policy specifications and reporting.

SIM

The Social Dynamics of Social Identity Transitions (session 1474)

The purpose of this symposium is to explore the social dynamics of social identity transitions. To this end, the symposium will include the presentation of four papers which illustrate how social mobility (Martin and Beetz), shifts in social expectations (Knowlton), and observer judgement (Levitt, Murphy, and Pratt) influence people's work-related social identity transitions. Research on people's efforts to revise, repair, reconstruct, reinforce, or navigate work-related identities, known as "identity work" (Brown, 2015), has typically focused on situations in which individuals move across static role/job boundaries, such as from one professional role into another (e.g. Pratt, Rockmann, and Kaufmann, 2006), or how individuals manage static occupations that, by their nature, induce intrapsychic tension regarding identity (e.g. Kreiner, Hollensbe, & Sheep, 2006). Social identity transitions can be highly socially dynamic, however, with people often engaging in identity work due to changes in other individuals, institutions, and/or broad social forces (Brown, 2015; Petriglieri, 2011; Petriglieri et al., 2019). In a world that is ever more socially connected, interdependent, and transparent, the potential for social actors or forces to spur individual-level identity work by affecting a social group's boundaries or meaning is high. By featuring work that provides insight into the social dynamics of social identity transitions, this symposium draws attention to a topic that is key to understanding the inner experiences of much of the present and future

MOC

The Space Between Role Identities: How Individuals Navigate Boundary Crossings (session 1472)

The papers in this symposium take a fresh look at the concept of boundaries between role identities and at how individuals navigate those boundaries while maintaining a coherent sense of self. It brings together four papers that investigate the sensemaking processes, the identity work strategies, and the boundary management tactics surrounding transitions across roles, cultures, and occupations. The first two papers focus on macro-role transitions, i.e., transitions between sequentially held roles. The first presentation focuses on what happens when individuals who cross cultural boundaries for work or education hold on to the self they left behind. The second presentation explores how hobby job holders, individuals who have turned previously held hobbies into jobs, create a sense of self that spans across temporal and work-life boundaries. The final two papers focus on micro-role transitions, i.e., transitions between simultaneously held roles. The third paper studies how YouTubers, whose job involves the use of social media to market products online, deal with their work-life boundaries in a context where self-disclosure is encouraged and where their private self is at the core of the work. The fourth presentation proposes a theoretical model of the boundary management tactics of multiple job holders. Together, the four papers in this symposium add to our understanding of the subjective experience of boundary crossings in the modern workplace.

process through which career self-management enhances education-to-work transition outcomes; (iii) examining the role of demographic factors on self-employment (an increasing trend in youth employment); and (iv) highlighting the prevalence of adverse working conditions for European youth. Moreover, each paper reports unexpected findings on youth employment that question the taken-for-granted approaches to employment and careers (e.g., a process approach to career preparedness does not predict career behaviors; career self-management and career competencies do not explain employment status for university-leavers; father monitoring and urban background are negatively associated with female Millennials' self-employment; and despite higher exposure to adverse working conditions, European youth do not report poorer general well-being). Taken together, the studies in this symposium question the increasing emphasis on individual agency for early career decision making, success, and individual well-being.

Career Identity and Career Barriers (session 1439)

The Pathway of a Change-Maker: Creativity and Affect Regulation to Bridge the Intention-Action Gap

Author: **Désirée Rehnert**; U. of Sankt Gallen

Author: **Sebastian Kernbach**; U. of St. Gallen

Author: **Prof. Dr. Wolfgang Jenewein**; U. of St. Gallen

With increased career opportunities as well as uncertainty, individuals strive to not only adapt to changing circumstances but also define their career intentions according to their values and strengths in order to live up to their potential and find fulfillment. The purpose of this study was to examine whether the dynamic regulation of affect, a critical capability studied across disciplines, may be useful in understanding how individuals deal with challenges at hand, creatively ideate solutions, define intentions and finally implement them against the adversity inherent in career construction. Mixed-methods were used to explore how Life Design as an intervention promotes creativity and affect regulation and whether this translates into intentions that are implemented. Quantitative measures and qualitative data were used to triangulate study findings. Results uncover aspects of the creativity-affect relation that are critical for the workplace and career counseling but often neglected when examining what forces contribute the creative ideation and implementation of intentions. New insights are developed that highlight the importance of mechanism that help down-regulating negative and up-regulating positive affect to broaden individuals' sight in shaping their careers. This information can be used to develop interventions designed to foster emotional self-regulation in the context of creativity and intention implementation.

Negotiation Tactics and Strategies (session 1442)

Going with the Momentum: Exposure to Decreasing Concessions Leads to a Distributive Disadvantage

Winner of CM Division Best Paper Award - Empirical or Theoretical

Author: **Kian Siong Tey**; INSEAD

Author: **Michael Schaerer**; Singapore Management U.

Author: **Nikhil Madan**; Indian School of Business

Author: **Roderick Ingmar Swaab**; INSEAD

We propose that making a series of concessions that decrease in size over time (e.g., \$1500, \$1225, \$1205, \$1200) can signal that senders are reaching their bottom line and results in a negotiation disadvantage for recipients. Seven studies (N = 2490) demonstrate that receiving decreasing concessions led negotiators to make less ambitious counteroffers (Studies 1-2) and reach less profitable agreements (Study 2). Building on theories of psychological momentum, we demonstrate that this distributive disadvantage occurred because decreasing concessions resulted in inflated perceptions of the sender's reservation price compared to other concession making strategies. We further show that this disadvantage disappeared when recipients were given specific information about the sender's reservation price (Study 3a), when the momentum of the pattern was disrupted semantically (Study 3b), and when counterparts focused on their own target price instead (Study 4).

Why Women Sometimes are as Likely to Lie as Men in Negotiations

Author: **Jason R. Pierce**; U. of North Carolina, Greensboro

What Next? Career Narratives of Women University Graduates in Times of Precarity

Author: **Maria Simosi**; Department of Organisation Studies and HRM, Royal Holloway

Author: **Maria Daskalaki**; U. of Roehampton Business School

Author: **Denise M. Rousseau**; Carnegie Mellon U.

Building on emerging research on women's careers and precarious employment, we conducted a longitudinal qualitative study of 16 young educated women over two years in the Greek post-crisis economy. By tracing their career trajectories and navigation of job-related experiences, we examine the subjective meanings these women attach to their career transitions. We find evidence of five career narratives, each indicative of the paths followed and the meanings they attribute to them as these women seek stable employment. These paths constitute trajectories, more cyclical than linear, based on goals predominant at the time, and influenced by situational constraints and coping responses to professional identity threat. Dysfunctional effects of persistence of old career identities contrast with a more resilient adjustment and pursuit of new identities. Results support the need to contextualize the study of career trajectory narratives and how they can change over time in accordance with individual goals, needs and opportunities.

Author: **Daniel Petri**; master student

This study explores the influence of fictional narrative experiences, such as reading books or watching movies or television series, on career identity. To explore this relationship, 20 semi-structured interviews were conducted with young professionals from a variety of work disciplines and

Author: **Leigh Thompson**; Northwestern U.

Men frequently express more willingness to lie in negotiations than women. However, women are just as ready to lie in some cases. We explain both outcomes by hypothesizing that some situational cues suppress sex differences in lying. Results from four experiments confirm our hypotheses. Experiment 1 showed that men and women express equal willingness to lie when negotiating with counterparts for whom they felt either great competitiveness or empathy. Experiment 2 extended these results by confirming that men only express more willingness to lie absent competitive or empathic feelings towards a counterpart. Experiments 3 and 4 demonstrated that inducing competitive or empathic feelings eliminated sex differences in lying by leading women to lie more and men to lie less respectively. Overall, our results suggest that the extent to which negotiators experience competitive or empathic feelings play important roles in whether sex differences in lying in negotiations emerge.

Unethical When Insecure: The Effect of Negotiators' Self-efficacy Beliefs on Ethical Behavior

Author: **Liliane Furtado**; U. Federal Fluminense

Author: **Gustavo Tavares**; Federal Institute of Rio de Janeiro

In this study, we use interactive negotiation activities to explore the link between state self-efficacy and deception, a particular kind of unethical – or at least ethically questionable – behavior. More specifically, we investigate whether and how negotiators' self-efficacy perceptions may make them more or less likely to use deception in negotiation. We argue that individuals with particularly low levels of self-efficacy beliefs in a specific situation are expected to experience high levels of anxiety arousal and tend to interpret this situation as threatening. This, in turn, lead them to adopt a self-defensive attitude that ultimately affects their (un)ethical behavior. We test our hypothesis in two experimental studies, totalizing 260 participants. In Study 1 we manipulate participants' negotiation self-efficacy beliefs with

200 students wrote micro-narratives in a survey. Fictional narratives affected career identity through a personal, cultural and reflective pathway. Fictional narrative experiences appeared to be embedded in people's personal narrative repertoire - the body of narratives they experienced in the past, and in their cultural narrative repertoire, containing narrative experiences as reflected by an individual's social environment. Influences on the impact of narrative experience were emotional transportation, identification with the characters and verisimilitude or realness of the narrative. This study contributes to the field of narrative impact and careers research by exploring how books, movies and television series can influence career identity, showing that there are different pathways in which narratives influence career identity, that narrative experiences do not operate in a vacuum but are embedded in a larger personal and cultural narrative repertoire and that narrative experiences create opportunities for identity play, whereby people can experiment with different career identities.

Career Barriers Experienced by Legal Professionals with an Asian Cultural Background

Author: **Amy Choi**; U. of Sydney Business School

Despite the increased numbers of culturally diverse legal professionals in Australia over the course of recent decades, barriers into leadership positions persist. Culturally diverse legal professionals continue to be significantly under-represented on the partnership level in law firms, at the Bar and the Judiciary. This study explores the career enabling and constraining structures that legal professionals with an Asian cultural background experience in progressing their career. Based on 65 in-depth interviews, the study identified five mechanisms that shape career enablers and barriers. They are business development requirement, demonstrating dedication, opaque promotion process, informal work allocation process, and an assimilationist culture. The findings revealed these mechanisms disadvantaged culturally diverse legal professionals.

[view paper \(if available\)](#)

bogus feedback and measure their actual use of ethically questionable tactics in a subsequent interactive negotiation activity. We find that low levels of self-efficacy lead individuals to use more ethically questionable tactics during a negotiation. In study 2, besides the manipulation of self-efficacy, we also manipulate participants' moral disengagement with priming messages to test for its mediating effects. Results suggest that moral disengagement mediates the effects of self-efficacy on (un)ethical behavior. We discuss the theoretical and practical implications of our findings.

Negotiating Through Agents: A Principal-Focused Agency Model in Representative Negotiations

Author: **Bushra Sarah Guenoun**; Harvard Business School

Author: **Jared R. Curhan**; MIT Sloan School of Management

While the negotiation field has thoroughly explored an agent's experience in representative negotiations, an examination of the principal's perspective is notably lacking. To address this under-researched area in management, we present the Principal-Focused Agency Model -- a trust-based, principal-centric conceptualization of how principals control their agents' behavior, and how those controls affect negotiation outcomes. This article puts forth four main propositions. First, we posit that principals' trust based in perceptions of their agents' benevolence (i.e., benevolence-based trust) negatively relates to how much principals attempt to control the outcomes of their negotiations (i.e., the "ends"). Second, we hypothesize that principals' trust based in perceptions of their agents' integrity (i.e., integrity-based trust) negatively relates to how much principals attempt to control the process of their negotiations (i.e., the "means"). Third, principals' trust based in perceptions of their agents' ability (i.e. ability-based trust) is necessary but not sufficient for principals to relinquish control over either negotiation outcomes or processes. Fourth, we posit that principals' decision to maintain control in representative negotiations negatively affects their outcomes, and that this relationship is moderated by the negotiation's integrative potential, such that

From Denial to Delay: Defending Fossil Fuel Hegemony Against Critique (WITHDRAWN)

Author: **Daniel Nyberg**; U. of Newcastle

Author: **Christopher Wright**; U. of Sydney Business School

Author: **Vanessa Bowden**; U. of Newcastle

The rise of new social movements, as well as the experience of unprecedented weather events, appears to represent a renewed and reinvigorated momentum for action on climate change. In Australia, however, even as public concern grows and business organisations recognise the climate emergency, there remains a reticence to implement any kind of climate change policy. It is well-documented that this is a result of the ongoing hegemonic position of the fossil fuel industry. In this paper, we develop current understandings of the ways this hegemony has been maintained and extended. We elaborate previous theorisations of moral and intellectual leadership by showing how the fossil fuel industry embeds particular technical claims into the climate change discourse. Second, we expand knowledge of political strategy to show how corporate discourses aimed at maintaining hegemony are extended through the state as an ideological promoter. Finally, we recall the contingent nature of hegemony, and argue that recent manoeuvres by the state to intervene

Intersectionality in Talent Management: Broadening our Sight for More Inclusive Theorizing (session 1455)

The extant work on talent management has largely promoted neoliberal agendas concerned with ranking, rating, and recording employees' talent, or indeed lack of talent. While there are emerging insights that unravel the gendered, racialized, and classed logics underpinning dominant TM writings, there is largely an acceptance of TM as a philosophy, and there has been limited work that challenges the epistemological foundations of TM. We argue that talent management philosophies that have strengthened instrumentalism are conceived as a managerial tool that showed a commitment to capitalistic frameworks, and ignored critical management studies, which stress the importance of resistance, and the power relations that shape, constrain, and may hinder opportunities for all employees. In line with this year's AOM theme "Broadening our Sight", this presenter symposium aims to broaden our sight for more inclusive TM theorizing by including five papers that bring intersectionality to the forefront. The collection of papers documents the voices of the silenced talent from the Netherlands, Germany, Switzerland, Austria, Ireland, New Zealand, Finland, and Ghana, and draws on feminist, critical, transnational and postcolonial epistemologies to challenge the dominance of masculinist and neo-liberal logics in TM theorizing and open up opportunities to review TM systems that stress inclusion and equity. This is a timely endeavor to draw out, extend, give emphasis and voice to what and who is silent or marginally present or ideologically represented in much of the

represent a new level of antagonism which may well indicate the hegemonic power of the industry is weakened. In this regard, the paper offers perhaps one of the few more positive means of looking at the current state of climate politics.

Re-Embedding Sustainable Leadership Development: A Gaia Storytelling Approach

Author: **Kenneth Molbjerg Jorgensen**; Aalborg U.
Author: **Pauline Fatien**; Grenoble Ecole de Management

This paper presents a Gaia storytelling approach to sustainable leadership development. This approach is inspired from Arendt's notions of storytelling, space of appearance and natality. Our purpose is to use her notion of storytelling to develop a sustainable leadership development approach that responds to two problems concerning leadership development. The first problem concerns a need to re-embed leadership development in social and material spaces. The second problem concerns a need to re-embed leadership development in what we, following Latour, call Gaia. Arendt's notion of natality is an embedded part of storytelling, which implies that storytelling is the process by which people begin and intervene in situations and processes. Natality is however also linked to what Arendt's calls the eternal recurrence of all species and life forms, and which she considers the highest principle of all being. Inspired by Barad, Haraway and Latour we reconceptualize eternal recurrence into the notion Gaia. Gaia is a metaphor for the living entangled relationships of human and non-human species, life-forms and in-organic matter that forms complex self-regulating processes that condition life. Gaia storytelling implies an attempt to restore our relations to Gaia and re-embed leadership development in the ecological, material and social practices and spaces. Following Gaia storytelling, we develop a grounded relational reflexive approach to leadership development, which is targeted towards the performative dimension of action and natality. We sketch two methods for this purpose: journeying through space and journeying across material spaces.

Making Sense of How to Become a Stricken Person: The Voice of the Communities Affected by a Disaster

Author: **Jussara Pereira**; FGV - EAESP

Author: **Caio César Coelho Rodrigues**; Fundação Getulio Vargas - EAESP

Author: **Alice De Freitas Olete**; FGV EAESP

Traditionally, sensemaking has been studied in organizational theory as a cognitive and social process. However, in recent years, scholars have progressively recognized the importance of daily experiences in the sensemaking process. We interpret our data to expand the understanding of sensemaking, adding the notion of ecological embodiment. Both concepts are gaining significant interest in the management field being, even, worked together in the notion of ecological sensemaking. Nevertheless, a question remains, what is ecological embodied sensemaking? We explore the concept of ecological sensemaking, emphasizing the centrality of the body in the process, the human materiality body, and the role of human senses in the process of making sense of reality. This research investigates the Samarco dam collapse that happened in Brazil on November 5th, 2015. We conducted a qualitative case study with two data collection strategies: netnography and the documental analysis of a local newspaper. Our results show that sensations are closely linked with both the material and the non-material world. As a theoretical contribution, we highlight the use of the human senses in the ecological sensemaking process after a catastrophe. We add the materiality of the human body to the puzzle of the ecological sensemaking process. Depending on the relationships with the environment and emotional reactions, each person had a sense of alarm that saved them from the catastrophe. Thus, bodily inscription can help the individual create senses to keep safe and understand the context of the change event.

Calculating the Climate: Assembling Practices for Adaptation

Author: **Nichole Kay Wissman Weber**; U. of San Diego

Author: **Daniel Nyberg**; U. of Newcastle

Author: **David Levy**; U. of Massachusetts, Boston

With the increasingly visible and expensive impacts of climate change, attention is growing to the necessity of local climate adaptation. Adaptation is an effort to reduce the vulnerability of ecological, economic and social systems by assembling knowledge about future risks associated with climate impacts. This study examines the processes of adaptation and how an assemblage of technologies produces risk knowledge in adaptation processes. We find that risk constructs are produced through networks of technical experts, systems of models, algorithms, and analytical techniques. We demonstrate that risk calculations are not neutral nor objective but are influenced by the goals of actors, metrics, and calculations which play a key role in shaping the operation and outcomes of the assemblage. We find that climate impacts were translated into narrow focal points because of competitive pressures, client demand, and institutionalized actuarial processes that do not fully reflect the extent or complexity of climate change. Importantly, this study demonstrates how an assemblage of actors is defining socio-material realities by configuring possibilities for courses of action. This analysis shows both how calculative practices within the assemblage define climate risks and how the frictions between the calculative practices produce unanticipated consequences.

New Directions in Gender and Organizations: Closing the Gender Gap in Career Advancement (session 1453)

GDO

Occupational Segregation (session 1452)

As long observed by Kanter (1977), climbing the corporate ladder is not a gender-neutral endeavor. Since then, improvement on women's career advancement within organizations has continued to be disturbingly slow. Research in management, sociology, and labor economics has highlighted the existence of gender bias and the lack of female representation in management positions (Bertrand and Duflo, 2017; Castilla and Benard, 2010; Heilman, 2012) and has put forward a set of explanations for the phenomenon, such as gender stereotypes and status beliefs (Correll, 2004; Bertrand, 2011, Eagly and Karau, 2002, Rudman and Glick, 2001). Gender bias and discrimination, in their contemporary forms, reveal themselves to be complex and subtle. After uncovering the phenomenon and its primary mechanisms, the literature is now focusing on building a more specific and detailed knowledge of the ways gender inequality is perpetuated through organizational mechanisms, such as task allocation and recruitment processes (Babcock et al., 2017; Brands and Fernandez-Mateo, 2017; Chang et al., 2019, Sarsons, 2017) and the ways it can be lessened (Flabbi et al., 2019; Parker et al, 2019). The four papers in our symposium contribute to this literature by exploring various organizational mechanisms, including structure, culture, and hiring practices, in relation to women's career advancement within organizations. In addition, some of these studies consider the interaction of such organizational mechanisms with individual factors, such as perceptions of the organization, and social capital through marriage ties. More broadly, the studies also situate organizations in the ongoing context of the knowledge economy and globalization.

Underdoing Gender in Job Crafting: Coping with Gendered Job Demands in Male Dominant Occupations

Author: Ai Yu; U. of London, Goldsmiths College
Author: Harishchandra Jyawali; Goldsmiths, U. of London

Considering 'job crafting as coping', we explore further how female employees cope with gender-related job demands in male-dominated occupations through their job crafting practices. Based on 21 interviews with female chefs working in professional kitchens, we show, through the lens "underdoing gender" (Thanem & Wallenberg, 2014), that they are able to combine and move between the feminine, masculine and ungendered perspectives that render their performance pressures, unequal gender status, and sexism in the kitchen relatively insignificant. As such, we offer a gendered analysis of job crafting by emphasizing the "grounded perspectives" – embodied, situated and fluid - that female employees take in their job crafting processes. This indicates that job crafting as coping in male-dominated occupations is less about challenging a dominant masculine order of work by increasing/decreasing its related job demands, but more about enacting gendered and ungendered perspectives on work conditions to make one's life more liveable and one's job more doable.

Gender Inequalities in Earnings and Sociable Jobs

Author: Thomas Lyttelton; Yale U.

An increasing proportion of the gender wage gap is a result of differences between workplaces, occupations, and organizations. Previous work shows that workers benefit when they match the behaviors and expectations of their workplace, and socializing with coworkers is an important facet of cultural fit. Women socialize with their coworkers less than men, and this may be both a cause and consequence of workplace gender inequalities. This study combines data from the American Time Use Survey and National Longitudinal Survey of Youth, 1979, to study the role of sociability in explaining workplace gender inequalities in earnings. It finds that sociable work worsens earnings inequalities

Gendered Occupations: Network Centrality and Difficult Work Relationships

Author: **Vijayta Doshi**; Indian Institute of Management, Udaipur

Author: **Satyam Mukherjee**; INDIAN INSTITUTE OF MANAGEMENT UDAIPUR

Gender as a contextual variable has remained under-researched in social network analysis. The authors find that employees' central position in a social network influences their tendency to cite difficult work relationships and this tendency differs in feminized and masculinized contexts. Using two field network studies, through the lens of gendered nature of the occupations, the paper shows that in a feminized occupation employees who are more central in positive networks are less likely to cite colleagues in their negative ties whereas, in a masculinized occupation, employees who are more central in positive networks are more likely to cite colleagues in their negative ties. The paper extends the field's knowledge by demonstrating how network centrality of employees is associated with dislike towards colleagues depending upon the gendered nature of the context. The study offers practical implications for organizations to bring about interventions that reduce employees' tendency to cite others as difficult in their occupational networks.

Finding the Right Couple Between Microfinance Loan Officers and Clients in Terms of Gender

Author: **Naome Otit**; U. of Adger

Author: **Cécile Godfroid**; UMONS-CERMi

Author: **Roy Mersland**; full professor

This paper examines the impact of the gender composition of client- loan officer pairs on loan repayment in an Ecuadorian microfinance institution. Using negative binomial regressions and random effects analyses, our results reveal that the most favourable client-loan officer pairs in terms of repayments are those with female loan officers whereas those with male loan officers are the least performing ones. We also show that a male client - female loan officer and female client-female loan officer pairs perform better when the previous loan officer the client was associated with was also a woman. Our findings have implications for theory and management. They point to relational differences between male and female loan officers when interacting with microfinance clients, these differences being confirmed through an additional qualitative research on the field.

INTERNATIONAL THEME RESEARCH SYMPOSIUM ASYNCHRONOUS

Drawing upon the resource-based view of the firm, human capital resource (HCR) and strategic human resource management (SHRM) scholars argue that organizations which secure and develop better pools of HCRs, through formal SHRM systems, are better positioned in their competitive environment. However, HCRs represent capacities to act, not action itself. Recent work has addressed this by highlighting the importance of appropriately deploying employees to realize the potential value of HCRs. Yet, the informal learning and teams literatures suggest that deployments would also greatly influence the further development of HCR over time. This presents a potential paradox for organizational decision makers as deploying employees for optimal current performance may be at odds with deploying to develop HCR for the future. Drawing upon the dynamic equilibrium model of organizing (Smith & Lewis, 2011), we address this paradox and advance a recurring episodic model of HCR deployment decisions. We argue that individual differences and situational demands pertinent to decision makers (i.e., managers) shift the balance of immediate performance versus longer-term development concerns, which may be addressed through an oscillating deployment approach. We argue that the two goals may be jointly optimized over time, and detail the nature of different developmental deployments.

Go from HRM Practices to HRM capabilities: A Dynamic Capabilities Perspective

Author: Mengwei Li; U. of Kansas

Author: Clint Chadwick; U. of Kansas

While a resource-based view (RBV) has been widely used as a theoretical framework to explain the role of HRM practices in enhancing firm performance, the HRM practices suggested by strategic HRM researchers do not truly satisfy the assumption of "valuable, rare, inimitable, and non-substitutable (VRIN)", resulting in the failure to obtain Ricardian rents. Hence, we find mixed results regarding the effects of HRM practices on firm performance in current longitudinal studies. As an extension of RBV, the dynamic capabilities theory does not emphasize

superior resources, per se, but instead this theory focuses on its capabilities of sensing, seizing, and reconfiguring resources. Accordingly, in this paper we propose the concept of HRM capabilities, which represents firm capabilities in terms of utilizing human resources to secure entrepreneurial rents. Specifically, we argue that HRM capabilities could lead to the change and transformation of generic and firm-specific human capital resources (HCRs), which will further mediate the relationship between HRM capabilities and long-term firm performance. In this way, we link strategic HRM literature with strategic human capital literature and explicate the paths through which HRM may influence long-term firm success.

HR? It's Not My Job! Toward the Framework of First-Line Manager's HR Role Identity.

Author: **Xuan Kou**; Trinity College Dublin

Author: **Hussein Kurdi-Nakra**; Trinity College Dublin

Author: **Jongwook Pak**; Trinity College Dublin

Although prior research has confirmed that HRM system strength and HR professionals' support can positively result in the first-line manager's HR implementation and effectiveness, little is known about the ways in which HRM many other actors at different organizational levels influence first-line managers' identification of performing their HR duties. The purpose of this conceptual paper is to explore the distinguishable impacts of HRM actors across all organizational hierarchies on first-line managers' HR role identity, and consequently on their HR implementation behaviors. We conceptualize multi-actor HR involvement construct and develop level-specific implementation climate to connect such each HR involvement to line managers' HR role identity. Given the articulated explanation of this multilevel model, we suggest the potential contextual antecedents for first-line managers' perceptual and behavioral outcomes to achieve their HRM goals.

Human Capital Evaluation in Private Equity Investment Decisions: Contemporary Practice & Challenges

Author: **Zara Whysall**; Nottingham Trent U.

Author: **Alistair Bruce**; NBSNTU

This paper investigates the processes involved in human capital (HC) evaluation in the investment of organisations by private equity (PE) firms. The significance of this issue relates to both the increasing importance of the PE industry in the wider corporate environment and the increasing recognition, within business and regulatory and financial communities, that the valuation and reporting of HC as a corporate asset requires attention. We examine the issue through the conceptual frame of HC evaluation by PE as an agency problem centred on asymmetric information. Findings are discussed from twenty-three semi-structured interviews with senior representatives of nineteen different PE firms with collective experience of over 3700 investments, to elicit insights into the nature, challenges and consequences of HC evaluation. The findings reinforce the agency perspective and characterise this setting as one featuring an aggravated form of asymmetric information-based agency problem. We find that the commonly employed HC evaluation methods are regarded as suboptimal in their susceptibility to heuristics and biases and to factors such as time pressure and interpersonal dynamics, potentially resulting in flawed judgements and negative investment decisions. We provide an analysis of the most commonly-reported consequences of shortcomings in HC evaluation, and offer recommendations for future research.

Relational Perspectives on Human Resource Management (session 1463)

Ethical and Empowering Leadership Styles and Follower Creativity: A Meta-Analytic Review

Author: **Andra Serban**; Virginia Commonwealth U.
Author: **Sven Kepes**; Virginia Commonwealth U.
Author: **Wenhao Wang**; Virginia Commonwealth U.
Author: **Alexander S. McKay**; Virginia Commonwealth U.
Author: **Elena Olson**; Virginia Commonwealth U.

The importance of creativity in contributing to organizational innovation, survival, and growth is widely recognized, especially in today's knowledge-based economy. Although leadership has been identified as an essential factor driving creativity in organizations, few studies have compared the effects of different leadership styles on employee creativity. Therefore, this meta-analytic review synthesizes the literature on the effects of leadership on creativity by comparing the effectiveness of six ethical and empowering leadership styles (i.e., authentic, empowering, ethical, humble, transformational, and servant) and contrasting them with charismatic and transactional leadership. Our meta-analytic sample was derived from 140 primary sources, which included 141 independent samples and 37,604 individual observations. Overall, the effects range from essentially nil to moderate in size. A relative weights analysis confirmed the effectiveness of authentic leadership when compared to the other ethical and empowering leadership styles. Examining several contextual and methodological moderators, we found that source of creativity ratings, study setting (laboratory vs. field), and sample characteristics (i.e., individualism and power distance) had a noticeable influence on the strength of the observed effects. Other factors, including level of analysis, did not moderate the effects. Implications of our findings for practice and avenues for future research are discussed.

Ethics-Related Mentoring and Protégé Moral Motivation and Ethical Leadership

Author: **Jonathan Crawshaw**; Aston U.
Author: **Corinna Busch**; Aston Business School
Author: **Yves R.F. Guillaume**; U. of Liverpool Management School

Despite significant theoretical, empirical, and practical advances, the relationships “boom” has yet to prominently reach the HR literature (Soltis et al., 2018). This symposium is intended to generate new insights on a relational view of HRM. In applying the term “relational,” we include examinations centered on how formal and informal patterns of interactions between dyads and groups of individuals within and outside the organization impact and are impacted by HRM practices and systems (e.g. Carpenter et al., 2012; Cropanzano & Mitchell, 2005; Ferris, 1985; Gittell & Douglass, 2012). This symposium will advance research and theory on a relational perspective of HRM in three ways. First, it will enrich our understanding of how HRM systems can be designed to shape relationship patterns that are more networked than siloed. Second, it will advance our understanding of how particular relationship patterns impact particular HR outcomes. Third, this symposium will advance our understanding of the process of change when HRM systems are redesigned to support new relationship patterns.

Papers presented in this symposium achieve these goals by addressing topics such as the role of relational work systems in organizational transformation, the impact of teamwork training on listening capabilities, and how organizational interventions can directly facilitate relationships to enhance learning and development.

We extend the mentoring and ethical leadership literatures by exploring the nature and importance of ethics-related mentoring, its effective measurement, and its potential role in promoting protégé moral motivation and ethical leadership. In study 1, qualitative interviews with 25 mentoring experts explored the concept of ethics-related mentoring and its potential importance in the mentor-protégé relationship. These interviews also generated items for a new measure of ethics-related mentoring. In study 2, we surveyed a sample of 114 working protégés in Germany, and exploratory factor analysis reduced these items and provided an initial factor structure for our measure. In study 3, a time-lagged Qualtrics survey of 152 protégés was used to further validate this measure and, drawing on social cognitive theory, test hypotheses where protégé perceptions of their mentor's ethics-related mentoring is positively related to their own moral motivation and ethical leadership, and that these relationships are stronger when they have a prototypical mentor. Across the three studies, we confirm the importance of ethics-related mentoring and develop a new ethics related mentoring measure. We also provide excellent support for our hypothesised model, confirming a significantly stronger positive relationship between protégé perceptions of their mentors' ethics-related mentoring and their own moral motivation and ethical leadership when they perceive their mentor is prototypical.

Ethics-Centered HR System, Moral Attentiveness, and Organization Citizenship Behavior in SMEs

Author: **Farheen Rizvi**; U. of Management and Technology

Author: **Khuram Shahzad**; U. of management and technology, Pakistan

Organization citizenship behavior (OCB) is an important determinant of organizational effectiveness. Therefore, there is considerable interest in identifying factors that may promote such behaviors. By integrating the theoretical foundations of the AMO (ability- motivation-opportunity)

framework with arguments from the social cognitive theory of morality, we conceptualize the role of ethics-centered HR systems in promoting OCB, and moral attentiveness as a mediating mechanism between this relationship. Analysis of data generated through a survey conducted among 222 employees of 62 SMEs in Pakistan provides evidence that ethics-centered HR systems relate positively to employee OCB, and suggests that perceptual and reflective moral attentiveness mediate this relationship.

Linking Idiosyncratic Deals and Unethical Pro-Organizational Behavior

Author: **Meiqin Jiang**; College of Economic and Management, Huazhong Agricultural U

Author: **Pengcheng Zhang**; School of Management, Huazhong U. of Science and Technology

We examined unethical pro-organizational behavior (UPB) as the downside of idiosyncratic deals (I-deals), and further the mediating role of perceived insider status (PIS) and moderating role of moral identity. Evidences from a field study and an experiment indicate that i-deals is positively related to employee PIS, which then in turn positively associates with employee UPB. Findings also support the moderated mediation model, that is, employee PIS will mediate the positive relationship between i-deals and UPB when employee moral identity is low, but not when employee moral identity is high.

U.

Author: **Benjamin B. Dunford**; Purdue

Author: **Wayne Boss**; U. of Colorado

Despite growing recognition that non-star performers play a greater than expected role in organizational effectiveness, we know surprisingly little about how so called “B-Performers” add value to firms. Integrating theory from socialization and social capital literatures, we assert that the value of non-star performers comes from their proclivity to develop complex social networks over time following internal job transfers. We derive and test a novel theoretical model of non-star internal mobility and network evolution in a medium sized US healthcare system, leveraging a multi-source, longitudinal data set comprised of email communications and personnel performance records. Supporting our model, we find evidence of a negative association between performance and internal mobility, and that internally mobile employees expand their incoming but not outgoing network ties over time relative to their immobile counterparts.

Stars in Teams: Their Implications for Non-Stars’ Work Autonomy and Job Performance

Author: **Genjiro Kosaka**; Sophia U.

Author: **Yoshio Yanadori**; U. of South Australia

Author: **Takahiro Endo**; Hitotsubashi U.

Studies on star employees in an organization have found that stars achieve high individual performance, and they positively or negatively influence coworkers in teams. However, scholars have not empirically examined the effect of stars in a team on non-star colleagues and the mechanism connecting the presence of stars in a team and non-stars’ performance. Applying resource dependence theory, we examine the mediating relationships of recognition as a star, the work autonomy of stars and non-stars, and their job performance. We collected multiple-source and longitudinal data from 514 employees in 117 teams at a large Japanese web-service company. The results of the mediation analysis show that recognition as a star in an organization increases the individual’s work

We used multilevel modeling from a longitudinal survey of 5,697 individuals and 23,756 observations across five waves of data collection, to examine the within-person change in the rate of health improvement over time. Consistent with Conservation of Resources (COR) theory, we found that the rate of health improvement slowed down when an individual increased work hours over time and presumably has fewer time resources to devote to health enhancement activities (e.g., less time at the gym). Our results also showed that the rate of health improvement increased when an individual experiences increased life satisfaction over time, which might suggest a psychological boost that would enhance mental and psychological resources. Finally, we found results consistent with the psychological empowerment framework, in that the rate of health improvement increased when an individual experienced greater work responsibility; we argue that increased work responsibilities can enhance an individual’s psychological resources by providing increased meaningfulness and competence, which further contributes to health improvement rate. Overall, our findings indicate that work conditions may help to improve employee health, such that managers who take action to improve employee work conditions may be able to reduce the substantial healthcare costs faced by organizations today.

Reactions Arising from Work-to-Family Conflict: Examining the Mediating Role of Work-to-Family Guilt

Author: **NianNian Dong**; U. of Science and Technology Beijing

Author: **Mian Zhang**; Tsinghua U.

The purpose of this study is to examine how an individual reacts to work-to-family conflict at work and family domains. Using survey data comprising of HR managers and professionals (N = 171), we found that work-to-family guilt mediates the relationship between work-to-family conflict and job satisfaction, and intrinsic motivation moderates the relationship. We also found that for men with non-traditional gender role attitudes, work-to-family guilt

autonomy, which leads to higher job performance. Moreover, by testing a multilevel mediation model, we found a significant cross-level indirect effect of the proportion of stars in a team on non-stars' job performance through a decrease in their work autonomy. These findings show that recognition as a star in an organization is beneficial for the individual's subsequent performance, while the larger presence of stars in a team has a constraining effect on their coworkers.

Talent Status, Ambiguity, and Early Career Programs (WITHDRAWN)

Author: **Pernilla Bolander**; Stockholm School of Economics

Author: **Andreas Werr**; Stockholm School of Economics

Author: **Jennie Sumelius**; Hanken School of Economics

Adopting an identity work perspective, we focus on the employee experience of talent management. More specifically, we explore the ambiguities that talents in an early-career program encountered in connection to their talent status, and the identity work tactics they used to make sense of their talent status and construct coherent, stable and valued identities amidst ambiguity. Drawing on qualitative interview data from a large Swedish MNC, this study contributes by identifying three aspects of talent status in relation to which talents encounter ambiguity (role, responsibility and status). Furthermore, our findings suggest that ambiguity about the implications of talent status leads talents to engage in identity work that results in positive outcomes for both the organization and the individual in terms of desirable behaviours such as hard work and focusing on learning and development.

The Leader in the Spotlight: Health-Oriented Leadership and its Antecedents and Outcomes

Author: **Miriam Arnold**; Leibniz Institute for Resilience Research

Author: **Thomas Rigotti**; Johannes Gutenberg-U. Mainz

Health-oriented leadership is a relatively new concept in the field of research on leadership. It incorporates health behaviors and attitudes towards the followers (StaffCare) as well as towards oneself (SelfCare). Little is known about antecedents of HoL and about effects on the leaders themselves. Therefore, in the present study we propose a serial mediation model with job resources and demands as antecedents and work engagement and emotional exhaustion as outcomes of SelfCare and StaffCare. Over the course of five working weeks, 234 leaders provided data on a total of 960 weeks that were analyzed with a multilevel structural equation modelling framework. Results showed that SelfCare and StaffCare within the leader are significantly related. Moreover, the relationship of job resources and demands with work engagement was serially mediated via SelfCare and StaffCare. This serial mediation could not be found for emotional exhaustion. The results suggest that work characteristics of the leader play a role in shaping leadership behavior. Theoretical and practical implications of these findings are discussed.

CGIO Best Paper in International Corporate Governance Finalist (session 1465)

Two to Tango: Board Interlocks, CEO Duality, and Foreign Debt Capital

IM Division CGIO Best Paper in International Corporate Governance Finalist
 Author: **Anish Purkayastha**; U. of Sydney Business School

Drawing from resource dependence and information processing theory in the context of corporate governance in multinational firms, we examine the impact of relevant board interlocks on the extent of additional year-to-year foreign capital raising by firms. Considering that there is a separation between transfer and receptivity of information, CEO duality or dual role of board chairperson as CEO might enhance the effectiveness of external resources while increasing cognitive load on the adoption of suitable capital management decision. Through an analysis of foreign debt investment from top 50 Indian firms (Nifty-50) during 2010-2018, we find that the relationship between focal firm's board interlocks with other firms that have raised foreign debt capital and the extent of year- to-year change in debt capital in the focal firm takes an inverted-U shape. Results indicate that CEO duality steepens this curvilinear effect. Our findings contribute to the intersection of corporate governance and international management literature.

Global CSR Policies, Practices, and Sustainability (session 1468)

The Role of CSR in the Relationship Between Social Trust and Financial Performance (WITHDRAWN)

Author: **Jae C. Jung**; U. of Missouri, Kansas City
 Author: **Junyon Im**; Asper School of business, U. of Manitoba

Institutional theorists suggest country-level informal institutions influence the economic prosperity of countries and firms. In this study, we examine the relationship between country-level social trust and firm-level financial performance, emphasizing the role of corporate social responsibility (CSR) as a mediator. In a society with strong social trust, individuals and organizations are expected to cooperate and behave honestly. Accordingly, individual interactions are guided by the norms of trustworthiness and the willingness to trust others. This study proposes that a firm can satisfy the norm of social trust by committing to socially responsible activities, which, in return, positively influence a firm's financial performance. Our analysis based on various data sources partially supports our theory. Although the mediation effect of CSR is found to be significant when a firm's financial performance is measured by return on assets (ROA), it is not significant when return on equity (ROE) is used as a financial performance proxy.

National Cultural Practice, Diversification Strategies, and CSR Environmental Disclosures

Author: **Rakesh B. Sambharya**; Rutgers U., Camden
 Author: **Irene Goll**; U. of Scranton

This study examines the relationships between market strategies (international and product diversification) and a key pillar of nonmarket strategy, corporate social responsibility (CSR). It focuses on environmental CSR disclosures by MNEs in their annual reports. We rely on Institutional Theory and the Stakeholder perspective to make our arguments. We hypothesize two counter relationships between diversification and

liberalization for non-standard employment. Using the Qualitative Comparative Analysis (QCA) approach, we illustrate that substantial employee turnover in the core manufacturing sector occurs under the restrictive context of high debt as a necessary condition. In the non-manufacturing sectors, in contrast, downsizing programmes take place under a set of permissive, and alternative, combinations of sufficient conditions driven by shareholder value maximisation objectives: the presence of ownership diffusion in the ownership structure of companies, the importance of highly financialized investors (hedge funds/private equity), or the presence of CEOs with an educational background in law and/or business management. We provide important insights for understanding patterns of change in corporate governance by integrating the QCA approach with theoretical perspectives stressing the characteristics of actors' identities in combination with their external business environments. The diffusion of new practices in contested contexts will be characterised by the presence of necessary, and restrictive, conditions whilst more favourable contexts will be associated with the presence of non-competing (i.e. alternative) sets of sufficient conditions.

environmental CSR disclosures. We also examine the moderating role of an MNE's home country national culture practices on the diversification – environmental CSR disclosures relationships. The study includes two higher order dimensions of GLOBE cultural practices: Performance Based Culture and Socially Supportive Culture. The sample includes 335 large MNEs from 31 countries then distributed among three CSR regimes: European, Anglo- Saxon, and Asian and emerging markets. Data was collected from publicly available sources from 2010 to 2012. The results show support for the hypothesized relationships between diversification and environmental CSR disclosures and that the direction of the relationship varies by the region of the world. They also provide significant support for the moderating role of national culture.

Legitimizing CSR Enactment Through Institutional Logics: A Cross-Market Comparison

Author: **Ivana Milosevic**; College of Charleston

Author: **Erin Bass**; U. of Nebraska, Omaha

As responsible business becomes an increasingly global concern, the ways in which organizations, and the individuals within, enact and legitimize corporate social responsibility (CSR), is increasingly important. Drawing on a qualitative study of scientists and engineers in the energy sector in Eastern Europe and Canada, we show differences in exposure to and interpretation of institutional logics in these two national settings that drive heterogeneity in how these professionals enact CSR through their work. In both contexts, the hazardous nature of their organizations requires them to act with agency. However, in the Eastern European context, professionals use localized logic—a constellation of local collective norms developed through a variety of organizational and social positions—to legitimize their CSR enactment. In contrast, in the Canadian context, professionals use professional logic—a constellation of artifacts and practices embedded in the standards of their profession—to legitimize their CSR enactment. Based on these findings, we develop a process model of legitimizing CSR enactment that explicates three mechanisms through which logics shape the

agency of CSR enactment at the micro- level of analysis.

The Renaissance of International Business Research in the Sustainable Development Goals Era

Author: **Ivan Montiel**; City U. of New York, Baruch College

Author: **Junghoon Park**; Baruch College & The Graduate Center, CUNY

Author: **Raquel Antolin-Lopez**; U. of Almeria

In this study we hope to inspire international business (IB) scholars to engage in research on grand challenges that pose an imminent threat to the planet and society. IB research has the potential to pave the road to sustainable development across the globe by delving into relevant themes aligned with the new decade—the United Nations Sustainable Development Goals (SDGs) decade. Given the global nature of SDGs, IB researchers are probably the best equipped business scholars to advance knowledge in this area. Likewise, an IB-SDG research agenda can energize the IB community and help to redirect their research efforts to have a broader impact beyond their research community and in the practitioner world. However, grand challenges have been essentially neglected in IB research. We therefore propose to adopt the UN SDGs as a framework to connect IB research and grand challenges to make IB scholarship more instrumental and actionable on understanding grand challenges

Extending Boundaries of Psychological Ownership Research: Measurement, Outcomes, Cultural Moderators

Author: **Franziska M. Renz**; U. of Texas at El Paso
Author: **Richard Posthuma**; UTEP
Author: **Eric Smith**; U. of Texas at El Paso

Psychological ownership theory and extended self theory explain why someone feels like the owner of his/her job or organization. Yet, there is limited prior research examining whether psychological ownership differs as an individual versus collective phenomenon, and in different national cultures. We extend this literature by examining the dimensionality of psychological ownership, multiple outcomes, and national culture as a boundary condition. Data from surveys of 331 supervisors from Mexico and the US indicate that both individual and collective psychological ownership are positively associated with organization-based self-esteem and a new outcome, paternalistic leadership behavior. National culture is a significant moderator with individualism enhancing and power distance attenuating these relationships. Additionally, we introduce a more precise measure of paternalism to capture the frequency of paternalistic leadership behavior instead of its mere occurrence. We also present an application of two-stage least squares (2SLS) regression analysis to the fields of international management and applied psychology.

Organizational Identity as an Antecedent of International Expansion: The Challenge of SA Banks

Author: **Lilac Nachum**; City U. of New York, Baruch College
Author: **Abdullah Verachia**; Gordon Institute of Business Science

The possession of intangible assets has long been assumed to be the major driver of international expansion and the factor that gives rise for the multinational company. The growth trajectory of South Africa banks does not conform to this theoretical prediction. In spite of the evident

A Spillover Model of Perceived Insider Status on the Success of Self-Initiated Expatriates

Author: **Angela Shin-yih Chen**; National Taipei U.
Author: **Guo-hua Lin**; National Taipei U.

Purpose: The purpose of this study is to gain a better understanding of how self-initiated expatriates (SIEs) integrate themselves into the foreign workplace, adapt to a new life, and be competent for their jobs. The following research questions are proposed: What are the relationships among cultural intelligence (CQ), perceived insider status, overseas work adjustment, and in-role performance with respect to SIEs? Can perceived insider status and work adjustment sequentially mediate the positive relationship between CQ and in-role performance? Can perceived organizational support moderate the indirect relationship between CQ and in-role performance via perceived insider status and overseas work adjustment such that the indirect relationship becomes stronger when perceived organizational support increases? Method: Due to the specificity of our target participants, an online questionnaire was established and delivered through the Internet via the Facebook community site, email, and communication software. A screening question was designed in the demographic section to check if the participants were self-initiated expatriates or corporate expatriates. In addition, a lucky draw was planned to encourage participation. SEM was applied for data analysis and latent moderated structural equation (LMS) was used for moderated mediation analysis. Results: We analyzed the data and tested the hypotheses using SEM via Mplus 8.3. A bootstrapping method was used to evaluate the direct and indirect effects. For the moderated mediation hypothesis, we followed the procedures for testing moderated mediation as described by Cheung and Lau (2017). The results indicated that perceived insider status and overseas work adjustment sequentially mediated the relationship between CQ and in- role performance. In addition, the moderated mediated effect of perceived organizational support was also supported. The conditional effect at various levels of POS was plotted with the Johnson-Neyman technique.

view paper (if available)

possession of vast and powerful stock of intangible assets, and the presence of strong pull and push factors for international expansion, these firms have remained predominantly domestic, with small and meager activity outside their home country. Exploratory study of these banks suggests that their organizational identity, with its antecedents in the characteristics of the home country, has restrained their ability to observe opportunities outside the home country and develop the capabilities to exploit them. We develop a theory of the impact of organizational identity on international growth and suggests that it should be incorporated in MNE theory as a critical condition for international expansion.

Spanning Identity Borders: Migrant Entrepreneurs Building Knowledge Collaborations

Author: **Stoyan Petrov Stoyanov**; U. of Bath

Author: **Veselina Petrova Stoyanova**; U. of Strathclyde

The changing geopolitical landscapes and the increased migration flows across the world call for a fresh perspective on the socio- cultural and economic integration of migrants in their new 'homes' and 'communities'. In this qualitative study, we provide insight into the identity work dynamics that underlie the initiation of interfirm cooperation. We see a sample of Bulgarian migrant entrepreneurs as knowledge boundary spanners who employ identity work tactics for the development of shared norms and values that facilitate interfirm cooperation in the UK. The study suggests that interfirm cooperation is preceded by a temporal identity work process, characterised by a series of inward and outward identity work tactics. The interplay between inward and outward identity work tactics occur over the phases of identifying identity differences, adopting identity cues and finally, realizing hybrid identity. The paper contributes to the literature that explores the underlying mechanisms for the initiation and the capture of interfirm opportunities by SMEs from a different cultural context.

Competing or Complementary? Government-Regulation and Self-Regulation in the Global Financial Sector

Author: **Danielle Renee Combs**; Florida International U.

Author: **Nan Zhang**; U. of Illinois at Urbana-Champaign

This study offers insights into the complex global regulatory environment by exploring the nature of the relationship between government-regulation and voluntary self-regulation within the context of the global financial sector. We specifically examine the extent to which financial sector government-regulation and self-regulation are complementary or substitutive, how they compare in their responses to a global financial crisis, and the extent to which changes in self-regulation may precede changes in government regulation (which is a widely held belief). Using a panel dataset of banking regulations across 71 countries during the years 2001-2015, we are able to reveal additional insights into the nature of the global financial regulatory system. Our empirical analysis indicates an overall substitutive relationship between industry government regulation and self-regulation. Additionally, we find that government regulation strengthens while self-regulation weakens in response to a financial crisis. Lastly, we find empirical support for the presumption that governments may take regulatory cues from private industry actors over time; however, government-regulation tends to respond in the opposite direction to changes in self-regulation.

This tension triggers complex emotions that expatriates need to regulate in order to perform. Although the link between the individual-level emotion and the firm-level strategy

Status Threat Through an Identity Lens: Cultural Influences on Motivational and Behavioral Responses

Author: **Elizabeth C Ravlin**; U. of South Carolina

Author: **Silvia Clark**; Darla Moore School of Business, U. of South Carolina

Author: **Anna Katherine Ward**; Virginia Tech

Author: **David C. Thomas**; U. of Victoria

We examine individuals' experience of status threats through the lens of identity theory, further building theory beyond the social exchange foundations typically argued for status processes. Status threat is considered an important aspect of identity threat, and occurs through the potential devaluing (diminishment of status) of an identity, change in status meaning associated with the identity, and inability to enact the status-relevant behaviors of the identity. As opposed to social exchange perspectives which focus on the self-enhancement motive, we argue that status threat leads to changes in the salience of multiple central identity motives (self-enhancement, uncertainty reduction, and affiliation), and that the effects of the salience of these motives is moderated by the cultural norms of the threatened individual (power distance), and the status of the focal person relative to source of the threat (a higher or lower status other). This process draws on the variance in subsequent behavior observed in prior research. We contribute to theory by further developing our understanding of the relationship between identity and status, and explicating how status threats can trigger multiple identity motivations and subsequent behaviors (information and emotional exchange and behavioral adaptation under different cultural and relative status conditions).

Receptivity to Voice: The Influence of Cultural Logics of Honor, Face, and Dignity Cultures

Author: **Maritza R. Salazar**; U. of California, Irvine

Author: **Haitham Houry**; American U. of Beirut

Soliciting and incorporating employee voice is

implementation is of utmost importance in a multinational corporate context, it remains under-researched to date. We therefore investigated what kind of emotions evoke under such tension and how the emotion results in organisation-level outcome. We collected a 612-day ethnographic data related to new product launch projects in a multinational corporation and triangulated the findings with internal archival information and formal interviews. As a result, we found that the global-local tension evoked mixed emotions among expatriates over time, and those emotions influenced the individual's legitimacy in two phases: legitimacy seeking stage and legitimacy owning stage. These phases reiterated, and the repetitive cycle over time developed an emotional dynamic at organisation-level across the project team. We argue that expatriates' actions and behaviours to regulate mixed emotions evoked by the global-local tension influence the way the individual's legitimacy develops, as they change the interaction and the relationship among the actors. In turn, the individual-level legitimacy influences the organisation-level emotional dynamic and thus the performance.

The Discontented Manager and the Anomic Mindset: An Interpretive Ethnography in an Automotive MNC

Author: **ALEXANDRE BOHAS ESSCA AIX**; ESSCA Graduate School of Management

Author: **Michael J. Morley**; U. of Limerick

In this detailed field study we explore how managers react to changes resulting from globalization. In observing and analyzing these managers in their daily routines, the situations they face, the discourse they engage in and the actions they display, we reveal the existence of an anomic mindset. Its presence leads them to react against rather than adapt to the globalization that surrounds them and the responses it demands. Our interpretive ethnography of these managers in situ casts particular light on a previously underexplored phenomenon whereby the more exposed to globalization, the more the observed managers appear to take an antagonistic stand toward it and

essential to organizational performance, yet managers display considerable variation in their openness to subordinate voice. To help explain when leaders will be open to employee voice, we draw on the CuPS (Culture x Person x Situation) approach that jointly and equally considers cultural differences and individual differences. Drawing on a sample from three different countries (e.g., the United States, China, and Lebanon), we present participants with a vignette in which they are asked to respond to a situation where a subordinate speaks up to them, a senior manager, with a concern about an aspect of work. Our studies show that in cultures where self-worth is derived more from external social relationships (face and honor) than from one's own subjective judgments (dignity) that people tend to respond less favorably to employee voice (i.e., with lower willingness to consider the input). The respondent's endorsement of the cultural ideal and the nature of the social relationship between the senior manager and the subordinate employee in the scenario also influence these results. We discuss the theoretical and practical implications of these findings for the justice and cross-cultural literature discussed, as well as practical implications and suggestions for future research.

Returning Home, Leaving Again? Insights from an Assisted Return and Reintegration Program

Author: **Daniela Bolzani**; Department of management, Bologna U.

Research on return migration has testified a growing and lively debate over the last decades, suggesting that return should be seen as one of the potential multiple steps of continuous, transnational migration patterns. Despite this suggestion, studies have tended to focus on the reintegration efforts of returnees and their potential contributions to the socio-economic development of their countries of origin. This study moves beyond these scholarly contributions by providing an understanding of re-migration intentions, building on insights provided by the theory of planned behavior. Specifically, acknowledging the diversity of return migrants, it focuses on "non- elite" returnees who have been traditionally considered in management literature. The study draws on unique longitudinal data about 93 return households supported by an assisted return and reintegration program, aiming at helping returnees in setting up micro-businesses. The results show that intentions to re-migrate are mostly influenced by attitudinal elements formed by comparative evaluation of economic, family, and psychological factors in the host and home countries, and perception of re-migration feasibility.

The Impact of State Ownership in Emerging Markets (session 1469)

Subnational State Owned Enterprises in Latin America: International Expansion and Financial Autonomy

Author: **Diego Finchelstein**; U. de San Andrés

Author: **Maria Alejandra Gonzalez-Perez**; U. EAFIT

Author: **Erica Helena Salvaj**; U. del Desarrollo

We examine four State Owned Enterprises (SOEs) and compare the international strategy and performance of those two controlled by the central government with the two owned by a subnational level of authority. After a thorough qualitative analysis, we find that subnational ownership creates a more gradual market driven international expansion while centrally owned SOEs is explained by non-market factors (i.e. government's international political agenda). We show how the different availability of resources between subnational and centrally owned SOEs as well as the financial autonomy of these firms play a key role to understand their international performance and evolution.

Author: **Fatima Bayma De oliveira**; Fundacao Getulio Vargas

Author: **Anderson De Souza Sant'Anna**; FGV-EAESP

Author: **Lygia Gonçalves Hryniewicz**; FGV-EBAPE

Discrimination against women in strategic positions is a recurring issue in the labor market, particularly in Brazil. Even though women generally have higher qualifications than men, this is not reflected in their salaries or positions. The causes of such limitations have historical, social, and psychological roots. This paper aims to understand better the challenges faced by women in the Brazilian public administration of executive branch. The study is based on the barriers to reaching leadership positions, such as "Glass Ceiling," "Leadership Labyrinths," and "Queen Bee," commonly described in the international and national literature on the theme. The study is organized in two stages. In the first, a qualitative approach was adopted, involving semi-structured and in-depth interviews with leaders – Under Secretaries – working in the government of the State of Rio de Janeiro (Brazil). The second stage adopted a quantitative approach, with a questionnaire applied to female managers working at the State Secretariat of Finance and Planning of Rio de Janeiro. As a result, it appears that women still suffer from prejudices and barriers associated with male codes of professional advancement. However, most women indicate no direct prejudice, claiming that they have grown and reached strategic positions on their own merits.

Internationalization of State-Owned Enterprises from Transitioning Economies (WITHDRAWN)

Author: **Pavlina Jasovska**; U. of Technology, Sydney

Author: **Quyen Thao Dang**; U. of Technology, Sydney

Author: **Ying (Joy) Guo**; Shanghai U. & U. of Technology Sydney

Author: **Hussain Gulzar Rammal**; U. of Technology, Sydney

Using the economic theory of the State and the resource-based view, we examine the role of the home country context in the internationalization process of state-owned enterprises (SOEs) from three transitioning economies (the Czech Republic, Slovakia, and Vietnam). While the literature has highlighted that strategies of SOEs are embedded in home country settings, little is known about how state capitalism shapes cross-border activities of state-affiliated multinationals. We propose a model to explain the types and degree of state involvement in SOEs' internationalization and discuss the various drivers of internationalization activities of SOEs from the three economies at different stages of transition.

Cross-Border Acquisition Performance of EM MNEs: The Moderating Role of State-Ownership & Performance

Author: **Vijay Edward Pereira**; Khalifa U., Abu Dhabi, UAE

Author: **Shlomo Yedidia Tarba**; U. of Birmingham

United States as well as comparisons across Business subfields. By drawing upon responses to the Survey of Earned Doctorates, we track changes in the backgrounds of doctoral graduates and find a trend over the past 20 years towards more gender, ethnic, and citizenship diversity. We also find that PhD cohorts in Business opt for Industry employment at approximately the same rate as non-Business PhD cohorts while very few pursue "postdoc" employment. We show substantial differences whereby Business salaries tend to be diverging towards nearly twice the income paid to non-Business doctoral graduates and – among the Business subfields – we find a wide range with Accounting earning the highest wages and Human Resources being paid the lowest. Our findings suggest that Business School faculty are not paid relatively high wages due to private-sector competition as is conventionally assumed; instead, it seems plausible that the salary differential exists partly to compensate for the typically higher wages earned by the non-PhD graduates that business schools train. Alternate explanations include the possibility that their current Business School faculty salaries are the unsustainable result of runaway competition among schools. Greater awareness and exploration of the types of patterns that we report offers important baselines for (prospective) PhD students and their advisors. NOTE: The use of NSF data does not imply NSF endorsement of the research, research methods, or conclusions contained in this report.

Gendering Sustainability in Management Education: An Advance on Integration

Author: **Jorge Alexis Arevalo**; William Paterson U.

Gender issues have been well conceptualized in feminist organization studies. However, gender research has had limited practical effects, in part because it has not been well conceptualized in the sustainability in management education (SiME) scholarship; nor has it been properly incorporated in business curricula. I argue that given the persistence of discrimination, segregation, sexual oppression, inequality, and lack of empowerment of women (to name a few...), mandatory gender

This paper draws on the resource-based view and organisational learning theory to analyse the moderating role of state ownership and acquisition experience for firm performance of emerging market multinational enterprises (EMNEs). We contribute to the evolving literature on state-owned EMNEs by identifying various post cross-border acquisition (CBA) strategies, which differ in their impact on performance compared with privately owned EMNEs. We test our hypotheses using panel regression analysis on a large firm-level dataset spanning 43 emerging markets over the period 2006-2015. Overall, our findings indicate an inverted U shape relationship between diversification through CBAs and firm performance. More specially, this concave relationship is greater in the case of diversification that occurs in developed countries (DCs) compared with diversification in emerging markets (EMs). Furthermore, these relationships are moderated, albeit at different levels, by state-ownership and the EMNE acquisition experience both in the domestic and foreign markets.

education is needed to equip management students as they enter diverse and equal opportunity working environments. Integrating SiME and Feminist Organization literatures, I develop a multi-dimensional framework for conceptualizing gender studies in the classroom. I also propose a three-level model intended to leverage the institutional, organizational, and individual tensions for prioritizing gender integration in management and business education. To conclude the paper, I touch on a number of strategies for creating space in research and pedagogy for the critical engagement of gender debates in our educational programs.

The Role of Trainer Characteristics in Intern Sexual Harassment Training Effectiveness

Designated as a "Best Paper" for MED

Author: **Shannon Rawski**; U. of Wisconsin, Oshkosh

Author: **Emilija Djurdjevic**; U. of Rhode Island

Author: **Joshua Foster**; U. of Wisconsin, Oshkosh

Author: **Andrew Soderberg**; U. of Wisconsin, Oshkosh

Sexual harassment has received considerable attention in the United States over the last several years, as evidenced by the #MeToo movement. During this time, it has become evident that sexual harassment is an enduring issue across industries, posing serious problems for both employees and employers. As a result, both academics and practitioners have focused on ways to prevent it, with sexual harassment training emerging as popular solution. While the effects of training characteristics on sexual harassment training effectiveness have been discussed in both the academic and practitioner literatures, one critical training factor, trainer characteristics, which is likely to influence training outcomes, has received surprisingly limited attention. To address this, we focus on two training formats and investigate how two critical and organizationally controllable trainer characteristics, trainer biological sex and area of expertise, interact to influence training outcomes, and consider the mediating mechanism of perceived trainer integrity. This is done using sexual harassment training for student interns administered in a laboratory setting. Our findings

show that trainers with gender-incongruent expertise (e.g., female employment lawyers or male HR professionals) are penalized through trainees' lowered perceptions of trainer integrity, which in turn decrease sexual harassment training effectiveness, when training is text-based. This effect is neutralized in video-based training, however. Implications of these findings, for both academics and practitioners, are discussed.

The Intentions of Undergraduate Business Students to Someday be an Organization's Top Executive

Author: **David J. Flanagan**; Western Michigan U.

Author: **Timothy B Palmer**; Western Michigan U.

Organizations of all sizes and types rely on top executives to navigate their competitive environments and business schools play an important role in developing these future leaders. While attention has focused on building general leadership skills, we don't know enough about factors leading business students to consider someday becoming chief executives. This paper relies on Ajzen's (1991) theory of planned behavior to examine factors that promote, or impede such aspirations. Using a sample of 272 business students, we found that each of the model's constructs, behavioral beliefs, normative beliefs and control beliefs impact students intentions about someday becoming a top executive. Recognizing a concern that men are more likely than women to pursue top leadership positions, we conducted a follow-up study and discovered that the model's constructs fully mediate the impact of gender on CEO intentions. Our study found that women, on average, report lower intentions to become a top executive but this impact is explained by women reporting lower normative, control and especially behavioral beliefs regarding the top executive position. Implications for future research and business school faculty and professional staff are discussed.

Revisiting the Historic Turn in Management Studies (session 1471)

Nearly two decades ago Clark and Rowlinson (2004) identified a distinct 'historic turn' in management and organizational studies. The implications of what a historic turn means for business, management, and economic analysis is still being debated. The papers in this session elaborate the concept of the historic turn with a range of empirical and theoretical analyses that extend the concept into such diverse areas as performativity, management teaching, and impact investing.

Form and Performativity in Organizational History Time and Space in Organizations

Author: **Mads Mordhorst**; Copenhagen Business School

Author: **Daniel Wadhvani**; U. of Southern California

While research on the “uses of history” in organizations and organizing has grown rapidly, relatively little attention has been paid to the role of “form” in the representation or exchange of historical knowledge. We argue that attention to form is essential to understanding the performativity of history because it imbues it with normative claims. The paper explores the role of form in both the production and exchange of history. Historical form, we show, imbues the representation of time and space with value judgments related to the essence of things and the futures that ought to be. And, form governs the social production of historical knowing by governing the practices related to exchange of historical knowledge. We contribute to the literature by not only bringing attention to role of form but also by demonstrating how the choice of form in historical representation and exchange is crucial to the skill involved in use of history in organizations.

Broadening our Sight of Gender and Leader Emergence: New Considerations for Research and Practice (session 1490)

Research has highlighted the widespread disadvantages women face relative to men in emerging as leaders. While it is certainly true that such disadvantages exist, they may not be as universal as have previously been assumed. We suggest that better understanding situations when the gender-based disadvantages women face relative to men in emerging as leaders are reduced, eliminated, or reversed is critical both theoretically and practically. Theoretically, it enables us to develop a more nuanced and accurate view of the relationship between gender and leader emergence by shedding new light on the psychological processes underlying leader emergence, as well as their boundary conditions. Practically, such an understanding translates readily to actionable insights about how organizations can improve diversity in their leadership ranks. The four papers included in this symposium offer a broader perspective on the association between gender and leader emergence. Using a variety of research approaches, the papers consider gender in conjunction with important aspects of leader emergence such as charisma, information processing, behavioral claims and grants, and dominance/competence attributions. Importantly, the papers identify several instances where gender-based inequities in emergence are reduced. Following the presentations, Lisa Leslie, whose research has made seminal contributions to understanding and improving diversity in organizations, will comment on the papers and facilitate an interactive discussion with the audience.

The Forgotten History of Impact Investing: Broadening the Research Agenda along the “Historic Turn”

Author: **Isabelle Lescent-Giles**; Hult International Business School - San Francisco

Author: **Rob Barlow**; Hult International Business School

This paper challenges the “recency bias” found in most academic and practitioner literature on impact investing and explores early examples of impact investing in 19th and 20th Century England. Building on Suddaby (2016), it then proposes to re-contextualize and reframe impact investing using historical data, methods and theoretical frameworks drawn from ANTi-hist, evolutionary theory, rhetorical history and neo-institutionalism, around six major research gaps: (1) Selecting effective metrics to capture social impact; (2) Evaluating forms of governance for effectiveness and inclusivity; (3) Reassessing impact investors as innovators, disruptors and change agents; (4) Analyzing Impact investors as builders of carefully constructed narratives for self-legitimization; (5) Extending research into early forms of for profit/for social good investments beyond the UK and the US; and (6) Exploring political contexts and assumptions in the choice of private, public and private/public forms of social action. For each research gap, we identify a set of relevant questions for future research.

mainstream business and management scholars. Given this newfound attention, it is timely to redress the role history can play in business and management teaching. History can provide value to students and educators by offering a holistic picture of business processes through time. This paper suggests history feeds into a number of central teaching strands in business and management school and thus, should be incorporated in various way across modules. Using a sample of ten modules offered across subjects at Newcastle Business School at Northumbria University (UK), the authors propose that this can be achieved through the module learning objectives, which are tools that dictate the content and assessment of modules. By weaving history into lecture content through explorations of theory creation and application in various historical contexts, longitudinal case analysis, long-run global economic development, past strategy formation and implementation processes, students will get an appreciation for the complexity of business processes and how theory plays out in practice.

Origins of SWOT Analysis

Designated as a "Best Paper" for MH

Author: **Richard Puyt**; U. of Twente

Author: **Finn Birger Lie**; Jafin Invest SL

Author: **Frank Jan De Graaf**; Hogeschool van Amsterdam

Author: **Celeste P.M. Wilderom**; U. of Twente

The origins of SWOT Analysis is obfuscated in the literature. This paper fills that void and reconstructs its early development in context. The empirical basis of SWOT started in 1952 within the Lockheed's Corporate Development Planning Department. One of its thus far unknown pioneers, Robert Franklin Stewart, became the head of the Theory and Practice of Planning group at the Stanford Research Institute in 1962. In 1965, Stewart published the so-called SOFT Approach in a report that was used by many large companies worldwide. In it, he presented a logical set of steps (the so-called chain of reasoning) for corporate aim setting. First, stakeholders' values are to be collected by staff planners. Then "each manager considers for each of

his own activities"... "what must be done to safeguard the satisfactory in present operations;" "open de door to opportunities"; "fix the cause of faults" and "avert the threats to future operations." These value judgments are then transferred into senior management's direction-giving statements of corporate purpose. In 1967, SOFT evolved into: Strengths, Weaknesses, Opportunities and Threats (SWOT Analysis). Stewart's participatory aim setting ideas have faded from our collective memory as well; they might fit perhaps the ideas propelled by the Opening Strategy movement.

Counterproductive Behaviors at Work (session 1480)

Workplace Deviance: A Systematic Literature Review and Future Agenda

Author: **Mamoona Arshad**; Lahore U. of Management Sciences

Author: **M Abdur Rahman Malik**; Lahore U. of Management Sciences

Workplace deviance despite being a prominently studied dysfunctional behavior has lacked a synthesis of the field altogether. In order to fill this gap, the present study has attempted to club together a literature on workplace deviance to provide a way forward. For this, we systematically reviewed 269 articles. The results of the review highlighted that individual-level, group-level, and organizational-level factors push individuals toward workplace deviance. Results of the review also outlined various research gaps and opportunities such as the need to examine unexplored theoretical lenses, explore empirical and methodological advancements, and analyze missing intervening mechanism and boundary conditions. Interestingly, less studies address the consequences of WD, therefore an emphasis to inspect them in future is also raised.

OB

Diverse Methodological Approaches to Understanding Novel Work-Life Interface Questions (session 1475)

Decades of research have indicated that work and family are inextricably intertwined (e.g., Amstad, Meier, Fasel, Elfering, & Semmer, 2011). Despite numerous lessons learned from the robust work-life literature, there are surprisingly many neglected areas and questions left to be answered. Much of the work-life research fails to examine or account for theoretical paradigms as they apply to shifting workplace characteristics (e.g., globalization, team-based flat organizations, technology) and how this may be related to under-explored factors in the work-life sphere such as job overqualification and corresponding multi-level influences such as public policy (e.g., state law mandating paid family leave). The purpose of this symposium is to highlight work that utilizes novel theoretical lenses and advanced analytic approaches in order to further theoretical understanding of the dynamic interplay between work and non-work. Given that advancement in work-life theory can be achieved more readily by relying on multi-source, multi-level, and longitudinal or time-lagged data analyses, this symposium draws on two time-lagged studies, one examining the effects of the quality of home life relationships on work with consideration to job over qualification, and the other on the synergistic effects of bi-

Job Insecurity and Unsafe Behaviour: Exploring Curvilinear and Moderated Relationships

Author: **Tengfei Guo**; Henan U.

Author: **Sudong Shang**; Griffith Business School, Griffith U.

Author: **Minghui Wang**; Henan U.

Author: **Peter Yih-Tong Sun**; U. of Waikato

This study examines a curvilinear relationship between job insecurity and unsafe behaviour among coal miners. Drawing from conservation of resources theory, we develop and investigate an explanation for coal miners' reactions to job insecurity based on their allocation of psychological resources at different levels of job insecurity. By using three-wave longitudinal data from 209 coal miners in northern China, we find support for the U-shaped relationship between job insecurity and unsafe behaviour. That is, coal miners' unsafe behaviour gradually decreases when they perceive a level of insecurity in their jobs, but beyond a certain point, their unsafe behaviour increases. Furthermore, we find that psychological detachment, but not self-control, moderates the curvilinear relationship, such that coal miners with higher psychological detachment exhibit less unsafe behaviours. We also discuss the theoretical implications of this study on job insecurity and unsafe behaviours, and the practical implications for organisations in the coal mining industry.

The Perils of Perfectionism: A Stress Lens on Self-Oriented Perfectionism and Workplace Cheating

Author: **Kaili Zhang**; East China U. of Science and Technology

Author: **Xinxin Li**; Antai College of Economics and Management, Shanghai Jiao Tong U.

As workplace cheating can cause numerous costs for organizations, it is imperative to understand what drives employees' cheating behavior. Adopting stress theory as an overarching framework, we examine why and when self-oriented perfectionism

directional work-family enrichment on job outcomes that are increasingly relevant due to a shifting focus on team work in organizations (OCBs). Another study examines the multi-level influence of public policy on the link between work-life conflict and individual job and well-being outcomes. The final paper examines the within-person day level effects of family supportive supervision on job satisfaction via the effect it has on employee perceptions of supervisor responsiveness.

motivates workplace cheating behavior. Integrating the conservation of resource theory and the self-protection model of workplace cheating, we propose that self-oriented perfectionism may lead to cheating by eliciting stress. Moreover, we examine work overload and supervisory support as contextual factors that strengthen and weaken the indirect effect of self-oriented perfectionism on cheating, respectively. A time-lagged survey study of 381 employees supported our model. This study enriches our understanding of how personality and work context may interactively induce unethical behavior.

Instrumental Counterproductive Work Behavior (CWB): Measurement and Evidence of Multiple Motives

Author: **Seth Smart**; Oklahoma State U.

Author: **Lindsey Greco**; Oklahoma State U.

Author: **Sheryl Walter**; Indiana U. - Kelley School of Business

Many theories explain counterproductive work behavior (CWB) as a reactionary response to negative stressors at work. The rationale is that stressors cause negative affect states, leading employees to want to strike out at a target (i.e., the organization, coworkers or supervisors) to buffer or reduce negative emotional states. However, there is some evidence that CWB can occur for other reasons. So-called instrumental CWB is different from reactive forms of CWB in that it is premeditated, calculated, and the employee's intent is some goal other than an intent to harm. For example, an employee may make fun of coworkers, not with the intent of harming those coworkers, but rather because making fun of others is seen as an acceptable form of interacting with others and the intent is to create stronger social bonds. Building on previous research, we define and develop a measure for four instrumental motives for CWB: two social motives: (1) affiliation and (2) conformity, as well as two self-enhancement motives: (1) status gain and (2) tangible resources. Hierarchical regression analysis showed that instrumental motives explained additional variance in both counterproductive work behavior aimed at

individuals (CWBI) and at the organization (CWBO) over reactive motive for CWB.

Gender Differences in Responses to Organizational Creativity Pressure: The Mediating Role of P-O Fit

Author: Hye Jung Eun; Singapore Management U.

Author: Roy Yong Joo Chua; Singapore Management U.

Creativity is increasingly valued at the modern workplace and many organizations have increased pressure for employees to perform tasks creatively. Yet, researchers have neglected the importance of studying how employees respond to the pervasive creativity pressure at the workplace. This paper introduces the concept of “organizational creativity pressure” and differentiates the concept from other similar constructs. In addition, using gender self-schema theory (Ruble & Martin, 1998) and Person-Organization fit theory (Chatman, 1989), we extend prior research on gender and creativity to examine gender differences in experienced P-O fit and burnout when working for organizations with high creativity pressure. A large-scale field survey and an experimental study involving working professionals provide evidence that women tend to experience more burnout than men when working for organizations with high creativity pressure and a lower level of P-O fit among women explains this relationship. Our research suggests that women’s own reactions to organizational creativity pressure may in part contribute to the persistent gender gap in fields marked by creativity and innovation.

Organizational Misfits as Creative Agents of Change: The Case of Pracademics

Author: Alice Lam; U. of London

The experience of 'misfit' between individuals' professional identities and work roles or work contexts is common in inter-role or inter-professional career transitions. Responses to identity threat arising from such misfit have often been framed in terms of attempts to minimize their negative consequences and maladaptive outcomes at the individual level. Less attention has been paid to the organizational outcomes of career actors' efforts to overcome misfit and their role as creative agents of change. This study examines how problematic identity dynamics associated with misfit motivate the shift towards the development of positive identities and induce change-oriented agency. It builds on theory of positive identity construction and the notion of identity work as a form of embedded agency. The empirical study looks at a group of 'pracademics' whose career trajectories deviate from the prototypical patterns in academia. It examines the identity work strategies that these people undertake to overcome misfit and construct a positive sense of their professional selves in career transitions. The analysis reveals the dynamic interplay between positive identity construction and micro- acts of creative agency. It distinguishes two identity work strategies: 'hybridization' and 'positive distinctiveness', which provide different pathways to identity positivity and disrupt knowledge boundaries and established work practices in different ways. The study contributes to the positive organizational scholarship literature and advances our understanding of identity work as an agentic and inherently creative human endeavour.

being a key predictor of creativity at different hierarchical levels. However, the relationship between diversity and creativity at and across the individual, team, and organizational levels remains under debate despite an ongoing scholarly interest. In this paper, we address and advance this debate by conducting a comprehensive multilevel review of 94 empirical studies exploring the effect of diversity on creativity. Following a levels-of-analysis structure to categorize the extant literature, we provide a systematic overview of empirical work on the different effects that numerous diversity attributes have on creativity at the respective hierarchical levels. Derived from this multilevel review, we offer a future research agenda that is intended to advance the current literature on this topic. More specifically, we highlight the importance of investigating the interaction effects of multiple diversity attributes and conducting multilevel studies for an improved understanding of the complex and therefore still puzzled relationship between diversity and creativity.

The Curvilinear Relationship between Team Informational Faultlines and Creativity

Author: **Jin Yao**; Xi'an Jiaotong U.

Author: **Wenxin He**; Xi'an Jiaotong U.

Academic research concerning the functionality of informational faultlines has produced mixed results. In order to reconcile the mixed findings in prior research and enhance our understanding of the effects of team informational faultlines, this research adopts and builds on a social information processing (SIP) perspective to explicate and test a theory focusing on the influence of team informational faultlines on team creativity. Using multisource and longitudinal data collected from 85 work groups, we reveal a significant curvilinear relationship between team informational faultlines and team creativity. Moreover, we identify team humble leadership as a boundary condition of the relationship above, such that the inverted U-shaped relationship is weakened in teams with high levels of humble leadership. Our study reveals the “double-edged sword” effect of informational faultlines and provides a new perspective to understand the

influence of team faultlines. Lastly, we discuss theoretical implications, limitations and possible directions that worth further exploration.

Evaluating Creativity: How Ideator and Evaluator Characteristics Shape Evaluations of New Ideas (session 1492)

Creativity is essential for organizational innovation, performance, and survival. Consequently, research interests in creativity and innovation have rapidly increased over the past decades. The bulk of these research efforts have been dedicated to studying the creative idea generation stage. Despite calls for research, however, studies on the succeeding creative idea evaluation stage remain scarce. Most studies that have been conducted demonstrate that idea evaluation is not an entirely rational cognitive process, which has critical implications for our ability to forecast groundbreaking innovations. Indeed, good ideas are often rejected and mediocre ideas selected, thereby disturbing the innovation process that is so crucial for organizational performance and survival. Accordingly, to ensure a smooth transition from creativity to innovation, it is crucial to more elaborately study the idea evaluation stage of creativity. By means of the presentations and discussion in this symposium, we aim to increase our understanding of idea evaluation.

The Bamboo Ceiling of Leadership Attainment in the United States

Author: **Jackson Lu**; MIT Sloan School of Management
Author: **Richard Nisbett**; U. of Michigan, Ann Arbor
Author: **Michael W. Morris**; Columbia U.

Asians appear disproportionately under-represented in leadership positions in the U.S., a problem called the “Bamboo Ceiling.” It remains unclear why this problem exists and whether it applies to all Asians. To investigate its mechanisms and scope, we compared the leadership attainment of the two largest Asian subgroups: East Asians (e.g., Chinese) and South Asians (e.g., Indians). Across nine studies (N=11,030) using mixed methods (archival analyses of S&P CEOs, field surveys, MBA leader elections, experiments), East Asians were less likely than South Asians and Whites to attain leadership positions, whereas South Asians outperformed Whites. To understand why the Bamboo Ceiling exists for East Asians but not South Asians, we examined three categories of mechanisms—prejudice (inter-group), motivation

OB

Leadership and Follower Well-Being (session 1479)

Transformational Leadership, Personality, and Followers’ Stress and Well-Being: A Multilevel CFA (WITHDRAWN)

Author: **Hallvard Føllesdal**; BI Norwegian Business School

Mixed findings have been reported regarding the factor structure of transformational leadership scores from the Multi-Factor Leadership Questionnaire (MLQ 5X). No known studies, however, have yet assessed the factor structure taking into consideration their hierarchical nature, which may lead to incorrect conclusions about the factor structure and the subdimensions’ relationship with other variables. The present study used Multilevel Confirmatory Factor Analysis (MCFA) to assess the factor structure and the subdimensions’ differential relationships with leaders’ personality, and followers’ stress, well-being, and personality. Norwegian executives (N = 111) were rated by followers (N = 490) on transformational leadership. A MCFA provided best fit for a model with four correlated factors on the within-group level and three correlated factors on the between-group level. The subdimensions of MLQ 5X were differentially

(intra-personal), and assertiveness (inter-personal)—while controlling for demographics (e.g., birth country, English fluency, education). Analyses revealed that East Asians faced less prejudice than South Asians, and were equally motivated by leadership roles as South Asians. However, East Asians were lower in assertiveness, which consistently mediated the leadership attainment gap. Overall, East Asians hit the Bamboo Ceiling because their low assertiveness is incongruent with American norms concerning how leaders should communicate. The Bamboo Ceiling is not an Asian issue, but an issue of cultural fit.

Leader-Follower Agreement on Paternalistic Leadership: A Cross-Cultural Investigation

Author: **Zahide Karakitapoglu Aygun**; Bilkent U.

Author: **Lale Gumusluoglu**; Bilkent U.

Author: **Alper Erturk**; GISMA Business School

Author: **Terri A Scandura**; U. of Miami

This study investigates how leader-follower agreement on two dimensions of paternalistic leadership (i.e., authoritarianism and benevolence) influence quality of communication experience with the leader across three countries: Taiwan, Turkey, and the U.S. We also examine the mediating role of quality of communication in linking agreement on paternalism to subordinate performance (i.e., in-role and extra-role performance). Our sample consisted of 674 Taiwanese, 409 Turkish, and 294 American employees and their leaders. For benevolence dimension, the highest quality of communication was reported for in-agreement/high leaders, second highest for under-estimators, third highest for in-agreement/low and the lowest for over-estimators, regardless of culture. However, agreement on benevolence was more important in Turkey and the U.S., as compared to Taiwan in predicting the quality of communication with leaders. Authoritarianism dimension, a negative leadership style, revealed more variability across countries suggesting that not only leader-follower agreement per se, but also the nature of leadership under question is important. Quality of communication experience was found to be a significant mediating mechanism in all three countries.

related to leaders' personality and empathy; and to followers' stress, affective well-being, and personality. Two-level Monte Carlo studies were conducted to assess the stability of parameters and determine power on the between-group level.

[view paper \(if available\)](#)

The Future is Yet to be Told: The Promise of Combining Visionary Leadership with Storytelling (WITHDRAWN)

Author: **Martin Buss**; U. of Potsdam

Although there is a voluminous literature on the broader construct of transformational leadership, there are few and decidedly mixed findings on the effects of the more circumscribed dimension visionary leadership. Prior research indicates that it may not only matter whether or not leaders engage in visionary communications, but also how they do it. For example, are there rhetorical tools that enhance the effectiveness of visionary leadership? In a three-wave, two-source field study of 148 teams, we examined the idea that storytelling augments the effects of visionary leadership on team efficacy and, in turn, team performance. Results confirmed that, as hypothesized, visionary leadership was more strongly positively related to both team efficacy and team performance when storytelling was high, rather than low. Moreover, team efficacy mediated the interactive effects of visionary leadership and storytelling on team performance. We discuss the theoretical and managerial implications of these findings.

Social Class, Nature of Work, and the Age of Significant Contribution

Author: **Anurag Gupta**; London Business School

The current research theorizes and tests a mechanism that can disadvantage the individuals from lower social class. We build on the research on differences in models of agency based on social class to argue that individuals are more likely to select certain types of work and this can affect the age of significant contribution. Lower social class individuals will choose experimental work and make a significant contribution later whereas higher social class individuals will choose conceptual work and make an early contribution. As our social institutions reward early achievement, individuals from lower social class can be disadvantaged. We test our hypotheses in an archival study of Nobel Prize winners from 1993-2017 in three fields-physics, chemistry and economics- and find support for them. These results suggest that we need to examine the choice of work as a possible mechanism in perpetuating inequality.

Generational Differences in Work Values: Moderating Effect of U. S. States' Liberalism-Conservatism

Author: **Hilla Peretz**; ORT Braude College

Author: **Ariel Levi**; Wayne State U.

Author: **Yitzhak Fried**; Texas Tech U.

Generational differences in work values have received significant attention in recent years. Researchers have focused most intensively on generational differences in the U.S., with particular emphasis on the differences between Millennials and other generations. In addition, researchers have typically assumed that generational differences will hold true across the country as a whole, and have thus neglected the possibility that such differences may vary as a function of geographical region or cultural variables within the country. In this paper,

sampling method was used to collect three daily surveys from 118 leader-member dyads (236 employees) for five workdays (n = 511 observations). Multilevel path analysis showed that on days when leaders took more morning microbreaks at work, they had higher levels of state positive affect in the afternoon, which in turn was linked to greater transformational leadership behavior (as reported by followers) as well as better followers' job satisfaction in the afternoon. Overall, the findings suggest that leaders' microbreaks can be positive affective events for both leader and follower. Importantly, leader-member exchange (LMX) moderates (strengthens) the indirect effects of leader microbreaks on the two dependent variables via the leader's increased positive affect. The indirect effects of leader microbreaks on transformational leadership behavior and follower job satisfaction via the leader's positive affect appear to be much stronger for employees in a high LMX condition than for employees in a low LMX condition. Theoretical and practical implications, limitations, and future research directions are discussed.

PAPER SESSION

we address this gap by investigating generational differences in work values as a function of U.S. state political environment. We propose that the prevailing ideology of U.S. states, along a liberal-conservative dimension, moderates the relationship between generation and work values. We collected data from 960 GenX and Millennial employees from four clearly liberal and four clearly conservative states, selected on the basis of the 2016 election results. As hypothesized, multi-level analysis revealed that differences between GenX and Millennial employees were found only in liberal states. Specifically, in liberal states, cognitive values (e.g., creativity, challenge) were significantly higher among Millennial employees, and instrumental values (e.g., benefits, job security) were significantly higher among GenX employees. In contrast, these differences were not significant in conservative states. We highlight the theoretical and practical implications of our findings and suggest avenues for future investigation.

What Leadership Feels Like: The Aesthetics of Leadership Success and Failure

Author: **Lindsey Duke**; Texas Tech U.

Author: **Hans Hansen**; Texas Tech U.

Author: **Steven S. Taylor**; Worcester Polytechnic Institute

Little is known about what leadership success or failure feels like for leaders, or how they come to define their leadership experience as successful or not. This study uses the aesthetic perspective of leadership to examine how it feels to succeed and fail at leadership from the viewpoint of leaders. We began with a study of the emotions related to leadership experiences. Qualitative data from 64 leader reflections provided valuable insights about leaders' sensory perceptions, connections, and responses their leadership experiences. Our data revealed that it is not emotions that influence leadership success or failure, but rather, the leader's actions or inaction in response to a leadership experience. We seek to extend leadership research by presenting an inductive model of the aesthetics of leadership success and failure.

In the rapid changing business world, employee learning from failures is of great importance for pursuing long-term sustainable development. Integrating the Self-Determination Theory and the classic two-dimensional leadership framework, from the leadership perspective, we theorized how leaders could promote employees to learn from failures, and further investigated its underlying mechanism. We designed a two-wave survey and collected data from 467 employees all over China. This paper theorized and the results indicated that: (a) Leadership consideration increased employee learning from failures; (b) Leaders providing employees with a psychological safety environment by consideration per se is not supportive enough under the difficult situations of failures. Notably, clear guidance and instructions of initiating structure should be delivered as well. Thus leadership structure positively moderated the relationship between leadership consideration and employee learning from failures; (c) Employee intrinsic motivation mediates the interactive effect of leadership consideration and leadership structure on learning from failures. Overall, the mediated moderation model contributes to the experiential learning literature by showing how the seemingly paradoxical leaderships could enhance each other in increasing employee learning from failures. Our research provides important implications for both theory and practice. Limitations and future directions are also discussed.

When Others are Watching: Visibility and Appointment of Women to Precarious Leadership Positions

Author: **Max Reinwald**; U. of Konstanz

Author: **Johannes Zaia**; U. of Konstanz

Author: **Florian Kunze**; U. of Konstanz

Women remain underrepresented in top management teams with only little progress made during recent years. An explanation for the relatively stable underrepresentation of women is the glass

cliff hypothesis which suggests that women are more likely than men to be appointed to leadership positions in crisis firms, resulting in a higher risk of failure for female leaders. However, mixed support for the glass cliff hypothesis has been found. By integrating theory on gender stereotypes with signaling theory we draw attention to the importance of signaling consideration in staffing and propose that a glass cliff appears most likely when the firm is highly visible. In line with our prediction, we find in a sample of over 9,500 top management turnovers in US companies over a ten year period a small direct effect of crisis on female leadership. The effect is modified by the extent to which a firm is subject to public visibility, as crisis firms are only more likely to appoint women to top management positions when the firm is highly visible in public. Notably, the results are robust when matching and instrumental variable techniques are used to deal with potential endogeneity issues.

A Metatheoretic Reconstruction of Collective Leadership Studies

Designated as a "Best Paper" for OB

Author: **Nicole Alexy**; Bundeswehr U. Munich

Over recent years, leadership scholars have become increasingly interested in the complex, dynamic and co-created nature of leadership. Even though most leadership scholars today agree that leadership is a collective achievement and not a function of a single leader, what this collective achievement exactly is, how it is accomplished and how it can be conceptualized is highly contested in contemporary collective leadership studies. This lack of conceptual consistency and clarity in collective leadership studies raises the question of how we can think and study collective leadership in the light of its conceptual plurality. The paper systematically reviews the collective leadership literature through a metatheoretic lens to surface the different metatheories of collective leadership that exist in contemporary collective leadership studies. The metatheoretic reconstruction identifies five metatheories: Collective Leadership as (1) Team Property; (2) System Property; (3) Discursive Practice; (4) Social Practice; and (5) Intersubjective Practice. As a result of this metatheoretic plurality, the paper argues that a metatheoretic inclusive research approach is needed to gain a holistic understanding of what the nature of collective leadership is.

The (in)Congruence Effect of Authoritative-Benevolent Leadership

Author: **Liqian Yang**; Renmin U. of China

Author: **Qian Zhang**; U. of Toronto

Author: **Hao Gong**; Rutgers U.

Author: **Yao Yao**; U. of Toronto

Drawing on the two-wave data of 336 employees, we adopt Latent Polynomial Regression and Response Surface Analysis to test the congruence/asymmetrical incongruence effect of authoritative and benevolent leadership on employees' thriving at work. Utilizing a paradox perspective, our results show that authoritative and benevolent leadership can be synergistically combined which enable leaders to manage these two contradicting roles in paternalistic leadership. We found that the congruence effect of authoritative and benevolent leadership on employees' thriving at work becomes greater than the sum of their individual impacts. Moreover, the most positive effects on leader-member exchange (LMX) is achieved at the simultaneous maximization of authoritative and benevolent leadership, rather than pursuing a balance or middle ground of the two leadership styles. Third, LMX mediates the impact of (in)congruence between authoritative and

On the Nature of Power Motivation: A Meta-Analytic Review

Author: **Yi Wang**; Pennsylvania State U.

Author: **Cristina Theriault**; Pennsylvania State U.

Author: **Kenneth Levy**; Pennsylvania State U.

Author: **James M. LeBreton**; Pennsylvania State U.

As one of the most important human motivations in social interaction, power motivation reflects a concern for having impact on others or maintaining reputation and prestige. The present meta-analysis systematically reviewed the power motivation literature and derived meta-analytic estimates of the relationships between power motivation and a number of correlates (e.g., personality traits) and outcomes. Cumulating evidence from 365 articles (528 independent samples), this meta-analysis established a nomological network of both the explicit (i.e., conscious) and implicit (i.e., sub-conscious) aspects of power motivation. Results showed that the explicit and implicit power motivation are two independent constructs with a weak correlation with one another, and different patterns of relationships with other personal characteristics as well as work and life outcomes. We also showed that both explicit and implicit power motivation contribute meaningful variance in job performance and leadership effectiveness above and beyond the variance contributed by the Big-Five personality traits and intelligence. Our findings contribute to a better understanding on the nomological network of both explicit and implicit power motivation. Theoretical and practical implications of these findings and future directions are discussed.

Snacking, Self Control, and Emotional Regulation (session 1478)

Want a Snack at Work? An Investigation of Mood Repair and Self-Control Perspectives

Author: **Linna Wan-Ling Chien**; Institute of Human Resource Management, National Sun Yat-sen U., Taiwan

Author: **Nai-Wen Chi**; National Sun Yat-Sen U.

Based on the mood repair and self-control perspectives, we develop an integrative model that explored the antecedents, mechanisms, boundary conditions, and consequences of snacking at work. To test our integrative model, we employed the experience sampling method to collect daily data twice (i.e., the afternoon and evening surveys) for two weeks, resulting in 1,286 matched daily responses from 180 fulltime employees. The results of multilevel path analyses showed that: (a) daily activating negative moods increase unhealthy snacking at work via enhanced hedonic motive, and employees' preference to eat palatable foods can strengthen such positive indirect effect; (b) although daily emotional job demands increase daily ego-depletion, the depleted states did not predict healthy snacking at work; (c) dispositional self-control capacity did not alter the strength of the self-control pathway to healthy snacking; (d) daily unhealthy snacking increases employees' subsequent positive moods, whereas healthy snacking increases their subsequent vigor.

Why Dominance Incites Deference: A Social Norms Account

Author: **Emily Reit**; Stanford Graduate School of Business

Author: **Deborah Gruenfeld**; Professor at Stanford U. Graduate School of Business

Behavioral displays of dominance are a widely documented antecedent to high social rank in both human and non-human species. Yet the reasons dominant actors incite deference in others are not entirely clear. In contrast to extant explanations that suggest the intent to defer is a direct effect of the dominant actor on the individual target, we predicted that the intent to defer to a dominant actor can also be caused by the indirect effect of a norm of deference that is evident in others' behavior. Specifically, we hypothesized that the targets of dominance assume, based on a norm of deference, that others respect dominant actors more than they do themselves, and that this assumption predicts the intention to defer over and above targets' direct perceptions of the dominant actor. Consistent with our hypotheses, the studies reported here show that, on average, individuals exhibit a self-other difference in status conferral judgments towards dominant actors such that they think others respect, admire, and esteem dominant actors more than they themselves do. Perceptions of others' status conferrals predicts the intent to defer to dominant actors above and beyond individuals' direct perceptions of dominant actors. Results document a novel pathway through which dominance incites deference, are indicative of the potential for pluralistic ignorance about the value of dominance in groups, and highlight the central role of social norms in hierarchical stratification and maintenance.

Threat or Opportunity? Leader Reactions to Employee Overqualification

Author: **Cangyan Li**; U. of hong kong

Author: **Yiwen Zhang**; U. of hong kong

Author: **Cristian Vasquez**; Alliance Manchester Business School, U. of Manchester

Author: **Hector Madrid**; Pontificia U. Católica de Chile

Author: **David Holman**; U. of Manchester

According to teamwork theories, team members' use of interpersonal emotion regulation, namely, behaviors that initiate, maintain, or change emotions in others, should influence team effectiveness. Drawing on this proposal, we hypothesize that the effects of team member interpersonal emotion regulation (TIER) on team performance occur through its effects on team motivation. Based on a sample of 392 cross-functional teams (N = 2071), our findings show a positive indirect effect of affect-improving TIER on team innovation through team approach motivation, and a negative indirect effect of affect-worsening TIER on team innovation through team avoidance motivation. These findings expand our understanding of interpersonal emotion regulation in teams by showing the processes through which team member interpersonal emotion regulation can facilitate or inhibit team effectiveness.

Feeding Your Faking: Understanding How and When Surface Acting Influences Eating After Work

Author: **Yu-Ching Wang**; National Sun Yat-Sen U.

Author: **Nai-Wen Chi**; National Sun Yat-Sen U.

Author: **Pei-Chi Chen**; National Sun Yat-Sen U.

In the present study, we incorporate the resource replenishment perspective to examine whether service employees' daily surface acting influences different types of eating behaviors after work via increased need for resource recovery. In addition, we also explore the moderating effects of two personality traits that are closely related to self-regulation in eating behaviors: body-esteem and impulsivity on the surface acting-eating behaviors linkages. Adopting the experience sampling method, we conducted a twice daily, 10-day daily study to capture the daily fluctuations in study variables. In total, 162 service employees participated in our daily survey, resulted in 997 valid matched daily responses. After controlling for alternative

Author: **Ying Zhang**; U. of hong kong

Research has shown that employee overqualification is a significant predictor of employee attitude, cognition and behavior in the workplace. However, scholars have yet to explore how supervisors react to perceived employee overqualification, and, in turn, modify their own leadership behaviors. This study adopts a leader-centric perspective that is novel to the overqualification literature, grounded in followership theory and the approach-avoidance framework. Specifically, we theorize and test a model in which leaders develop higher performance expectation when they perceive followers as overqualified and tend to exhibit more leadership consideration behaviors. Simultaneously, leaders also experience threat to their own status by the overqualified followers which results in leader ostracism. A field study of 334 employees and 102 supervisors at an information technology company provides general support for this model. Our findings with multilevel structural equation modeling analyses suggest that employee overqualification is positively linked to leader performance expectation which is positively linked to leader consideration, but overqualification is not linked to leader threat perception. However, when leaders' power relative to followers is higher, they are more likely to expect high performance from overqualified followers and less likely to perceive those overqualified followers as a threat. These findings signal the potential utility of examining leader-centric outcomes of employee overqualification.

You are What You Eat: How and When Healthy Eating at Work Cultivates Coworker Reactions

Designated as a "Best Paper" for OB

Author: **Trevor Watkins**; West Texas A&M U.

Author: **Amanda S. Patel**; Suffolk U.

Author: **Giselle Elaine Antoine**; U. of Washington, Seattle

To date, food consumption has been established as being integral to employees' physiological functioning. Whereas prior research uncovering the intrapersonal effects of food consumption is informative, consuming food at work may also affect employees on an interpersonal level. Drawing from consumption stereotype theory, we posit that eating healthy versus unhealthy food at work influences coworkers' perceptions of self-control of the focal employee, which subsequently impacts how coworkers treat the focal employee. Moreover, we postulate healthy eating climate as a boundary condition to the effects of healthy versus unhealthy eating. When there is a strong healthy eating climate, employees are less likely to be stereotyped based on what they eat. Overall, we broaden the scope of employee food consumption by explaining how it affects coworkers' perceptions and behaviors.

When Teams are Caught in Discussion Circles: Introducing Team Rumination

Author: **Selina Stracke**; TUM School of Management, Technical U. of Munich

Author: **Kristin Knipfer**; Technical U. of Munich

This research introduces a new team-level construct, referred to as team rumination. Building on increasing attention of social forms of rumination, we propose that team rumination is a higher-order phenomenon that unfolds unique dynamics in the team context. We define team rumination as an ineffective attempt to make sense of a shared problem at work that the team perceives to be adverse and beyond its control. It is characterized by intrusive discussions, in which the team repetitively talks about the same aspects again and again, speculates about causes and consequences, shares negative thoughts and feelings, and mutually reinforces the problem talk. Team rumination is ineffective because the team uses up resources and cannot accomplish actual tasks while it does not produce a solution for the problem at hand. First, in performing a literature review on individual, co-

OB

Teams and Negative Work Behaviors (session 1476)

Examining the Effects of Team Cheating Configurations

Author: **Trevor Spoelma**; U. of New Mexico

Unethical behavior remains a persistent issue in groups and teams. To model unethical behavior at the team level, scholars tend to rely on consensus-based theorizing and methodology that emphasizes homogeneity in underlying member behavior. In this paper, we depart from this approach to introduce the concept of team cheating configurations, which take into account differentiation in the arrangement and level of individual member cheating behavior. Combining ethics research with principles of team emergent phenomenon, we first build theory around two specific forms of team cheating configuration: "bad apple" and fragmented. In turn, integrating social impact theory (Latané, 1981), we propose that these configurations are differentially associated with team relationship conflict and team creative performance; effects moderated by peer-based rational control. We tested our model using a sample of 522 employees of 94 teams across a

rumination, and collective rumination and conducting 13 semi-structured interviews with team members, we 1) established a conceptual definition of team rumination. Second, in applying a confirmatory factor analysis to a sample of 303 working adults, we 2) propose a 25-item measure of team rumination. Our research lays the groundwork for the empirical examination of this novel team phenomenon.

Does Pay Transparency Affect How Employees Bargain for Idiosyncratic Terms?

Author: **Man-Nok Wong**; Hong Kong Baptist U. / Lingnan College, Sun Yat-Sen U.

Author: **Wai-Yuan Leon Lam**; Hong Kong Polytechnic U.

Author: **Bonnie Cheng**; Hong Kong Polytechnic U.

This study investigates how pay transparency affects employees' desire to bargain employment conditions for themselves. Drawing from past research of pay transparency as well as compensating differentials theory, the authors propose that pay transparency affects employee i-deal requests via incentive pay compression. Hypotheses were tested in a sample of 111 medical device distribution firms located in China using multiple data sources. Results suggest that the positive impact of pay transparency on employee i-deals requests is largely explained by incentive pay compression, but only when firm collectivism is taken into consideration. Implications for theory and practice are discussed.

Economic Booms Prompt Sexual Harassment at Work

Author: **Nina Sirola**; Singapore Management U.

Author: **Margaret Lee**; Haas School of Business, UC Berkeley

Author: **Madan M Pillutla**; London Business School

Author: **Nilotpal Jha**; Lee Kong Chian School of Business, Singapore Management U.

Despite unprecedented economic growth and gender emancipation in recent decades, sexual harassment continues to be prevalent in organizations. This fact is puzzling given the dominant theoretical perspective of sexual harassment as a way for men to manage threat posed by women entering the workforce and competing for jobs, which suggests that sexual harassment should decrease with economic growth and should be least pronounced during prosperous times. We extend this traditional view, the job market perspective, with a novel theoretical model we develop, the mating-market perspective, which suggests that persistent sexual harassment during economically prosperous times might not be unexpected but rather a predictable (and, as such, manageable) product of an evolved mating-related psychological architecture. We argue that the state of the economy impacts not just career-related, but also mating-related motives, ultimately leading people to engage in more rather than less acts that can engender experiences of sexual harassment during more prosperous times. We find support for our model across two large-scale field studies (including almost 7,000 employees), which examined how actual experiences of sexual harassment relate to objective economic conditions across 450 U.S. counties, as well as an experimental replication. Our work extends the understanding of motivational underpinnings of sexual harassment and advances organizations' ability to predict and manage one of

40 globally distributed virtual teams. In addition, we examined the role of structural supports, transformational leadership, and team composition as inputs to virtual team (VT) processes and performance outcomes. Virtuality dimensions of team isolation and imbalance were found to moderate the relationship between input factors and virtual team processes, whereas spatial distance moderated the relationship between virtual team processes and virtual team performance. Implications of the results for managing virtual teams are discussed.

Transactive Memory Systems: A Dynamic, Compilational Perspective (WITHDRAWN)

Author: **Adam Arthur Roebuck**; U. of Connecticut

Author: **John Mathieu**; U. of Connecticut

Author: **Travis Grosser**; U. of Connecticut

Author: **Semin Park**; U. of Iowa

Transactive memory systems (TMSs) are associated with positive team outcomes due to their ability to allow members to expeditiously draw on expert knowledge while reducing the cognitive burden across members of the team. Despite links to positive outcomes, the TMS literature continues to make assumptions incongruent with its original patterned and dynamic conceptualization. Accordingly, we develop a network-based theory of TMS that incorporates both compilational and system dynamic perspectives, and focuses upon multi-dimensional patterns of members' interactions over time. We suggest that the accuracy of members' perceptions about their teammates' knowledge expertise informs the structural pattern of coordination at the team level. We then suggest that a lack of credibility or misaligned coordination ties may motivate members to seek alternative TMS pathways over time. By relying on the collective knowledge of the team, we suggest members can develop a differentiated structure where each member knows where to find expert knowledge and coordinate accordingly. Moreover, we introduce the concept of workarounds to the TMS literature. In doing so, we propose the TMS can maintain its benefits in light of disruptions to knowledge flows on the part of an expert.

the key workplace problems.

Why Peers Engage in Costly Control of Free Riding

Designated as a "Best Paper" for OB

Author: **Meike Birgit Wiemann**; U. of St. Gallen

Author: **Antoinette Weibel**; U. of St. Gallen

In knowledge-intensive teamwork, the control of free riding strongly relies on the team members themselves, since for supervisors, individual contributions to the team outcome are difficult to specify, monitor and enforce. However, peer control involves costs for the controller and likewise benefits other non-controlling team members, thus, constituting a second-order social dilemma. In this article, we study how this dilemma can be overcome. To this end, we examine the reasons why peers choose to engage in costly control. We first summarize the existing knowledge on reasons for costly control in the light of a theoretical model of decision-making in social dilemma situations followed by an empirical mixed-methods research design including both an inductive qualitative and a scenario-based quantitative study. The results support our theoretical assumption that costly control relies on the subjective utility peers attach to their control actions. Specifically, we find situational, norm-related and personality factors to affect such utility assessments. Among these factors, we find six to increase and one to decrease actors' perceived utility of peer control. Drivers are: (1) actors have a cooperative personality, (2) actors are achievement motivated, (3) actors are directly negatively affected by the free riding, (4) team performance suffers from the free riding, (5) an external problem solution is not foreseeable, and (6) free rider severely violates collaboration norms. Hinderer is: (7) actors have a conflict avoiding personality. Contrary to our hypotheses, we found injustice sensitivity and social support to have no significant effect on costly control. Contributions and limitations are discussed.

Double-Edged Effects of Group Performance Pressure on Cheating Behavior

Author: **Mo Chen**; U. of Science and Technology of China

Author: **Chao Chen**; Rutgers U.

Author: **Zhaopeng Liu**; Antai College of Economics and Management, Shanghai Jiao Tong U.

Drawing on social identity theory and research on group morality, we develop and test a theoretical model of double-edged effects of group performance pressure on group-level cheating behaviors. We hypothesize that through the mediation of group-serving cognitions, group performance pressure constrains group-level cheating for self yet promotes group-level cheating for group. We further predict that these effects are strengthened by inter-group competition and weakened by group ethical culture. Findings from three time-lagged field studies of work groups involving multisource data provide support for our hypotheses. We concluded by discussing the theoretical and practical implications of these findings.

guilt. While the former effect is channeled through the affective reactions pathway, the latter is channeled through the inferential processing route. Further, we identify two social-relational factors (two perceived causes of anger expression) that moderate the mediation effects – altruistic concern and responsibility of self. Study 1 involving 186 undergraduate students provided support for an overall negative effect of leader’s anger expression on subordinate’s trust. Study 2 with a sample of 805 MTurk workers supported the competing mediation processes as well as the moderation effects.

Author: **Colette Real**; Dublin City U. Business School

Author: **Michael Keane**; Actualise.ie

Author: **Theo Lynn**; Dublin City U.

Trust is widely regarded as being foundational in human relationships. The violation of interpersonal trust results in a range of negative affective, cognitive and behavioural consequences for the injured party. Research has yet to isolate the specific neural areas and mechanisms activated when different types of interpersonal trust are breached. Using electroencephalogram, we tracked the effects of three distinct types of trust violations, ability violation, integrity violation and benevolence violations, on brain activation. Our results identify the significance of the default mode network (DMN) in trust violation and further isolated distinct activation patterns for ability, integrity and benevolence trust violation. These findings highlight the importance of the DMN in processing cues regarding the trustworthiness of others and the distinctiveness of the processing of violation cues of the three facets of trustworthiness.

Is Suspicion Harmful or Beneficial in Teams?

Author: **Rebecca Mitchell**; Macquarie U.

Author: **Brendan Phillip Boyle**; Newcastle U.

Suspicion has been linked to significant cognitive and behavioural effects, yet its influence in teams remains largely unexplored. We draw on the motivated information processing theory of groups (MIP-G) and interpersonal deception theory to develop a model of suspicion's effect on team innovation through the mediating role of minority dissent. Further, in recognition of the potential dysfunctional role of suspicion and dissent, we explore an important moderator of this mediated path, inclusive leadership. Survey results from 76 healthcare teams lend support to our moderated mediation model. These results provide a valuable contribution to our understanding of the role of suspicion in team information-processing and innovation.

Who's to Blame? The Role of Economic Factors in Organizational Trust (WITHDRAWN)

Author: **Wiebke Doden**; King's College London

Author: **Manuela Christina Morf**; U. of Lucerne

Author: **Bruno Staffelbach**; U. of Zurich

In the current research, we provide evidence that trust between employees and their organizations unfold within a larger macroeconomic context rather than operating in a vacuum. Organizational trust is an essential component in the employee-employer relationship that is often undermined by negative events (i.e., job insecurity). In our research, we hypothesize that employees who are experiencing job insecurity are less likely to attribute the cause of their insecurity to managerial ineptitude or bad intent when they are exposed to poor economic conditions protecting organizational management from losing trustworthiness. Two studies found evidence consistent with our theorizing. With data from 4,612 employees surveyed across 55 regions in Central Europe, Study 1 demonstrates that a poor economic environment mitigates the negative relationship between job insecurity and organizational trust. Study 2 experimentally induced the perception that the U.S.

economy is performing poorly with a sample of 538 U.S. employees and found that this perception led employees to attribute their insecure situation to the economy rather than to the management of their organization. By demonstrating that the economic context shapes assessments of organizational trustworthiness, our research opens new avenues for future work to bridge micro and macro levels of theories.

Enhancing the Business Value of IT (session 1495)

Understanding the Influence of IT Alignment on Small-to-Medium Enterprise Performance

Author: Rui Bi; Charles Sturt U.

Despite a plethora of studies that demonstrate the positive impact of information technology (IT) alignment on firm performance, our understanding of the processes through which such gains are achieved in the small-to-medium enterprise (SME) context remains limited. This study fills this gap by exploring the role of IT alignment in the development of partnership competence and agility at the SME level. Using data from 310 SMEs in Australia, we find positive, significant, and impactful sequential linkages between IT alignment, partnership activities, agility and SME performance. We also show that partnership activities and agility fully mediate the relationship between IT alignment and SME performance. This study suggests the critical role of IT alignment in SME success. These findings have important implications for business practices.

Agility and Adaptability in Organizational Change (session 1496)

Development of an Organizational Agility Assessment for Government and Nonprofit Organizations

Author: Shelley A. Kirkpatrick; The MITRE Corporation

Author: Sarah Miller; The MITRE Corporation

Author: Adam Terragnoli; The MITRE Corporation

Author: Amber Sprenger; The MITRE Corporation

To keep pace with constant change in the environment, organizations must broaden their sight by finding new ways to carry out their work. Based on literature review, we developed an organizational agility model and the Government Organizational Agility Assessment (GOAA) for use with government and nonprofit organizations. Over a two-year period, the GOAA was administered to eight units within separate government and nonprofit organizations, resulting in a sample of 1,119 participants. Reliability exceeded acceptable levels for each GOAA scale, and content validity was demonstrated through grounding in the literature. Use of the GOAA is discussed as an evidence-based tool that organizational consultants can use to make a case for change and provide a framework that organizations can use to become more agile. Limitations and suggestions for future research are discussed.

Author: **Terence Saldanha**; U. of Georgia

How do IT investment and IT alignment with respect to overall strategy and a functional strategy influence firm profitability? This study investigates the joint effects of IT investment and strategic IT alignment on firm profitability by using a configurational perspective and fuzzy-set qualitative comparative analysis (fsQCA) method that allow us to account for complex and hitherto unexplored interactions among multiple alignment types and investments in IT, R&D, and advertisement. To draw insights on these complex interactions, we use a rare archival and survey data from firms and business units belonging to a leading conglomerate in India. Our fsQCA results reveal multiple equifinal configurations to achieve high firm performance, and asymmetrical causal structure between high-performing and low-performing configurations. Thus, we show that the effects of IT investment and strategic IT alignment with respect to overall business strategy and functional quality strategy are much more complicated than previously thought. This study contributes to theory and practice by providing a few viable configurational solutions that explain multiple causal recipes to configure IT investments with other types of investments for different types of alignments to produce high firm profitability for large and small firms. We discuss implications for research and practice.

Playing it Safe: Design Thinking as Episodic Change

Author: **Sonja Förster**; ETH Zurich
Author: **Sebastian Feese**; Antavi
Author: **Stefano Brusoni**; ETH Zurich

How does episodic organizational change, in the form of a Design Thinking intervention, unfold? To study how and to what extent participants process and integrate learning, we followed a world-leading water-systems firm that introduced Design Thinking to trigger innovation. To investigate the effect of this intervention, we relied on a mixed-method approach and pre-/post-test design. We interviewed, observed, and tracked a sample comprising both participants and non-participants in a Design Thinking workshop. Using our data, we pinpointed participants' changes in behavior and social interactions, and how they were perceived by non-participants. Our findings suggest that psychological safety plays a key role in Design Thinking, as it enables participants to balance the positive and negative emotions that arise during the process. The rationale behind this operationalization of change resonates well with Schein/Lewin's theory of change (Lewin, 1947a, 1947b; Schein, 1992, 1996). We build on their three-step model by linking the change process to behavioral responses, and show that some participants overwrite institutionalized practices in the post-phase. Our findings respond to calls raised in the management literature to connect the analysis of change to that of emotions.

Improving Innovation Efficiency Through Competition Networks and Digitized Operational Integration

Author: **Mariana Giovanna Andrade Rojas**; Nanyang Technological U.

Author: **Abhishek Kathuria**; Indian School of Business

Author: **Hsiao-hui Lee**; U. of hong kong

Given the considerable investments in innovation, Innovation Efficiency is of high priority for policy makers, practitioners and academics. The pervasiveness of digitization and changes in the structure of competition networks are two converging trends that play an important role in innovation by facilitating access to information and knowledge. However, the links between digitization, competition networks and innovation remain poorly understood. In this study, we develop a multilevel research model of Innovation Efficiency that simultaneously considers the effects of Digitized Operational Integration (DOI, firm level), and Competitive Brokerage (competition network level). We assess the model using a 7-year (2004-2010) longitudinal secondary dataset including firms from multiple industries. We find that DOI and Competitive Brokerage positively influence Innovation Efficiency. We also find that DOI and Competitive Brokerage are substitutes, as they provide similar information and knowledge access benefits to the firm. Taken together, these findings have relevant managerial and policy implications. Specifically, we show that DOI enhances Innovation Efficiency, especially for firms that are not competitive brokers. We also show when firms are

adaptability culture on organizational performance through action orientation. The moderated-mediation model suggests that firms need an adaptability culture that is driven by action orientation in order to affect organizational performance. The model also examines how risk taking moderates this relationship. Findings show the importance and willingness for employees to not just embody of culture of adaptability but also take action and risk to put strategies into motion.

When Old Logics and New Work Clash: Overmanagement as a Response to Conflicting Management Models

Author: **Nora Rosendahl**; Aalto U., Department of Industrial Engineering and Management

Author: **Jane Seppälä**; Aalto U., Department of Industrial Engineering and Management

Evolution of management models is often accompanied by conflicts, failure and cycles of adaptation. What is less well understood is the co-existence of two conflicting management models, which can lead the organization to “hoard” systems, processes, roles, and practices from the new and the old, resulting in an overlap of the models. Based on our qualitative, inductive case study at a large Finnish telecommunications hardware and software provider, we propose a model that shows how conflicting management models lead to overmanagement and contradicting demands. We contribute to research on management models by detailing what can happen in the critical transition period when two management models not only overlap, but compete. Further, we describe the effect of over-management on the individual by highlighting how employees use five behaviors to cope with the conflicting demands. Finally, we add empirical insight to research on how technology disrupts management models and organizational practices.

[view paper \(if available\)](#)

Asynchronous

competitive brokers, investing more in DOI does not endow marginal benefits to Innovation Efficiency. Our results are robust to concerns of endogeneity and alternative model specifications. These findings imply that policy measures aimed at increasing Innovation Efficiency can either be micro-level by incentivizing firm-level investments in digitization, or macro-level by driving network-level changes in the structure of competition networks.

Business Analytics Adoption and Firm Performance: An Efficiency Study via Cross-Industry Comparison

Author: **Erkan Bayraktar**; American U. of the Middle East

Author: **Ekrem Tatoglu**; Ibn Haldun U.

Author: **Arafat Salih Aydiner**; Assistant Professor, Istanbul Medeniyet U.

Due to the increasing popularity of business analytics (BA), investigation of the adoption of BA and its subsequent impact on firm performance has become an important research topic. Drawing on the fundamentals of the resource-based view, this study proposes a data envelopment analysis model to assess the adoption efficiencies of BA applications in terms of the level of achievement on firm performance, including decision-making performance (DMP), business-process performance (BPER) and financial performance (FP). Based on the survey data from 204 medium-to-high level business executives in various industries, the results of this empirical study provide a statistical support to the cross-industry differences of BA adoptions efficiencies and indicate that the firms in tertiary industries have the highest level of efficiency in terms of BA adoption and its impact on firm performance followed by the firms in technology-intensive and resource-intensive industries, respectively.

Contextualizing the Dynamics of Strategic Change (session 1498)

Understanding the Dynamics of Shifting Multi-Brand Competition to a Collaborative Alliance

Author: **Stephanie Kay Herbst-lucke**; Weatherhead School of Management, Case Western Reserve U.
 Author: **Paul F Salipante**; Case Western Reserve U.
 Author: **David Aron**; Weatherhead School of Management, Case Western Reserve U.
 Author: **Jacqueline M. Stavros**; Lawrence Technological U.

Much of the brand alliance literature focuses on the publicly espoused visible catalyst to alliance change, that of resource enhancement and market adaptation. This research suggests members are profoundly affected by less visible, less apparent constructs of system structure, governance, stakeholder aspiration pressures, and relationships. While the power to influence brand alliance decisions lies with executive membership, a system that lacks sufficient structure, governance, or relationships can disempower executive members, making them vulnerable to stakeholder aspiration pressure. Relationships can have an inverse effect enhancing a member's agency to focus on their view of mission, create stability, and improve the predictability of the system.

Momentum for Change and Stakeholder Dynamics in the Public Sector

Author: **Christine Benedichte Meyer**; NHH Norwegian School of Economics
 Author: **Inger G. Stensaker**; NHH Norwegian School of Economics

This paper examines how stakeholder dynamics influence the momentum for change in a public sector context. Creating and maintaining energy is essential for reaching planned change goals. Existing research suggests that social interactions among stakeholders influence the momentum for change.

Organizational Trajectories, Forms and Images (session 1497)

Research on Change Implementation Interventions – An Integrative Review

Author: **Christina Hagl**; LMU Munich
 Author: **Rouven Kanitz**; LMU Munich School of Management

Change implementation interventions (CIIs), i.e., systematic activities aimed at facilitating successful organizational change, are of high relevance for change research and practice. Scholars from different fields have generated a large body of change implementation research drawing from diverging perspectives and methods. Thus, the current state of the CII-relevant literature remains fragmented and difficult to synthesize. This makes it challenging to infer what we know about interventions and establish a coherent research stream that allows cumulative knowledge development on CIIs. To address this shortcoming, this paper provides a review of research in the fields of organizational behavior (OB), strategy, healthcare management, and information systems (IS) research that informs CIIs. Drawing from 155 empirical studies published from 2000-2019, we integrate our findings into three main categories of CII approaches (ability-, motivation-, and opportunity-enhancing interventions) that have been studied to facilitate change implementation. We then summarize relevant research and critically discuss how it informs the CII approaches. Based on this discussion, we point out unresolved questions and propose pathways for advancing future research to enhance our understanding of evidence-based change interventions.

Redirecting the Trajectory of Research on the Human Side of Change: Bridging Across Disciplines

Author: **Rouven Kanitz**; LMU Munich School of Management
 Author: **Katerina Gonzalez**; Suffolk U.

While the role of internal stakeholders has been documented, we know less about how external stakeholders can influence planned change processes, yet particularly in the public sector, externals often play an important role. This inductive study draws on the experiences of a top manager and adopts a collaborative research approach to show how external stakeholders can influence change processes. We compare and contrast two change processes within the same public sector organization, where one change process resulted in goal attainment while the other came to naught. Our analysis shows how stakeholder interaction can either amplify or kill the momentum for change. Four dynamic patterns influence momentum for change: external stakeholders influence the process, internal stakeholders mobilize external stakeholders and vice versa, external stakeholders trigger multiple stakeholders and external stakeholders legitimize shifting positions.

Advice Tie Reallocation Under Organizational Turmoil: A Longitudinal Intra-Firm Network Study

Author: **Hendrik Leeendert Aalbers**; Radboud U. Nijmegen

Author: **Alexander Smit**; assistant professor

Drawing on both social network theory and social exchange theory, this study investigates how the hierarchical position of those constituting a firm's discretionary advice network affects individual's propensity to provide advice to others. Based on a unique field survey that captures the dynamics of organization downsizing, findings indicate that under enhanced organizational turmoil, new advice activity centers on advice provided to hierarchical equals, shifting away from a vertical orientation towards a horizontal advice orientation as organizational turmoil increases. Hierarchical popularity nor activity affects this relation, arguing for the direct effect of organization structure on advice giving activity within the firm. We discuss the implications of our findings on the literature of intra-organizational networks in the context of abrupt network disruption, contrasting pre and post network structure to a sudden downsizing event.

Author: **Viswanath Venkatesh**; U. of Arkansas Sam M. Walton College of Business

One factor which is deemed as critical to successfully navigating organizational change is the human side – or how recipients experience and respond to change initiatives. Scholars from several management disciplines have studied the human side of change, with minimal integration taking place across disciplines. The resulting fragmented state of the literature is among the greatest challenges for researchers, making it difficult to advance knowledge cumulatively. We review 265 empirical articles published from 1998 to 2018 and use a co-citation analysis to visually interpret the knowledge base of the field. This analysis reveals that research has mainly evolved within three disciplines: information systems, organizational behavior, and strategy. Based on this insight, we integrate articles across the disciplines by developing eight thematic perspectives that emphasize different mechanisms to explain responses to change; the eight themes are sensemaking and discursive, judgment- and belief-focused, emotional, relational, work structure and design, learning-focused, person-centric, and ethical. We then develop research pathways which encourage researchers to (1) further develop work within perspectives, (2) combine multiple perspectives, or (3) bridge disciplines within perspectives in order to advance important but underdeveloped issues. Our integrative review enriches the development of future research and facilitates cross-disciplinary knowledge creation on the human side of organizational change.

Visualizing Turnaround Strategies over Time in a Volatile Commodity Industry

ODC Division Best Paper Based on a Dissertation
Author: **Alice Palmer**; U. of British Columbia

With the rise of the internet and electronic media, the first two decades of the 21st century have seen a rapid decline in demand for printing and writing paper. This study creates a visual representation of how pulp and paper companies' strategies have changed over time, based on a four-quadrant turnaround strategy model developed by Pretorius (2008). It examines the strategies of forty such companies operating in North America and northern Europe over a fourteen-year period from 2004 to 2018. Companies that were most exposed to products with declining market demand tended to be the most likely to require financial restructuring; these companies also had to make simultaneous operational and strategic changes in order to stay in business. In contradiction of the turnaround model, companies responded to some types of external turnaround causes with operating (rather than strategic) actions. Companies operating in commodity industries must often adapt their strategies to deal with cyclical downturns; this contingency is not well reflected in the extant turnaround literature.

increasingly acknowledge the potential of collective power over a firm's strategy making process – enhanced when all employees autonomously organize and act towards a firm's corporate vision and stakes. Nevertheless, enacting SMO is challenging for organizations. First, SMO requires sustained upper management communication to entice employees to autonomously move from a hierarchy- centric a stake-centric organization. Second, SMO requires organized communication among employees to collectively distribute strategic responsibility. Therefore, to better theorize the Self-Managed Organization, we adopt a Communication as Constitutive of Organizations' (CCO) perspective since SMO can only be enacted in and through communication. We also strengthen CCO's claims with evidence from an emerging area of investigation – new organizational forms. Our results – based on an empirical study conducted at one of the few existing self-managed multinationals – demonstrate how communication has the power of enacting and stabilizing a new organizational form. Indeed, we expose how SMO is enacted and stabilized when performativity of strategy occurs in a communication praxis.

Behavioral Approaches to Formalization, Exploration, and Firm Failure (session 1503)

Shared Fate: The Impact of Peer and Industry Characteristics on Peer Failure Experience and Investment Intensity

Author: **Anna Pak**; Fox School of Business, Temple U.

Most studies on learning from failure have focused on the strategic incentives of a focal firm. We examine the relationship between peer failure and investment intensity from external actors' point of view and argue that peer failure can be a negative signal to external actors due to a harm spill-over effect, restricting a firm's actions. Our analysis of the U.S. movie industry shows that peer failure leads to a decrease in investment intensity, the relationship attenuated by peer recognition and industry growth. Our study highlights the role of external actors that shape a firm's ability to learn and take action.

[view paper \(if available\)](#)

Why Informal Firms Formalize: A Strategic Decision-Making Perspective

across these four images, we expose a salient grand- narrative of contrast between good and evil organizations. Within this duality, we uncover that individuals experience different kinds of struggles, of belonging and identity; and exhibit different kinds of behavior, insurgent and heroic, depending on the kind of organization they are related to in the films. We theorize that this grand-narrative is a form of moral critique of the present, and suggest that normative transformational scholarship can improve the collective global imaginary of the futures of organizations today.

The Exchange, Formalization, and Implementation of Meaning in Sensemaking Conflicts

Author: **Morten Aaltvedt**; U. of Lausanne
Author: **Deborah Philippe**; U. of Lausanne

This paper draws on previous sensemaking and sensegiving research in an attempt to explain how repeated situations of competing understandings around issues could lead to a catastrophic outcome. We provide insights to this question by drawing on qualitative data from the 2010 Deepwater Horizon disaster. We analyze four critical events (i.e., sensemaking conflicts) that took place during the months leading up to the disaster. These events have in common that 1) multiple understandings existed as to how the event should be dealt with; and, 2) action was required to overcome the event and proceed with the operations. Our findings suggest that these sensemaking conflicts were solved through a three-stage sensegiving process consisting of meaning exchange, meaning formalization, and meaning implementation, where organizational systems and procedures were used as devices to strengthen the effectiveness of sensegiving. We also suggest that access to such

Author: **Selorm Agbleze**; Copenhagen Business School

Author: **Marcus Møller Larsen**; Copenhagen Business School

We offer a behavioural framework to explain informal firms' decision to formalize. We argue that aspirations for which firms skirt formal regulation to operate in the informal economy serve as reference points in interpreting and evaluating the prospect of formalization. We differentiate between the influences of firms expected performance relative to aspired performance and the influence of different form of aspiration being pursued (aspirations related to subsistence, exploitation, legacy, and resistance). In conclusion, we contribute to extant research emphasizing formalization as a quasi-rational calculation by recognizing how formalization can be seen as a complex decisions-making process surrounded by severe information incompleteness and uncertainty.

Off the Beaten Path: Asocial Exploration in Managerial Decision-Making

Author: **João Duarte**; U. della Svizzera Italiana

The process of search focuses on identifying new solutions. When we define a new solution as a choice that an individual has not yet identified as a viable alternative, novelty may be derived from two fundamentally distinct processes: either from search undertaken in isolation from others or from the adoption of solutions that others have already explored. We refer to the former process of search as asocial exploration and to the latter as social exploration. In our experimental study, we examine the behavior of individuals who are given the opportunity to choose between social and asocial exploration, in the face of failure. After reporting on the relative levels of these two forms of search, we seek to identify conditions within the social environment that can elevate individuals' propensity to engage in asocial exploration. Our focus is on evaluations of choices that result in negative outcomes. We find that, under conditions of failure, asocial exploration is greater when individuals receive positive evaluations of past choices. We also

devices varied between organizational members, thereby creating a disadvantage for some of the members to successfully transmit their understanding to others. We propose that the recurrence of these sensemaking conflicts and their interconnectedness led the decision-makers to vastly underestimate the riskiness of the situation, thereby contributing to the occurrence of the disaster.

Organizational Failure as a Value Judgement: A Review and Reconceptualization

Finalist for the Louis R. Pondy Best Paper Based on a Dissertation Award

Author: **Kilian Bergmann**; Leuphana U. Lüneburg

Author: **Christoph Seckler**; ESCP Business School

While organizational failure has been a central concept in the broader Management field for some time, the question of how to conceptualize organizational failure remains widely debated. We review previous reconceptualizations of organizational failure, and subsequently propose to conceptualize failure as a value judgement. As a value judgement, we argue, failure is a relational concept of the fifth degree. This means that organizational failure is related to (a) the state of an organization, (b) somebody who assesses the situation, (c) with regard to certain aspects, (d) specific circumstances, and (e) in view of a goal. This reconceptualization shifts the discourse on failure from considering it as a state of an organization (e.g., insolvency, bankruptcy), or an event (e.g., closure, termination, cessation) (i.e., ontological concepts) towards studying organizational failure as a value judgement (i.e., axiological concept). Conceptualizing failure as a value judgement helps to differentiate failure from related concepts such as organizational decline, organizational error and others.

firm's mental representation that consists of the sensing layer that reduces a given situation to decision factors and the responding layer that formulates the firm's response to the decision factors. The results suggest a temporal trade-off of cultivating a complex sensing layer. Firms pursuing multiple objectives cultivate a complex sensing layer, which promotes their adaptation in the short run. However, in the long run, the complex sensing layer impedes the firms from formulating a proper rule to respond to the observed situation. This study extends our understanding of the role of mental representation in firms' adaptation. Also, this study sheds light on the interdependence among firm objectives, which emerges and resides in firms' cognition.

Communicating Sense: The Role of Inference in Joint Sensemaking in Equivocal Contexts

Author: **Sai Kalvapalle**; Erasmus U. Rotterdam

Author: **Joep Cornelissen**; Erasmus U. Rotterdam

Author: **Pursey Heugens**; Erasmus U. Rotterdam

In this paper, we build a conceptual framework that elaborates the communicative mechanisms by which individuals in high reliability organizations (HROs) jointly make sense in order to coordinate in equivocal contexts. We build on past work in cognitive and discursive sensemaking, while also highlighting that past research tends to conflate cognition and discourse by presupposing cognitive effects of discourse. Instead, we submit that sensemaking research would benefit from a focus on how organizational actors make inferences and build shared understanding in context. We provide this analytical focus on inference by borrowing theoretical principles and assumptions from relevance theory, a theory in the neighboring field of pragmatic linguistics, and illustrating these principles with examples from seminal past cases of sensemaking under pressure. Our conceptual framework exposes the communicative processes of ostension and inference by which actors build a mutual cognitive environment. Crucially, our paper underscores the importance of investigating how failed inferences hinder coordinated action. We elaborate the contributions of our conceptual

Hiring and Career Outcomes in Contemporary Organizations (session 1504)

The Uncertain and the Unexpected: Pathways to the Evolution of Job Structures in the Throes of Hiring

Author: Lisa Ellen Cohen; McGill U.

Author: Sara Mahabadi; McGill U. - Desautels Faculty of Management

In this paper, we examine the evolution of job structures in the throes of the hiring process – how jobs change in the time between making a decision to bring in someone to do a body of work and officially hiring someone. We analyze interviews about startup hiring and find that during hiring tasks are added and removed from jobs, jobs are abandoned, replaced, and moved, and hiring processes are re- launched. There are three pathways for this evolution, each shaped by a form of the uncertain or the unexpected: not knowing about what the job should be; lacking understanding of labor markets; and unexpected events. Not surprisingly, most of the jobs on these pathways are new to their organizations but contrary to common conceptions, these processes are not the product of managers who lack experience or who use lax hiring practices. The pathways differ in their longer-term consequences.

Innovation in Teams and Organizations (session 1506)

Historical Political Ideology and Firm Innovation: Worldwide Evidence of R&D Investments (1982-2016)

Author: Kunyuan Qiao; Cornell U.

Dominant national political ideology during founding or initial public offering (IPO) shapes a firm's structures and routines—leaving an organizational ideological imprint—and persistently affects firms' innovation. I argue that the communist (capitalist) ideological imprint discourages (encourages) firms' innovation enduringly. To triangulate the theoretical mechanism, I argue that the communist (capitalist) ideological imprint weakens (strengthens) the impact of two determinants of innovation, i.e. competitive aspirations and organizational slack. Meanwhile, I differentiate types of sensitive periods when imprinting processes take place and argue that founding imprint is more powerful than its IPO counterpart. Finally, I suggest that the subsequent IPO imprint modifies the influence of founding imprint, and therefore imprinting is a punctuated process. Empirical analysis of a longitudinal sample of worldwide firms' research and development (R&D) investment supports my hypotheses. My study contributes to imprinting theory and strategy literature.

[view paper \(if available\)](#)

Author: **Jie Yang**; State U. of New York Polytechnic Institute

Whether to be a specialist or generalist is a long-standing question for job candidates. The extant literature argues that the excess returns to labor market specialization exists, and the returns will decrease as job market candidates climb the career ladder. Should the aforementioned argument be valid, a job candidate with a long tenure will avoid being specialized. This argument, nevertheless, is contradictory to an observation in the feature film labor market that the ratio of specialists is stable among job candidates across different career stages. We argue that considering the effects of external audiences on hiring decisions can help reconcile the classic argument with the observation. Specifically, we argue that specialist advantage may sustain among the specialists whose skills and ability are highly matched with their image among audiences. We use rich longitudinal data from 1990 to 2015 on the careers of 21,914 actors and actresses in English-speaking films to test our hypotheses. We find that the moderating effects of actors' tenure on specialist advantage is contingent on their public image among audiences. For actors whose skills and public image are highly matched, a long tenure will not decrease, but enlarge their specialist advantage. Our research contributes to the labor market identity research by presenting hiring decisions as dual-matching processes in which both the hiring firms and external audiences are involved.

A New Look at Occupational Learning and Socialization in Contemporary Careers

Author: **Ece Kaynak**; Cass Business School

As the traditional employment relationship has deteriorated in the U.S. and in much of the world, the nature of careers has been changing. Workers today need to continually navigate an external labor market, construct their careers out of a series of jobs or short-term gigs, and take responsibility for training and retraining themselves to remain employable over time. Despite the burgeoning literature examining workers' efforts at navigating

Necessity is the Mother of Innovation: A Quasi-Experimental Study of Stress-Driven Innovation

Author: **Kristina Potocnik**; U. of Edinburgh

Author: **Nick Oliver**; U. of Edinburgh

Author: **Melike Senturk**; U. of Edinburgh business school

Author: **Thomas Stephen Calvard**; U. of Edinburgh

Author: **Maurizio Tomasella**; U. of Edinburgh

Innovative teams are typically assumed to be successful teams, but little is known about innovation in teams that face stressful conditions. Although necessary to cope with such conditions, innovation or the generation of novel and useful ideas and their implementation to create improvement, may also provoke further stress, leading to negative rather than beneficial outcomes. To study this, we conducted a simulation study of teams simultaneously working on time-critical tasks of physically manufacturing greetings cards in a competitive environment. Our manipulation of the working conditions was such that teams were likely to experience varying degrees of stress during the manufacturing process and face problems and challenges that could be solved by means of innovation. Using a multi-level path analysis on a sample of 43 teams composed of 345 participants our findings revealed an inverted U-shaped relationship between severity of exposure to stressors and team innovation. In turn, team innovation was negatively associated with team performance but positively with individual team member wellbeing in terms of enthusiasm. Our study contributes to the literature on the dark side of innovation by showing how stress-driven innovation is a paradoxical phenomenon that might be both beneficial and dysfunctional.

Serendipity and Framing in the Emergence of a Platform for Responsible Innovation

Author: **Madeleine Stefanie Rauch**; Copenhagen Business School

Author: **Shahzad Ansari**; Cambridge U.

Why would an academic research project turn into a platform for responsible innovation despite incentives to focus on publishing research papers?

the new economy, we know relatively little about how workers attempt to reskill themselves in the course of their careers. This paper utilizes a unique setting—coding bootcamps—to examine how workers attempt to enter a skilled occupation without traditional organizations serving as the backdrop for their efforts. I argue that bootcamps resembled learning collectives where learning from peers and near-peers figured more prominently than expert instruction. Under conditions of minimal expert instruction and obstacles to legitimate peripheral participation, I show how aspiring software developers sought out an occupational community in virtual spaces, learned asynchronously from unknown others, developed their practice through mock-work among themselves and managed to get hired into junior developer roles.

To address this puzzle, we draw on the case of Patient Innovation, a non-profit medical platform, focusing on innovations by patients and caretakers to find affordable solutions for rare and chronic diseases by creating a ‘knowledge commons’. Initially set up as a ‘research platform’ aimed at generating scientific publications, it turned into a ‘help-society platform’ to create a wider social impact, despite not initially targeting such a goal. Using a framing lens, we explore the role of moral emotions and serendipitous inspiration in the creation of this medical platform. We examine how the reframing towards socially responsible innovation occurred despite strong institutional pressure to focus on publishing scientific research. In doing so, we develop a model illustrating how interactional framing in situations lead actors to shift towards responsible innovation. We explain how actors frame and reframe situations in which they interact and transcend their immediate self-interests in order to serve collective interests.

Innovating Beyond: Social Innovation as Extra-Organizational Innovation

Author: **Gorgi Krlev**; U. of Heidelberg

Today's grand challenges call for innovations that enhance societal problem solving. Such innovations unlike conventional “organizational innovation” are not exclusively meant to improve innovators’ position in the marketplace through increasing customer satisfaction. Instead, the innovations need to (1) incorporate action on different levels of society, including policy or public discourse, and (2) address and involve a broader range of actors to lead to improved social outcomes. Social innovation is a prototype of such “extra-organizational innovation”. I use microfinance as a prime example of social innovation to theorize it as extra-organizational innovation by means of Giddens’ structuration theory. I develop a theoretical model and research propositions on innovation (a) mechanisms, (b) actors, and (c) effects that highlight how social innovation is systematically different from organizational innovation. I extend my theorizing to how structuration can help understand other new types of innovation that can be

Managing Paradoxical Processes in Organizations (session 1505)

What Does it Take to Engage with Paradoxes: The Challenge of Persistence

Author: **Christel E. Dumas**; ICHEC Brussels Management School

Author: **Céline Louche**; Audencia Business School

This paper explores how actors engage with persistent paradoxes over time. Drawing on a two-year participant observation of institutional investors involved in developing a framework for ESG investing, we identify four efforts actors engage in: anchoring, experimenting, ordering and creating a safe zone. Actors do not constantly engage in those four efforts but alternate between moments of active engagement and moments of indirect engagement. This alternation enable them to engage with the paradox over a long period of time, by varying the depth of their engagement. Our study concludes that saliency is not a stable and single state but that there are different manifestations of saliency along a spectrum, contributing in making the paradoxes livable and manageable. Difficult emotions and a sense of purpose and urgency trigger oscillations between direct and indirect engagement with paradoxes.

Experiencing work as meaningful is a central desire for individuals in organizations, but scholars face three challenges that together hinder research progress. Current works on work meaningfulness (WM) fall short in: (1) conceptualizing the inherently processual nature of WM; (2) accounting for the social, other-oriented dimension in WM process; and (3) addressing the tensional and paradoxical nature of WM. We argue that these are interrelated issues arising from the dominance of representational ontology in WM research, and propose the adoption of relational ontology in addressing them. Blending practice approach and dialogic perspective, we develop a dialogic practice theory of WM and generate three central insights. We theorize that, firstly, a person's WM emerges in the purposive engagement in practices and changes in his/her becoming aware of the inherent tensions and contradictions in such engagement. Secondly, this awareness prompts the person to re-evaluate his/her purposive engagement and justification. Thirdly, this re-evaluation leads to the differential positioning of the self in relation with and in contrast to others through inquiring, selecting, and crafting the self-other dialogues. In sum, this cycle of purposive engagement, awareness, re-evaluation, and differential positioning suggests a theoretical model that captures the social, processual, and tensional nature of WM.

**How to Learn from the Man in the Mirror:
Navigating Paradoxes Through Self-Reflexivity**

Author: **Ghita Dragsdahl Lauritzen**; Copenhagen Business School, Denmark

Author: **Anders La Cour**; Copenhagen Business School, Denmark

In the light of increased organizational and environmental complexity, research turns ever more often to the notion of paradox to investigate how managers can navigate conflicting demands. However, the internal dynamics of paradox remain unclear, making it difficult to understand what exactly is meant by the concept, and how it can be

managed in practice. This article notes that the full potential of paradox as an analytical tool for understanding complex situations of organizational life has not been reached, and reveals instances of organizational complexity that appear even more radical than current definitions of paradox posit. Using the sociologist Niklas Luhmann's concepts of distinction and re-entry, we unfold the complexity of such situations and develop a typology that includes a novel type of paradox that appears underexplored. Illustrating several different ways that opposites can appear interdependent, interwoven, persistent, and synergistic, we contribute to theory- building within paradox research. Finally, we discuss our findings and managerial implications and point towards future research.

Making Paradoxical Tensions Salient: Changing Information not People

Author: **Siarhei Manzhynski**; Umea U.

Author: **Frank Figge**; Kedge Business School

Author: **Andrea Thorpe**; Kedge Business School

Many firms are confronted with paradoxical tensions. For firms to recognize tensions these have to become salient. Prior research suggests that environmental and cognitive factors render latent tensions salient and argues implicitly that where environmental factors are complex, paradoxical cognition is required. In this paper we present the general model of rendering paradoxical tensions salient where developing cognition is only one of three possible strategies. We argue that information must fit both a described situation and actors' cognition for latent tensions to become salient. Based on this condition we introduce the other two alternative ways to make tensions salient, i.e. simplification of the information and simplification of the situation, that have been overlooked by scholars. Using the doubly complex application of cooptation for sustainability we show how the strategy of simplification of the information can help to recognize and systemize paradoxical tensions.

New Organizational Forms (session 1507)

The Role of Proto-Forms in the Emergence of Historic Movie Theaters in Chicago Communities: 1896-1962

Author: **Ying Li**; U. of Illinois at Urbana-Champaign
Author: **Olga Khessina**; U. of Illinois at Urbana-Champaign

We develop a novel concept of proto-form to understand the “pre- birth” processes of organizational form emergence, which take place between the discovery of a technological or social novelty and the eventual emergence of organizational forms dedicated to exploiting this novelty. We define a proto-form as a provisional organizational form that arises when entrepreneurs and enthusiasts experiment with possible applications of a novelty by using preexisting organizational forms as a basis. Proto-forms are a key step in the emergence of dedicated organizational forms, because they provide audiences with initial understandings of the novelty’s socio-cultural meanings. We theorize that the cultural status of proto-forms can affect how quickly dedicated forms with either similar or dissimilar cultural status emerge in geographic communities. Using data on all historic movie-showing venues in Chicago, Illinois, 1896-1962, we predicted and found that the proliferation of proto-forms with low cultural status in a community accelerated the emergence of dedicated organizational forms with low cultural status and delayed the emergence of dedicated forms with high cultural status. We predicted the opposite for the proliferation of proto-forms with high cultural status and found partial support to this prediction. These results provide initial evidence for the important role of proto-forms in understanding the emergence of new organizational forms.

Performativity and Control in Organizations (session 1501)

“Ella Says...” How Authority in Eponymous Firms is Authored Through Ventriloquial Acts

Author: **David Hollis**; Nottingham Business School, Nottingham Trent U.
Author: **Alex Wright**; U. of Sheffield Management School

This article advances ‘communicative constitution of organization’ (Ashcraft, Kuhn & Cooren, 2009: 7) understandings of how authoring authority organizes daily practice. We show how authority is eponymously authored during ventriloquial acts and produces multidirectional, temporal and fluid organizing patterns. Our ethnography of a cosmetics firm demonstrates how performative, segmented and misfiring authoring impacts quotidian activity in subtle, nuanced and precarious ways. This research also enhances communicative understandings of authority and elevates eponymy’s role within organization and management theorizing.

Orchestrating for Performative Resource and Capability Configurations

Author: **Stephanie Christine Schleimer**; Griffith U.
Author: **Mette Praest Knudsen**; U. of Southern Denmark
Author: **Rita Faillant**; U. of Southern Denmark

Value-adding orchestrations of resources and capabilities are at the heart of Penrose’s resource-base-view (RBV). However, while the management literature unanimously agrees on the importance of such resources and capabilities orchestrations for performance at the level of the firm, little research has investigated how performative firms, those firms leading their respective industries, orchestrate

Categorization and Organizational Evolution: A Species Approach to Organizational Form

Author: **Jason Scott Entsminger**; U. of Missouri

Organizational evolution has become a keystone of wider organizational sciences as it seeks to understand the emergence and sustained presence of organizational forms within the ecosytem. Rooted in a population ecology approach to evolutionary theory, the field is presented with the key issue of how to draw the boundaries between organizational forms and thus delimit populations. Despite this centrality, development of a cogent classificatory scheme that meets the demands of both the philosophy of science and social ontology has been elusive. In this paper I integrate the concept of natural kinds taken from philosophy of science with allegory to the ecological niche to formulate an Organizational Species Concept which accommodates these demands. I operationalize this framework through cluster analysis and an abductive process of exploratory science. This is applied to a unique national data set covering an emergent organizational form in food systems, the “food hub”, as a proof of concept. This application carries policy import for goals that center food hubs within initiatives to scale up local and regional food systems. Through this application, I show how determinations about organizational form and underlying populations can be made.

Managing the Identity-Size Paradox in Platforms: The Case of Platform Cooperatives

Finalist for the OMT Division Best International Paper Award

Author: **Jovana Karanovic**; Vrije U. Amsterdam

Author: **Hans Berends**; Vrije U. Amsterdam

Author: **Yuval Engel**; U. of Amsterdam

Platform organizations operate between two different competition logics: winner-takes-all, which prioritizes platform size, and distinctiveness logic, which prioritizes platform identity as a strategic dimension. While the platform strategy literature

their resources and capabilities. This paper has two significant contributions: Theoretically, it takes a performative lens to the RBV and thereby focuses on specifically on the resource-capability orchestrations of firms with performative outputs. Empirically, the paper is one of the first to apply a configurational methodology to identify these performative resource-capability orchestrations by investigating 124 performative Danish manufacturing firms and their investments and deployments of innovative technology resources and human-centred capabilities. The paper finds that there are differences in the orchestration of resources and capabilities based on the innovativeness of the firm’s outputs. Performative firms make heavy investments into and deployment of technologies, but only the configurations of the most performative firms additionally include investments into and deployments of specific human-centred capabilities. Important implications emerge in relation to what performativity theory can add to the original RBV and how a configurational methodology can operationalize this theory.

has primarily focused on the former, outlining ways to quickly grow the network of users and complementors, it has largely ignored platform identity. A key challenge for platforms is, however, to manage tensions that arise when both size and identity constraints are present. To explore how strategic tensions between platform size and platform identity are manifested and what platforms do to address them, we employ a multi-case study of platform cooperatives – an organizational form that commences from a distinctiveness logic. We find that platform cooperatives deal with several size-identity tensions as they go through three core phases: (1) enacting identity as a vehicle for growth; (2) diluting identity to enable growth; (3) growth-enabled identity redefinition. Moving across these phases, we identify the underlying strategic activities that platforms use to navigate what we termed as the ‘identity-size paradox’. Overall, we contribute to the literature on multi-sided platforms, and particularly in regards to platform strategy, as well as to the broader platform economy literature. Keywords: platform strategy, new organizational forms, platform cooperatives, platform identity

Does Investor Gender Matter? The Signaling Effect of Gender Homophily in Entrepreneurial Finance

Author: Kaisa E. Snellman; INSEAD

Author: Isabelle Solal; INSEAD

One proposed solution to closing the gender gap in venture capital is to encourage female investors to invest in female entrepreneurs. This paper explores how gender homophily affects the long-term success of male-founded and female-founded firms, defined as the continued ability to raise venture financing. Using longitudinal data on venture-backed firms in the United States and employing

2012). Recent studies also explore the role of place in reviving tradition (Dacin, Nasra, & Leithwood, 2009), voluntary standards adoption (York, Vedula, & Lenox, 2018), and in institutional work (Lawrence & Dover, 2015). Our symposium explores the situatedness of institutional dynamics. Through the presentation of a theoretical model and three empirical studies, we will discuss how place impacts the salience, resonance, strength, and scope of institutions. With an introduction to place at the beginning, discussant's comments, and a directed Q&A with audience participation at the end, this symposium will also explore the value of place to broader discussions about institutions.

Tweet Storms as Social Movements? Managing Stakeholders in the Social Media Era

Author: Yan Chen; U. of Missouri

Author: Joel Andrus; U. of Missouri

Author: Rhonda K. Reger; U. of Missouri

The manner in which social movements influence firms has garnered significant research among organizational scholars. This research has suggested that secondary stakeholders, lacking direct access or power, influence firms through enlisting the support of elites such as the media to increase the salience and urgency of collective actions. However, social media provide secondary stakeholders additional tools to bypass traditional media elites in pressing their agenda. We first develop new theory to describe how collective actions organized using social media influence firms through multiple paths. Specifically, collective actions (e.g., email campaigns, petitions, threats of boycotts) can influence managers directly through reputation threats on social media and indirectly through primary stakeholders who can pressure managers to address the social media propagated issues. We then introduce a new model for firms to manage social movements emanating from social media. The theoretical and practical implications of our model are also discussed.

Drivers and Barriers to Participation in Voluntary Environmental Programs: A Meta-Analysis

Author: **Pete Tashman**; UMass Lowell

Author: **Svetlana Flankova**; U. of St. Gallen

Author: **Marc Van Essen**; U. of South Carolina

Author: **Valentina Marano**; Northeastern U.

We meta-analyze research on the antecedents of firm participation in voluntary environmental programs (VEP) to better understand why firms to join these environmental self-regulations initiatives. Most existing studies consider singular programs and their idiosyncrasies, and arbitrary sets of institutional or resource-based motivators of business participation. Further, they overlook factors that discourage participation. Our meta-analysis of 119 studies and 21 VEPs addresses these gaps by testing a comprehensive model of institutional and resource-based motivators of VEP participation, and VEP governance characteristics that discourage participation by increasing firms' adoption and compliance costs. Our results confirm that VEPs tend to attract firms when environmental institutional pressures are higher, and when firms have complementary resources to VEP participation. Further, they suggest that strictly governed VEPs discourage participation when normative and cultural-cognitive institutional pressures are higher, and when firms have prior experience with VEPs. Our study helps answer the question: "Why do firms join VEPs?"

Mind the Other Gap: Means-Ends Decoupling of Environmental Certification

Designated as a "Best Paper" for ONE

Author: **Hyeonjin Cha**; U. of Oregon

Author: **Sangchan Park**; KAIST College of Business

The importance of environmental certification in the

realm of corporate sustainability has been widely discussed, but existing literature has mostly focused on the gap between adopting and implementing certification. We suggest that prior studies have neglected the actual goals and outcomes of environmental certification, and that the notion of means-ends decoupling clearly explains the gap between them. That is, environmental certification schemes are duly implemented and evaluated, yet such activities are not linked to enhancing environmental performance and moving towards accomplishing sustainable development. Using empirical data from the Korean Green Certification, a government program for formally recognizing sustainable technologies, the study finds that the duration of certification is a key source of variation in the outcomes of implementing certification. The findings also show that the effect of certification duration is negatively moderated by the degree of implementation efforts. Implications for organization studies and environmental policies are discussed.

Transparency and Secrecy: Corporate Information Strategies Under Competitive & Stakeholder Pressure

Author: **Patrick J. Callery**; Sprott School of Business, Carleton U.

Stakeholders increasingly pressure firms for action and performance along issues of concern; transparency is a primary mechanism by which firms communicate about these issues with stakeholders. But firms face a tension between satisfying stakeholder demand for greater transparency and maintaining secrecy when those relevant issues are focal to firm motives for information asymmetry or competitive advantage. This study addresses different strategies firms employ to balance stakeholder and competitive pressures for greater transparency with maintaining secrecy. We develop a typology of secrecy strategies along dimensions of non-financial performance with general relevance to multiple stakeholder groups, hypothesize several antecedents of these strategies, and test those hypotheses using rigorous empirical analyses of firm participation in a prominent voluntary disclosure mechanism. Findings indicate

that firms employ different modes of secrecy strategies depending on the prevalent modes of external pressures for transparency. The study contributes to extant theory in competitive secrecy and transparency strategies, and provides insight into nature of secrecy strategies for non-financial information disclosures.

Substainability: Integrated Strategy and the Design of Industry Sustainability Standards (WITHDRAWN)

Author: **Thomas Peyton Lyon**; U. of Michigan

Author: **A. Wren Montgomery**; Ivey Business School

Author: **Jenifer Lynn Robertson**; U. of Western Ontario

In many markets, social movement organizations design private standards and certification systems as a way to improve an industry's social or environmental performance. As the market share of these systems grows, incumbents often fight back by creating competing standards, and many markets now face a bewildering proliferation of standards. The literature offers a number of accounts of standards competition, but with outcomes that vary widely and no coherent theoretical account that can

explain the wide range of outcomes. In order to gain a deeper understanding of competing standards, we conducted a qualitative study of sustainability standards in the North American wine industry, where proliferation of standards is rampant. Building on our qualitative findings, we develop a theory of how industry standards-setting entities choose the breadth, prescriptiveness, stringency and opacity of their labels. Our theory builds on work in economics and political science and argues that incumbents design industry standards with both market and nonmarket objectives in mind. First, they attempt to undercut consumer demand for movement-driven standards by crafting industry standards that can gain wide adoption. Second, they attempt to forestall external community and regulatory pressure by presenting a broad coalition of self-regulating industry participants. Both motivations drive the industry to attract wide participation through standards that are strategically broad, non-prescriptive, lax, and opaque.

User-Perceived Value and Network Effects: A Study about Environment-Oriented Business Platforms

Author: **Diego Gama Amaral**; Fundação Getulio Vargas - EAESP

Author: **Renato J. ORSATO**; Fundação Getulio Vargas - EAESP

The emergence of business platforms has been motivated by cost reduction of data processing combined with the diffusion of the internet and mobile technology. Due to the potential to generate network effects, this technological improvement associated with sustainability goals became a key driver for business model innovation. While the literature about network effects addresses the concept of value only superficially, studies about

Supply Chain Financing, IT Infrastructure Intensity, and Firm Performance: An Empirical Investigation

Author: **Suwendu Naskar**; Indian Institute of Management, Calcutta

Author: **Palash Deb**; Indian Institute of Management Calcutta

Author: **Preetam Basu**; Indian Institute of Management, Calcutta

Author: **Anup Kumar Sen**; Indian Institute of Management, Calcutta

As markets have evolved in an increasingly complex and globalized world, the rapidly transforming capabilities of Information Technology (IT), and its effects on firm performance, have come into sharper focus. Prior studies have established that IT capabilities can have varying degrees of influence on

customer-perceived value in digital economies are inconclusive. Overall, how these research fields relate to each other remains unclear. Therefore, the study presented in this article focused on the interface of the literature about business platforms, network effects, and customer-perceived value, in an environmental sustainability scenario, with particular attention to the impacts of food waste. The research addressed the following question: When do business platforms directly contribute to environmental sustainability in B2B markets? Based on multiple case studies of Brazilian platforms, the results allowed us to formulate three propositions about the contribution of business platforms to environmental sustainability in the B2B market (called environment-oriented business platforms or eco-platforms). First, eco-platforms mediate transactions to reduce market friction and environmental impacts. Second, eco-platforms offer strategic and economic benefits to business users. Third, business platforms and eco-platforms stimulate positive network effects when benefits perceived by buyers and suppliers are higher than sacrifices. The findings provide evidence for platform owners to attract and retain buyers and suppliers due to the stimulus of certain benefits and minimization of sacrifices.

Sustainability-Oriented Innovation with Stakeholders: Achieving System Level Impacts

Author: **Jennifer Goodman**; Audencia Business School

Author: **Jouni K. Juntunen**; Aalto U.

Author: **Minna Halme**; Aalto U. School of Business

Given the centrality of innovation to addressing grand societal challenges, this paper uses a Europe wide data set to identify conditions for sustainability-oriented innovation (SOI). Such challenges cannot be resolved by firms alone but rather in collaboration with stakeholders within the innovation process. Using the focus of 'doing good by doing new things with others' we connect the often technical orientation of SOI research to a relational account of stakeholder collaboration in innovation. We operationalise different measures to distinguish innovation leading to incremental or

firm performance. Moreover, a firm's IT capability can influence several intermediate variables that in turn impact firm performance. We use the Resource Based View (RBV) to add to the literature on how financial supply chain management affects performance, and how IT infrastructure intensity moderates this relationship. Using data on US-based manufacturing firms, we analyse four firm level supply chain finance components, namely, Days inventory outstanding (DIO), Days payables outstanding (DPO), Days sales outstanding (DSO) and Cash Conversion cycle (CCC). Our results indicate that IT infrastructure intensity has a salutary moderating effect on the DIO-performance, DPO-performance and CCC- performance relationships. We can therefore infer the importance of IT infrastructure intensity as a critical resource that complements a firm's financial supply chain management capabilities.

Which is More Effective for Platform Performance: Punishments or Incentives?

Author: **Wei Gao**; Southwest U.

Author: **Yi Liu**; Shanghai Jiao Tong U.

The success of online third-party business-to-business (B2B) platforms relies heavily on simultaneous governance of both sellers and buyers. This study examined and compared the effects of punishments and incentives on seller's opportunism toward platforms, buyers' trust in platforms, and platform performance using data from B2B platforms in China. The results show that punishments (both severity and speed) and incentives toward sellers are negatively related to sellers' opportunism toward platform. The effect of punishment severity is greater than that of punishment speed or incentives on curbing seller opportunism, and the effect of punishment speed is not significantly different from that of incentives. The findings also reveal that both punishment severity and speed toward sellers are positively related to buyers' trust in platform, although their effects are not significantly different from each other. Additionally, incentives toward buyers do not significantly affect buyers' trust in platform, and both punishment severity and speed have a greater

system level impact, bringing the latter to an empirical level. The use of qualitative comparative analysis (QCA) reveals a causal complexity behind SOI. Our findings identify concrete configurations of firm-stakeholder collaboration associated with incremental and system level impact. We demonstrate the influence of timing and stakeholder selection on the innovation outcome. In this way we contribute to understanding how and when collaborating with stakeholders can bolster the system level impacts of innovations and enlighten the future for organisations and institutions faced with grand societal challenges.

Supporting Business Model Innovation for Sustainable Development

Author: **Philipp Trotter**; U. of Oxford

Author: **Aoife Brophy Haney**; U. of Oxford

Meeting the sustainable development goals requires transformation across multiple systems from energy to food and mobility. In order for transformative change to be delivered, policymakers are challenged with directing innovation in much more proactive ways than they have been accustomed to in the past. They are also being challenged to intervene in the implementation phase of innovation and not just early support stages of technology invention and development. Supporting business model innovation (BMI), which is a concept that connects directly to implementation of technologies and new ideas, offers a means for policymakers to meet these goals. But we know very little from existing literature on BMI and sustainability transitions about how policies should be designed in a way that enables BMI for sustainable development. In this paper we draw on the policy mix and business model literatures to understand how BMI can best be supported by policy to enable transformative change. We study the context of off-grid energy in sub-Saharan Africa (SSA) where we observe the emergence of an innovative business model we refer to as Integrated Development (ID). We analyse how the ID model has emerged by conducting 50 interviews with different actors in the off-grid sector. We find that there are tensions for policymakers in setting sector-specific and society-wide strategies.

effect than buyer incentives on building buyer trust. These findings not only make novel theoretical contributions to the B2B platform and governance literature by exploring platforms' triadic governance issue but also provide valuable practical suggestions for platform managers.

E-commerce and E-supply Chain Resources and Capabilities in the Fashion Industry: A Dynamic View

Author: **Lapo Mola**; SKEMA Business School

Author: **Barbara Gaudenzi**; U. of Verona

Author: **Cecilia Rossignoli**; U. of Verona

This exploratory and longitudinal research has been developed from the perspectives of the Resource-Based View (RBV) and Dynamic Capabilities (DC) theories to address how fashion companies configure their supply chain e-business models and which are their distinctive resources and capabilities, focusing particularly on the e-commerce network configuration. A longitudinal multiple case study, based on a pilot test and in-depth interviews with 35 interviewees collected over 2011–2019 at four Italian fashion companies, is used to explore the evolution of the pathways of supply chain e-business models, e-commerce and core capabilities. Results indicate that these evolutions were driven by the optimization of a mix of six core capabilities and dimensions: network structure and flows, relationship governance capabilities, exploitation of information asymmetry, service architecture, core logistics capabilities, Customer Relationship Management capabilities and digital capabilities. Three evolution pathways have been identified —“abandon,” “vertical integration,” and “supply chain orchestration”— driven by product or brand. Given the results of this exploratory study, a framework has been developed, providing an initial study for investigating the evolution of e-commerce using the lens of the RBV and DC theories.

[view paper \(if available\)](#)

Ultimately both are required to achieve transformation but the ways in which they are combined can play an important role in the business model innovation that emerge.

A Critical Review of 'Sustainability' Assumptions in the Transitions Literature

Author: **Ebru Susur**; U. Politécnica de Madrid
Author: **Emrah Karakaya**; KTH Royal Institute of Technology

The research on sustainability transitions addresses globally pressing sustainability challenges. However, the scholars in the field tend to use the term 'sustainability' without reflexivity, often implicitly assuming that the studied transition cases contribute to sustainability. In order address this blind spot, we propose a reflexive critical inquiry framework and review a set of systematically selected cases following this framework. Our review shows that the potential source of unsustainability and alternative sustainability solutions are often overlooked. Moreover, the sustainability-effects beyond the case boundaries are typically not reflected, and trade-offs among social, economic and environmental sustainability are mostly not considered. Finally, a relational consideration of actors is often missing, and time notion has been mostly approached in a linear way. Thus, we urge future transition studies to have a reflexive critical inquiry on the sustainability assumptions and, therefore, suggest our framework as the starting point.

Enhancing Transparency in the Supply Chain: An Information Processing Perspective

Author: **Dominik Roeck**; U. of St. Gallen
Author: **Erik Hofmann**; U. of St.Gallen
Author: **Dale Stewart Rogers**; Arizona State U.

While nowadays' need to enhance transparency in supply chains (TSC) seems undisputable, supply chain management (SCM) scholars and practitioners lack an operationalization of the phenomenon and a clear understanding of how to enhance TSC. This study aims to address this need by applying a multiple case study design with 24 awarded or industry-wide good practice solutions to disclose how focal companies can enhance TSC. Drawing on information processing theory (IPT), this study contributes to the understanding of the phenomenon by placing TSC in context and identifying 29 TSC determinants that have to be attained in order to enhance TSC. The study reveals that although the targeted effect of enhanced TSC is mainly beneficial for the focal company, it requires all relevant supply chain partners to enhance TSC. By presenting the TSC determinants that are required on an intra-firm and inter-organizational level to enhance TSC, we elaborate IPT in the context of TSC.

Scalability in Platforms for Local Groceries: An Examination of Indirect Network Economies

Author: **Lina Wang**; W. P. Carey School of Business, Arizona State U.
Author: **Elliot Rabinovich**; Arizona State U.
Author: **Timothy Richards**; W. P. Carey School of Business, Arizona State U.

Despite a significant rise in consumer interest in local food, supply constraints limit consumer access to these products in many markets. Online platforms for local foods may help solve these constraints. However, there is no empirical research on the economic viability of these platforms. We study this problem by analyzing a two-sided platform subject to indirect network effects. Our analyses reveal the existence of these indirect network effects, as consumers prefer a variety of local vendors and vendors derive greater surplus

change and other persistent problems related to sustainability. Underlying this belief is the assumption that innovation, especially when radical enough, brings relevant change. In this paper, we problematize this assumption by shedding light on the role of innovation for maintenance and stability. Drawing on innovation studies and organizational institutionalism we suggest that the question of change versus maintenance is often a matter of level of analysis, which we go on to show through two empirical case studies of radical innovation. By conceptualizing innovation-as-maintenance, we offer a more nuanced discussion on the role of innovation for societal change and sustainability.

from greater consumer demand. Therefore, platforms like the one we analyze may serve as viable alternatives for the commercialization of local groceries, and could provide greater access to local products. Importantly, however, our analysis also reveals the existence of significant non-linearities in the strength of indirect network effects. These are due to the attraction of consumers to the platform marginally decreasing in the number of local vendors and to the existence of marginally increasing delivery costs as more of these vendors join in. As a result, indirect network economies are subject to a cap imposed by the number of vendors participating in these platforms. Through counterfactual simulations, we offer policy recommendations on how to alleviate this constraint.

Transparency, Performance, and Accountability: Handling Disagreements among Institutional Principals

Author: Yousueng Han; Yonsei U.

Author: Shui-Yan Tang; U. of Southern California

Transparency has been assumed to enhance government accountability. Recent studies, however, have suggested complex relationships between transparency and various accountability mechanisms. By conducting new empirical analyses on the Program Assessment Rating Tool (PART) during the Bush Administration, we found that both management transparency and result transparency led to increased presidential budget allocations only when transparency contributed to higher performance ratings. Result transparency, but not management transparency, directly affected congressional budget allocations. Result transparency also reduced the differences between presidential and congressional budget allocations;

groups called (i) events, (ii) social interaction and (iii) the use of tools and techniques. As contributions, besides the microprocesses identified in the practices reported by the interviewees, this study presents a systematization of how the knowledge identification occurs in the context of project management, which allows organizations to interfere in their processes and activities with the microprocesses that best fit them to the reality of projects according to their complexity, criticality or innovation.

An Effective Risk Mitigation Plan: A Benefits-Oriented Model

Author: **Elham Merikhi**; Australian National U.

Author: **Mehdi Rajabi Asadabadi**; Australian National U.

Author: **Ofer Zwikael**; Australian National U.

Projects are generally associated with unexpected events that may pose a risk to project success. To manage risk, a selection of mitigation actions (i.e., a risk mitigation plan) can be considered. The importance of developing models to select the most effective set of mitigation actions can be discerned from the growing literature in the field. However, the existing models mainly identify the selection of mitigation actions that reduce uncertainty with regard to the project's output-related criteria, i.e., time, cost and scope, and neglect the project's long-term objectives, i.e., project benefits. This paper addresses this drawback and for the first time, introduces to the literature a benefits-oriented model capable of identifying the optimal selection of mitigation actions. Based on expected utility theory we developed the project evaluation map to assess project attractiveness considering two dimensions: project risk and project return (project return is a function of project cost and benefits). This study brings a new insight to project risk management by suggesting a risk mitigation plan that most enhances the likelihood of delivering the project's long-term objectives.

[view paper \(if available\)](#)

this effect was larger for discretionary programs. During divided governments, management transparency also contributed to reducing the differences between presidential and congressional budget allocations. These findings show the importance of institutionalizing both transparency and performance evaluation at the same time as a way to improve accountability and reduce conflicts between institutional principals responsible for holding government agencies accountable.

Red Tape, Organizational Performance, and Employee Outcomes: A Meta- Analysis

Author: **Bert George**; Ghent U.

Author: **Sanjay K Pandey**; George Washington U.

Author: **Bram Steijn**; Erasmus U. Rotterdam

Author: **Mieke Audenaert**; Ghent U.

Author: **Adelien Decramer**; Ghent U.

Due to the legacy of the Weberian bureaucracy, bureaucratic red tape (BRT) is omnipresent in public organizations. While the procedures underlying BRT might have been stipulated to ensure equal and fair treatment of citizens, too many procedures become counterproductive. Indeed, there is widespread consensus among public administration scholars that BRT carries negative consequences. Nevertheless, there is a lack of research synthesis on the topic. We conduct a meta- analysis of 90 correlations from 26 public administration articles and ask: What is the impact of BRT on organizational performance and employee outcomes, and which conditions moderate this impact? Our meta-analysis finds that BRT has a significant, negative and small-to-medium impact on organizational performance and employee outcomes. Meta-regression shows that BRT is less harmful to organizational performance in E.U. compared to U.S. samples and in public organizations compared to private organizations. Moreover, external BRT is less harmful to organizational performance than internal BRT.

The Performance Effects of Project Status Misreporting

Author: **Carsten Kaufmann**; Technische U. Darmstadt

Author: **Alexander Kock**; Technische U., Darmstadt

Project steering committees and portfolio boards regularly receive project reports that include the current status of each project, with the projects' health being communicated in form of traffic lights (red, amber, green). This process of status reporting enables decision-makers to efficiently capture the central project status. However, this process is very error-prone, since the project status is subjective and project managers might intentionally choose to misreport the status. Optimistic biasing refers to presenting the status as better, pessimistic biasing refers to presenting the status as worse than it actually is. In this study we investigate the performance effects of status misreporting on project's future development using a sample of 46,474 project status reports from 1,229 projects. Surprisingly, and in contrast to previous literature, we find that optimistic biasing is positively and pessimistic biasing is negatively related to future project margins. Furthermore, the results show that the effects of misreporting diminish over the course of a project and that continuous misreporting negatively moderates the relationship between performance and both types of misreporting.

successful projects paramount to an organization's existence. Utilization of projects to successfully deliver both internal and external outputs is ever more important. Contributing to this movement are improved systems and software, management techniques and availability of trained professional project managers. These factors are increasing the speed and delivery of successful projects. Advanced tools, techniques and methodologies are of critical importance in the world of project management. Unfortunately, a high percentage of projects still fail to meet their stated objectives even with the advent of advanced project techniques and tools. Of crucial importance is the human element. Project activities are performed by people. The individuals in a project scenario carry the flag for success or the torch for failure. This actual experience begs the question: What can be done to improve the likelihood of projects achieving their stated objectives? It is in this context that the concept of flow is introduced. Flow is defined as that moment of human engagement when results exceed expected norms, time loses relevancy, and individuals operate at an optimal level of human performance. This manuscript describes flow, its effect on project success, and how it can be cultivated in a project environment.

The Role of Boundary Spanners in Knowledge Sharing within Inter-Organizational Projects

Author: **Mehrnoush Sarafan**; U. of Bath and Cambridge U.

Author: **Benn Lawson**; U. of Cambridge

Sharing knowledge among multiple organizations is key to addressing adaptation challenges and unforeseen issues involved in the delivery of complex projects. While much research has focused on governance and institutional factors within these projects, less attention has been paid to individual boundary spanners, who act as gatekeepers for the transfer of knowledge to other organizations. We draw on self-determination theory to examine how the mode of governance (shared versus lead) and motivational climate (mastery and performance) affects psychological needs satisfaction, and ultimately, boundary spanners' knowledge sharing

motivation. Results from a behavioral experiment of 256 managers shows that shared versus lead modes of governance enhance knowledge sharing through psychological needs satisfaction. Moreover, while mastery climate facilitates the needs satisfaction and consequently, boundary spanners' knowledge sharing motivation, the results do not show a significant effect of performance climate on knowledge sharing.

Constructing Participation to Strategic Threat

Author: **Sarah Woolley**; Warwick Business School

Author: **Graeme Currie**; U. of Warwick

Top Management Team involvement in strategizing is assumed and undertheorized, despite the problematic contexts that they present for organizational strategizing. We address this by investigating how a top management team construct participation as they develop their strategizing responses to mediate threats in their external environment. Through an ethnographic field study, we show that the TMT organized participation situationally, according to the alternate configuration of three interconnected practices, boundary defining; commitment assigning and conversation constructing. Our analysis revealed three patterns of participation, retro-active participating proactive participating and contested participating, which were associated with the emergence of different strategizing responses. We found that these practices emerged from the group's negotiations related to the interplay between expectations present in the TMT's external organizational environment, their shared group concerns and their individual accountabilities and expertise. We contribute by showing the situated dynamics of TMT participation, through the alternate selection, integration and performance of practices, in relation to their localised group organizing context and the wider social structures, in which they are embedded.

You are Who I Say You are and You Do What I Say You Do: The TMT as Co-Constituted by Middle Manager

Author: **Elena Tavella**; Roskilde U.

Author: **Jane Kirsten Le**; WHU - Otto Beisheim School of Management

This practice-theoretical paper explores how the dynamic interface of top management and middle managers (TMT-MM interface) co-constitutes TMT strategizing. Using the notion of strategic concept, our 12-month inductive case study of the TMT-MM interface at an elite Scandinavian organization explores how the interface co-constitutes TMT strategizing by (i) constructing the 'TMT' in relation to different strategic initiatives, (ii) formulating action expectations, and (iii) proposing or dictating TMT action. We highlight the critical role of communicative practice in the process, with constructive communicative practices leading to indirect TMT strategizing by proposing TMT action, while destructive communicative practices lead to direct TMT strategizing by dictating action. We contribute to the literature on upward strategizing by going beyond influencing to interfacing; we contribute to the literature on strategic concepts to show that different types of strategic concepts exist (content-, process-, and relationship-based) and can influence organizational activity and practice differently. We also demonstrate that concepts are mobilized and contextualized differently as they are employed in specific contexts, and can have effects that go beyond mere sensemaking and legitimizing.

Risk as Threat and Opportunity: The Institutional Logics of Board Risk Management

Author: **Simon Ashby**; Vlerick Business School

Author: **Cormac Bryce**; Cass Business School

Author: **Patrick Ring**; Glasgow Caledonian U.

Organisations make strategic decisions in a world of uncertainty, and their success or failure depends on their ability to organize this uncertainty and exploit or mitigate the associated risks. At the apex of this risk-strategy nexus is the board of directors. We use the institutional logics perspective to investigate how board directors make sense of and act on their authority and accountability for risk management in an environment of conflicting social identities and goals that are bounded by limited resources and

cognition. Through the analysis of 30 semi-structured interviews with executive and non-executive directors we find that boards are struggling to reconcile competing supra-organisational logics of 'risk as opportunity' and 'risk as threat'. Many boards adopt a 'governance and compliance' logic for risk management, emphasizing threat reduction/value protection over the exploitation of opportunities/value creation. A very few opt for a 'strategic-swashbuckling' logic that gives primacy to value creation via opportunity exploitation. We also find evidence of a nascent 'appetite aware' logic, rooted in the object of the risk appetite statement and spread by directors acting as cultural entrepreneurs. Discovery of the appetite aware logic adds to the evidence on logic modularisation and the ability of cultural entrepreneurs to act as change agents by transferring elements of institutional orders from one situation to another. We find that the introduction of a risk appetite statement can influence board risk narratives and management practices.

A New Dimension: The Impact of Institutions on Firm Search (session 1519)

Do Political and Social Ties in China Blunt the Impetus of Problemistic Search?

Author: Qiang Gu; Yonsei U.

Author: Kyung Min Park; Yonsei U.

We develop a contingency model that predicts how political and social network ties affect technological search (R&D expenditures) when key decision makers in firms are confronted with negative performance feedback. We propose that in a negative performance discrepancy context, a firm engaged in less technological search when decision makers had a high proportion of political

concept of slack and legitimacy spillovers, we argue that the willingness to invest corporate resources into socially responsible activities is contingent on the company's level of control, the expansion direction of business group to which the company belongs, and the degree of global competition. Using longitudinal dataset of 553 publicly listed companies in Asian emerging economies, we find that vertical expansion orientation and presence of foreign competition positively modify the relationship between available slack resources and corporate social performance. While we do not find statistical support for structural control, we observe that the ability to exercise control within the business group potentially creates a negative impact on resource commitment for corporate social performance. We highlight the implications of our findings for policy makers and future research on emerging economies and emerging market multinationals.

Social Business Hybrids' Diversification: Effects on Socioeconomic Combined Performance

Author: **Luca Mongelli**; IESE Business School

Author: **Francesco Rullani**; Ca' Foscari U., Venice

Author: **Antonino Vaccaro**; IESE Business School

Author: **Pietro Versari**; Rotterdam School of Management, Erasmus U.

Existing organizational research has extensively investigated how SBHs can preserve their hybridity but has so far provided a limited understanding of the strategic choices undertaken by these kinds of organizations, for example when they diversify in different fields of intervention. Depending on their differentiated or integrated nature, this may impact differently on their combined, socio-economic, performance. In this paper we investigate the case of the integrated SBHs, where social impact and economic returns are pursued through the very same activities and processes. We take the stance coming from the complexity theory of the organization and argue that the interdependence between the social and the commercial dimensions of integrated SBHs rises the overall organizational complexity, adding up to the complexity due to diversification, hindering the combined socio-

involvement (personal political ties) or when the firm was majority-owned by the state (organizational political ties). Similarly, when more decision makers were embedded in the board interlock network (social ties), firms undertook less technological search as a consequence of confirming beliefs by decision makers. Using longitudinal data on listed firms operating in the Chinese manufacturing industry from 2007 to 2017, the empirical findings are consistent with our baseline prediction (problemistic search) and moderation-effect predictions. This research forms linkages between network ties and performance feedback. The moderating roles of political and social ties on problemistic search also provide practical implications for both managers and policy makers.

A Closer Look at Problemistic search: Understanding Strategic Change and Change Enablers Among VCs

Author: **Jake Duke**; Kansas State U.

Author: **Taha Havakhor**; Fox School of Business, Temple U.

Author: **Rachel W. Mui**; Kansas State U.

Author: **Owen Nelson Parker**; UT Arlington

Despite the many advances in the Behavioral Theory of the Firm (BTOF) literature regarding the outcomes of problemistic search, most research has utilized only one search outcome and treated change as unidimensional. Furthermore, research that addresses how firms identify and select appropriate solutions also remains scant. In this study, we first take into consideration the importance of treating change as multidimensional in nature, and incorporate networks theory to explain how a firm's network structure can differentially affect problemistic search beyond our current understanding. Utilizing the venture capital (VC) industry as our context and a longitudinal panel of 718 VCs from 2010 to 2015, our results indicate that firms can change in specific strategic directions (i.e., portfolio shift as opposed to portfolio entrenchment), and such changes can be further facilitated by their network.

[view paper \(if available\)](#)

economic performance. We further advance that the same level of complexity affects also the balance between the social and the commercial components of the combined performance, implying a specific role of diversification on the capability of the SBH to keep its mission and avoid, or foster, its mission drift. We test these and verify predictions by using data from the ISTAT 2011 census of the “Terzo Settore”, the Italian Social Sector.

How do repeated ties influence the international joint venture (IJV) completion? We address this question by considering the joint influences of repeated ties held by foreign and local firms and incongruence/congruence between countries. Repeated ties have been often viewed as an advantage of JV partners, which may help complete the announced IJV deal by the same partners. We argue that the impact of repeated ties on IJV completion depends on whether it meets or violates expectations held by the host atmosphere. Repeated ties have been often viewed as an advantage of JV partners, which may help complete the announced IJV deal by the same partners. We argue that the impact of repeated ties on IJV completion depends on whether it meets or violates expectations held by the host atmosphere. Specifically, drawing on expectancy violations theory, we argue that repeated ties as past fulfilment of expectations by IJV partners increase the likelihood of announced IJV deal completion because past collaborations bring partners into a psychological contract with each other that aligns their expectations for future collaboration. However, such advantage of repeated ties may turn to be a liability when partners' home and host countries experience animosity caused by military conflicts and communication barriers resulting from different languages. Using a sample of announced IJV deals in a global setting, we find supportive evidence of our theoretical predictions.

Birds of the Same Feather? Exploration and Exploitation Alliances and Institutional Ownership

Author: **Malika Chaudhuri**; U. of Dayton

Author: **Jay J. Janney**; U. of Dayton

We examine 17,563 strategic alliance formations among 652 pharmaceutical firms from 1990-2012. We categorize each alliance as either exploitation or exploration, while categorizing institutional shareholders as either dedicated or transient. We

find a significant willingness to pay a 10-17 % price premium for an offer signaling a supplier commitment to good working conditions. We find evidence that this willingness is driven by a combination of 1) formalized requirements, 2) informal expectations, and 3) associations between working conditions and service quality. The presence of informal expectations is particularly important when signaling social ambitions beyond compliance with existing certifications. We also investigate whether a prosocial firm could gain an advantage by presenting good working conditions as a driver of service quality. Our results suggest that while this type of argument would not effectively shift preferences from a low-cost offer to a more expensive offer signaling good working conditions, it is useful when addressing customers with an intrinsic motivation for requiring good working conditions from suppliers.

CEO and Top Manager Succession and Strategic Change (session 1523)

How Successive CEOs Animate the Process of Organizational Becoming: A Meso-Level Analysis

Author: Robert A Burgelman; Stanford U.

Author: Yuliya Snihur; Toulouse Business School

Author: Llewellyn D W Thomas; LaSalle U. Ramon Llull

We study the evolution of Hewlett Packard between 1978 and 2015 and focus our meso-level analysis on how six successive CEOs animated its process of organizational becoming set in motion by the founders. Our longitudinal comparative findings elucidate how all CEOs had to harness the strategic legacy of their predecessors while driving the future through their own strategic leadership. We document temporal interfaces between successive CEOs who mediate the dynamic interplay of the company's external business ecosystem and internal

New Developments in Competition Theory and Policy (session 1524)

Popular press and politicians across the globe are increasingly debating whether innovations to technology and business models are resulting in anticompetitive behavior in the marketplace. While there has certainly been increased attention at the Academy to digital business models, platforms, the internet of things, entrepreneurial finance trends, or artificial intelligence, whether these innovations have changed the nature of competition in the marketplace and whether they challenge existing theory and policy over competition is yet under-explored. Panelists will discuss network and scale effects, data as a key asset/differentiator, operation opaqueness, and endogenous user-specific utility as potential reasons that the way entry barriers are assessed, markets are defined, or consumer welfare is evaluated requires modernization. In doing so, we aim to provoke thoughtful research inquiry and

ecology of strategy-making. While highlighting the importance of CEO agency, our analysis reveals the existential struggle that each CEO faces, in that his or her tenure may not be consistent with continued organizational becoming. It also highlights the paradox that securing fit with the business ecosystem while maintaining evolvability but not attaining dominance of the ecosystem might be key to avoiding sources of strategic inertia that could impede continued organizational becoming. Our analysis indicates novel avenues for further research about the role of CEO agency in organizational evolution.

Prior Peak Attainments of New CEOs: How Task-specific Human Capital Affects Executive Performance

Author: **Alessandra Rizzi**; Pennsylvania State U.

Author: **Vilmos F. Misangyi**; Pennsylvania State U.

Author: **Timothy J. Quigley**; U. of Georgia

Author: **Donald C. Hambrick**; Pennsylvania State U.

We introduce a novel construct for considering the qualifications of new CEOs. This construct, a CEO's prior peak attainment, refers to the highest level of executive responsibility the individual has previously held, particularly the degree to which that highest responsibility approximated the role-set of the focal CEO position. By conceptualizing prior peak attainment as a key element of a new CEO's task-specific human capital, we argue that higher prior peak attainments are associated with better post-succession performance. At one extreme, for instance, we anticipate that CEOs whose prior peak attainments were as functional area heads, but without experience in general management positions, will perform least well as new CEOs; at the other extreme, we expect that those who had previously been CEOs of comparably-sized firms will perform best. We further argue that this relationship between a new CEO's prior peak attainment and post-succession performance is moderated by multiple forms of managerial discretion, in line with the premise that managerial attributes matter only in proportion to managerial leeway. Results from a large-scale empirical study provide strong support for our expectations. We

What Changes After Women Enter Top Management Teams? TMT Cognitions and Strategic Renewal

Author: **Corinne A. Post**; Lehigh U.

Author: **Boris Lokshin**; Maastricht U., School of Business & Economics

Author: **Christophe Boone**; U. of Antwerp

The over-reliance on cross-sectional and lag-structured data in studies theorizing the effects of female representation at upper echelons has triggered repeated calls for research designs that can more reliably establish causal linkages between executive gender and firm outcomes. Addressing this need, we propose a dynamic model that theorizes time-dependent, within-firm linkages, for how changes in a TMT at one point in time (i.e., female TMT appointments) shift the TMT's cognitions, which subsequently causes strategic renewal. Estimating a dynamic OLS model on panel data (1998-2012) from 163 multinationals in 20 countries, we find robust support for our theory and predictions. Following female (but not male) TMT appointments, TMT cognitions shift, becoming less willing to take risks and more receptive to change. Conditions that facilitate the integration of female appointees to the TMT (i.e., TMT female incumbency) amplify those shifts. Subsequently, these TMT cognitive shifts cause a decrease in M&A and an increase in R&D. Our findings suggest that female TMT appointments play an indirect role in reorienting corporate strategies away from M&A towards R&D by shifting TMT cognitions, especially when the TMT includes female incumbents and likely also when the cohort of new TMT appointees is small.

Does Founder CEO Succession Always Lead to Changes?

Author: **Ying Feng**; Xi'an Jiaotong-Liverpool U.

CEO succession events are perceived to be important signal of strategic change in an organization. However, this perception may also be utilized to obtain legitimacy from the environment. In this paper, we use the theory of symbolic management to examine how founder CEO succession events are used to gain legitimacy from external constituents. We propose that in the event of founder CEO succession, the retention of founder CEO as board chair is likely to be negatively related to firm's strategic change. We show that the demand for resources encourages firm and founder CEO to increase visible efforts in improving leadership structure, for example, through appointing a professional CEO. But retention on board as chair enables the founder to continuously exert influences on the firm's strategy without losing legitimacy. We further propose that this relationship will be moderated by post-succession firm performance and founder tenure as CEO. Our empirical analysis of all founder CEO succession events (1994-2010) for firms listed on the Shenzhen Stock Exchange in China provides support for our arguments.

Firm-Stakeholder Relationships and the Institutional Capacity to Manage Horizontal Inequalities

Author: **Brian Ganson**; U. of Stellenbosch Business School

Author: **Tony He**; The Wharton School, U. of Pennsylvania

Author: **Witold Jerzy Henisz**; U. of Pennsylvania

Institutions that fairly distribute benefits, costs, and risks within a market-based economic system reinforce the social contract on which that system is built. When institutions fall short in addressing horizontal inequalities (across identity groups), social and political conflicts escalate. Using tools and constructs from social networks as a meeting point for insights from a range of fields and disciplines that examine institutional evolution in conflict systems, we develop theoretical arguments linking the structural characteristics of firms' relationships with stakeholders—the degree of structural balance, the salience of societal faultlines, and the degree of local network closure—to the local system's institutional capacity to manage horizontal inequalities. When the structure of firm-stakeholder relationships promotes (inhibits) information flow, trust, norms of reciprocity, and intergroup coordination, the institutional capacity to manage horizontal inequalities increases (decreases). We thereby show that the distributional function of institutions is not exogenously determined, but endogenously shaped at least in part by firm-stakeholder relationships. If the declining trust in market-based systems stems in part from their failure to distribute benefits, costs, and risks fairly, then reversing this trend requires a reorientation of firm-stakeholder relationships in a manner that increases the relational embeddedness of the private sector with its stakeholders.

founders' start-up experience and external shareholders, can help start-ups overcome early staffing challenges. However, through a contingency perspective, we demonstrate that a start-up's ability to leverage those initial competences and hire soon after entry is contingent on its strategic orientation towards innovation. Both internal and external competences are likely to be underutilized in less R&D intensive start-ups lacking innovation-based growth aspirations. We find general support for our hypotheses with a rich dataset of Italian innovative start-ups, and additionally show that early staff recruitment is largely characterized by (positive) assortative matching dynamics in the human capital attributes of the demand and supply sides.

Startup Acquisitions as a Hiring Strategy: Worker Choice and Turnover

Author: **J. Daniel Kim**; The Wharton School, U. of Pennsylvania

This study investigates the effectiveness of high-tech startup acquisitions as a hiring strategy ("acqui-hiring") versus traditional hiring. Unlike regular hires who choose to join a new firm on their own volition, most acquired employees do not have a voice in the decision to be acquired. I theorize that this lack of choice instigates organizational mismatch, thereby elevating turnover rates among acquired workers. Using employee-level data from US Census, I find empirical support for higher turnover among acquired workers relative to regular hires, as well as the moderating role of organizational mismatch. Moreover, analysis of serial acquirers suggests that firms learn over time how to effectively retain acquired employees. Together, these results elucidate the conditions under which firms can harness new talent by acquiring startups.

When Consumers Lose Power: An Examination of the Stakeholder Dynamics in the Pharmaceutical Industry

Author: **Zhi Tang**; Rochester Institute of Technology

Author: **Ezekiel Masao Leo**; Rochester Institute of Technology

Author: **Clyde Eiríkur Hull**; Rochester Institute of Technology

Primary stakeholders' pressure has long been considered the main reason that for-profit firms engage in CSR. However, prior studies are generally silent on how industry features can drastically reshape the dynamics between a firm and multiple primary stakeholders. By integrating the economic theory of credence goods with the stakeholder framework, we posit that the extent to which consumers can evaluate the qualities of goods can alter the dynamics between a firm and its two primary stakeholders, i.e., regulators and consumers. Longitudinal data collected 72 public U.S. pharmaceutical companies indicate that consumers of credence goods can be reduced to secondary stakeholder status, exerting influence on firms only through another primary stakeholder. Further, contrary to the conventional wisdom that innovative firms are more capable of resisting pressure from stakeholders, we find that R&D intensity increases the dependency of pharmaceutical firms on regulator. Lastly, we do not find that lobbying directly mitigate regulator's pressure; however, it reduces the dependency of R&D intense firms on the regulator.

This study examines how the human capital of spinout founders is associated with the performance of spinouts by using a U.S. matched employer-employee data set covering all industries. We evaluate several types of human capital and analyze whether these various types of human capital affect spinout performance differently, and how durable the potential impact of these types of human capital are. We examine how these effects differ along two dimensions: whether the spinouts are formed in the same industry as their parents or in a different industry, and whether spinouts are formed in rapidly changing industries or elsewhere. We find that spinout founders' earnings, a measure of their general human capital, has a positive and lasting effect on spinout performance. This effect is stronger when spinouts are formed in rapidly changing industries (as identified by whether an industry is a tech industry) and within their parents' industries. Spinout industry experience and group human capital appear to have positive effects for the performance of spinouts, especially when they are formed outside of the parent industry.

Returns to Entrepreneurial Experience Over the Business Cycle (WITHDRAWN)

Author: **Erin McGuire**; Georgia Institute of Technology

In this paper, I explore business cycle-related dynamics in the returns to entrepreneurial experience. Using time-series geographic variation in economic conditions, I disentangle the effects of shocks to aggregate demand, alternative employment options, and credit availability on differences in firm exit rates between serial and novice entrepreneurs. Weibull survival model estimates indicate that serial entrepreneurs are more likely to endure negative shocks to aggregate income and credit availability, but are relatively more likely to go out of business as slack increases in the labor market. In the second part of the paper, I provide evidence that these dynamics are driven by differences in access to financial resources and business strategies.

Technology Strategy (session 1521)

Technological Diversification, Technological Complexity, and Change

Author: **Aleksey Martynov**; U. of Houston, Clear Lake

I study interactions between technological diversification and technological complexity in their joint effect on firms' invention performance. I argue that their effect depends on the amount of technological change that firms go through. I conceptualize technological change as adjusting the technological boundaries of the firm and changing the relative weights of different technology domains in the firm's portfolio. I show that technological diversification tends to be beneficial for firms' invention performance. However, when a firm's inventions are highly complex, and it is going through the process of technological change, the positive effect of technological diversification disappears. This study contributes to our understanding of boundary conditions impacting the effect of technological diversification on firms' invention performance.

Understanding and Reexamining Search (session 1522)

What Directs Search? Multi-Site Experimental Evidence on the Triggers of Exploration

Author: **Sheen S. Levine**; U. of Texas at Dallas

Author: **Charlotte Reypens**; U. of Texas at Dallas

Author: **Christoph Riedl**; Northeastern U.

Search is a cornerstone of the behavioral theory of the firm. It is theorized as a process, a chain of events: a choice leading to an experience, such as performance feedback, followed by reaction and a subsequent choice. Individuals have regularly been featured in theory and evidence on search, but individual behavior is often presumed, rarely systematically examined. Here we explore the micro-processes of search performed by individual decision-makers. To do that, we designed an experimental task that embodies a canonical exploration-exploitation environment, manipulated conditions, introduced resource constraints, and offered incentives for performance. To the economic behavioral experiments we added protocol analysis, to capture cognition side-by-side with experiences, feedback and resulting behavior. For reliability, we replicated the studies in four populations. The findings support central assumptions of behavioral search, but they also evidence a cognitive source for some macro-phenomena. Search behavior, we find, is largely driven by experiences. Four of them are related to exploration: stable performance (low performance variance), low financial slack, high landscape ruggedness, and negative aspiration-performance gaps. Further complexity arises from interaction effects between performance variance, financial slack, and exceeding aspirations. The evidence contributes to an emergent process-theory of search, one that stresses the cognitive and behavioral mechanisms that underlie organizational

percentage of competitors within a market that have successfully adopted the new technology and the performance of firms that stick with the old technology. This prediction was thoroughly examined using comprehensive data from the traditional Chinese medicine industry in China between 1991 and 1996 and received robust empirical support.

Litigate or Let It Go? Multi-Market Contact and IP Infringement-Litigation Dynamics (WITHDRAWN)

Author: **Luis Diestre**; IE Business School

Author: **Fabrice Lumineau**; Purdue U.

We explore how multi-market contact (MMC) explains the kind of intellectual property (IP) infringement-litigation dynamics that arise within a particular pair of competitors. We build a contingency model in which the role played by each firms in shared markets determines which of the two possible dynamics will arise: mutual forbearance (low probability of IP infringement and high probability of litigation) vs mimetic behavior (high probability of IP infringement and low probability of litigation). Specifically, we examine whether firms are seen by rivals as innovators or imitators in the markets they share and propose that: (1) mutual forbearance dynamics arise when firms see their competitors as innovators whereas (2) mimetic behavior dynamics arise when firms see their competitors as imitators. We find support for our predictions in a sample of 813 patent infringement cases in the biopharmaceutical industry.

PAPER SESSION

ASYNCHRONOUS

Technology purchasing and in-house R&D have always been the main means for enterprises to improve their innovation performance. However, the existing research ignores the specific mechanism of the impact of technology purchasing and in-house R&D on enterprise innovation. Based on panel data of 1551 high-tech companies in ZGC (2008-2015), this study explores and verifies that there are threshold paths for the impact of technology purchases and in-house R&D on enterprise innovation. The study found that there is an enterprise size threshold for the innovation performance of technology purchasing, and the mediating effect of in-house R&D on technology purchase and innovation performance only occurs within the effective size threshold for technology purchasing. This study contributes to a better understanding of the innovation driven by purchasing through building a theory framework combing firm size, complementarity among innovation resources and threshold effect.

Business Model Innovation Capability: The Role of Digitization and Collaboration

Author: **Eduard Esau**; Gottfried Wilhelm Leibniz U.

In the wake of the rapid and ongoing digitization, firms are increasingly forced to not only accelerate the rates at which they innovate products, services, and processes, but also to adopt a holistic approach and constantly realign their value architecture to remain competitive. In this regard, the concepts of dynamic capabilities and business models have emerged as particularly interesting areas for further study. We argue, that these perspectives are strongly linked and the capacity to innovate business models is in fact a dynamic capability, which we refer to as business model innovation

innovation. This model indicates that at the early stage of innovation diffusion, legitimacy-related factors are more important than efficiency-related factors in characterizing the process. Moreover, as long as the new technology is legitimate to some degree, its diffusion process over time will become significantly more driven by efficiency or demand factors, such as network externalities, cost advantage, and function performance.

Different Loci of Digital Innovation in Organizations: A Conceptual Analysis

Author: **Corinna Bertling**; LMU Munich

The rapid advancements in information technology (IT) cause a digitization of innovation processes and outcomes. This trend demands a theoretical reevaluation of the innovation process and its key actors involved. Following a phenomenological approach, we argue that the impetus for digital innovation in large enterprises may reside within different organizational units, namely research and development (R&D), IT units, and the increasingly popular digital innovation units (DIUs) that aim at digitizing organizational innovation. Previous scholars have identified organizational legitimacy as a key concept when it comes to intra-organizational innovation challenges, yet the implications arising from multiple loci of digital innovation are still vague. We thus argue that different forms of legitimacy are needed at certain stages of the (digital) innovation process and seek to unravel the question of how organizational innovation endeavors unfold when R&D, IT, or DIU provide the impetus for digital innovation. In so doing, we first provide a conceptualization of the different forms of legitimacy needed throughout the innovation process. We then distinctively explore the units' assets and liabilities as well as formulate propositions on their advantages in and challenges of obtaining the legitimacy needed. Our paper thus offers much-needed insights into the organizational underpinnings enabling digital innovation.

[view paper \(if available\)](#)

capability (BMIC). Despite the growing importance of this capability, little is known about how firms can actually build it. While prior research points towards the relevance of information processing, internal and external collaboration in innovation processes and the supporting role of digital technologies, there is little empirical evidence in the context of business model innovation underpinning this claim. Using a sample of 154 German firms from the mechanical engineering sector, our study takes up these indications and investigates how a firm's digitization degree, the structure of external innovation networks as well as the internal team composition shapes its BMIC. The estimation results suggest that a higher degree of digitization enhance a firm's BMIC and that a cross-functional team composition and the depth of innovation networks partially mediate this relationship. Overall, our study responds to recent calls for empirical research on the antecedents of dynamic capabilities and business model innovation by shedding light on the role of digital technologies and collaboration as facilitating factors.

Digitalization of Complex Manufacturing - A Disruptive or Sustaining Innovation (WITHDRAWN)

Author: **Ivanka Visnjic**; ESADE Business School

Author: **Wiebke Reim**; Luleå U. of Technology

Author: **Vinit Parida**; Luleå U. of Technology

Author: **David Sjödin**; Luleå U. of Technology

How to approach digital technology, or digitalize, is a question that executives in most industrial manufacturing companies are struggling with. Past evidence from sectors such as newspapers or video rental suggests that digital technology is disruptive for the incumbent companies, calling for the creation of a standalone digital business instead of a gradual digitalization the existing business. Our study provides evidence to the contrary. From experiences of four successful and one unsuccessful industrial incumbent, we isolate the processes of digitalization that lead to success versus failure. Based on this evidence, we argue that industrial incumbents, who approach digitalization as a sustaining innovation succeed, whereas the ones that approach it as a disruptive innovation fail. More specifically, we find that the process of digitalization

A Critical Realist Perspective on Organizations' Approach to Blockchain

Author: **Nadine Kathrin Ostern**; Frankfurt School of Finance & Management

Author: **Friedrich Holotiuk**; Frankfurt School of Finance & Management

Author: **Jürgen Moormann**; Frankfurt School of Finance & Management

Blockchain technology, a decentralized infrastructure validating tamper-resistant transactions, was introduced roughly one decade ago. Till today, numerous financial service providers (FSPs) claim to have developed and test use cases as well as prototypes of blockchain-based solutions. However, hitherto organizations do not scale their existing solutions. As a result, the actual business value of blockchain falls short of the expected business value of the technology. Information systems (IS) researchers increasingly criticize this situation and develop recommendations for FSPs how to foster the adoption of the technology, thereby trying to realize their dream of a fully decentralized blockchain-economy. This paper asserts, however, that despite having good intentions, IS researchers currently neglect an essential characteristic of blockchain technology, i.e., equivocality. IS researchers should consider that FSPs apply the technology not only in different ways but also because of a plethora of reasons and causes, which is why we cannot treat FSPs as equal based on the assumption that they are all 'adopters'. Using a critical realist perspective, we found divergences between FSPs' actions taken toward the adoption of blockchain technology, i.e., what they do, and why and how they adopt the technology. Our results disclose the need to develop more differentiated recommendations that take into account the impact of sensemaking activities as well as the divergent motives of FSPs which induce them to adopt blockchain technology.

Towards a Digital Capability Framework

Author: **Xiaoyue Liu**; The U. of Queensland

Author: **Rui Torres de Oliveira**; Queensland U. of Technology

Author: **Marta Indulska**; U. of Queensland

Author: **Martie-Louise Verreynne**; RMIT U.

Digital technology continues to drastically reshape traditional business. As a result, scholars and practitioners alike are increasingly interested in digital capabilities as a source of competitive advantage and business model transformation. However, despite this interest, digital capabilities are not well nor universally understood in research or practice. Accordingly, in this paper, we define digital capabilities and propose a digital capability framework by synthesizing two streams of literature: information systems and strategic management. On the basis of this synthesis of literature, we argue that digital capabilities involve the ability to dynamically integrate firm resources with digital tools or systems. Moreover, digital capabilities are composed of a series of routines embedded in the firm, which highlight the value of information through a process of collecting, storing, and processing digital data. They also share some characteristics with dynamic capabilities, as they facilitate sensing of changes in the variables within

Prior research extensively addressed the adoption of digital and of green innovations. However, these research streams developed separately from each other, ignoring the complex affordances of digital technologies: Different adopters can use same technological functionalities because of different rationales and for different purposes. Moreover, previous adoption studies have been dominated by “correlational theorizing” (Delbridge & Fiss, 2013), highlighting the isolated effects of diverse adoption antecedents. Addressing these shortcomings, we argue that adoption of digital technologies can be driven by complex configurations of three mechanisms –the economic rationale, the ecological beliefs and values, and the social pressure towards conformity. We integrate these mechanisms within a comprehensive theoretical framework and collect data from 53 “green innovators” – owners of biogas plants in the German’s energy sector that is currently in the midst of transition toward sustainability and digitization. We analyze data by the use of the fsQCA methodology. Our findings reveal four archetypes of adopters that essentially differ with regard to the configuration of adoption antecedents. Our study contributes to the literature by shedding light on new affordances of digital technologies, providing a more comprehensive understanding of technology adoption factors, and developing theoretical bridges between digital innovation research and green entrepreneurship.

Linking Different Artificial Intelligence Functions to Employees’ Psychological Appraisals and Work

Designated as a “Best Paper” for TIM

Author: **Jieqiong Cao**; National U. of Singapore

Author: **Jingxian Yao**; National U. of Singapore

People hold mixed views about adopting artificial intelligence (AI) in the workplace – some believe that AI facilitates work tasks, while others worry that it poses threat to the importance of human labor. To address this conundrum with regard to how employees feel and behave when AI is applied in their jobs, we build upon a typology of AI functions and examine how these functions differentially impact employees’ psychological appraisals and work outcomes. Specifically, we categorize AI into assistive AI, augmented AI, and autonomous AI, and validate a measure of these three AI functions. Drawing on cognitive appraisal theory, we propose that assistive AI will be positively related to opportunity appraisal, autonomous AI will be positively related to threat appraisal, and augmented AI will be positively related to both opportunity and threat appraisal. Opportunity appraisal, in turn, will generate beneficial work outcomes, including increased learning behavior and citizenship behavior and enhanced performance and well-being. In contrast, threat appraisal will elicit detrimental work outcomes. Furthermore, we propose that AI self-efficacy will function as a moderator that weakens the effects of augmented and autonomous AI on threat appraisal. Three studies using diverse samples and methodologies provided strong support for the validity of the AI functions measure and the hypotheses. Theoretical and practical implications of the findings are discussed.

Author: Jiexun Li; Western Washington U.

While single individuals and small teams used to be the primary driving forces of scientific and technological breakthroughs, large teams have become more important in recent years. This raises an important question of how large and small teams may contribute to technological advances differently. According to the combinatorial view of technology, a new technology can simultaneously develop and disrupt different parts of its knowledge base. Hence, we in this study developed a novel dual-index approach that uses disruption and development indexes to quantitatively measure the extent to which a technology disrupts and develops its knowledge base. Using these two indexes, we analyzed a dataset of 5.5 million US patents and found that large teams are more likely to both develop and disrupt previous technologies than small teams. Importantly, our finding is robust and unaffected by different samples and different index operationalization. Our study suggests that scientific contributions have two dimensions – development and disruption – and large teams have advantages in advancing technology in both dimensions than small teams.

Ecosystems & Platforms: TIM Conversations - Ecosystem & Platform Emergence (session 1531)

The Effects of Using Existing Brands in Platform Ecosystems

Author: Yuki Inoue; Hiroshima U.

In platform ecosystems, the complementors' product brand management could have significant effects on both the innovation management and evolution of platform ecosystems. By contrast, use of existing product brands could have long-term negative effects on platform ecosystems: generation of excessive bias in sales results among complementary goods and reduce variety, decrease of the possibility of radical innovation caused by suppression of the creation of new brands. This study tested how facilitating existing brand use influences these indicators, through an empirical agent-based simulation using a dataset of Japanese video game markets. The results showed that although there are positive effects of using existing brands to acquire a large installed customer base, there are also some negative effects. This study indicated that the influence of the facilitation of brand management is largely determined by the platform owner's capability for development of complementary goods. When the platform owner is capable of being a market leader in software development, the facilitation of existing brands may have negative effects for these two indicators, even if the brand facilitation is implemented in conjunction with complementors. By contrast, when brand facilitation is implemented by platform owners without market leader capability, these two factors are improved.

Innovation and Competition

Author: **Laura Rosendahl Huber**; Rotterdam School of Management, Erasmus U.

Author: **Marco Kleine**; Max Planck Institute for Innovation and Competition

We study the causal effect of subsidized R&D collaboration on innovation performance. In particular, we make use of a randomized controlled trial to analyze the effect of an innovation voucher scheme in the United Kingdom that grants small and medium-sized enterprises financial support of up to 5,000 GBP for engaging the services of experts, e.g., from universities, research institutes or IP advisors, when pursuing an innovation-related project. Our findings provide evidence that the innovation voucher program successfully accelerates the execution of R&D projects with short-term effects on innovation outcomes. We find that being awarded a voucher has a positive short-term impact on product development for firms that collaborated with a university. In addition, we find a positive effect on the number of patent applications for firms indicating to be in need for specialist IP knowledge. In terms of collaboration outcomes, we can show that subsidized university-industry collaborations result in an increase of joint ventures two years after the voucher has been awarded.

Interdisciplinary R&D Performance: The Role of Knowledge Variety, Dissimilarity & Complementarities

Author: **Turanay Caner**; North Carolina State U.

Author: **Melissa Appleyard**; Portland State U.

Author: **Beverly B. Tyler**; North Carolina State U.

Author: **Griffin Weber**; Harvard Medical School

As the technological underpinnings of many industrial sectors have advanced, R&D programs targeting “frontier science” often require collaboration across scientific disciplines. This research considers how experience with interdisciplinary R&D can enhance a scientist’s publication performance. We draw on the theoretical grounding of complementarities to understand the payoffs to interdisciplinary collaboration. In the research stage, we anticipate complementarities to arise from the interactions of

How Science-Based Start-Ups and their Innovation Ecosystems are Co-Produced: A Process Study

Author: **Catherine Lynelle Welch**; U. Of Sydney

Author: **Alexandra Kriz**; U. of Queensland

Author: **Maria Rumyantseva**; U. Of Sydney

The concept of an innovation ecosystem has become increasingly popular in recent years, but theories accounting for it are still underdeveloped. Existing studies tend to focus on the components of the ecosystem at a specific point in time, leaving open the question of how the firm-environment interface is constructed and changes over time. Accordingly, this study is an attempt to explain the underlying processes of the firm-ecosystem interface, addressing the question: How does the development of the ecosystem impact the development of the start-up, and vice versa? In order to address this question, we turn to the evolutionary tradition, which has the advantage of being a systemic and process-based perspective. We employ a qualitative process-based methodology to investigate the trajectories of multiple science-based firms. Our theoretical contribution is a process model of how ecosystems emerge, potentially contributing to greater strategic adaptability at the firm level. Our empirical findings provide us the basis for theory extension, going beyond existing literature which posits a positive self-reinforcing process of resource accumulation as driving the development of an ecosystem over time. We propose a second process of dissipation, which forms because of the difficulties in transferring and accumulating experiential knowledge over time. We conclude by arguing that understanding the co-production of firms and their ecosystems have broader implications, particularly for theories of the growth of the firm.

Co-Evolution of Ecosystem Value Proposition Across Institutional Fields: Longitudinal Case Study

Designated as a “Best Paper” for TIM

Author: **Paavo Ritala**; LUT School of Business and Management

Author: **Leena Aarikka-Stenroos**; Tampere U. of Technology

Author: **Devi R. Gnyawali**; Virginia Tech

multiple disciplines to broaden the opportunity set of possible scientific outcomes. In the development stage, interdependencies across disciplines are assumed to be the basis of the relevant complementarities. In both stages, because of the presence of these complementarities, we expect scientists to exhibit an “impassioned commitment” to their R&D projects, which in turn, increases their productivity including their publication count. By assessing the publication performance of 169 scientists who participated in a government-funded interdisciplinary research program in nanomedicine, we find their knowledge variety as well as the dissimilarity of their knowledge when compared to their collaborators are positively associated with their publication performance. We consider knowledge variety and dissimilarity as critical antecedents to interdisciplinary R&D. We hope that funding agencies can apply lessons from our findings to improve R&D effectiveness when interdisciplinary collaboration is required.

'Never Let a Good Crisis Go To Waste': The Impact of the 2014 Ebola Epidemic on West African Science (WITHDRAWN)

Author: **Caroline Fry**; Massachusetts Institute of Technology

Relationships with more prominent affiliates can be crucial to the success of a scientist's career. In practice, relationships with those more elite are limited to high achieving or high potential scientists, making their value very hard to measure. The 2014 West African ebola epidemic afforded scientists working in endemic countries an unexpected opportunity to build relationships with more prominent affiliates from around the globe. Using a matched sample of scientists from non- endemic countries I estimate the effect of the ebola epidemic on international collaborations and publication rates of endemic country scientists. I find evidence of a persistent post- epidemic boost in international collaborations and increases in publication rates. However, these results are only found for those endemic country scientists who were already well connected with international scientists and working in similar disease areas prior to the epidemic. This rare causal evidence highlights the importance of

Ecosystem value propositions for new technologies are created via complex interdependencies between actors, technologies and institutions. Based on a historical case study spanning 30 years, we develop a co-evolutionary process model linked to ecosystems' emerging value proposition. Our study examines how a global ecosystem consisting of diverse actors from business, science, and regulatory agencies developed around the technological innovation of plant stanol ester (a chemical compound) and related functional food products under Benecol brand. Our findings demonstrate how an ecosystem and its value proposition develops around a focal new technology via four interlinked co-evolutionary episodes of discovery, replication, resonance, and friction. Together, these episodes highlight the strategic interdependence between actors leading the ecosystem with other actors across different institutional fields who help to replicate these initiatives, or provide resonance or friction that shape the environment for the value proposition.

Towards Conceptualizing Legitimation in Ecosystems in the Digital Age: Insights from 3D-Printing

Author: **Roman Barwinski**; U. of Bayreuth
Author: **Till Marius Gantert**; U. of Bayreuth

The digital age brings changes of technologies but also of industry boundaries facilitating the emergence of digital categories and ecosystems. Our exploratory study investigates ecosystems in the 3D printing industry. We analyse the intersection of the firm-, category-, and ecosystem-layer considering normative and cognitive legitimacy. Our theorizing is informed by 65 interviews with firms triangulated with expert interviews and with coding of narratives. Findings indicate that the high dynamics in the industry are compensated by strongly coherent norms and values related to normative legitimacy. Cognitive legitimacy forms along physical technology and operations, anchoring strongly on input materials. Firms might strategically address legitimation by three strategies, the passive-adaptive, the developmental-nurture, and the

opportunities to build relationships with more prominent affiliates, but at the same time raise concerns over the potential implications of global networks on inequality within groups of scientists outside the exclusive elite.

Knowledge Management & Learning: Creativity (session 1528)

Group Brainstorming: Should We Build on Prior Ideas?

Author: **Thomas Gillier**; Grenoble Ecole de Management

Author: **Barry Bayus**; Kenan-Flagler Business School, U. of North Carolina at Chapel Hill

Although building on ideas is considered to be highly beneficial for generating creative ideas during brainstorming, there has been very little empirical support for such a practice. Using a verbal protocol research method, we provide a micro-analysis of the build up of 667 ideas generated by nine brainstorming groups of professionals. Using fixed effects panel regression models, we have three main findings. In contrast to conventional wisdom, we find that ideas building on previous ideas are not more creative than ideas that do not. However, our study does show that more novel ideas are generated when ideators build on earlier novel ideas. Finally, we find that ideas that are later built upon are more likely to be selected than ideas that are not. Thus, the general brainstorming rules “encourage wild ideas” and “build on ideas” are good advice only when taken together.

Does CEO Power and Compensation Drive Innovation Performance in the U.S. Pharmaceutical Industry?

Author: **Margaret Kuyor**; Southampton Business School, U. of Southampton

Author: **Jeremy Eng-Tuck Cheah**; Nottingham Business School, Nottingham Trent U.

Author: **Qinging Zhang**; Southampton Business School, U. of Southampton

Author: **Ming-Chien Sung**; Southampton Business School, U. of Southampton

Drawing upon the agency and upper-echelons theory, this article investigates the association between CEO power, compensation and innovation performance by using the U.S. pharmaceutical industry as illustration. We find, first, both CEO power and compensation have curvilinear associations with innovation performance. Second, the long-term compensation or long-term incentive plan (annual stock options, restricted stock, and other long-term compensation) and short-term compensation or cash (salary and bonus) have diverse impacts on the associations between CEO power and innovation performance. Our findings highlight a more profound understanding that CEO compensation plays twofold roles. Precisely, the long-term compensation is indeed a governance mechanism that aligns the interest of powerful agent with the shareholders'. Surprisingly, to an extent, short-term compensation contributes to the

School

Previous studies have focused on exploring the factors that influence employees' 2 distinct types of creativity, i.e., radical and incremental creativity, while very little attention has been paid to the outcomes of creativity and how the two types of creativity interact within individuals. The present study addresses this issue by adopting both variable-centered (correlation) and person-centered (latent profile analysis) approaches for three samples of supervisor- employee dyads data from China (n = 159, 213, and 273). Using variable-centered analysis in sample 1, general creativity was positively associated with the four work performance dimensions, while there was no significant correlation between creativity and well-being. Using person-centered analysis, five very similar creativity profiles were found across samples 2 and 3 based on employees' radical and incremental creativity. These five classes differed in work performance dimensions and well-being, with classes characterized by a high level of incremental creativity profiles reporting a higher level of well-being and classes characterized by a high level of both incremental and radical creativity profiles reporting a higher level of the four work performance dimensions. The results of the present study contribute to uncover the potential outcomes related to employees' creativity by identify distinct profiles of creativity types.

The Relationship Between Top Management Team Diversity and Firm Innovation Output: A Meta-Analysis (WITHDRAWN)

Author: **Svenja-Marie Smolinski**; Heinrich-Heine U. of Dusseldorf
Author: **Jost Sieweke**; Vrije U. Amsterdam
Author: **Florian B. Zapkau**; Vrije U. Amsterdam

We conduct a meta-analysis on the relationship between top management team (TMT) task-related diversity and firm innovation output. Empirical evidence from 74 primary studies containing 25,968 firm observations shows that TMT task-related diversity has a positive relationship with innovation output. Building on this finding, we demonstrate that TMT task-related diversity has a positive association with radical innovation, but not with incremental innovation output. Moreover, we find positive relationships between TMT task-related diversity and innovation output quantity as well as innovation output quality. In some additional analyses, we further show that TMT bio-demographic diversity is not related to firm innovation output. Thus, it seems that diversity in expertise, skills, and knowledge are important for fostering innovation in firms. The study contributes to research on the TMT diversity-firm innovation relationship. Based on the findings, we develop opportunities for future research.

Who Runs the Show? TMT Duality and Firms' Internal Innovation

Author: **Youstina Masoud**; UMass Amherst

This paper introduces and defines TMT duality and

moods influence changes in daily creativity (i.e., controlling for the effects of prior daily moods and creativity) in real organizations. Furthermore, although the importance of physical working environment has been highlighted in the creativity literature, it remains unclear how the dimensions of physical working environment (i.e., adjustable work area and facilitation of informal communication) influence employees' daily creativity as well as moderating the effects of daily activating moods on creativity. Using the daily diary research design, we collect lagged daily data from 70 creative workers across 10 consecutive working days, yielding 662 valid matched daily responses. The results of multilevel path-analysis show that both changes in daily activating positive/negative moods had lagged and positive effects on changes in subsequent creativity, and the physical environment that facilitates informal interactions strengthened these positive lagged effects. In addition, a physical environment that facilitates informal interactions also directly predicted changes in daily creativity. Surprisingly, an adjustable work area attenuated the positive lagged effect of changes in daily activating positive moods on daily creativity.

How the Perception of Organizational Politics Affects Organizational Creativity

Author: **Xiaona Xu**; Liaoning U., Business School

Author: **Chunhui Huo**; Liaoning U. Asia-Australia Business College

Author: **Tariq H. Malik**; Liaoning U.

Author: **Xiaorui Wang**; Liaoning U.

Our understanding of the driving force of organizational creativity is limited. In particular, there has been a lack of investigations on restrictive factors, and the relationship between the perception of organizational politics and organizational creativity has been unexplored. This paper investigates and examines the effect of the perception of organizational politics on organizational creativity and the joint moderating effects of political skill and environmental uncertainty. Based on data from a questionnaire survey of 408 samples, the results show that the perception of organizational politics has a negative

examines its influence on firms' internal innovation. To this end, we build on agency theory and knowledge-based view to explain how TMT duality can negatively influence internal creativity and access to external information making dual TMTs advance less innovative projects that limit personal losses and improve personal financial well-being. Further, the paper identifies TMTs' involvement in R&D, TMTs' compensation structure, and TMTs' tenure as mitigators of the TMT duality-firms' internal innovation relationship. A panel of knowledge intensive firms shows partial support to the proposed model. The proposed framework contributes to the corporate governance and agency body of work by offering a better understanding of the mechanisms behind the overlooked phenomenon of TMT duality. It also advances scholars' understanding of the knowledge-intensive firms' decision-making processes by shedding light on how dual positions of executives may serve as a platform for decision-making that differs from that of non-dual executives.

Project at Stake! Voluntary Stakeholder Responses to Unexpected Events in a Mega Project

Author: **Baris Morkan**; Stevens Institute of Technology

Author: **Heidi Bertels**; Chazanoff School of Business, CUNY College of Staten Island

Author: **Patricia J. Holahan**; Stevens Institute of Technology

Project management is critical to the planning and success of any project. However, unexpected events do occur, and limited information is available of how to deal with such unexpected events. There has been some research in recent years on management of unexpected events in projects, but it has typically been conducted from the perspective of the project manager and the project management team. For the most part this literature assumes that it is the project manager's responsibility to find solutions and courses of action in an endeavor to mitigate the negative effects of unexpected events in projects. However, unexpected events cannot always be resolved by one stakeholder. There is no knowledge about how different project stakeholders

effect on organizational creativity, while political skill plays a moderating role in the relationship between the perception of organizational politics and organizational creativity that depends on environmental uncertainty. When environmental uncertainty is high, political skill can reduce the negative effect of the perception of organizational politics on organizational creativity, and when environmental uncertainty is low, political skill can enhance the negative effect of the perception of organizational politics on organizational creativity. Therefore, this study fills the gap in research on the driving factors, especially the restrictive factors, of organizational creativity, and further clarifies the boundary conditions. It provides a theoretical foundation for companies to summarize local management experience and cope with environmental challenges.

Does Gender Matter? Cognitive Biases and Entrepreneurial Funding

Author: Anushka Iyengar Daut; U. of Pittsburgh

Author: Sharon Alvarez; U. of Pittsburgh

Entrepreneurial funding plays a pivotal role in new venture growth, however, there is a significant disparity in funding based on gender. We argue that the disparity in funding can be explained by linking cognitive biases with gender-specific expectations in entrepreneurial settings. Using social cognition theory, we examine four cognitive biases: overconfidence, an illusion of control, the ability to generalize from small numbers, and an escalation of commitment. We propose that when male and female entrepreneurs demonstrate these biases, there is a direct relationship to the amount of funding they receive from investors and that this relationship differs based on gender. We conducted

was organised including data related to GIs and food patents of 255 European NUTS2 regions over the time period from 2000 to 2011. The data regarding GIs and food patents was collected from the DOOR and the OECD RegPat database respectively. Results show a positive and significant impact of both, GIs and food patents, on the regional manufacturing GVA per employee, but a negative combined effect of these two elements. Similar results, but less significant, are shown on the agricultural labour productivity. The implications of these findings in terms of policy design are then discussed extensively.

IT Capital in Improving National Innovation Productivity: Understanding the IT Productivity Paradox

Author: **Shashi Kant Srivastava**; Indian Institute of Management Sirmaur, Sirmaur, Himachal Pradesh, India

Our paper deals with the issue of the IT productivity paradox. Our research examines the influence of IT capital and IT institution on the national innovation productivity. Applying Hayek's model of the mind, and Bandura's explanation of learning we understand this relationship through the cognitive path dependence model. Using a data set of 137 countries, we perform our analysis. We use the Partial Least Square (PLS) technique of Structural Equation Modeling (SEM) to conduct our investigation. Our empirical findings suggest that the existence of strong IT institutions is essential to transform the presence of IT capital to national innovation productivity. The IT institutions of the nation fully mediate the relationship between IT institutions and national innovation productivity. The direct relationship of IT capital to national innovation productivity is non-significant in the presence of IT institutions.

Tainted Perceptions? An Assessment of Legitimacy Judgments of Entrepreneurial Failures (WITHDRAWN)

Author: **Sonia Siraz**; U. of Pittsburgh

Author: **Julio O. De Castro**; IE U. - IE Business School Madrid, Spain

Author: **Bjorn Paul Claes**; The Open U.

This paper specifically seeks to examine legitimacy perceptions in an entrepreneurial environment. It aims to shed light on how validity cues in the form of stereotypes impact the legitimacy perception of failed entrepreneurs. More specifically, this work investigates how gender and nationality stereotypes affect the legitimacy evaluation of failed entrepreneurs based on a series of conjoint experiments on 2,368 assessments nested in 74 evaluators. Additionally, this study examines how evaluators' beliefs in a just world moderate the relationship between stereotypes and legitimacy judgments, to contribute to a better understanding of how system inequality and prejudicial stereotypes endure. The study establishes that prejudices linked to stereotypes participate in female and immigrant failed entrepreneurs being judged less legitimate than male and native failed entrepreneurs. Moreover, while a higher education level increases the legitimacy perception of failed entrepreneurs, the effect is less for failed female entrepreneurs than for failed male entrepreneurs and less as well for failed immigrant entrepreneurs than for failed native entrepreneurs. Finally, the findings establish that evaluators who hold higher in beliefs in a just world attribute lower legitimacy to failed female entrepreneurs and to failed immigrant entrepreneurs than to failed male and failed native entrepreneurs compared to evaluators who hold lower in beliefs in a just world.

Author: **Laura Zimmermann**; IE U.

Lately, screen time tracking applications have been launched by the biggest mobile technology companies and praised as a solution to mobile phone overuse. These tracking apps provide detailed information about an individual's mobile app usage and supposedly enable users to regain control over their phone habits. This research demonstrates, using a large-scale longitudinal field study and an experimental online survey, that screen time tracking apps are well received by consumers and improve digital self-awareness. However, this improved knowledge does not translate into a reduction of mobile screen time. Conversely, a self-imposed digital nudge—turning one's phone to grayscale mode—may be more effective in reducing screen time. Finally, the results indicate that higher screen time is linked to lower performance (i.e., grade point average) several months later. The findings of this research advance our understanding of how tracking apps influence users' self-awareness, their mobile behavior and long-term consequences for performance.

The Social (de)Construction of Technology and the (dys)Functions of Innovation Systems

Author: **Isla Milne**; McGill U. - Desautels Faculty of Management

The functions of innovation systems model provides a useful tool with which to analyze the dynamics of an innovation system, a system which has often only been studied in its static state. The framework presented in this paper combines the functions of innovation systems approach with the social construction of technology (SCOT) literature to emphasize the social dimension of the technology substitution process. The framework outlines the process by which changes in the social construction of both the incumbent and/or the challenger can lead to functions or “dysfunctions” of their respective technological systems. Equal emphasis is placed on the incumbent technology and the challenger technology, providing a framework that focuses on both sides of the substitution equation. The framework highlights that the social

Effects of Inequality on the Relationship Between Gender, Self-Efficacy, and Entrepreneurial Success

Author: **Alexander Glosenberg**; Loyola Marymount U.

Author: **M.K. Ward**; Curtin U.

Author: **Jeffrey M. Pollack**; NC State U.

Author: **Lori Lea Foster**; North Carolina State U.

Author: **Samuel B Pond**; North Carolina State U.

There is meta-analytic evidence that higher self-efficacy is associated with greater entrepreneurial success; however, there is unexplained variance in this relationship. We predict that higher levels of self-efficacy might not tend to translate as readily into entrepreneurial success for women as they do for men. To test this proposition, we performed a meta-analytic regression on studies ($k=101$) that assessed the relation of self-efficacy with entrepreneurial success. In line with social role theory, we find that the relation between self-efficacy and success in entrepreneurship tends to be lower for women in societies with high gender inequality.

Beyond Knowledge, Skills, and Ability: The Impact of Neurodiversity in New Ventures

Author: **Nicola Anne Thomas**; Technical U. of Denmark

Author: **Carina Lomberg**; Technical U. of Denmark

Author: **Lars Alkærsg**; Technical U. of Denmark

Recent entrepreneurship literature highlights the adaptive benefits of neurological differences for lone entrepreneurs. However, it is not known how neurological diversity plays out within new venture teams (NVT). This paper adopts a strengths-based lens to define neurodiversity and empirically test our neurodiversity model by analysing more than 5,452 Danish NVTs over a nine-year period. Our findings reveal that the inclusion of a neurodiverse founding member enhances team performance; this effect is enhanced for founders who have received treatment. This study contributes to entrepreneurship theory by empirically showing the adaptive benefits of multiple neurodiversity conditions and the positive benefits for founding teams composed of neurodiverse entrepreneurs.

construction of technology is an ongoing process that is occurring throughout the innovation process, even though path dependencies may develop due to feedback cycles between the functions of innovation systems

Effectuation and Bricolage 3 (session 1446)

How Bricolage Influences Green Management in High-Polluting Manufacturing Firms

Author: **Liang Wu**; Guangdong U. of Foreign Studies
Author: **Heng Liu**; Lingnan U. / Sun Yat-sen U.

As green management (GM) matters not only for firms' competitiveness, but also has social and health benefits, both the public and government often expect firms to apply it. Yet, the current literature fails to provide a detailed explanation of how firms in high-polluting manufacturing (HPM) deal with challenges when applying GM activities, despite that these firms may be a key source of environmental problems. To address this research gap, we draw upon a subjectivist view of resource construction to investigate how and when HPM firms in emerging economies can rely on bricolage to boost GM. We tested our research model on a sample of 180 petrochemical manufacturing firms in China. Our results showed that HPM firms can rely on bricolage to positively implement GM but its effects vary in different market and institutional environments. That is, firms can benefit more from bricolage in implementing GM in the context of difficult-to-forecast market change, but its positive effects will be impaired when environmental protection policies change constantly. This study highlights the role of subjective resource construction activities in GM under different market and institutional conditions in emerging economies, and provides novel explanations and policy implications for this emerging phenomenon.

Family Firm: Strategies and Innovation (session 1445)

Increased Innovation Performance through Transgenerational Rejuvenation in Family Firms

Designated as a "Best Paper" for ENT
Author: **Thomas Dorsch**; Philipps-U. Marburg
Author: **Peter Jaskiewicz**; Telfer School of Management, U. of Ottawa
Author: **Jim Combs**; U. of Central Florida
Author: **Torsten Wulf**; Philipps-U. Marburg

Although family firms invest less in innovation, evidence suggests that they generate a relatively higher innovation performance (per unit of investment) than non-family firms. Despite this important difference between family and non-family firms, relatively little remains known about the drivers of the vast innovation performance differences among family firms. Drawing on temporality research, we theorize that transgenerational control intentions increase family business leaders' willingness to enhance the firms' innovation performance to rejuvenate the family business for the next generation. Moreover, we theorize that family successors' (1) past childhood involvement and (2) current leadership involvement reduce family business leaders' uncertainty regarding the feasibility of transgenerational control, further fueling their motivation to enhance innovation performance to rejuvenate the firm. Hypotheses tests using a multi-respondent, multi-time period survey of 190 family leaders and potential successors in 95 private German family businesses support our theoretical framework. A

Dynamics of the Entrepreneurial Process: The Role of Bricolage and Effectuation

Author: **Vanessa Vasconcelos Scazziota**; Fundacao Getulio Vargas

Author: **Luiz Guerrazzi**; Instituto Superior Manuel Teixeira Gomes

Author: **Fernando A R Serra**; U. Nove de Julho - UNINOVE - São Paulo

Effectuation and bricolage are two of the alternative theoretical approaches to entrepreneurship that provide explanations about the entrepreneurial activity in dynamic and resource-limited environments. The focus of this study will be on effectuation and bricolage, considering the need to broaden our understanding of entrepreneurial action beyond the traditional analysis of effectuation and causation. We used a longitudinal process approach to answer the following research questions: How does the entrepreneurial process occur in the light of the effectuation and bricolage? Why does it happen? We analyzed 120 events that influenced the entrepreneurial process in 4 ventures. Our results improved our understanding of the dynamics between bricolage, effectuation, and causation as modes of actions. We showed that bricolage is a preferred mode of action to capture resources and knowledge about these resources to extend its services, while effectuation is a preferred mode of action to acquire abilities. Causation seems to occur due to internal factors, such as the need to internalize routines and structures to improve the business process to gain efficiency or by the pressure of external stakeholders.

The Effect of Owner Birth Order on R&D Investments in Family Firms

Author: **Wen Li**; U. of Technology, Sydney

Author: **Jin-hui Luo**; School of Management, Xiamen U.

The debate on whether family firms are risk-averse or risk-taking in R&D activities is yet inconclusive. Move beyond prior studies assuming family influence as a whole, this study aims to investigate the impact of a nascent but essential factor, family owner's early life experience which is largely captured by their birth orders, on R&D investment decisions. Drawn on evolutionary theory related to birth order effect and family innovation literature, we conceptualize that birth order of family owners will affect how they perceive the preservation of socioemotional endowment and react to risk-taking strategy, namely R&D investment in this study. We propose that later-born family owners tend to be risk-takers and invest more in R&D projects compared with those who are earlier-borns. However, the proposed enduring birth order effect will also be hindered or promoted in the family firms where family management also sets boundaries. We further expect that the positive association between birth order and R&D investments is weakened and strengthened respectively when a family member is a chairperson on the board and when there is a presence of owner-CEO duality. We confirm our hypotheses by using a sample of 747 firm-year observations from Chinese listed family firms during the period of 2006-2014. The results confirm the role of "family" life in an understanding of innovation heterogeneities among family firms, and we believe it also serves as a strong case to cross-pollinate ideas among family business, innovation strategy and family science which is much-needed in management and strategy area.

the process of new venture or new market creation through effectuation processes by conceptualising a stakeholder perspective on commitments to effectual processes and the rationales that underlie them. We argue that while effectual and causal logics sufficiently represent decision-making under instrumental rationality, there is currently a lack of discussion on the subjectively rational motivations that may influence stakeholder decision-making towards entrepreneurial effectual processes under varying levels of uncertainty. While the extant literature suggests that the logic underlying stakeholder commitments to effectual networks and processes will be follow a similar means-oriented rationale to effectual entrepreneur, we suggest different commitments will follow different rationales ranging from instrumentally rationale effectual and causal logics, to subjective logics based upon 'self-belief' and 'faith-reasoning'. Explicating these four ideal types of commitment rationale in a typology in relation to motivation and perceptions of uncertainty, we go on to theorise on how stakeholders employing these different rationales may behave pre- and post-commitment, and the implications these pose for how effectual processes unfold.

Effectuation Across Ecosystems: How Ecosystem Differences Influence Entrepreneurial Actions

Author: **Sylvia Hubner**; National U. of Singapore (NUS)

Author: **Fabian Most**; Ludwig Maximilian U. of Munich (LMU)

Author: **Jochen Wirtz**; National U. of Singapore (NUS)

Author: **Christine Auer**; LMU Munich

This paper shows why and how ecosystem differences influence entrepreneurial decisions and actions. We introduce ecosystem differences as a predictor of effectuation and causation, and explore why and how some ecosystems facilitate and others hinder effectuation (Sarasvathy, 2001). To do so, we draw on 43 qualitative interviews with successful players in three different ecosystems: Silicon Valley, Munich, and Singapore. First, we identify ecosystem specific constellations in culture and attitudes, the

The Impact of Family Ownership on Firm Innovation and the Moderating Effect of Cooperation.

Author: **Taewoo Kim**; Mississippi State U.

Author: **Laura Elizabeth Marler**; Mississippi State U.

Research reveals inconsistent findings related to the effect of family ownership on firm innovation. Drawing upon a socioemotional wealth framework, this study sheds light on how family ownership affects firm innovation when considering inter-organization cooperation as a strategic option. We hypothesize that inter- organization cooperation moderates the negative relationship between family ownership and firm innovation and that the moderating effect depends upon the type of cooperative partner and type of cooperative activity. Results support the notion that the negative impact of family ownership on firm innovation can be mitigated by a firm's inter-organization cooperation and that both the type of cooperative partner and type of activity both demonstrate moderating effects. Contributions and future research directions are also discussed.

Innovativeness in the Digital Era: An Empirical Study of Family Influence and Dynamic Capabilities

Author: **Jonas Soluk**; WHU - Otto Beisheim School of Management

Author: **Ivan Miroshnychenko**; Free U. Bozen, Bolzano

New digital paradigms have prompted many firms to innovate their business models. Consequently, new sets of dynamic capabilities are required to cope with these new digital paradigms. We examine the heterogeneity of organizations' dynamic capabilities and introduce such capabilities as a key driver of digital business model innovation (BMI) in family and non-family firms operating in environments with different levels of dynamism. Based on unique survey data from 1,444 German

market and environment, and resources and networks. Second, we illuminate in how far the constellation in each ecosystem drives specific entrepreneurial actions and decisions, and how these mechanisms in turn relate to tendencies towards causation or effectuation in each ecosystem. Our findings indicate that the mechanisms in Silicon Valley facilitate effectuation and discourage causation, whereas the mechanisms in Munich emphasize causation and hinder effectuation; and the mechanisms in Singapore establish a cautious balance of both effectuation and causation. We discuss the implications of these results.

[view paper \(if available\)](#)

PAPER SESSION

ASYNCHRONOUS

family and non-family firms, we examine dynamic capabilities in terms of knowledge exploitation, entrepreneurial capability, risk management, networking, development and change management, and market and customer knowledge, showing that this wide range of heterogeneous dynamic capabilities in combination fully mediates the positive relationship between family influence and digital BMI. Moreover, we find that the mediation effect is stronger for firms operating in environments with high dynamism. However, when examined one-by-one, our findings reveal that not all of the different capabilities play the same role and matter in a dynamic environment. Taken together, these findings highlight that the effect of family influence on digital innovation is more complex than previously thought, which holds important implications for the digital innovation and family business innovation literatures, and offers important insights into the crucial role of capabilities and environmental dynamism in the digital economy.

Bouncing Back from Bankruptcy: Narratives of Entrepreneurial Antifragility

Author: Amit Rawal; Mr

Author: David Sarpong; Brunel Business School

Drawing on antifragility as a lens, we explore UK-based entrepreneurs' accounts of their behaviours and choices to theorise how they managed to bounce back from bankruptcy to restart their new firms. Our findings suggest that antifragility as an entrepreneurial competence enables once bankrupted business owners to identify potentialities and limits of restarting and managing a new venture in ways otherwise overlooked by others. In this way, we illuminate how antifragility as an organising capability could be harnessed by developing a process model that highlights the core

Is Experimentation a Substitute for Experience? The Effect of Experimentation on a Funding Platform (WITHDRAWN)

Author: **Chiara Spina**; Bocconi U.

Author: **Charles Williams**; Bocconi U.

As entrepreneurs start new ventures, they rely on resources they do not own or fully control. In communicating with resource providers, entrepreneurs make specific choices about what they disclose, and this can have a large impact on their likelihood of obtaining the resources they need. We study the description of experimentation- and planning-related activities – prominent aspects of the process of new venture creation – to show that they help elicit support from resource providers. By analyzing 54,337 project descriptions from Kickstarter, we find that describing experimentation- and planning-related activities result in an increase in the likelihood of obtaining funding. These results are replicated through online experiments to address causality concerns. With the growing emphasis among entrepreneurs on experimentation and lean start-up techniques, this research clarifies if sharing these activities helps nascent entrepreneurs gain access to resources.

A Blessing or a Curse? Unicorn Ventures in the IPO Market

Author: **Seowon Joseph Shin**; U. of Washington

Author: **Uisung David Park**; Syracuse U.

This paper investigates the valuation of high-growth entrepreneurial firms labeled as unicorns – private venture firms that are valued more than \$1 billion – during Initial Public Offering (IPO). We explore unicorn valuation at IPO compared to non-unicorns by expanding the entrepreneurial finance literature and contextualizing unicorn phenomenon into underpricing literature with two dominant theories that compete in this context; information asymmetry and ex- ante uncertainty. Using a unique dataset of 226 IPOs in the US including unicorn firms

financing of the immigrant entrepreneurs. For this purpose, we conduct a two-step analysis on systematically selected 37 articles. In the first step, we provide an overall description of the field, while in the second step, we perform a SWOT analysis on different aspects of the field including the units of analysis, the main questions and the use of theories and methods in the field. The review identifies some gaps and weaknesses in the field, suggests potential opportunities for the future research, and highlights some threats that could impede the implementation of the future opportunities. Finally, the review suggests further questions to be explored for the future advancement in the field.

The Effect of Push-Pull Forces and Local Integration on Internal Migrant Entrepreneurship in China

Author: **Tenghao Zhang**; Edith Cowan U.

Author: **Pi-Shen Seet**; Edith Cowan U.

Author: **Janice Redmond**; Edith Cowan U.

Author: **Jalleh Sharafizad**; Edith Cowan U.

There are significant local-migrant and urban-rural dichotomies that stand in the way of China's modernization, which can ascribe to the enormous inter- regional economic and institutional disparities, as well as the longstanding hukou system. With a focus on migrants' home region's and host region's economic and institutional differences, this research investigates how push and pull forces and local integration influence internal migrant entrepreneurship in China. Drawing on an integrated conceptual model which incorporates social integration theory into the push-pull framework, we investigate a national sample of 128,539 internal migrants across the country. The results suggest that push and pull forces and local integration significantly influence migrants' choice of entrepreneurial entry. We also find that social integration plays a mediating role in the relationship between push-pull forces and entrepreneurial entry. Furthermore, we notice that migrants' local integration is also largely driven by push and pull forces. The study advances theory by incorporating the integration theory with the push-pull theory and argues that migrants' entrepreneurial entry

and controlling for potential sampling bias with an instrumental variable approach, we find that unicorn firms are more underpriced than non-unicorn firms in the IPO market that aligns with ex-ante uncertainty theory but against information asymmetry theory. We also examine three moderating factors that support our finding. This paper contributes to literature on entrepreneurial finance, celebrity firms, and unicorn phenomenon.

The Diffusion of New Entrepreneurial Practices Around the World: The Case of Initial Coin Offerings

Author: **Cristiano Bellavitis**; U. of Auckland
Author: **Tom R. Vanacker**; Ghent U. and U. of Exeter
Author: **Douglas Cumming**; Florida Atlantic U.

We examine the cross-country diffusion of a new entrepreneurial practice, namely Initial Coin Offerings (ICOs). Drawing on institutional theory, we argue that governments (including their financial regulators), the media and academic institutions affect the institutional legitimacy of ICOs, thereby influencing their cross-country diffusion. Further, we hypothesize that ICO bans in one country have internationally mobile governance implications that affect the diffusion of ICOs in other countries. We introduce new quarterly data on ICO activity from 73 countries between 2013 and 2017 (inclusive), and present evidence consistent with our new hypotheses and institutional theory. Overall, we offer novel insights on the cross-country diffusion of ICOs, a new entrepreneurial practice, in an increasingly global and decentralized world.

Time, Entrepreneurial Experience(s), and the Meaning of Place: A Study of Migration Discontinuities

Author: **Zografia Bika**; U. of East Anglia (UEA)
Author: **Christos Kalantaridis**; London Metropolitan U.

In this paper we explore how does the meaning assigned to place influence entrepreneurial choices (regarding knowledge resources), and innovation outcomes in rural areas. Drawing insights from the ideas of Alfred Schütz we argue that processes of innovation in rural Cumbria (North West England) stretch beyond its geographical boundaries not only because of the absence of local knowledge generating organizations, though this undoubtedly may act as the trigger, and the background of key actors. Entrepreneurial choices, in our view, are influenced by meanings of place that are neither objective nor shared but individual: shaped by direct experiences and through experiencing the experiences of others over a two-dimensional time (i.e. internally as part of an individual life 'journey' as well as externally as chronological events). This offers a new and more nuanced explanation of how time, experience, and meaning(s) of place influence the entrepreneurial actors' ability to innovate.

Where to Start-Up? Immigrant Opportunity Entrepreneurs' Location Decisions

Author: **Nastaran Simarasl**; California State Polytechnic U., Pomona

Author: **Kaveh Moghaddam**; U. of Houston, Victoria
Author: **David W. Williams**; U. of Tennessee

We draw on sociology (ethnic enclave theory) and economics (location theory) to investigate immigrant opportunity entrepreneurs' start-up location decisions. We used conjoint analysis to explore location decisions made by 79 highly-educated, first-generation immigrants with entrepreneurial intentions. Costs of doing business had a negative impact on location decision likelihood whereas government support positively influenced the likelihood to choose a location. Financial capital access moderated the relationships between costs of business and location decision likelihood. Furthermore, social network support moderated the relationship between government support and location attractiveness for these entrepreneurs.

Enhancing Entrepreneurial Orientation Research: From Theorizing to Measuring

Author: **Birton Cowden**; Kennesaw State U.

Author: **Jintong Tang**; Saint Louis U.

Developed more than thirty years ago, the construct of entrepreneurial orientation (EO) has helped identify which firms are entrepreneurial versus those that have a conservative strategic posture (Miller, 2011). As markets and competitive dynamics have significantly changed, however, in order to ensure EO's relevance for the next 30 years and beyond, the current research identifies issues with current EO research, and proposes some preliminary solutions to tackle both the breadth and depth issues of EO. Drawing upon more profound theoretical foundations, we broaden the EO conceptualization by incorporating both Schumpeterian and Kirznerian perspectives, and we

effective than external attributions (e.g. distancing from failure) in the employment job interview. Additionally, we find that the combination of internal and controllable failure attributions is more effective than those that are external and uncontrollable. Thus, person-centered strategies seem more advantageous than distance-taking strategies. Importantly, we demonstrate that former female entrepreneurs are better off with internal failure attributions, whereas males are better off with external attributions.

Building Trust in Entrepreneurial Teams: The Role of Team Narratives

Author: **Aishwarya Kakatkar**; TUM School of Management, Technical U. of Munich

Author: **Holger Patzelt**; TUM School of Management, Technische U. München

Author: **Nicola Breugst**; TUM School of Management, Technical U. of Munich

Although trust between co-founders is critical for the success of an entrepreneurial team, we have limited insights into what builds a founder's trust in the team. Taking a social information processing perspective, we develop theory on the role of entrepreneurial team narratives in building a founder's cognition-based trust in his or her entrepreneurial team. We focus on two structural dimensions of entrepreneurial team narratives, heterogeneity of narrative topics in a team and uniqueness of narrative topics in a team, hypothesizing that these are positively related to a founder's cognition-based trust in his or her entrepreneurial team. We theorize these relationships to be context-dependent, such that a founder's perceived resource scarcity will negatively moderate the relationships between the structural dimensions of team narratives and a founder's cognition-based trust in the team. We draw on interview and questionnaire data from 102 founders across 43 complete entrepreneurial teams to provide evidence in support of our hypotheses. Not only does our study have implications for research on building trust in entrepreneurial teams, entrepreneurial narratives, and resource scarcity, but it also has methodological implications by

deepen the EO dimensions by linking EO research with effectuation theory. From the measuring perspective, we propose that qualitative studies must commence in order to map out a robust measure that allows not only the distinction between conservative and entrepreneurial firms, but also among entrepreneurial firms in terms of their innovativeness, proactiveness, risk-taking, and forms of market entry, as being entrepreneurial can mean many things (Wales et al., 2020). We hope that through this work, EO will become even stronger and more useful for academia and practice.

The "Emergence" of New Organizations - A Complex Adaptive Systems Perspective

Author: **Su Lyn Cheng**; EMLYON Business School

Author: **Frederic Delmar**; EMLYON Business School

Author: **Gregoire Croidieu**; EMLYON Business School

The establishment of a new organization is a tumultuous process where out of the initial chaos, some entrepreneurial groups succeed in creating order, but many do not. Given the importance of creating new organizations, emergence – the interactive process of lower level independent elements converging, leading to the creation of novel, self-reproducing processes a higher, systems level – has not been sufficiently addressed in entrepreneurship literature. To offer a fresh perspective on this topic, we incorporate the assumptions of complex adaptive systems – a non-equilibrium system; members' self-organization; nonlinear system behavior; and non-reducible emergent entities – to better illustrate systemic conditions necessary to drive emerging processes that act as foundations for new organizations. Complexity science frameworks have proven to be useful for modeling what occurs in rapidly changing systems, such as the emergence of a new organization from entrepreneurial groups. To better illustrate this emergence process from an entrepreneurial group, we incorporate Tuckman's four stage framework of team development: Forming, storming, norming and performing and overlay them with the characteristics of emerging processes. In closing, we suggest several avenues

illustrating how automated topic modeling techniques can be used to study narratives and other texts in entrepreneurship research.

Building Bridges: A Review of the Art in Entrepreneurship and the Entrepreneurship in Art

Author: **Adrienne Callander**; U. of Arkansas

Author: **Michael Cummings**; U. of Arkansas

Arts Entrepreneurship is still in its early stages as an emerging field of academic and scholarly inquiry at the intersection of art(s) and entrepreneurship. As such it is still in the process of defining its own scope and boundaries. In this article, we examine entrepreneurship's recent treatment of art (and vice versa) to explore and describe the hidden assumptions evident in each parent discipline's characterization of the "other". To do so, we identify and systematically review 56 articles in leading entrepreneurship journals that address the field or practice of art(s). We first descriptively analyze the breadth of approaches towards art(s) in entrepreneurship scholarship and identify six different roles that art plays. We then use the description as a basis for identifying opportunities for further enriching the arts entrepreneurship field.

Typifications of Contemporary New Venture Units: An Exploratory Analysis of Visual Registers

Author: **Eve-Michelle Basu**; Uppsala U.

Innovation 'labs' and 'garages' and units sometimes simply called 'X' are mushrooming in large corporations. Such new venture units are, however, not a novel phenomenon and have gone in and out of fashion since the 1970s. Extant work conceives of these units as vehicles for corporate venturing and discusses them as places that allow internal new ventures to grow in an environment, designed specifically to support and protect the development of fledgling new ventures with the appropriate culture and routines, until they are ready to be adopted by the mainstream organization. This understanding is, however, colored by the common conceptual and methodological choices of prior research and may overlook other meanings of NVUs. In this study, we thus problematize the 'settled' view of NVUs in the literature and study corporations' intersubjectively shared, situated and culturally embedded ideas about NVUs, and their essential characteristics, that are embodied in visual representations of NVUs. For this purpose, we explore recurring, typified symbolic instantiations of actors and acts, as well as the use of visual language, in 464 images used to present and introduce NVUs on the websites of 30 large, European corporations. We find that the habitat of NVUs, and life inside it, (i.e. NVUs way of working and working conditions) and not ventures and outputs are central to the visual discourse.

Examining the Theoretical Implications of Practical Implications: A Qualitative Meta-Analysis

Author: **J. Kirk Ring**; Louisiana Tech U.

Author: **Jon C. Carr**; North Carolina State U.

entrepreneurs mobilize resources. We theorize that a particular type of story will have a significant impact on an entrepreneur's ability to garner support. Drawing from the literature on resourcefulness, cultural entrepreneurship, and organizational narratives, we develop a conceptual process model centered around the concept of a resourcefulness narrative, which is a story about specific instances of resourceful action by an entrepreneur that is told and retold to potential venture stakeholders. We argue that a resourcefulness narrative generates both an emotional and cognitive reaction among venture stakeholders that draws them in to want to support an entrepreneur. By acting resourcefully and transforming that action into a story, entrepreneurs are able to attract substantially more resources and support for their ventures that they otherwise would.

Author: **Paul L. Drnevich**; U. of Alabama

In management research, theory is of central importance, and as an inherently applied field, the practicality associated with theory development and testing is an important, but due in part to methodological difficulty, generally overlooked contributor to future theoretical insights. To address this important gap, we use a novel qualitative meta-analytic (QMA) technique to synthesize the degree to which practical implications of published academic articles reveal new opportunities to expand or clarify theory. In an effort to illuminate the contributions of practical implications to theory refinement and development, we limit our analysis to the practice oriented domain of strategic entrepreneurship. Our sample includes all quantitative and qualitative research published in the Strategic Entrepreneurship Journal since its inception through the summer of 2019. Through our analysis, we demonstrate how practical implications can generate insights for theory within the context of strategic entrepreneurship, and validate QMA for similar applications across the management discipline.

Social and Sustainable Entrepreneurship: Strategies and Business Models 1 (session 1449)

Business Model and Internationalization of Social Enterprises in Base of the Pyramid Markets

Author: **Filip De Beule**; KU Leuven

Author: **Johan Bruneel**; IESEG School of Management (LEM-CNRS 9221)

This paper analyzes the internationalization of social enterprises, which are firms that take a business-oriented approach to tackling social problems. By focusing on the impact of the configuration of their business model for their international involvement, our study sheds new insights on the relationship between the local specificity and their internationalization. Employing an unique dataset of social enterprises in India, our study shows that social enterprises in which customers and beneficiaries are differentiated, on the one hand, and do not deliver additional activities to create the intended social value, on the other hand, are more likely to internationalize.

The results further indicate that social enterprises that depend primarily on donations are less likely to internationalize. As such we contribute to the social entrepreneurship and international business literature by analyzing the importance of the business model concept for firm internationalization.

Shades of Green: Investigating New Ventures' Attention Upon Sustainability and its Impact on Success

Author: **Verena Hossnofsky**; Friedrich-Alexander U. of Erlangen-Nürnberg

Author: **Franziska Schlichte**; Friedrich-Alexander U. of Erlangen-Nürnberg

Author: **Sebastian Junge**; U. of Erlangen-Nuremberg

This study examines whether new ventures' varying attention upon environmental issues influences their success. Drawing on CSR and entrepreneurship literature, we hypothesize that the financial benefit arising through new ventures' attention upon sustainability is exponentially decreasing for newly founded firms that pay little attention and exponentially increasing for new ventures with high attention upon sustainability. We further propose a moderating role of founder experience. Our results extend previous research by confirming this U-shaped relationship. Additionally, we show that prior work experience of the founder flattens (for low attention), respectively steepens (for high attention) the U-shaped relationship. We contribute to CSR and sustainability literature by focusing on the peculiarities of new ventures and considering different types of sustainability practices. Moreover, we contribute to entrepreneurship literature by conceptualizing and testing attention upon sustainability as an environmental influence factor of new venture success. Furthermore, we contribute to upper echelon literature by implementing prior work experience as a moderating factor.

Modelling the Entrepreneur's Decision on Which Practice Use to Create Sustainable Businesses (WITHDRAWN)

Author: **Alberto Peralta**; U. of Alcala (Spain)

Author: **Javier Carrillo-Hermosilla**; U. of Alcala (Spain)

Author: **Fernando Crecente**; U. of Alcala (Spain)

We have examined how the constructs influencing the entrepreneur's election of the practice to design and test new sustainable business models connect with their use of such eco-innovation practices. We present a comprehensive model aiming at explaining the use of experimentation practices by entrepreneurs, based on an empirical analysis of a sample of Spanish entrepreneurs (N=234). Using the PLS-SEM algorithms and a sound behavioral model, we modeled eleven constructs (Performance Expectancy, Effort Expectancy, Social Influence, Facilitating Conditions, Hedonic Motivation, Habit, Costs, Speed, Funding, Security and Behavioral Intention). Out of them, only three (Effort Expectancy, Hedonic Motivation, and Behavioral Intention) are meaningful; they explain 73% of the variance of the actual use of an eco-innovation practice and its associated experiments to build sustainable business models. Our results are relevant for entrepreneurs, mentors, educators, investors and public administrations as entrepreneurs might be considering only the easiest and more enjoyable innovation practices, independent if they are in line with sustainable objectives.

Strategic Orientations, Founding Imprints, and Social Enterprise Performance

Author: **Yingzhao Xiao**; Tianjin U.

Author: **Zhen Liu**; Shandong U.

The dual business-social nature is fundamental to social enterprises. Drawing upon the strategic orientation arguments, we propose competitor orientation and social orientation as the strategic choices the dual nature of social enterprises manifests and relate the effects of both orientations to their economic and social performance. We further posit that consistency between founding conditions and current strategic behaviors importantly influences social enterprise outcomes. We delineate how different founding imprints, social and founder, interact with strategic orientations in affecting social enterprise performance. Results based on a sample of 230 social enterprises in China show that compatible imprints and strategic orientations enhance performance, and vice versa. Our findings advance understanding of how the dual business-social nature of social enterprises manifests in market behaviors and how an integration of the past and the present can provide a more refined picture of social enterprises.

Broadening our Sight on Workplace Flexibility to Include Under-Emphasized Perspectives (session 396)

Workplace flexibility is ubiquitous in the 21st century. Research over the past 20 years has informed us that workplace flexibility such as telework, flextime, and reduced-load work are of increasing importance to employees' well-being and organizational productivity. However, there are still gaps in the literature, hindering our understanding of workplace flexibility and its impact on employees and employers. For example, past research has overly focused on individual employee perspectives over other stakeholders such as co-workers and supervisors. Furthermore, studies have focused more on FWA adoption and worker attitudes rather than on implementation and objective career outcomes such as performance, promotions, or pay. Dependent variables such as team effectiveness, communication, wages, and promotion/career outcomes have been neglected in favor of commonly examined variables such as well-being and engagement. Well-aligned with the Academy of Management theme, the goal of this symposium is to "broaden our sight" on workplace flexibility by examining these new under-researched issues. The presentations included in our symposium highlight a mix of qualitative and quantitative studies, consider implementation and utilization of FWAs from a multilevel lens, and balance theories with practical problem-solving, directly studying workplace practices that are currently being enacted by a significant number of organizations. Collectively, they provide new insights for understanding workplace flexibility, its impact on employees and employers, and mechanisms that govern the relationship between workplace flexibility and employee and employer outcomes.

Embracing Decolonising-Colonizing Dynamics within Management and Organisational Knowledge (session 400)

It is just about time for management knowledge (MK) to de-discriminate itself and broaden embodied sights by including decolonization, decolonizers and decolonized in a planetary scale. The argument is as follows. MK has been triggered and partially organised by forces of transnational capital, post-Eurocentric Western houses of knowledge, and the post-nation state. It has been counter-balanced by resurging, insurging, emerging peoples, alternatives, borderlands, and 'border' scholars. As such, houses of management knowledge in the US and Europe are increasingly embracing, in particular ways, the argument enunciated collectively at the borderlands of the intercultural pluriversity in the Andean region (Walsh, 2012) and of the decolonizing Western University in South Africa: "the decolonizing project is back on the agenda worldwide" (Mbembe, 2016: 36). Underpinned by such interconnected discourses and intersecting praxis, capitalism dynamics and heterogeneous policies of inclusion-exclusion, the contemporary globalised world in general, and houses of knowledge in particular, are experiencing multiple and under-investigated transitional situations of managing colonizing- decolonizing dynamics (Mignolo & Walsh, 2018). Through this workshop, we would like to make a case for acknowledging and investigating these dynamics not only a legitimate but also an urgent matter within practical-theoretical realms of management knowledge and knowing.

Interdisciplinary Dialogues on Organizational Paradox (session 405)

Increased attention to paradoxical tensions has informed our understanding of organizations, challenging us to frame tensions as an inevitable part of organizational functioning which, when worked through effectively, can enable creativity and more sustainable institutions (Bednarek, Paroutis, & Sillince, 2017; Clegg, Cunha, & Cunha, 2002; Schad, Lewis, Raisch, & Smith, 2016). Yet even as paradox theory emerged more recently within organizational theory, the roots of these ideas date back thousands of years (Smith, Lewis, Jarzabkowski, & Langley, 2017). Initially viewed through the fields of logic, philosophy, and religion, insights about paradox have informed and have been developed in a broad range of disciplines. As such, paradox arrives at the shores of organization theory from vast and varied fields. Expanding our insight about paradox and organizational theory therefore depends on both returning to and reconnecting with these rich interdisciplinary foundations, and using these insights to offer novel cutting-edge research. In this symposium, we engage more deliberately and deeply with these multidisciplinary roots in order to expand our insights about paradox scholarship in organizational theory, while also igniting opportunities for paradox theory to impact critical conversations in other disciplines. By doing so, we accept the challenge of the Academy of Management's annual theme to 'Broaden our Sights' by diminishing false dichotomies and creating connections across broad disciplines and ideologies – including connections to theology, physics, music, and mathematics. This symposium showcases and provides a discussion point for a pending special issue to the Research in the Sociology of Organizations on the same topic, seeking to both look backwards to the multidisciplinary foundations of paradox theory and forward to its ongoing development via this foundation. In doing so, it showcases several thought-pieces in this volume (four papers), advances perspectives on how disciplinary roots can further advance paradox and organizational theory, and also fosters discourse and debate to explore similarities and differences across different foundational disciplines. Specifically, in this symposium, we showcase the breadth of multidisciplinary foundations. We showcase four papers from the special issue (shifting from logics to Ubuntu philosophy; from gender studies to quantum physics). We also offer space to reflect together on this multidisciplinary project via our distinguished discussant who will offer reflections and commentary on this issue and the specific papers at hand.

Believing is Seeing: Motivated Reasoning, Moral Judgments, and Divergent Perceptions of Social Issues (session 404)

Many of the most pressing challenges in the 21st century involve social, moral, and political conflict. This symposium examines barriers to developing a common and clear vision of these important challenges. We present five papers that examine how motivation cognition and disparate perceptions of morality lead to divergent perceptions of social, moral, and political issues and feed into intergroup conflict. Specifically, the papers presented examine how individuals' ideologies and identities influence their attention to inequality, their perceptions of who is moral, and their recollection of political events. Finally, we highlight how recognizing these subjective and myriad perceptions of social issues can inform our understanding of ethical decision-making in organizations. Together, this symposium expands research and theory on how divergent and motivated perceptions contribute to conflict at large and create barriers to addressing important organizational and societal issues.

Boundaries of Markets and Equilibria (session 406)

Ethics in the Anthropocene

Author: **Kevin Morrell**; Durham U. Business School

Author: **Frederik Dahlmann**; U. of Warwick

The label "Anthropocene" signals that humans have become the major force determining the planet's environment. The associated existential threat of climate change prompts challenges for societies, governments, businesses and individuals – whether as customers, consumers, employees or other stakeholders. Interactions between these different agents at different spatial scales prompt challenges to established theories of governance. We suggest that of three major normative traditions: Mill's consequentialism, Kant's ethic of duties and Aristotelian virtue ethics, the language of consequences and duties dominates understanding. Without displacing or losing sight of these insights, we demonstrate the comparative potential of using virtue ethics to respond to the challenges of the Anthropocene. To do so we identify three distinctive foci of virtue ethics: (i) agents rather than acts, (ii) laws and customs versus nature (iii), and the importance of context. We derive implications for governance in the Anthropocene.

boundaries of the discipline. Our research focuses on the central place of animals in certain organizations that we describe as biosocial. Based on the analytical developments of boundary-work, our article makes two contributions to the emerging theory of biosocial organizations. First of all, we highlight a variety of biosocial organizations that do not pursue the same objectives and grant different status to animals. We also highlight the many externalities associated with the functioning of biosocial organizations that strain the equilibriums of the earth system and are at the root of political tensions and ethical questions. In response to the scientific and industrial developments of biosocial organizations and their societal and environmental footprints, our research highlights the need to integrate these organizations as research objects within the theory of organizations and management research. We also bring original developments for boundary-work by showing the importance of taking an interest in the boundaries of living organisms that are challenged by biosocial organizations and which lead to questioning the very notion of the human species.

Beyond Prosperity: How Market-Shaping Firms Advance Progress

Designated as a "Best Paper" for SIM

Author: **Wouter Rosingh**; the OMREUS Companies

Author: **Peter Moran**; China Europe International Business School

Author: **Michele Simoni**; Parthenope U. of Naples

Author: **Han Ming Daniel Chng**; China Europe International Business School (CEIBS)

The contributions to society of market-based economic systems are undeniable and impressive. Markets have mobilized knowledge to deliver significant advances in prosperity, in terms of greater economic wealth. For decades prosperity had been accompanied by equally impressive gains in progress in terms of improved social well-being. However, while prosperity continues to advance, particularly where markets are most efficient, progress seems to have stalled. Today, scholars are again questioning whether prosperity can adequately deliver progress. We answer, in this

paper, that it can—but only if guided by a purpose that is not determined by the blind pursuit of market efficiency and profit maximization. We explain how a relentless pursuit of efficiency allocates resources towards ever greater prosperity but often away from progress. Closing the prosperity–progress gap, we argue, will require a broader role for firms that includes market-shaping. We define market-shaping as the paradoxical process of persistently pursuing a purpose by allocating resources in a way that, on the one hand, shelters them from the market’s forces of efficiency, and on the other hand, redefines what the market indicates is efficient. In this way, markets and firms can reinstate themselves as engines of both prosperity and progress.

Theorizing Radical Conflict: Employment Relations in the Gig Economy

Designated as a “Best Paper” for SIM

Author: **Alessandro Niccolo' Tirapani**; Cass Business School, City U. London

Author: **H. C. Willmott**; City U. London Cardiff U.

Contemporary crises, like mounting social inequalities, trigger an intensification of conflicts arising from the transformations associated with the limits and failings of contemporary neoliberalism. This paper contributes to the responsiveness of our field to these developments. Specifically, it restores and rethinks conflict by moving beyond two well-established frames of reference: functionalism, which conceptualises it as something that must be either excluded or optimised; and structuralism, which marginalises the presence of contingency and interpretation in processes of social reproduction and radical change. Engaging a poststructuralist approach, we examine grievances and conflict in the neoliberal ‘gig economy’. Our analysis discloses how radical conflict is impeded through four key dimensions: ‘radical responsabilisation’, ‘quantification’, ‘universality’ and ‘disembeddedness’. But it also exposes areas of vulnerability to challenges and demands that may prefigure the development of less insecure, unequal organisational forms.

Family Firm: Top Managers (session 401)

CEO Divorce and Firm Performance – The Role of CEO's Family Situation

Designated as a "Best Paper" for ENT

Author: **Mateja Andric**; U. of St. Gallen

Author: **Miriam Bird**; TUM School of Management, Technical U. of Munich

Author: **Karin Maria Kristina Hellerstedt**; Jonkoping International Business School

Author: **Thomas Markus Zellweger**; U. of St. Gallen

We investigate the impact of CEO divorce on firm performance and examine how this relationship depends on the CEO's life stage and the involvement of the CEO's family in the firm. Using data from Statistics Sweden covering the period from 2004 to 2014, we tested our hypotheses using a difference-in-difference design on a matched sample of 2,336 firms, most of which are small firms. With our results we contribute to upper echelons theory by showing that CEO divorce negatively affects firm performance, and that this relationship strongly depends on the length of the marriage, the presence of children, as well as whether the CEO's spouse and children work in the firm. We show that under certain conditions CEO divorce can even have a positive impact on firm performance, in particular in the presence of CEO's children in the firm.

Executive Compensation in Family Businesses: A Review and Framework for Future Research (WITHDRAWN)

Designated as a "Best Paper" for ENT

Author: **Anneleen Michiels**; Hasselt U.

Author: **Isabel C. Botero**; U. of Louisville

Author: **Roland E. Kidwell**; Florida Atlantic U.

Executive compensation can have implications for multiple elements of a family business and its importance to firm competitiveness has resulted in a large body of research in the areas of law, finance, accounting, human resources, organizational behavior, strategy, and economics. This integrative review examines 74 journal articles on executive compensation in family businesses published between 1983 and 2019. We identify theoretical perspectives that have guided this research, contrast executive compensation findings across family firms and between family and non-family firms, point out gaps in the literature, and outline a framework to guide future research. Our framework addresses a missing element in the research of executive compensation in family firms: how the business impacts the family and how the family impacts the business regarding executive compensation.

Family-Firm Transformational Leadership, Familiness, and Performance

Author: **Carolyn Neffe**; Münster U. of Applied Sciences

Author: **Celeste P.M. Wilderom**; U. of Twente
Author: **Frank Lattuch**; Münster U. of Applied Sciences

Familiness is considered one of the most valuable assets of family firms. But how familiness-related forces at the top management level of family firms may work their way into positive firm performance has not been addressed empirically before. The present field study couples upper-echelon theory with team-leadership theory and examines the effects of the transformational leadership style (TFL) of family-based CEOs in top management team (TMT) processes and on firm performance. Survey measures were gathered from 72 CEOs of German family firms as well as from 245 members of their TMTs. We tested the aggregated firm-level data, including objective firm-performance indicators of the 72 German family firms they led. Support was obtained for a four-path mediation model, in which three distinct familiness-related team forces (TMT cohesion, behavioral integration, and efficacy) serve as mediators between CEO TFL and family-firm performance in a series. With our model we focus on the under-researched area of familiness vis-à-vis family-firm performance. Theoretical and practical implications of the findings are discussed, and suggestions are offered for new avenues of family-firm familiness inquiry.

The Delicate Balance Between Family First Behaviour and Formal HR in Family-Owned SMEs (WITHDRAWN)

Author: **Anneleen Michiels**; Hasselt U.
Author: **Diane Arijs**; KU Leuven
Author: **Lorraine Marie Uhlaner**; EDHEC Business School

The objective of this paper is to investigate the antecedents of formal HRM practices in private family firms. More specifically, we look at family-centered noneconomic (FCNE) goals and family governance practices (FGP) through the lens of the behavioural theory of the firm to understand its effect on adopting formal HRM practices. Using regression models on a sample of 293 Belgian family SMEs, our results support the hypothesis that pursuit of FCNE goals is associated with less formalized HRM practices. Additionally, consistent with our second hypothesis, the simultaneous use of FGP while pursuing FCNE goals attenuates this negative effect. One implication of the research is that FGP can be beneficial not only to family but also nonfamily members of the firm.

New Frontiers in Community Research (session 408)

Humans have a fundamental need to belong and to be a part of a community, yet it is said that we are currently living in an “age of loneliness” plagued by isolation, fragmentation, and social disconnection. The changing nature of work offers limited opportunity to create the social glue that binds us together, and thus exacerbates social disconnection. Management scholars have been increasingly concerned with promoting a sense of community (SOC) in organizations. This symposium examines new frontiers in community research. Four of the papers included examine how community can be cultivated in non-traditional organizational settings such as co-working space (papers 1 and 2) and third places that are not the home or workplaces (paper 3) and emerge swiftly in temporary organizations (paper 4). Our collection of papers also addresses the consequences of experiences of community in non-traditional settings on thriving, well-being (paper 1 and 2), employee proactive and prosocial behavior (paper 3), and highlight community as an asset to draw from but also as an obligation or a source of responsibility (paper 5). This symposium integrates qualitative/quantitative methodologies drawing on a variety of micro/macro theoretical frameworks, challenging some of the self-imposed dichotomies around community and thus allows us to see other alternatives to building community in the 21st century and beyond.

Virtual Work and Women's Career Equality: A Double-Edged Sword (session 407)

Research has shown that virtual work can change characteristics of the work environment in ways that have both positive and negative effects for women. Hence, virtual work may be a double-edged sword for women's career equality. A complete understanding of this double-edged sword is critical to determining how to leverage virtual work's benefits for women while at the same time mitigating its negative effects. However, gaining a holistic view of gender dynamics in virtual work is challenging due to the segmented and interdisciplinary nature of this research field, which has occurred in silos related to different virtual work domains (e.g., telecommuting, virtual teams, computer-mediated work) and conducted by scholars from different organizational disciplines (e.g., management, communications, information systems, psychology). This symposium assembles a panel of renowned scholars who study different aspects of gender effects in virtual work. Its interactive format will address the following questions: (1) How has existing research integrated the study of virtual work and gender differences? (2) What key themes have emerged from this research that inform understanding of the implications of virtual work for women's career equality? (3) What are some important future research directions related to gender differences in virtual work?

**Is Gender Diversity a Threat or an
Opportunity? Unpacking Firm
Responses to a Societal Imperative
(session 410)**

Abu Rehan Abbasi

Papers in this symposium examine the responses to, and the consequences of, growing institutional and stakeholder demands for gender equality and inclusion in the labor market. While some firms substantively embrace the value of diversity, others do so only symbolically. Using formal theory, computational models, verbal reasoning, and empirical evidence, we aim to shed new light on the mechanisms and mediators that influence how firms respond to the societal imperative to embrace gender diversity.

be the preferred option given that CSR is traditionally considered outside the scope of firms' core business activities. Yet we found the opposite to be true after the passage of the 2013 amendment to the India Companies Act regulating firms' CSR contributions, based on government data covering all 71,732 CSR projects implemented subsequently. We theorize that firms' choices are driven by a combination of macro-institutional and firm-level considerations. We argue that corporations refrain from contracting with NGOs who specialize in the provision of social goods and are driven to internalize CSR implementation instead due to their concerns about the capability-based and legitimacy-based assets at stake across both levels of analysis. We find empirical support for these arguments. Our findings advance research on CSR and nonmarket strategy, by contributing to our understanding of how macro-institutional factors can influence firms' governance choices in transaction-cost analysis.

Doing Well by Doing Good, Uniquely: The Market Value of Unique CSR Strategies

Designated as a "Best Paper" for STR

Author: **Leandro Nardi**; Insper Institute of Education and Research

Author: **Todd Zenger**; U. of Utah, David Eccles School of Business

Author: **Sergio Giovanetti Lazzarini**; Insper Institute of Education and Research

Author: **Sandro Cabral**; Insper Institute of Education and Research

Even within the same industry, CSR investment patterns across firms often diverge considerably. The capacity to invest in several distinct CSR categories at varying levels (e.g., environmental innovation, diversity, community) leaves firms with a multitude of patterns from which to choose. Drawing from literature on the uniqueness of strategic choices, we theorize that unique CSR strategies, often defined by firms distinctively performing at high levels in selected CSR categories, are likely to be more effective in helping firms access valuable resources provided by particular stakeholders. Using a novel measure of uniqueness of CSR strategies and a database containing

environmental, social, and financial information of 2047 firms between 2002 and 2017, we find a strong positive association between the uniqueness of a firm's CSR performance and market value. Our results suggest that this association persists even when firms perform poorly in CSR categories that are considered more material in their industries. To assure the consistency of our main findings, we address endogeneity concerns by examining two natural quasi-experiments arising from shocks that exogenously increased the importance of corporate reputation and CSR engagement. According to our results, firms with more unique CSR strategies prior to the shocks performed better in the period following these events. Our findings thus confirm the strategic value of CSR uniqueness.

[view paper \(if available\)](#)

Opening the Black Box of Value Appropriation: The Appropriation Ability in Constrained Markets

Designated as a "Best Paper" for STR

Author: **Fernando Deodato Domingos**; Insper Institute of Education and Research

Author: **Sandro Cabral**; Insper Institute of Education and Research

Author: **André Duarte**; Insper Institute of Education and Research

There has been growing interest in how companies appropriate value when interacting with their exchange parties. We contribute to this debate by hypothesizing and testing the role of heterogeneous appropriation abilities of transacting agents (buyers and sellers) on bargaining outcomes in constrained settings. To test our hypotheses, we employ proprietary data from a franchisor of dental clinics focused on the Bottom of the Pyramid (BoP), a market in which value appropriation is particularly relevant because buyers are highly constrained in their ability to pay for high-quality services. Our quasi-experimental design allowed us to identify that the existing constraints of transacting agents are likely to limit the extent of the appropriation abilities of both actors in the negotiating dyad. We show that even sellers with superior appropriation abilities (proxied by previous experience in negotiations) appropriate less value by providing extra discounts when negotiating with buyers with

severe financial constraints. Nevertheless, we observe that sellers with enhanced appropriation abilities reduce their appropriation in the short-term to secure long-term appropriation through recurring purchases from financially constrained buyers.

Illuminating Secrecy in Corporate Political Activity

Designated as a "Best Paper" for STR

Author: **Stanislav Markus**; Darla Moore School of Business, U. of South Carolina

Author: **Timothy Werner**; U. of Texas at Austin

Law-abiding firms often conduct corporate political activity (CPA) covertly, yet such use of secrecy in CPA has not been matched by our understanding of the phenomenon. We rigorously conceptualize the phenomenon of relative "secrecy" or "covertiness" in CPA. Our framework then analyzes the circumstances that prompt firms to conceal their CPA. Specifically, we investigate why socioeconomic stakeholders may object to firms' CPA; why policymakers may cater (or not) to these stakeholders; and how the broader institutional context shapes the preferences of stakeholders and policymakers. We build on theories from multiple disciplines: to understand stakeholders' preferences, we adopt both an economic perspective to examine material benefits or costs and a sociological perspective to examine perceptions of legitimacy; to understand policymakers' incentives and the institutional environment, we draw on scholarship in political science. Our framework addresses multiple levels of analysis including firms, markets, state agencies, political issues, and institutional systems. We argue that theory is particularly important for investigating consequential phenomena that yield scarce data – it is theory which guides data discovery ex ante, helps assess bias ex post, and uncovers key insights that empirical analysis alone cannot generate.

ENT

Institutional Environment (session 411)

Entrepreneurial Engagement and Performance: A Meta-Study on the Effect of Institutional Systems

Designated as a "Best Paper" for ENT

Author: **Lance Jordan Cosaert**; Amsterdam Business School, U. of Amsterdam

Author: **Jatinder Singh Sidhu**; Leeds U. Business School

Building on the varieties of capitalism literature, we examine the extent to which the different modes of coordination that underly institutional configurations influence value appropriation from entrepreneurial engagement. We theorize how the consistency of these modes of coordination across different institutions, in particular, affects value appropriation. Doing so, we test the influence of a collection of formal institutions instead of institutions in isolation of one another. We take stock of prior research and conduct a meta-analysis on the effect of entrepreneurial engagement in small and medium-sized enterprises across 13 OECD countries. The extent to which firms appropriate value from entrepreneurial engagement decreases in contexts that are characterized by inconsistency in the way institutions support firm coordination. Furthermore, this moderating effect of institutional inconsistency is U-shaped. This study adds to previous work on the effect of institutional configurations and comparative capitalism, showing how inconsistency across coordination mechanisms matters for the effectiveness of entrepreneurial engagement. Our findings also have implications for managers and policymakers.

Entrepreneurial workaround practices in severe institutional voids: Evidence from Kenya (WITHDRAWN)

Designated as a "Best Paper" for ENT

Author: **Alisa Sydow**; U. Cattolica del Sacro Cuore

Author: **Benedetto Lorenzo Cannatelli**; U. Cattolica del Sacro Cuore

Author: **Alessandro Giudici**; Cass Business School, City U. London

Author: **Mario Molteni**; Catholic U. of the Sacred Heart, Milan

Entrepreneurs in developing economies rely extensively on informal institutions such as family and political relationships to cope with weak or absent formal institutions. However, in many cases, informal institutions are also unreliable, adding risks and costs to doing business and increasing the severity of institutional voids in the surrounding ecosystem. We investigate the practices followed by 47 entrepreneurs in Kenya to 'workaround' these severe institutional voids to achieve business creation and growth. We find that severe institutional voids create a need for a more strategic orchestration of available means, stimulate the hybridization of goals to include blended impact and economic value, and motivate entrepreneurs to proactively cross-brace the institutional infrastructure around them. We contribute by unveiling the important role of entrepreneurs as microinstitutional agents in developing economies and by detailing how commercial and social goals become intertwined in the context of African entrepreneurship.

Explicating How Institutions Connect the Dots Between Human Capital and Entrepreneurial Aspirations (WITHDRAWN)

Author: **Mircea Epure**; U. Pompeu Fabra and Barcelona GSE

Author: **Victor Martin-Sanchez**; King's College London

Author: **Sebastian Aparicio**; Durham U. Business School

Author: **David Urbano**; U. Autònoma De Barcelona

Drawing from institutional economics and theories on human capital, we study how institutions moderate the relationship between human capital and entrepreneurial growth aspirations (EGA). We propose a multi-level model in which a high regulatory burden and a cultural pressure against failing negatively moderate the relationship between the entrepreneur's human capital and EGA. We test our predictions on a combined dataset of individual- and country-level characteristics, which we obtain from the Global Entrepreneurship Monitor and World Development Indicators for the period 2006–13. We find that informal institutions strongly condition the human capital-EGA relationship in developing countries. However, in developed countries this relationship is highly influenced by formal institutions.

[view paper \(if available\)](#)

When Do Institutions Constrain? A Construal Level Theory of Rule-Breaking Entrepreneurial Action (WITHDRAWN)

Author: **David Lucas**; Syracuse U.

Author: **Caleb Fuller**; Grove City College

The New Institutional Economics tradition emphasizes that institutions enable and constrain entrepreneurial action. Meanwhile, entrepreneurs are known to alter or evade existing rules. Surprisingly little is known about why entrepreneurs are sometimes constrained and other times enabled by the institutional rules of the game. We argue that this is because prior work has treated institutions as “given” constraints that are commonly understood by entrepreneurs. Building on construal level theory, we provide a model in which entrepreneurs subjectively interpret the nature and enforcement of political and social rules. The entrepreneur's institutional distance, or relative proximity to the political process, informs how they construe the rules of the game—facilitating different types of entrepreneurial action. In our model, low institutional distance enables pragmatic action and superior navigation of the existing institutional environment. By contrast, high institutional distance enables divergent thinking and superior deviation from existing institutions, yielding disruptive change. After presenting the model, we briefly discuss how our work enriches the literature on the political economy of technological change. Our work changes the way we think about the entrepreneurial-institutional interface, illuminating how the heterogeneity of entrepreneurial perceptions of the institutional environment yields patterns of rule-breaking and rule-shaping entrepreneurial action.

Computational Approaches to Study Organizations and Markets: New Methodological Frontiers (session 418)

Studying the functioning of organizations and their interactions within markets represents the core of the academic endeavour in the management field. With increasing availability of large-scale data in the form of text, images, and sound, as well as greater computational power, researchers can now refine old research questions and advance our knowledge about organizations and markets. This PDW focuses on acquainting empirical researchers with cutting-edge computational approaches to study organizations and markets, leveraging advances in deep learning and its applications to natural language, image and sound processing. The content of the PDW is relevant to scholars in different fields, including organization management and theory (OMT), strategic management (STR), technology and innovation management (TIM), and entrepreneurship (ENT). Given the broad applicability of the presented tools to other research domains that can leverage similar data, the PDW is also relevant to scholars broadly interested in research methods (RM). The PDW has two main objectives: first, provide empirical researchers with an overview of novel computational approaches to study organizations and markets, and second, create a venue for cross-disciplinary discussion about the relevance and impact of such advances in research methods that encompass a broader audience. To achieve the objectives, we have invited a panel of five prominent scholars in the field, to share their perspective through different disciplinary lenses, research topics, and methodological approaches. An open discussion with the audience will follow the presentations, to favour cross-fertilization of research ideas.

Publishing Rigorous and Impactful Literature Reviews in Business and Management Research (session 416)

The proposed panel symposium aims at turning a spotlight on literature reviews. With an ever-growing body of knowledge in business, management, and organization studies, literature reviews are crucial for the development of an accumulated body of knowledge, advancing theory and guiding future research efforts. Yet little discussion about their roles, different types, and approaches exist. We aim to discuss their roles for building accumulated bodies of knowledge and advancing theory as well as various methodological approaches. We will provide scholars across AOM divisions with advice and guidance for conducting and eventually publishing rigorous and impactful literature reviews. Specifically, this symposium will address several fundamental questions related to literature reviews, including but not limited to the following: (1) What are they, and what are they not? For example, how do they differ from theoretical works and empirical studies? Which journals publish what types of review studies? (2) Why to conduct review studies? For example, (why) do we need reviews in management research? (3) When to conduct them? For example, how mature should an area of research be? (4) How to conduct them? For example, what gets published and what does not? How important are scientific criteria such as transparency, reliability, reproducibility, and how may these be demonstrated?

The Meaning of Work Across Levels of Analysis: Tensions, Dynamics, and Future Directions (session 414)

Research on the meaning of work continues to grow within management research. Through foundational

SIM

Debating Corporate Responsibility in the Era of Digitization and Digitalization (session 420)

Recent technological advancements in artificial intelligence (e.g., algorithms, machine learning, predictive analytics) have brought the phenomena

work on sensemaking (Weick 1995), work orientations (Pratt et al. 2013; Wrzesniewski et al. 1997), and calling (Bunderson & Thompson 2009), scholars have gained a basic understanding of the psychological factors that shape the meaning of one's work. Recently, however, scholars have acknowledged that "the organizational literature on the meaning of work has largely ignored social, other-oriented, and community-based perspectives on the nature of work in favor of individual perspectives" (Rosso et al. 2010: 119). Research—particularly empirical work—on the meaning of work across levels remains small, with several important questions still remaining: how do larger organizational or societal forces (e.g. culture, values, discourse) shape the meaning of work for individuals or groups? How do individuals make sense of conflicting messages regarding the meaning of their work? More broadly, what role do others' perceptions play in the process of constructing meaningfulness? This session brings together a range of scholars who explore these questions.

The Importance of Time & Temporal Theories (session 415)

Job Attitudes: A Meta-Analytic Review and the Creation of a Temporal Theoretical Framework

Designated as a "Best Paper" for OB

Author: **Haley Woznyj**; Longwood U.

Author: **George Banks**; UNC Charlotte

Author: **Christopher Whelpley**; College of Charleston

Author: **John Batchelor**; U. of West Florida

Author: **Frank A. Bosco**; Virginia Commonwealth U.

Given the importance and popularity of employee job attitudes in the academic and popular press, there has been a great deal of construct and theory proliferation in the job attitudes literature. Such growth in the number of job attitudes raises concerns about the potential of construct redundancy. The present review investigated redundancy among seven common job attitudes (organizational commitment, perceived organizational support, job involvement, job satisfaction, job engagement, procedural justice, and distributive justice). Using a set of three primary studies and one meta-analytic study (147 job attitude effect sizes; total $k = 6,530$; total $n = 3,386,552$), our results suggest that true redundancy among job attitudes is not a major concern. Most relations among attitudes fall into the $r = .40$ to $.60$ range. Yet, the findings illustrate that some attitudes are more valuable in predicting key employee outcomes than others. For example, distributive justice explains only an additional 2% of the variance in performance above job satisfaction, the dominant job attitude predictor. We contribute to the literature on job attitudes by advancing a temporal theoretical model that represents a different way of looking at job attitudes based on the results. Individuals bracket their work experiences, which vary in lengths of time; understanding these time periods may help to identify the nuances of job attitudes. Finally, the current review also serves as a job attitudes primer with definitions, applicable theoretical frameworks, scales and items, and empirical relationships between job attitudes and key constructs provided.

Toward a Theory of Subjective Time

Designated as a "Best Paper" for OB

Author: **Brad Aeon**; John Molson School of Business, Concordia U.

Author: **Laura Maria Giurge**; London Business School

Author: **Ashley Whillans**; Harvard Business School

Subjective time plays an essential role in management scholarship, yet remains undefined and theoretically undeveloped. This paper advances a theory of subjective time by addressing three key questions: What is subjective time? How does it operate? And when does it diverge from clock time? We define subjective time as the mental representation and experience of time. Though much of the work on subjective time has been conducted in the cognitive sciences, sociology offers a broader, all-encompassing understanding of subjective time that is more germane to management studies. Accordingly, we draw on the sociology of time to outline the conceptual components of subjective time. The first component, symbolic time, captures the experience of time as a language through which people convey social messages. The second component, internal time, refers to individuals' cognitive and emotional biases associated with the experience of time. The third component, biomechanical time, captures the influence of biological, physical, and technological rhythms on individuals' experience of time. The fourth component, instrumental time, captures the interplay between the strategic use

of time and the experience of time. These components, together, make up the concept of subjective time. Yet, the very essence of organizations and organizational theory is often built on assumptions pertaining to clock time—one of organizations' chief functions is to coordinate, synchronize, and streamline work in order to ensure long-term productivity. Accordingly, this paper makes predictions about when individuals' subjective time diverges from organizations' clock time assumptions. This matters for management theory because individuals often subjectively experience time in ways that are at odds with organizational objectives.

Best Papers II: Markets and Legitimacy (session 417)

Who Can Start a Stock Exchange? Silent Legitimacy, Mundane Materiality, and the Genesis of Markets

Designated as a "Best Paper" for OMT

Author: **Philip Roscoe**; U. of St Andrews

Author: **Katy Jane Mason**; Lancaster U.

This study presents an account of the genesis and development of two stock markets established in London in 1995. It draws on elite interviews and documentary sources to explore how the founders of these markets sought to legitimize them as stable and durable venues for security trade. The analysis accounts for the success of one market, AIM, which adopted a novel organisation and became a model for growth company markets worldwide, and the failure of the other, OFEX, despite a strategy of isomorphic conformity to the expected norms of market operation. The study uses insights from the STS- inflected study of markets to present an account of legitimacy as embedded in taken-for-granted socio-material structures. We term this phenomenon 'silent legitimacy'. The successful market was supported by such silent legitimacy, which outweighed the ostensive strategy of isomorphic regulatory and procedural legitimacy followed by its rival. Contributing to a nascent 'material turn' in institutional theory, the study argues that the markets-as-institutions literature can be strengthened through theoretical engagement with the market- studies literature and empirical attention to the mundane material dimensions of institutional fields.

Good Fun or Laughing Stock? How CEO Trait Humor Affects Social Approval, Reputation, and Legitimacy

Finalist for the OMT Division Best Student Paper Award

Designated as a "Best Paper" for OMT

Author: **Benno Stöcklein**; U. of Passau

We theorize how a CEO's level of trait humor – i.e., the tendency to engage in playful social behavior that establishes incongruent relationship or meaning and, thereby, amuses followers – affects external judgements of the focal organization. Combining the social psychology of humor with research on social evaluations of firms, we argue that CEO humor has differential effects, depending on humor type (positive versus negative, and self-directed versus others-directed) and the category of social evaluations (social approval, legitimacy, and reputation). For instance, we propose that a CEO's inclination to display affiliative humor engenders positive emotions and perceptions of social closeness and, in turn, social approval. Conversely, self-enhancing humor and aggressive humor convey more negative emotions and decrease social closeness and thus lower social approval. Moreover, as humor oftentimes violates expected norms, higher levels of non-affiliative CEO humor negatively affect perceptions of the firm's legitimacy. Interestingly, aggressive CEO humor can foster firm reputation, as it demonstrates a CEO's confidence in future performance and conveys self-beliefs of superior status. We also theorize that the effects of CEO humor differ, depending on the CEO's celebrity and the type of external evaluators. Our analysis contributes to research on corporate reputation, executive personality, and leader humor.

You Jump, I Jump: A Bundle-Based Perspective of Category Membership

Finalist for the OMT Division Best Paper Award

Designated as a “Best Paper” for OMT

Author: **Jie Yang**; State U. of New York Polytechnic Institute

Author: **Stan X. Li**; City U. of Hong Kong

Extant studies in category research has increasingly focused on the horizontal structure of the category system and incorporated the interconnectedness between categories into their analyses. However, we know relatively little on different types of connections a category can build with other categories and to what extent different types of connections will affect a category’s usage in products. We argue that categories bundle together and form different clusters. We refer to a group of aggregated categories as “category bundle” in this paper. We argue that market participants (i.e., producers, audiences, and market intermediaries) are aware of category bundles, and they utilize the bundle-based approach in their evaluation of products. In this sense, not only the overall position of a category in the category system, but also a category’s fitness in the category bundle, affects its chances of appearing in the description of a product. We find support for the bundle-based perspective in our empirical analysis of feature films produced in Canada and the U.S. Our study enriches the understanding of the structure of category system and its impacts on the product market. We also provide a novel explanation on why category spanning remains ubiquitous although existing studies propose that category-straddling products are prone to be punished harshly.

Breaking Out Without Selling Out (WITHDRAWN)

Finalist for the OMT Division Best Paper on Entrepreneurship Award

Designated as a “Best Paper” for OMT

Author: **Minjae Kim**; Rice U.

Based on a theoretical framework that addresses the “motive inference problem,” I identify when and why expansion may be interpreted as betrayal by original customers and when original customers may accept and even welcome expansion. In particular, insofar as the available market size in the original market segment seems too small for survival and sustaining services valued by original customers, expansion to new segments will appear justified as a way to serve original customers. By contrast, when the available market size in the original market segment seems sufficiently large, expansion will raise suspicion of betrayal. This theory is tested in two studies. Study 1 shows that expansion of a microbrewery beyond its home state is associated with lower online ratings from home-state reviewers when the available market size in the home state is large but the same action is associated with higher ratings when the home state’s available market size is small. Study 2, an online experiment on a simulated consumer goods startup, shows that the key driver of the effect is the consumer’s perception of how expansion undermines or augments a startup’s perceived commitment to its original customers.

Health Care Teams and Interactions: New Studies of Key Dynamics (session 1552)

The Relationality of Knowledge Sharing in the Public Sector: Insights from the UK's National Health Service

Author: **Negar Monazam Tabrizi**; U. of Manchester

This study aims to understand how relational dimensions shape individual motivations for sharing experiential knowledge in the public sector, using the example of the National Health Service (NHS) of England. The idea of relationality explored here draws on elements of social network thinking and sees work organizations as social spaces that are given meaning by the interactions among and between individuals. The relational view underpinning this study enabled us to understand better the nature of the social relations shaping experiential knowledge sharing in our case organizations, and how these relationships help in embedding and structuring the process as well as the inherent benefits/utility of the whole process to those involved as well as the organization. These insights support more sceptical readings of current approaches to knowledge sharing in the public sector, particularly the health sector and advance new knowledge on the relational dimensions motivating individuals to share experiential knowledge.

Critical Events at a Critical Time: Setbacks and Shocks in Early Academic Career Stages (session 1567)

Experiencing failure and setbacks in academic careers is almost inevitable. Early career professionals who do not yet have permanent positions may be particularly impacted by these challenges because of the relatively greater job insecurity and lack of resources afforded by such positions. Dealing with setbacks and critical events is especially important because of the events' frequency and the potentially disproportional influence they can have on academics' career trajectories. The four papers within this symposium focus on early career academics and analyze the effects of setbacks and shocks – negative, positive, and neutral in the work and non-work realms – and their influence on performance, resilience, and identity salience. By combining a conceptual paper with several quantitative studies that use key moderators (e.g., gender, resilience, and meaning) and analyze these phenomena and their effects over time, this symposium aims to provide complementary evidence of setbacks, shocks, and their effects on early career academics.

Research Institute

Many primary care organizations are in the midst of a transformation towards delivering team-based care that is coordinated, person centered, and goal oriented. However, taking a team approach to care delivery has proved to be challenging for many teams, particularly when there is a need to work across organizational boundaries. Understanding the mental models of providers and leaders involved in the delivery of team-based primary care is one approach to identify the mechanisms behind effective teamwork. This paper examines the extent to which shared mental models exist among a team that adopted a goal-oriented approach to deliver team-based primary care. We conducted a secondary analysis of a qualitative dataset from a case study of an interdisciplinary and trans-organizational team that successfully transformed the delivery of primary care in Vermont, United States. Using Shared Mental Model Theory, we explicate the content of providers' and leaders' mental models in delivering goal-oriented care (i.e., knowledge and beliefs regarding their task and team). We found evidence of strong shared mental models of goal-oriented care in the team under study. The results provide a framework of key elements of shared mental models which may be required for team-based delivery of goal-oriented care.

RESEARCH

DIVERSITY

SYMPOSIUM

ASYNCHRONOUS

effective emergency care, professionals must integrate rapidly, working across functional, spatial, and professional boundaries. To provide a more holistic understanding of the inherent challenges to professional integration in this setting, we carried out an in-depth case study at a busy, level one trauma center in the Netherlands that recently implemented a reorganization of acute care delivery to improve emergency department flow. Speaking directly with medical professionals at the interfaces of emergency care across two models of care delivery we provide insights into key relational and cultural factors that come to effect supply chain functioning. We find the existence of structural, relational and cultural barriers across both models of care, and demonstrate how each boundary uniquely influences collaboration, and ultimately, patient flow.

Managing Diversity in High-Reliability Teams in the Emergency Department

Author: **Grace Williams**; U. of Queensland

Author: **Gemma Irving**; U. of Queensland

Author: **April L. Wright**; U. of Queensland

Author: **Stuart Anthony Middleton**; U. of Queensland

We examine the question of how High-Reliability Teams (HRTs) manage deep-level diversity, with a particular focus on educational diversity, power diversity and functional diversity. To investigate this question, we conduct a qualitative inductive study of a public hospital emergency department in Australia. Our findings reveal a set of six strategies that HRTs in emergency departments use to manage different types of deep-level diversity. Strategies of active explanations and experience-based task assignment manage educational diversity within HRT team processes. Strategies of deferring to a single-leader and balancing delegation and participative leadership manage power diversity. Finally, strategies of sequential specialist involvement and a co-production mindset manage functional diversity. Our theoretical model of these strategies and their implications for effective and ineffective team processes contributes to the literature by offering nuanced insight into deep-level

diversity in HRTs and opens up new avenues for future process-based inquiry into HRTs.

Recasting Loyalty Dilemmas: Theoretical and Empirical Insights from Social Contexts (session 1568)

Loyalty is highly valued in organizations and business relations, and recent research has shown how loyalty can benefit both organizations and individuals. But there is a “dark side” to loyalty that has begun receiving attention, demonstrating that loyalty can lead to unethical behavior. The present symposium seeks to understand how people navigate loyalty dilemmas, and in so doing moves beyond the typical two-character model of loyalty in organizations: the organization and the loyal or disloyal individual. We will consider how network ties and organizational affiliations shape an actor’s decision to be loyal or disloyal. Specifically, this research investigates how the strength of an employee’s organizational affiliation shapes disloyal behavior, how loyalty can be called upon by colleagues and leaders to take the side of bad actors or do something unethical, and demonstrate the surprising benefits to disloyal behavior. Together, these presentations recast our understanding of the relationship between employee loyalty and organizational performance.

The Challenge and Opportunity of Navigating Multiple Identities at Work (session 1569)

How employees construct and manage their identities at work has important consequences for individuals and organizations (Ashforth & Schinoff, 2016). Yet recent workplace trends are blurring the boundaries between work and non-work domains, bringing increasingly diverse and interrelated sets of identities to bear on workplace dynamics (Ramarajan & Reid, 2013). Despite this, the management literature has little explored how individuals manage and construct multiple identities at work, particularly those that are seen as conflicting, counternormative, or misfit. The current symposium shifts the focus from investigating the effects of a single identity to considering a plurality of identities and the interactions between them. We explore how multiple identities and identity options are constructed and managed, examining how individuals negotiate seemingly incompatible identities; the consequences for individuals when conflicting identities cannot be reconciled; how nascent professionals choose between multiple identity options; and the potential benefits of identifying as a misfit at work.

Career Sustainability and Career Success (session 1534)

Determining a Sustainable Career for the Independent Creative Professional

Designated as a "Best Paper" for CAR

Author: Sofie Jacobs; U. of Antwerp/ Antwerp Management School

Author: Ans De Vos; U. of Antwerp/ Antwerp Management School

This study presents a comparative case study of the careers of 105 creative professionals in Western-Europe . The study looks into both engagement and subjective career success as indicators of sustainable careers. From a Self-Determination Theory perspective, the configurational analysis explores the combination of different conditions regarding engagement and success, namely autonomy, competence, belongingness and job rate. The application of fuzzy set qualitative comparative analysis (fsQCA) contributes to the exploration of a configurational theory of conditions that explains

interpersonal influence. Analyses based on 277 matched supervisor-subordinate dyads data provide support for the hypothesized first-stage moderated-mediation model. Specifically, leader-member exchange mediates the negative relationships between supervisor job insecurity, and subordinate task performance and career satisfaction. Both supervisor psychological resilience and subordinate interpersonal influence attenuate the negative relationship between supervisor job insecurity and leader-member exchange, such that this relationship is less negative when supervisor psychological resilience or subordinate interpersonal influence is higher. In addition, the indirect effect of supervisor job insecurity on subordinate task performance and career satisfaction via a leader-member exchange relationship is weaker when supervisors have higher psychological resilience or when subordinates have higher interpersonal influence.

Career Uncertainty and Decision Making: A Real Options Perspective

Author: **Gregory Hennessy**; Claremont Graduate U.
Author: **Jeffrey Yip**; Simon Fraser U.

Changes in the career landscape call for a rethinking of how people make career decisions. Current perspectives focus on matching career decisions with individual values and interest. This, however, neglects the role of time and uncertainty in a career. In this paper, we unpack how optimal matching approaches to decision making are challenged with the increasing complexity and uncertainty in careers. New approaches to career decision making are needed. Building on the recent application of heuristics to career decision making, we develop a real options perspective to careers and career decision making. In contrast, to an “optimal match” approach to decision making, a real options perspective reframes career decisions not just as point-in-time decisions but as decisions that shape future choices. In this paper, we unpack a set of theoretical propositions that explain the benefits of a real options decision making, particularly in situations of career uncertainty. In addition, we provide a typology of real option heuristics that can

why some creatives (do not) achieve engagement and career success. In order to achieve both engagement and career success, a fulltime occupation as designer seems essential, in combination with high levels of autonomy and competence. No significant proof was found for needing high levels of belongingness. These findings enhance configurational understanding of the independent creative career and the development of a configurational theory of engagement and career success in the creative industries.

Sustainable Careers: Social capital in Transitions Between Wage-Employment and Entrepreneurship

Author: **Heli Helanummi-Cole**; U. of Oxford

In this paper, I develop a conceptual framework that incorporates career transitions between employment and entrepreneurship within the conceptualization of sustainable careers. The framework explores the role of social capital in sustaining and constraining careers that span different forms of work. I argue that career transitions within corporate employment reflect a different mode of organizing, and subsequently different principles of valuation and evaluation than those of entrepreneurship. I propose that career transitions between wage employment and entrepreneurship traverse separate modes of organizing and develop propositions that outline the role of social capital in assisting career moves across divergent principles of valuation and evaluation. While past research has shown the importance of weak ties in supporting career transitions between employment positions, I postulate that both strong and weak ties have a role to play in ensuring the sustainability of career transitions between employment and entrepreneurship.

Resource Profiles in Late Working Life – A Latent Profile Analysis Using the HILDA Panel Survey

Author: **Lee Sarandopoulos**; Australian National U.

Resources are central to both the challenges posed by aging workforces, as well as the strategies that can be used to manage these challenges. This study aims to contribute to the literature on resources and aging at work by providing a novel person-centered approach to resources in late working life. Using Latent Profile Analysis with data from the Household Income and Labour Dynamics Australia (HILDA) Panel Survey, and an extensive typology of resources drawn from the resources literature, five distinct resource profiles are identified in the 50-70 year old Australian worker sample (N = 1361). Differences were found between the five distinct resource profiles on mean intended retirement age, perceived employability, job and life satisfaction 1-year later. Occupational status, gender and marital status were found to significantly decrease the likelihood of belonging to a resource profile with high levels of resources in one or more resource categories. Theoretical implications of these findings for key concepts in the resource and aging at work literatures including successful aging and sustainable employability are discussed.

How to Successfully Adjust to Retirement? Examining the Role of Pre-Retirement Resources

Author: **Yujie Zhan**; Wilfrid Laurier U.

Author: **Ariane Froidevaux**; U. of Texas At Arlington

Author: **Yixuan Li**; Purdue U.

Author: **Junqi Shi**; Zhejiang U.

Successfully adjusting to retirement represents a major challenge for many older workers. Although studies emphasize that successfully adjusting to new life circumstances in retirement may depend on the availability and fluctuation of specific resources, little is known about the impact of multiple pre-

Prior research has documented different aspects of the relationship between managers' past careers and their subsequent executive pay. The literature revolves around the distinction between general and specific experience and their impact on CEO compensation. By contrast, this paper focuses on whether and how a history of entrepreneurial experience influences executive pay. By means of highly detailed register data from Denmark, this paper compares the pay of managers with and without entrepreneurial experience. Simple descriptive statistics indicate that former entrepreneurs tend to have a higher compensation despite sorting into smaller and younger firms. In more sophisticated analyses accounting for individual- and firm-level heterogeneity, I find that this premium holds even after alleviating concerns from unobserved traits. Yet, the presence of a premium for managers with an entrepreneurial career is sensitive to several contingencies, such as the level of success, the time since the last entrepreneurial venture, and the degree of industry relatedness. Theoretical interpretations and potential implications are discussed.

Antecedents of Career Success: The Role of Protean and Boundary-less Career and Job Crafting Behavior

Author: **Yasir Mansoor Kundi**; Aix-Marseille

Graduate School of Management – IAE, France

Author: **Sandrine HOLLET-HAUDEBERT**; IAE Toulon

Author: **Jonathan PETERSON**; Aix-Marseille

Graduate School of Management – IAE, France

This study examines the multiple mediation model between protean and boundaryless career mindsets and career satisfaction through job crafting and career commitment. Drawing on career motivation and job crafting theories, the results of a cross sectional study (French sample = 321) demonstrate that protean and boundaryless careers are associated with subjective career success in the form of career commitment and career satisfaction by way of job crafting. We find that the relationship between protean and boundaryless careers and career satisfaction is serially mediated by both job crafting and career commitment. These results bring

retirement resources availability and change on two distinctive outcomes: the process of successfully adjusting to retirement and, subsequently, the outcomes of such process in terms of post-retirement well-being. The current study draws from retirement adjustment resource-based dynamic theory to argue that multiple pre-retirement resources availability and change facilitate the process through which retirees get used to their new retirement life (retirement adjustment process), and, subsequently, their post-retirement well-being levels and change (retirement adjustment quality). Using archival data from 667 Chinese older workers transitioning into retirement collected with prospective longitudinal research design, we found evidence for positive impacts of multiple types of pre-retirement resources and their latent changes (i.e., financial well-being, family support, and proactive personality) on retirement adjustment process, which was in turn positively associated with post-retirement life satisfaction and its change. Further mediation tests revealed that the indirect effects through retirement adjustment process were statistically significant. The theoretical and practical implications of these findings are discussed.

Shi, 2014). Based on this premise, we explored how retirees re-construct retirement from hindsight. Another purpose of our research was to examine whether retirees distinguish between pre-and post-retirement work. Our analysis of 26 in-depth interviews involving bridge employees revealed that though retirement meant different things to different participants, the view that retirement was a point of departure from an obligatory bread-winner role was a robust one. This seemingly liberating conceptualization of retirement changed the priorities of people in their post-retirement work. Using the Kaleidoscope Career Model, we analyzed how bridge employees distinguish between their pre and post-retirement work. We found that putting oneself first, making a meaningful contribution and having flexibility to pursue pleasure took priority over career goals. Getting a realistic picture of how retirees prioritize different goals in their lives and how they situate work in post- retirement life is an important contribution to the career literature, one which we feel can spawn future research.

Broadening our Sight (Site): Indigenous Economic Development and Socioeconomic Well-Being (session 1538)

In our symposium, participants will share case studies from Indigenous communities across the world to provide nuanced insights into the myriad of Indigenous socioeconomic practices that reflect heterogenous values, traditions, access and proximity to markets, lands and resources, degrees of collectivity, and differing socioeconomic conditions. Presentations will identify and explore a range of entrepreneurial and economic development initiatives and demonstrate how these initiatives engage with a community's particular

term Integration Year that includes an internship and training. The theoretical framework draws on the notions of cultural, social and symbolic capital developed by Bourdieu (1986, 1990). Using data from a large-scale refugee survey we find that Austria's short-term Skills Assessment does not increase refugees' employment chances. The Integration Year is positively related to employment in the case of refugee women. We conclude that programs help finding employment only if they provide refugees with cultural and social capital. We discuss implications for research and practice.

Career Adaptability Process in Refugee Resettlement: The Case of Venezuelans in Colombia

Author: **Yarid Ayala**; EGADE Business School, Tecnologico de Monterrey

Author: **Jaime Andrés Bayona**; Pontificia U. Javeriana

Author: **Aysegul Karaeminogullari**; Assistant Professor, Pontificia U. Javeriana

Author: **Jesus Hernan Perdomo**; Pontificia U. Javeriana Bogotá

Author: **Mónica Ramos-Mejía**; Pontificia U. Javeriana Bogotá

In this study, we test the theoretical model of career adaptability of refugees' successful resettlement proposed by Champion (2018). The theoretical model is grounded on career construction and social network theory. We tested the model in a sample of 87 Venezuelans living and working in Colombia. We combined quantitative and qualitative methodologies. The quantitative results provided partial support for Champion's model. However, an alternative model tested suggest that career adaptability has a direct relationship with subjective resettlement (i.e., life satisfaction and psychological health). In addition, cultural identification played a buffering effect on the harmful effects of discrimination on subjective resettlement. Qualitative results from eight in-deep interviews, helped to analyzed in a deeper way the process that may underlay refugee resettlement, specially the role of social networks, which are important for the migrants, but are not key for a successful work

socioeconomic objectives for social, cultural, environmental, spiritual, and economic value creation. Based on their experiences working with Indigenous peoples, symposium participants will engage the audience in a nuanced discussion of Indigenous community socioeconomic development initiatives, research methodologies and research findings. Our symposium's objectives are to: 1) broaden the sight/site to include Indigenous entrepreneurial and economic ventures and communities worldwide; 2) define the optimal ethical space of engagement in which collaborative research partnerships between Indigenous peoples, communities and organizations can be developed and managed over time; 3) share our stories and experiences about engaging with Indigenous peoples, communities and organizations globally as non-Indigenous allies and Indigenous researchers working to facilitate community self-determination and socioeconomic well-being; and, 4) highlight how Indigenous peoples, communities and organizations are challenging colonization worldwide through developing robust entrepreneurial and economic development ventures that address their community's particular socioeconomic needs, values, and objectives on their terms.

Social Inequalities in Careers: Effects of Social Class Origin and Gender on Career Success

Author: **Lea Katharina Reiss**; WU Vienna

Author: **Michael Schiffinger**; WU Vienna

Author: **Wolfgang Mayrhofer**; WU Vienna

Author: **Marco Rapp**; WU Vienna

Even though awareness for unequal opportunities in societies is rising, career research continues to have blind spots regarding issues of inequality. While there are several studies that investigate the gender pay gap, only few look at the effects of social class origin and even fewer at the intersectional interplay of gender and class origin. This paper explores core factors in connection with inequality, i.e. social class origin, gender and their intersectionality, emphasizing their effects on career success over time. Data used in this study stem from two cohorts of a longitudinal survey among Austrian business school graduates graduating around 2000 and 2010. Our results suggest that social class origin and gender both influence objective career success (i.e. income) over time, but do not appear to influence subjective career success (i.e. ascribed career success) to the same extent. Regarding the intersectionality effect of social class origin and gender, results differ markedly between the two cohorts. Our findings not only add to the broad bodies of gender and class inequality literature, but also provide insight into effects of inequality factors on careers over time.

research continues to consider each of these domains as relatively rigid or static, with some seeing the two in conflict with the other (Greenhaus & Beutell, 1985) and others seen each enriching the other (Greenhaus & Powell, 2006). However, both work and life may not be static but instead be fluid and changing (Greenhaus & Kossek, 2014; Mark & Su, 2010; Spreitzer, Cameron, & Garrett, 2017), each with the potential to be adapted to better align with the other domain. To investigate the notion of the alignment of work and life as fluid phenomenon, we studied workers who live in vans, people maintain mobility in both work and non-work domains. In this ethnographic study, the principle investigator lived in a van while meeting and interviewing 18 workers who live in vans. Through thematic analysis, a variety of themes related to the extent to which work and home are aligned or in conflict were identified, including (1) the identification of the van as home, (2) sense of identity, (3) career and financial freedom and (4) work-life synchronicity. We consider how these findings contribute to theory on work-life synchronicity for all workers.

Does Board Gender Diversity Reduce Default Risk? A Global Analysis

Author: **Sivathaasan Nadaraja**; Griffith U.

Author: **Allen Huang**; Griffith U.

Author: **Benjamin Liu**; Griffith U.

Author: **Searat Ali**; U. of Wollongong

We document a negative effect of board gender diversity on default risk for a sample of firms from 49 countries for the period 2005– 2016. To identify the causal effect, we use the legislation of female quotas on corporate boards as an exogenous shock to gender diversity and control for a series of potential omitted observable and unobservable factors. The effect of gender diversity on default risk

theorists. We offer an existential critique of authentic leadership, which challenges the dominant narrative constructed by positive psychologists and contemporary management researchers. Our critique leverages the philosophical underpinnings of Merleau-Ponty, Deleuze, Sartre, and Heidegger to illuminate how contemporary researchers have misappropriated the Self and authentic leadership. We argue that contemporary approaches to authentic leadership misuse the philosophical concept of the Self and the Other on which authenticity is built by converging them into a single Being, de facto, creating an inauthentic representation of authenticity itself – and authentic leaders. Our approach uses a living story lens where authenticity is not an explicit condition, but rather emerges as leaders make strategic decisions that move them towards, or away from, pure authenticity. To overcome the dominant narrative in contemporary research, we offer critical management theorists' new opportunities to continue authentic leadership's epistemological, ontological, and existential development.

Performance Measurement in Academic Work: Surveillance, Control, and Self-Governance

Author: **Kirsi-Mari Kallio**; U. of Turku, School of Economics

Author: **Annika Blomberg**; U. of Turku, Finland

Author: **Tomi Juhani Kallio**; U. of Turku, Finland

Author: **Robin Roslender**; U. of Dundee

In recent times, performance measurement (PM) and individual performance evaluation have become everyday activities in the higher education sector and the previously collegial university management has taken steps towards a managerial model. The implications of PM for individual academics have had negative tones; resulting for example in increasing stress, anxiety and feelings of inadequacy. Inspired by Foucauldian framework of governmentality, we look at Finnish academics' experiences of PM in academic work. The empirical material of the study consists of a case study of three Finnish universities. Responses from university employees to open-ended questions collected from a large survey in 2015 with 672

is stronger in high-masculine countries but weaker for firms with greater governance controls. Further, we show that firms with gender-diverse boards have lower default risk partly by lowering cash holdings, risky R&D investments, and debt financing. Finally, we document that while reducing default risk, women directors enhance firm value. Overall, conditioned on country and firm-specific environments, our findings support the recent calls for women representation on corporate boards worldwide.

Board Gender Diversity and Corporate Financial Performance: Is there an Economic Case in Australia?

Author: **Subba Yarram**; U. of New England

Author: **Sujana Adapa**; Associate Professor

The main objective of this study is to understand the relationship between board gender diversity and financial performance. Australia offers a unique context as board quotas are not mandated and the governance code is principle-based rather than rule-based. Corporate firms in Australia are subject to corporate governance recommendations issued by the Australian Securities Exchange (ASX) in 2003. Additionally, ASX diversity initiatives introduced in 2010 require listed firms to incorporate additional recommendations from 2011. The Australian economy is characterised by large resources and financial sectors with each of these two dominated by a few large businesses. The gender pay gap is still considerable in Australia. Given these contextual considerations, an examination of the association between gender diversity of corporate boards of directors and corporate financial performance in Australia is likely to offer additional insights into the debate on the importance of gender diversity in the corporate sector. The sample of firms is derived from the constituents of S&P ASX 300 Index for the period from 2004 to 2016. At an aggregate level, empirical findings provide evidence that board gender diversity is not positively associated with corporate financial performance. However, a closer examination of the study period before and after gender diversity initiatives by ASX and consideration of sectoral differences shows that the association

respondents serve as the primary material. The results show that PM combined with ambiguous and undecidable objectives has created a situation where individuals strive to work more and become better, but never reach the point of adequacy. This is where the Foucauldian idea of 'normality' merges with the illusionary idea of 'ideal academic', causing constant feelings of inadequacy.

The Impact of Past Traumas on Workers from Forced Migration Backgrounds: Implications for CDS

Author: **Bob Townley**; The York Management School
Author: **Martyna Sliwa**; U. of Essex

This paper aims to introduce Critical Diversity Studies (CDS) scholars to the importance of the impact of past traumas on the way in which members of minority groups, especially those from forced migration backgrounds, experience and respond to organisational events. We draw on ideas from psychoanalytic theory regarding the influence of the past on the experience of the present in the context of individuals who have been affected by trauma earlier in life. The paper adopts a psychoanalytically-informed method in gaining an in-depth understanding of the life histories of individuals who have experienced forced migration and have re-lived these earlier traumas in the presence of organisational change. Our findings demonstrate that the responses of individuals who have experienced the trauma of forced migration to organisational turbulence and change are driven by repressed, unconscious, memories of past traumatic events. As a result, the past and the present become conflated in the individuals' minds, which leads them to behaving in similar ways to the past. We draw implications from our study for CDS researchers and for organisational leaders as well as all organisational members with regard to training and support related to this aspect of diversity.

[view paper \(if available\)](#)

between gender diversity and financial performance varies over time and across sectors. In particular, board gender diversity has a significant positive association with financial performance of Australian firms in the financial and services sectors specifically after the diversity initiatives were introduced by ASX in 2010. In the resources sector, there is no evidence that gender diversity has a positive association with financial performance. This study therefore offers some support for an economic case for gender diversity initiatives particularly in the financial and services sectors.

What Drives Investors' Reaction to Board Gender Diversity Regulation: Gender Diversity Regulation?

Designated as a "Best Paper" for GDO

Author: **Nicolas Mangin**; Faculty of Economics and Business, U. of Groningen

Author: **Shibashish Mukherjee**; Faculty of Economics and Business, U. of Groningen

We assess the relative validity and strength of four alternative explanations of investors' reaction to Board Gender Diversity (BGD) regulations: (1) a mediation by the intended increase in female representation; mediations by unintended side-effects on other characteristic of the board, like (2) board independence or (3) gender-based faultlines; and (4) a direct reaction to State intervention, irrespective of its intent or impact. We rely on a database of 45,516 firm-year observations in 9 regulating and 18 non-regulating countries from 2005 to 2015. We use a difference-in-difference design where BGD regulations are the treatment. We include a wide variety of controls and leverage institutional differences across countries and differences between firms in a moderated mediation path analysis to reduce risks of alternative explanations of our observations. Our results nuance the conclusions of prior studies about the impact of BGD regulations. Investors reacted favorably to increases in BGD, especially in high gender equality countries. Unfavorable reactions to BGD regulations are thus not attributable to gender, but instead to increases in board independence, stronger gender-based faultlines and a disapproval of State intervention.

Identity and Resistance in Paternalism

Author: **Elham Moonesirust**; U. of Aberdeen

Research on corporate paternalism draws attention to employee obedience through thankfulness to the employer. However, the dynamics of obedience in such systems and how the sense of employee thankfulness could constitute a mechanism of control is under-researched. Based on an in-depth case study of Volkswagen in Wolfsburg, Germany, my study contributes to the literature on paternalism in two ways: first, it demonstrates how living under paternalistic system stimulates discursive construction of specific interrelated identities. Four types of identities were identified: cynical, insignificant, appreciating and fearful. Second, it revisits the mechanism of control and resistance in paternalist systems. In doing so, it argues that despite what is implied in extant literature, thankfulness and the feeling of indebtedness do not automatically result in the minimisation of resistance in paternalism. Rather, the latter is the outcome of employee identity work in such contexts where the fear of losing their material wellbeing as well as their becoming alienated of the self facilitate their self-suppression of resistance.

Our moderation analyses provide additional support for these interpretations. Our study stresses the importance of addressing simultaneously several causal explanations for the impact of BGD regulations on investors' expectations to avoid attributing to one board characteristic, gender, the impact of its correlates. It also highlights subtle and potentially dysfunctional consequences of BGD regulations when men and women are not evenly distributed across professional backgrounds.

The Gender Diversity Imitation Game

Author: **Ruth Mateos De Cabo**; U. CEU San Pablo

Author: **Ricardo Gimeno**; Banco de España

Author: **Pilar Grau**; U. Rey Juan Carlos

Author: **Patricia Gabaldon**; IE U.

Companies measure and consider themselves in comparison with similar and closer companies, so to be legitimized equally towards investors and stakeholders. In this same process, companies tend to imitate the behavior of their neighbors in a process of isomorphism when it comes to incorporate women on boards. In this work, we evaluate the isomorphic behaviors on company boards with respect to the presence of women on these boards. We analyze more than 3800 European companies from 1999 to 2019, considering the relationships between boards when they share a director. We find mimetic strategies among those companies regarding the proportion of women on boards. We also find that these mimetic effects tend to be stronger when companies have a higher proportion of women than their neighbors and tend to reduce it, rather than when the proportion is lower, and the tendency is to increase it. However, given that European companies are under a lot of pressure to comply with gender equality recommendations, we observe that this asymmetry is reduced and even disappears in the presence of both quotas and recommendations on corporate governance codes.

Identity Experiences and Attitudes (session 1548)

A Systematic Review of Employment and Workplace Experiences of Muslims

Author: **Rami AlSharif**; U. of Glasgow

Author: **Rosalind Searle**; Centre for Trust, Peace and Social Relations, Coventry U.

Author: **Ann-Marie Nienaber**; Centre for Trust, Peace and Social Relations, Coventry U.

Author: **Charis Rice**; Centre for Trust, Peace and Social Relations, Coventry U.

The employment and workplace experiences of Muslims are rarely studied, and yet this group appears to face distinct challenges in securing work and progressing in their careers. In addition, given the historical developments in discrimination research designs, little is known about the impact of different designs on the validity of research findings. This paper makes three contributions. It is the first systematic review of the employment and workplace experiences of discrimination against Muslims. Second, we investigated adverse prejudice attitudes towards Muslims and the factors that lead to labor market and workplace discrimination. Third, through our investigation of this phenomenon, we identified the limitations of study design in the current discrimination literature and introduced strategies for future research to overcome them.

portray Asians as hard-working, industrious, and technically competent. Positive stereotypes, such as these, can in turn influence individuals' attitudes towards Asians, and as a result, also affect their ability to perceive racial microaggressions. To test this, we asked participants to read a series of vignettes that depicted different types of racial microaggressions, consisting of both overt (microassault) and covert (microinsult, microinvalidation, and overvalidation) types. Results showed that positive attitudes towards Asians diminished one's ability to perceive the negative effects of experiencing subtle types of microaggressions compared to the most blatant type of microaggression. This was especially true when the subtle microaggressions were based on positive stereotypes of Asians. The negative effects of acting on positive group stereotypes are discussed.

Hearing Loss and Career Attitudes: Disengaging from Lower Quality LMX (WITHDRAWN)

Author: **Camellia Bryan**; Schulich School of Business

Author: **David Baldrige**; Oregon State U.

Author: **Liu-Qin Yang**; Portland State U.

Author: **Richard Dirmyer**; U. at Buffalo

Isolation from professional connections can negatively impact how employees with disabilities feel about their careers, and research suggests that poorer quality employee-supervisor relationships can exacerbate isolation. In a sample of 181 deaf and hard of hearing subordinates, we investigate how professional isolation helps explain the relation between severity of hearing loss and subordinates' career attitudes, and how this process differs depending on the quality of LMX relationships. We find that subordinates with less severe hearing loss report more isolation than subordinates with more severe hearing loss, and in turn report lower career commitment and career satisfaction. Yet, these effects only hold in lower quality LMX relationships. We build theory for the LMX and stigma literatures by predicting these effects using the theoretical perspective of possible selves. These findings suggest that lower quality LMX relationships are not experienced as hurdles for all employees with disabilities, and disability impairment may produce

resilience against isolation.

What Does it Mean to be a Military Veteran? Issues of Veterans in Non-Military Organizations

Author: **Sarah Villanueva**; U. of Texas at El Paso

Military veterans have not been studied widely in the context of non- military organizations, although academic interest in veterans' topics has increased in the last decade. Relatively little is known about veterans' employment experiences, organizational contributions, and workplace challenges in non-military organizations beyond the liminal period of transition from military service to non-military organizations. I review twenty years of multidisciplinary research on military veterans with an emphasis on post-World War II veteran cohorts, identify gaps in the literature, and provide direction for future research using on a theory elaboration approach. I organize and describe research on military veterans based upon the authors' conceptualizations of veterans' status as a demographic trait, a bundle of human capital, or a unique culture that is indicative of deep-level diversity. I find that these conceptualizations serve to influence the research questions and theoretical approaches to the study of military veterans.

HR

CEO Succession, Leadership and Internal Hiring (session 1559)

CEO Strategic Leadership, High-performance Work Systems, and Corporate Entrepreneurship

Author: **Yueyue Liu**; Nanjing U.

Author: **Meng Xi**; Nanjing U.

Corporate entrepreneurship plays a key role in

diversity, it is likely that younger individuals will rise quicker to higher leadership positions, where they have to lead relatively older followers. However, existing work suggests that younger leaders may be negatively evaluated due to not matching leader prototypes, for instance in terms of lowered perceived effectiveness. We focus on this negative leadership perception bias against younger leaders. Drawing on contextual prototype activation, we suggest that specific contexts increase or decrease the leadership perception bias. On the one hand, we propose that the negative bias increases with an observer's older age due to more negative stereotypes against younger individuals. On the other hand, organizational change (as compared with stability) might decrease the negative perception toward younger leaders due to positive stereotypes against younger individuals. Two experimental studies (N = 327 and 644, respectively) confirm that younger leaders are perceived as less prototypical and less effective compared to middle-aged and older leaders. This negative effect is attenuated in times of organizational change and strengthened for older (as compared with younger) observers. These findings point to the importance of contextual factors in the leadership perception process of younger individuals.

Is White Always the Standard? Using Replication to Extend What We Know About Leadership Prototypes

Best Student Paper Award

Designated as a "Best Paper" for GDO

Author: **Adaora Ubaka**; U. of Illinois at Chicago

Author: **Xinxin Lu**; U. of Illinois at Chicago

Author: **Lyangela Gutierrez**; U. of California, Los Angeles

In 2008, Rosette, Leonardelli, & Phillips published a study in which they examined whether race was an implicit component of the business leadership prototype. At the time of the study Rosette et al. (2008) underscored that among the then 43 United States Presidents, none had been a racial minority and suggested that this leadership example had implications for how U.S. citizens acquired their implicit leadership prototypes. With the election of

enhancing organizations' core competitiveness and sustainable development. To better understand the antecedents of corporate entrepreneurship, this study draws on the strategic leadership literature and upper echelon theory to explore the influences of CEO strategic leadership and high-performance work systems (HPWS) on corporate entrepreneurship and tests the moderating effects of the organizational life cycle on the relationship between these influences. Using matching data from 192 Chinese firms, the paper finds that both CEO task-focused leadership and relationship-focused leadership are positively related to HPWS and corporate entrepreneurship; a HPWS mediates the positive relationship between CEO strategic leadership and corporate entrepreneurship; and an organizational life cycle moderates the influence of CEO strategic leadership on a HPWS and the indirect effects of CEO strategic leadership on corporate entrepreneurship through a HPWS. This study integrates the CEO strategic leadership, strategic human resource management, and corporate entrepreneurship literature. It has important theoretical and practical implications.

Effects of Power Relations on Relationship Between Gender Performativity & Leadership Effectiveness

Author: **Nan Tang**; Columbia U.

The overarching purpose of this study is to examine the moderating effects of power relations in organizations on the relationship between gender performativity and leadership effectiveness. Previous researches on the effects of gender on leadership effectiveness perceive gender as a dichotomized category and generalize the differences of biological sex to sharing gender norms and gendered expectations. This study was designed to explore how a diverse spectrum of gender performances impacts the configuration of leadership effectiveness. The study implemented hierarchical regression to analyze the data collected from 172 participants who are partners of 50 Wall Street law firms using an online survey questionnaire. The research results indicate that the partners possessing more feminine gender performance than masculine gender performance have higher scores of leadership effectiveness. The results also indicate that structural power, ownership power, and expert power moderate the relationship between gender performativity and leadership effectiveness.

distinct. Specially, the breadth of knowledge coming from various fields (represented by career variety) enhanced CEO's humble leadership behaviors, while the depth of knowledge in one area (represented by education level) was negatively related to CEO's humble leadership. In addition, we found that CEO's education level and elite education can both strengthen the positive relationship between career variety and CEO humble leadership. Directions for future research and managerial practices are discussed.

Variety is the Spice of Internal Hiring: How Pool Diversity Affects Post-Hire Performance and Exit

Author: **Kathryn Dlugos**; Penn State U.

Although internal hiring is associated with a number of benefits for firms, organizations may only be able to fully capture these benefits when they create complementary person-job matches. This can be difficult, as hiring managers have incomplete information about how internal candidates will perform in a new job even within the boundaries of the firm. I introduce internal-external candidate pool heterogeneity as a source of information to aid internal hiring decisions. I argue that, by enabling hiring managers to benchmark characteristics of their internal candidates against those available in the external market, heterogeneous pools (i.e., interview pools that include both internal and external candidates) lead managers to select higher-performing internal hires than they would if they only interviewed internal candidates. I argue that interviewing external candidates is not without risk, however, as doing so also provides information to internal hires about their future internal and external mobility prospects. Using data on over 2,000 internal hires at a large, U.S.-based health services firm, I show that internal hires from heterogeneous pools are 1.43 times more likely to be rated a top-performer in their first year in the new job but also 2.01 times more likely to voluntary exit, compared to internal hires from pools containing only internal candidates. I conclude with a discussion of the theoretical and practical implications of this tradeoff for both firms and workers.

Through My Eyes: African American Women Leaders' View on the Multi- Source Feedback Assessment

Author: **Amber Kea-Edwards**; Claremont Graduate U.

Intersectionality is an emerging topic in leadership development research. Intersectionality theory is an expansion of feminism that looks at the effects of overlapping identities, such as gender and race. This current study sought to understand the role of intersectionality on a popular form of leader development, multi- source feedback interventions. Multi-source feedback interventions provide an individual with self-referent information that promotes motivation and energy towards self-growth (Atwater, Waldman, & Brett, 2002). One's social identity often impacts the content of feedback, the process of how feedback is delivered, as well as how feedback is accepted and processed (Toegel & Conger, 2003). Using a hermeneutic phenomenological research design, I interviewed twenty African American women in leadership roles on their experience with the multi-source feedback assessment. Common themes emerged such as fear of confirming certain stereotypes, a desire for personality-based feedback, and the use of the multi-source feedback for leadership development.

Author: **Jeroen De Jong**; Radboud U. Nijmegen

High Performance Work Systems (HPWS) have been shown to associate with performance at diverse levels. In this paper, we study the effects of employee age on the relationship between HPWS and employee performance. We use a role-based measurement of employee performance, which introduces 5 roles that an employee can hold within an organization, namely the roles of Job holder, Career seeker, Innovator, Team member and Organization member. Integrating social exchange theory with lifespan theories, we propose that HPWS have different associations with job roles for older employees. Using 349 pairs of supervisors and their subordinates, nested in 118 service organizations, multilevel analyses show that HPWS associate positively to employee performance in the Organization member role. Moreover, the relationship between HPWS and performance is negatively moderated by employee age for the Job holder and the Career seeker roles. The results are discussed in light of the challenges that they pose for the management of an ageing workforce.

Win-Win? A Study on the Effects of High Performance Work Systems on Well-Being and Performance

Author: **Rentao Miao**; Capital U. of Economics and Business
Author: **Yi Cao**; Peking U.
Author: **Luona Gan**; Renmin U. of China
Author: **Nikos Bozionelos**; EMLYON Business School

In the field of strategic human resource management scholars have recently called for attention at the relationship of high performance work systems (HPWS) with outcomes that pertain to employees' well-being rather than simply to performance. However, there is limited evidence on whether the organization can take into account the dual benefits of employer (performance) and employee (well-being). This possibility was

Corporate volunteer programs present opportunities for employees to contribute their time and skills to further important causes and help communities in need. The programs not only contribute to a better world, but the literature suggests they benefit participants themselves with participation associated with increased happiness, reduced stress, and better job performance. Despite these benefits, the uptake of these programs by employees is surprisingly low. And little is known about the affective reactions of employees that do not participate. We draw on signaling and social influence theory to examine the effects of corporate volunteer programs on employees who take part in a volunteering initiative, as well as those who do not. In a longitudinal field study at a large organization in the Northeast, we find that even when employee participation in volunteering is low, there is a significant influence on employees' organization- and volunteer-related perceptions resulting from social sharing among coworkers. These positive effects are most prominent when employees are in positions that afford flexibility, and when coworker ties are close. Understanding these effects of corporate volunteer programs on employee outcomes is important as firms seek to provide a more enriching environment for their workforce.

The Workplace Social Performance of Family Firms: A Configurational Approach

Author: **Georges Samara**; American U. of Beirut
Author: **Maria Jose Parada**; ESADE/JIBS
Author: **Ramzi Fathallah**; American U. of Beirut

Comparative research on family versus non-family firms' workplace social performance has produced mixed results. Consequently, several calls have been made to account for family business heterogeneity to understand better how family involvement in the business affects the workplace social performance of family firms. Using qualitative comparative analysis, we respond to these calls by exploring the governance antecedents that can lead family firms to increase their workplace social performance. We find two governance configurations that lead to

investigated with data from the matching questionnaire survey of 74 supervisors and 301 employees of Chinese localization enterprises. Data were collected at different time points. The results showed that HPWS were positively related to both employee well-being and to team performance. Work-family facilitation rather than work-family conflict mediated the relationship between HPWS and employee well-being. Authoritarian leadership moderated the relationship of HPWS with work-family facilitation rather than team performance. Finally, the moderating role of authoritarian leadership was mediated by work-family facilitation. The implications of the findings for theory and practice are discussed.

Are We All in the Same Boat? Congruence Effects of HPWS for Leaders and Followers

Author: **Saehee Kang**; Marquette U.

Author: **Robin Mengxi Yang**; School of Economics and Management Tsinghua U.

Drawing on HR strength theory, this study suggests that HPWS congruence between leaders and followers is an important construct in explaining additional variance in team outcomes over and above the effects of HPWS intensity. Employing polynomial regression and response surface analysis on time-lagged data gathered from 436 service teams, we found that the team climate for service is influenced by the degree of congruence between HPWS for leaders and followers. Results also revealed that team climate is higher when the congruence effect occurs at a high level rather than a low level. Furthermore, we found that incongruence of HPWS led to an asymmetric effect on team climate such that the incongruence effect was stronger when HPWS for followers was greater than HPWS for leaders. Lastly, the results show that team climate mediates the relationship between HPWS congruence and team process and team cohesion. We conclude that to fully understand the implications of HPWS, researchers should consider HPWS with respect to different employee groups.

A Self-Regulation Perspective on the Double-Edged Sword Effects of the Performance-Oriented HRS

Author: **Guanglei Zhang**; Wuhan U. of Technology

Author: **Rong Ma**; Wuhan U. of Technology

Author: **Mingze Li**; Wuhan U. of Technology

The performance-oriented human resource system (HRS) brings both opportunities and challenges to employees. Prior studies mainly report the positive impact of high-performance work on organizational and employee performance, ignoring the negative impact on employee's behavior. Based on self-regulation theory, this paper discusses the double-edged sword effects of the performance-oriented HRS on employees. A total of 253 employees were studied in three waves, and the linear model was used to analyze the data. The results indicates that the perceived performance-oriented HRS not only can positively predict employees' concerns with performance and improve their willingness of self-development but also may lead to resource depletion and lower employees' moral awareness, which increases the risk of employees' unethical behavior. Employees' self-control is a regulator of the negative effect of a performance-oriented HRS. That is, when employees' self-control is low, the performance-oriented HRS has a stronger influence on unethical behavior through moral awareness than when it high. The above results can broaden our understanding of the effects of the performance-oriented HRS on employees, and provide some new insights for intervening the effects of performance-oriented HRS in organizational human resource practices.

Fighting Scaling Challenges With Internal Means: A Paradox

Author: **Evy Van Lancker**; Ghent U.

Author: **Veroniek Collewaert**; Vlerick Business School & KU Leuven

Author: **Frederik Anseel**; Business School, U. of New South Wales, Sydney

While high-growth firms are important providers of innovation, employment, and wealth, it is not clear how a young firm's top management team navigates the process of scaling their business into such a firm. One particular challenge young firms must learn to overcome if they want to grow is the 'people' challenge. This paper studies the boundary conditions of the adoption of high-performance work practices as a means to help overcome the growing pains of these firms. Building on the attention-based view, we show that the adoption of these practices uncovers a paradox which is subject to the influence of financial performance and the team's previous entrepreneurial experience.

How Different Components of Socially Responsible HRM Influences Affective Commitment

Author: **Kamran Iqbal**; Bahria U. , Islamabad Pakistan

Author: **Xin Deng**; U. of South Australia

The purpose of this paper is to investigate the process through which socially responsible human resource management (SRHRM) affects employees' affective commitment. Drawing on Social Exchange theory and Social Identity theory, we argue that the link between SRHRM and affective commitment (AC) can be direct and indirect through the mediation of organizational trust (OT) and organizational pride (OP). Using data collected from the banking sector in Pakistan, we tested the mediating role of OT and OP between AC and three components of SRHRM: legal compliance HRM (LCHRM), employee-oriented HRM (EOHRM) and general CSR facilitation HRM (GFHRM). We found that EOHRM significantly influences affective commitment directly and through organizational trust. On the other hand, the effect of GFHRM on affective commitment is only through organizational trust. LCHRM, however, has no significant effect on affective commitment either directly or indirectly. Organizational pride was found to mediate GFHRM and affective commitment relationship. Our findings shed light on the social and psychological process of SRHRM influencing employee's affective commitment and provide insights for practitioners in selecting suitable HR policies to achieve CSR goals while enhancing employee's organizational commitment.

Why Share? Owners' Motives for Profit-Sharing and Firm Profit

Author: **Jinyun Sun**; Fudan U.

Author: **Thomas Garavan**; Edinburgh Napier U.
Author: **Michael J. Morley**; U. of Limerick

We theorize and test the combined effects of both firm level skill- enhancing human resource investments, designed to boost specific and general knowledge resources, and of national level human capital contextual endowments, on incremental and radical innovation rates in knowledge intensive firms. Drawing on the intellectual utility of both the resource based view and the configurational perspective, at the firm level we theorize the impact of three such skill-enhancing human resource investments, namely specific training, general training and the implementation of functional flexibility, along with various configurations of these investments, on both incremental and radical innovation. At country level, we mobilize contingency arguments to hypothesize the likely effects of contextual variations in national level human capital provisions on the firm level knowledge resources-innovation relationship. Then, using a unique two-wave dyadic data set assembled from 1,764 interviews conducted in 882 knowledge intensive firms in France, Finland, Sweden, and the UK we test our arguments. Our analysis finds broad support for both direct relationships and synergistic interactions between particular combinations of the firm level skill-enhancing human resource investments examined and the incremental and radical innovation gains secured. Our results also demonstrate that higher levels of national human capital provision moderate the firm-level relationship between the skill-enhancing human resource investments and the innovation outcomes. Our analysis adds to the body of knowledge on the explanatory power of the resource-based view as a lens for explicating the link between skill-enhancing human resource investments and both incremental and radical innovation. From a contingency perspective, it also suggests that the value of firm level investments in specific and general knowledge resources for incremental and radical innovation is enhanced where national human capital contextual endowments are higher. We discuss the theoretical and practice implications of our findings and we outline possible directions for future research.

Author: **Jiwen Song**; Renmin U. of China
Author: **Zheng Tianyi**; Fudan U. School of Management

We examine the relationship between the owner-manager's motive for utilizing a profit-sharing plan and firm performance in China. By examining the psychology of the owner-manager for this collective compensation practice, we enhance our understanding of the impact of this collective pay-for-performance practice and the conditions under which it is associated with firm performance. Specifically, we find a negative association for the wealth-capture motive, whereby owners use the profit-sharing plan with the primary intention to enhance firm financial performance, and a positive association for the wealth-sharing motive, whereby owners want to share the firm's financial success with employees on firm profits. We further find that these associations are strongest when the owner's motives are clear (using firm age as a proxy) and when the profit-sharing plan is provided selectively to employees. Our study provides insights into the importance of owner-manager psychology in when a profit-sharing plan produces financial benefits to the firm.

How to Boost Participation in Employee Ownership Plans – A Contextual Analysis of Profit Sharing (WITHDRAWN)

Author: **Rieke Hullmann**; U. of Goettingen
Author: **Jan Christoph Hennig**; U. of Goettingen

Firms aim to increase participation in employee ownership plans via profit sharing programs. This study investigates the impact of a profit sharing distribution on individual decisions to participate in the subsequent employee ownership plan (ESOP). We assume that a firm's profit sharing distribution has a positive impact on subsequent ESOP participation. More specifically, we posit that this effect is especially strong in settings where employees face higher barriers to investment in stocks. Evidence from a sample of about 1,200,000 employee-year observations from 46 countries supports our hypotheses. The effect is enhanced in specific individual-, workgroup-, and country-level

“Best Practices” or “Best Fit”: Exploring the Effects of the HR Systems and Contexts on Outcomes

Author: **Meng Xi**; Nanjing U.

Author: **Yan Chen**; Idaho State U.

Author: **Yueyue Liu**; Nanjing U.

In the strategic human resource management (SHRM) field, there has been a classic debate regarding the “best-practice” versus “best-fit” approach to HRM. The present study aims to address this debate. Using a sample of 481 organizations representing a range of industries, we found that there are four types of HR systems, namely cost minimizers, commitment maximizers, motivation enhancers, and skill builders. Moreover, we found that various organizational contexts (i.e., firm ownership, employee-oriented organizational culture, local human resource supply, and local government-market relationship) and different types of HR systems interactively influence collective affective commitment and firm performance. The theoretical contributions and practical implications of these findings are discussed.

Status Increase Despite Passivity: HRM Professionalization in the Civil Law Context

Author: **Isabella Scheibmayr**; U. of Salzburg

Author: **Astrid Reichel**; U. of Salzburg

In the ongoing debate about professionalization of Human Resource Management, the interaction of HRM with the legal context has rarely been explored and the few studies have been conducted in Common law contexts (especially the US). To investigate the interaction between the legal context and HRM professionalization we consider the case of a legal change in a Civil law context, the amendments of the equal treatment law in Austria (2011/2013). Using a discourse analytical lens we show that even though HRM practices were the explicit target of the law, representatives of the HRM occupation did not actively engage in the legislative process before the law was passed. Rather, HRM framed its own practices and interacted with the legal context in implementing the amendment. Still, these implementation activities were associated with HRM status improvement.

settings. Particularly we find a stronger positive effect for a) individuals with a lower degree of education, b) for those working in departments thematically distant from the firm’s ESOP and c) for those embedded in a culture with higher levels of uncertainty avoidance. The results are attractive for research in gaining a better understanding of how individuals derive financial decisions and for companies and regulators aiming at increasing ESOP participation.

The Dual Paths Linking Leaders’ High Performance Expectations to the Followers’ In-Role Performance

Author: **Mian Zhang**; Tsinghua U.

Author: **Quan Li**; Nankai U.

The purpose of this study is to explore how leaders’ high performance expectations influence followers’ in-role performance. We propose two paths linking leaders’ high performance expectations to followers’ in-role performance. Dyadic data between leaders (N = 51) and followers (N = 251) were collected by using three time-points survey. Guided by the activation mechanism, we found that follower’s work engagement mediates the relationship between leaders’ high performance expectations and followers’ in-role performance. Guided by the mechanism of negative source attribution, we found that follower’s work-to-family conflict mediates the relationship between leaders’ high performance expectations and followers’ work engagement. Besides, followers’ gender and gender role attitudes play a joint moderating effect in the relationship between leaders’ high performance expectations and followers’ work-to-family conflict. Specifically, a positive relationship exists for non-traditional male followers and traditional female followers. Using a scenario-based experiment, we also found evidence supporting that work-to-family conflict reduces work engagement. Theoretical and practical implications are discussed.

Pay - Gender, Cultural, and Status Difference (session 1553)

It Gets Worse with Time: An Examination of the Gender Pay Gap Among Government Employees

Author: William Obenauer; Ithaca College

More than fifty years after the enactment of the Equal Pay Act, it is not clear that women receive equal pay for equal work. Multiple analyses show economic trends indicating that women earn less than men despite the fact that they attain college education at comparable rates. While these trends are informative, they have also raised questions regarding the conditions in which the gender pay gap is likely to emerge. We examined this issue using two separate salary data sets for the wages of government employees. Using hierarchical linear modeling, we accounted for differences within individuals, specific employment positions, and state agencies. Our analyses showed consistent support for an overall gender pay gap, but they indicated that this inequity was attenuated in at least one female-dominated occupation (secretarial positions). Contrary to our expectations, we found that while there was a gender pay gap in leadership positions, at non-executive levels it was not greater than that of the rest of our sample. Our results also offered insight into the positive relationship between employee tenure and the gender pay gap. We discuss the implications of these findings as well as opportunities for new research.

Work and Emotions (session 1556)

Roller Coasters of Happiness: A Study of Interns' Happiness Variability, LMX, and Job-Seeking Goals

Author: Courtney R. Masterson; U. of San Francisco

Author: Jiaqing Sun; U. of Illinois at Chicago

Author: Sandy J. Wayne; U. of Illinois at Chicago

Author: Donald H. Kluemper; U. of Illinois at Chicago

Building on a rich body of research that demonstrates the tightly connected relationship between affect and leader-member exchange (LMX), we develop and test theory regarding the influence of happiness on LMX in an important yet understudied context of internships. Adopting a discrete and dynamic emotions perspective, we bring attention to interns' happiness variability (i.e., between- person differences in the stability of happiness over time) that results from their reactions to daily interactions with supervisors. Integrating Affective Events Theory and Feelings as Information Theory, we investigate how interns' happiness variability informs their perceptions of LMX, its interactions with individual differences (i.e., optimism and core self-evaluation), and ultimately, its indirect effects on interns' job-seeking goals related to future employment with the organization. Findings from our experience sampling method field study reveal a positive relationship between happiness variability and LMX among interns low in optimism and interns low in core self-evaluation but a negative relationship among interns high in optimism. The findings also provide evidence of conditional indirect effects of interns' happiness variability on a key employment outcome, job-seeking goals, via their perceptions of LMX. Extending our results, we discuss theoretical and empirical implications for future research and

Author: **Lin Xiu**; U. of Minnesota, Duluth

Author: **Yufei Ren**; -

We conducted an experiment to examine the gender difference in salary negotiation initiation. Using a unique design, we find that in a double-blind environment with no external social and economic costs, there is no gender difference in the likelihood of initiating salary negotiation. When participants are informed that they would need to reveal their identities when asking for a higher pay, fewer women initiated salary negotiation, and the effect on men is not significant. We further examined the effect of competition-based rule on the asking decision and found that men are more likely to initiate salary negotiation when salary increase is based on competition, and there is no impact on women. Lastly, social norms also discourage men to negotiate a higher pay if the payment is based on competition and they have to ask in public.

Does Pay Matter to Everyone? A National Culture Analysis of Pay, Sex, and Job Satisfaction

Author: **Hilla Peretz**; ORT Braude College

Author: **Andrew B. Blake**; U. of Arkansas

Author: **Yoav Ganzach**; Tel Aviv U.

Author: **Yitzhak Fried**; Texas Tech U.

Despite the importance of pay as a key incentive at work, the relationship between pay and job satisfaction is inconsistent. In the current study we propose that societal culture, more specifically, the Masculinity/Femininity and Individualism/Collectivism cultural dimensions (Hofstede, 1991), moderate the relationship between pay and job satisfaction. We further examine the moderating effect of sex independently, and jointly, within the two cultural dimensions. To our knowledge, this is the first comprehensive study that examines the influence of culture on pay-job satisfaction relationship. The study consists of a sample of 147,827 individuals from 20 countries. The results supported our hypotheses by indicating that the impact of pay on job satisfaction is stronger in Masculine than Feminine societies and in Individualistic than Collectivistic societies. Further, we also hypothesized

Spurring Tensions at Work and the Moderating Role of Psychological Resilience

Author: **Rawia Ahmed**; Zayed U.

Author: **Maria Fernanda Wagstaff**; U. of Texas at El Paso

Paradoxes are integral parts of our work lives. In this paper, we tested workplace triggers of four different categories of tensions: belonging, learning, organizing, and performing paradoxes, and we offered a theoretical framework on how these types of paradoxes negatively affect employees' well-being by examining job stress. Further, we presented psychological resilience as a contingency variable that reduces the experience of job stress. We also developed and validated the organizing tensions instrument. We tested the theoretical model with three samples: Sample 1 (125 MBA students), Sample 2 (Time 1 with 520 Qualtrics Panel respondents), and Sample 3 (Time 2 with 136 Qualtrics Panel respondents). We found support for two triggers of tensions: a) perceptions of organization change to learning tensions, and b) plurality of stakeholders to performing tensions. Further, we found support for learning tensions as a mediator of the relationship between perception of organizational change and job stress when psychological resilience as a moderator is accounted for. Theoretically, we initiated a discussion of workplace triggers of paradoxes at the individual level of analysis, and how these triggers ultimately relate to well-being at work. Several practical implications are discussed.

Does Competition Protect Temporary Guest Workers from Wage Theft?

Author: **Peter Norlander**; Loyola U. Chicago

Combining data on wage and hour violations and data on the firms that sponsor workers on temporary visas to the United States, this study finds that greater employer concentration in a labor market is associated with a greater incidence of violations of wage and hour laws. The magnitude of the effect is large: in a pure monopsony labor market, guest workers are six to twelve times more likely to be employed by firms caught violating wage and hour laws. These findings contribute to the literature on the correlates of labor abuse, could aid in the detection and prevention of wage theft, and suggest reforms for guest worker programs.

Go Out for Jobs? Foreign Investment Projects and their Impact on Firms' Domestic Employment Growth

IM Division Georgetown Best Paper in International Business and Policy Finalist

Author: **Guus Hendriks**; U. of Amsterdam

Many governments, especially those of emerging economies, have policies in place to stimulate their firms to internationalize and engage in outward foreign direct investment (OFDI). Although it may serve interests other than that of economic development, it is unclear to what extent it contravenes policy aimed at raising employment, an area particularly important for countries if they are to make progress on sustainable development goals. This study looks at three dimensions of OFDI promotion policies typically adopted by emerging economy governments, as they encourage firms to choose acquisitions over greenfield investments, and support large firms with considerable presence in a region of interest as their national champions. I study how these firm- and investment-related characteristics affect how emerging market multinationals grow their own domestic employment after undertaking a specific foreign investment project, whereby I draw on the resource-based view and agency theory to formulate hypotheses. Analyzing detailed data pertaining to 409 such projects by firms from 13 emerging

engage in a workplace romance. Additionally, relationship secrecy was proposed as a predictor of projected life and job satisfaction. Relationship secrecy was negatively related to both projected life and job satisfaction. Implications for the workplace are discussed.

Cultural Differences in the Content of Employees' Psychological Contract

Author: **Jiahong Du**; Vrije U. Brussel

Author: **Tim Vantilborgh**; Vrije U. Brussel

This study qualitatively explores differences in psychological contract (PC) content between Belgian and Chinese employees, while attempting to understand these differences from the perspective of cultural values. We build on theory concerning horizontal and vertical individualism/collectivism to interpret differences in PC content. 21 Chinese and 20 Belgian employees were interviewed, with results indicating that Belgian interviewees' PCs tend to be balanced with an emphasis on egalitarian interpersonal relationships, reflecting a horizontal collectivist culture. We propose that a "culture of compromise" forms a fitting description for Belgian interviewees' PCs. For Chinese interviewees, the PC was characterized by mixed contracts aligning with the ideology of 'Utilitarianistic Guanxi', which forms a Chinese philosophy that combines the pursuit of profit with objective goods, reflecting a culture of vertical collectivism.

Fractionalization and Decentralization Predictors of the Relationship of Within-Country Region Diff

IM Division Georgetown Best Paper in International Business and Policy Finalist

Author: **Mikael Sondergaard**; Aarhus BSS, Aarhus U.

Author: **Mark F. Peterson**; Aarhus BSS, Aarhus U.

Author: **Aycan Kara**; IU Southeast

We consider whether, when and why within-country regional differences overwhelm country differences in work goals. Whereas country boundaries have continuing cultural significance, within-country groups often have cultural importance that governments can support or undermine. Countries can recognize cultural groups by creating corresponding internal divisions (e.g., provinces, states, oblasts, etc.) and decentralizing different forms of control to them. Superficially, similar internal divisions, however, can also be created simply for administrative convenience or to undermine traditional cultural groups. Previous studies have sought, with limited success, to distinguish reasons for creating within-country divisions by distinguishing federated from unitary countries. We extend that research by studying the implications of ethnolinguistic fractionalization and regional decentralization rather than federalization. As in the previous research about the effects of federalization, we use work goals measures from the World Values Survey (WVS) and assess their association with WVS measures of attitudes toward democracy and ethics

Unsolicited Justice: the Institutional Externality of FCPA Enforcement on Corruption and Investment

IM Division Georgetown Best Paper in International

Author: **Hilla Cohen**; Kaye College of Education

This study presents a systematic, contextual, and cross-cultural comparison of the stress evaluation and consequent coping mechanisms employed by 111 Israelis and 76 Indians, members of high-tech virtual teams. The study demonstrates that in conditions created by a stressful external environment, low levels of divergence in team members' stress evaluation and coping strategies can lead to a negative dynamic of stress escalation among team members. Based on the study data, and on intercultural encounters research and ego depletion theory, the study suggests an analysis of the creation, development and ending of coping dynamics that result from team members' cultural differences, under conditions of a stressful work environment. The study makes several contributions to GVT research. First, unlike existing research that generally discusses team dynamics associated with cultural differences in terms of the creation of subgroups, the findings of this study show that cultural differences between members of GVTs can create forms of micro-dynamics associated with the team member's sources of stress and their coping behavior. Second, the study illuminates the significant impact of these dynamics on the performance and well-being of team members. Third, the study contributes to stress and coping research by demonstrating that coping itself can create secondary sources of strain. In particular, our research suggests that secondary sources of strain may be formed when (a) the participants are interdependent; (b) participants are diverse in their coping behavior; (c) and participants work under stressful work routines, which might push individuals into a state of ego-depletion.

Individual-level effects of foreign language use on

Business and Policy Finalist
Author: **Jian Xu**; Emory U.

This paper examines the impact of transnational anti-corruption legal regimes, represented by the U.S. Foreign Corrupt Practices Act (FCPA), on firms' behavior and performance. I argue that external anti-bribery enforcement disrupts the informal quid pro quo in corrupt countries where firms offer bribes in exchange for market access and protection from expropriation. As a result of the legal intervention, firms subject to FCPA regulation are deterred from navigating predatory regulations using illegal means, and their investment performance suffers. Therefore, such companies decrease investments in markets with burdensome regulatory restrictions enforced by unconstrained government bureaucrats. Using an original dataset on the enforcement actions of the FCPA, I examine the law's impact on multinational enterprises under its jurisdiction. I find that FCPA enforcement decreases the revenues and profitability of firms listed in U.S. stock markets, and the reductions are mostly found in high-barrier industries within countries lacking strong legal institutions. Results also show that FCPA intervention makes firms tied to U.S. markets more likely to sell fixed assets and reduce both short-and long-term investments in high-risk markets. This paper extends the institution-based view of international business by showing the institutional spillover effects of domestic market regulations. Transnational law enforcement applies a country's domestic law to foreign jurisdictions, which provides a form of institutional subsidy to countries with weak judicial systems to sanction local corruption.

ASYNCHRONOUS

decision making are often related to shifts between more intuitive/heuristic and more deliberate/rational decision making. Intuitive behavior is substantially influenced by socialization and context. Consistently, meta-studies on the relationships between the use of intuition and specific behaviors in cooperation dilemmas reveal cross-country variation, suggesting that how foreign language use affects decision making might as well be highly dependent on the specific country context. This creates challenges to single-country studies. We, therefore, replicate in Germany a single-country study conducted in the Netherlands. While Germany and the Netherlands are quite similar on general cultural criteria, a recent meta-study on the use of heuristics in cooperation dilemmas suggests important differences regarding default social heuristics. This study thus aims at testing whether the cooperation-reducing effect of using English as a foreign language as found for the Netherlands generalizes across other country/mother tongue settings, which potentially differ considerably in terms of default social heuristics. An empirical comparison between Germany and the Netherlands replicates related effects from different types of experiments and supports the basic mechanism that supposedly underlies foreign language effects—i.e. a tendency towards more reflective decision making, independent of any specific heuristics—, but also suggests significant differences in ultimate outcomes, presumably due to cross-country differences in social heuristics.

The Importance of Institutions for Global Business (session 1562)

How CEO Pre-Career Overseas Experience Affects Location Choice of Cross-Border Acquisitions (WITHDRAWN)

Author: **David Weng**; Vrije U. Amsterdam
Author: **Yi Tang**; U. of hong kong

Executives' oversea experiences have been noted as valuable resources, but the channel through which such experiences affect firm international strategies is less clear. Draw on the imprinting perspective, we argue that a CEO with pre-career overseas experience would prefer to make cross-border acquisitions in countries where he or she grows up and/or receives education. We further maintain that the above relationship will be strengthened or weakened by certain boundary conditions at the CEO-, firm-, and country-levels. An analysis of a sample of U.S. public firms during 1996-2015 renders support to our arguments. Our findings provide evidence on the imprinting role of executives' pre-career experience in their strategic decisions later on.

Terrorism, Response Strategies, and Gender Diversity in Top Management Teams (WITHDRAWN)

Author: **Chang Liu**; Rutgers Business School
Author: **Dan Li**; Indiana U.

Building on the crisis management literature, we argue that multinational enterprises (MNEs) enhance information control to improve their assessment of host country terrorist incidents, and increase their levels of within-country geographic diversification to mitigate the negative impact of terrorist incidents. Further, MNEs' likelihood of using information control and within-country geographic diversification in response to host country terrorist attacks is influenced by the cognitive frame diversity of their top management teams (TMTs). Drawing on TMT diversity and cognition research, we propose that TMT cognitive frame diversity is a function of TMT gender diversity. Subsequently, MNEs' likelihood of information control and within-country geographic diversification in response to host

Copy Me if You Can? Surviving Institutional Voids Through Business Model Evolution in Africa (WITHDRAWN)

Author: **Augustine Awuah Peprah**; U. of Professional Studies, Accra
Author: **Claudio Giachetti**; U. Ca' Foscari of Venice
Author: **Marcus Møller Larsen**; Copenhagen Business School
Author: **Tazeeb Rajwani**; U. of Surrey

The question of how a firm's business model evolves in an institutionally voided environment still deserves research attention in the business model literature. Bridging the institutional-based view of strategy and interorganizational imitation literature, this study examines how a firm's business model evolves in an institutionally voided environment in a developing economy. Using a qualitative data on Jumia—an e-commerce giant in Africa, our results suggest that the business model of a firm enfolded by significant institutional voids evolves through the following: first, the firm intentionally seeks to learn vicariously by imitating a successful firm's business model template. Second, because of the substantial impact of the institutional voids, the intentional pure imitation of the business model template of the successful firm becomes impossible and therefore, the firm begins to modify various components of the imitated business model template through experiential learning that blends the business model imitation process with innovation. Based on our finding, we propose a business model evolution process-model we called "imitate-but-modify", that explains how a firm's business model evolves in four unique stages in institutionally voided environments in developing economies. Implication on theory and practice of this finding are discussed.

Institutional Diversity and Internationalization of Emerging Market Firms

Author: **Arpit Raswant**; Lancaster U.
Author: **Chinmay Pattnaik**; U. Of Sydney

In this paper, we argue that examining the attributes of subnational region where a firm is headquartered only partially explains the role of institutional development on firm internationalization. Subsequently, we contend that richer explanation

country terrorist attacks is contingent upon their TMTs' gender diversity. Using a sample of 89 Fortune US 100 companies and their foreign subsidiaries between 2005 and 2014, we find that as the severity of terrorism in a host country increases, MNEs are more likely to increase information control and within-country geographic diversification. In addition, the relationship between terrorism severity and the increase in information control is stronger for MNEs with female representation in TMT than for MNEs with all-male TMT.

How CEO Narcissism Predicts Initial-Entry and Post-Entry Speed of Internationalization

Author: Xiaoxuan Li; Macquarie Business School, Macquarie U.

Author: Yue Wang; Macquarie Business School, Macquarie U.

Author: Min-Huei Yang; Macquarie Business School

Author: Yanzhao Tang; School of Management, Xiamen U.

Building upon the perspective that narcissism is an important personality trait of CEOs, the present study examines its effect in the international business context. International operations are potentially associated with great advantages but also certain threats. Distinct from traditional incremental approach, an increasing number of firms internationalize with a higher speed than they used to do, not only the time between inception and start of internationalization but also the subsequent period one internationalization starts becomes shorter. Therefore, from a multiple perspective of internationalization speed, this research examines how IEO explains why narcissistic CEO-led firms implement their first international operations rapidly and experience a faster expansion to a great many foreign markets after the initial-stage. Using survey data collected from 248 exporting firms, and an archival measure to calculate the firms' internationalization speed, we find support for our model. These findings offer an improved understanding of CEO narcissism in an international business context, help to better understand the drivers of firms' rapid internationalization in both

on firm internationalization could be derived from understanding the relationship between the home-based operations and decisions related to internationalization. We examine location choices of firms within the highly diverse home country and argue that firm's engagement in diverse subnational regions of varying formal and informal institutional settings impact its internationalization. In addition, we assert that the effect of informal diversity experience is more noteworthy on internationalization than that of formal diversity experience. Our results indicate that firm's home-based experience in diverse regions is likely to influence its probability of engaging in international markets.

Institutional Distance, Inter-Country Relationship, and Cross-Border M&A Performance of EMNEs

Author: Xiaoxi Liu; Guanghua School of Management, Peking U.

Author: Yanming Chai; Guanghua School of Management, Peking U.

How do the country-level institutional difference and inter-country relationship influence the value creation of cross-border mergers and acquisitions (M&As) by emerging market multinational enterprises (EMNEs)? Drawing on institutional-based view, this study investigates how the regulatory distance between home and host country affects stock market reactions to cross-border M&As announcement by EMNEs, using a sample of 1083 deals from 2003-2018 by Chinese listed firms. Our findings indicate that (1) The announcement of cross-border M&As will generate positive stock market reaction for EMNE acquirers. (2) M&A direction as well as regulatory distance matters, EMNEs are more likely to achieve better stock market reaction when they acquire targets from regulatory similar countries, but will gain less cumulative abnormal returns when the targets are from more institutionally mature countries, comparing to institutionally weaker ones. (3) Inter-country relationship can mitigate the negative influence of regulatory distance. EMNEs' acquiring targets from 'One Belt One Road' (B&R) countries are more likely to bring about better stock market reactions in spite of the regulatory distance.

inception stage and post stage, and the mediation effects of international entrepreneurial orientation of the firm.

The Influence of Protectionism on Cross-Border Acquisitions: The Importance of Legitimacy

Author: **Filip De Beule**; KU Leuven

This study investigates the impact of host country protectionism on the completion likelihood of an announced cross-border acquisition. Adopting a legitimacy perspective, I identify and test boundary conditions at the firm and national levels to study the relationship between protectionism and cross-border acquisition completion. I hypothesize that in host countries with a high level of protectionism, as reflected by the level of non-tariff barriers, cross-border acquisitions are less likely to be completed. I also propose that the relationships between protectionism and acquisition outcomes are influenced by critical host and home country's political conditions such as political constraint, political affinity and government ownership.

People management and standardization. Management consulting cases of small businesses in France.

Author: **Laurent Cappelletti**; LIRSA-Cnam Paris

Author: **Florence Noguera**; U. Paul Valery, Montpellier

Author: **Jean-Michel Plane**; U. Paul Valery, Montpellier

The introduction of a standardization of human resource management (HRM) in a small private sector business (SB) is certainly challenging from a managerial point of view but certainly risky from a human point of view if certain precautions are not taken. And yet, in order to improve the efficiency of their organization and customer satisfaction, more and more small companies are adopting such an approach. Is normalizing HRM, at a time of debate on the development of managerial agility, not anachronistic? At a time when there are many standardised companies, the article examines the problem of introducing standardization in the context of SBs through the implementation of an ISO 9001-type quality approach in French notarial offices. This text is based on a vast socio-economic intervention-research programme carried out at 250 notarial offices between 2004 and 2019, using a sample of 420 notaries and 1754 employees.

[view paper \(if available\)](#)

an educational subject. The process used to identify students' (pre)understandings was photo-elicitations with 387 students. Altogether 1197 student phrasings showed that there is reason to add Cooperation as a ninth theme to Gartner's original eight, and that students focus on entrepreneurial behavior, innovation and uniqueness, rather than the more traditional value- and organization creation. The study also highlights differences between male and female students' (pre)understanding of entrepreneurship, and discusses ways to open the field for more feministic approaches. Conventional perspectives on entrepreneurship and a gender-biased entrepreneurial ideology appears to still be reflected in content and methods of entrepreneurship education. This complicates the fulfilment of student-centered learning in entrepreneurship education. The insights from this phenomenographic study have implications for how entrepreneurship education in higher education is organized and performed, and indicates that there are reasons for educators to pay attention to students' (pre)understandings.

Author: **J. Kirk Ring**; Louisiana Tech U.

Author: **Bao Hoang**; Louisiana Tech U.

Author: **Christopher Martin**; Louisiana Tech U.

Author: **Erin Treon**; Louisiana Tech U.

This study reports some of the initial findings of a long-term assessment of learning/curriculum development program recently initiated in a College of Business (COB) at a mid-sized University in the southern United States of America. We present information about the mission- and data-driven framework (i.e., The Entrepreneurial Impact Project--EIP) and the entrepreneurial ecosystem that has been built to support entrepreneurial education at the University. We also present the results of an empirical study showing entrepreneurial self-efficacy interacts with individual adaptability to predict entrepreneurial behavior. This both validates the measurement regime of the EIP and contributes

Project Success Criteria and Project Success Factors in Information Technology Projects

Author: **Robert Calder Cooney**; UNC Charlotte

Public and private-sector organizations make significant investments in information technology projects to enable significant business change, drive organizational efficiency and effectiveness and achieve competitive advantages. Unfortunately, many of these projects do not achieve some or all of the planned business objectives and many are outright failures. This challenge in implementing projects has led to considerable research about both what constitutes project success criteria (the dependent variable) and what are the project success factors which influence achieving a successful project outcome (the independent variables). This paper will review the current state of the literature for both project success criteria and project success factors. Based on this review of the literature, a conceptual model is proposed to predict the potential success of a project for evaluation in future research, based on an adaptation of Westerveldt's (2003) Project Excellence® model which seeks to link project success factors with project success criteria.

Is Entrepreneurship Education Only about Entrepreneurship?

Author: **Anjali Chawla**; McMaster U.

Author: **Benson Honig**; McMaster U.

An important and unexamined issue in the study of entrepreneurship education (EE) and its outcomes concerns understanding the role of students in defining the outcomes of entrepreneurship education. Drawing on the narrative interviews with 31 students of educational programs, we identify that not all students join EE programs to become entrepreneurs and many students have the objective of becoming management professionals. Students with these decision frames engage themselves in constructing their respective professional identities: entrepreneurial and managerial. Professional outcomes achieved by those students either resulted in work- professional identity integration or work- professional identity coherence violation. Students were able to enact their professional identity in the situation of work- professional identity integration and work- professional identity coherence violation triggered identity redefining and/or constructing dual identity (managerial and entrepreneurial). Based on these findings, we develop a theoretical model of students' experiences of constructing, enacting and redefining their professional identities during and after the program and contribute to the literature of entrepreneurship education and identity.

The Making of Innovative Entrepreneurs in Business Schools in a Resource Constrained Environment

Author: **Victor Udeozor**; Nottingham Business School, Nottingham Trent U.

Author: **David Smith**; Nottingham Business School, Nottingham Trent U.

Nurturing innovation has become a central rather

than peripheral focus of entrepreneurship education in most Business Schools in the West. Yet the link between pedagogy and innovative entrepreneurship is under-explored. Using case study approach this study explores experiential pedagogy - teaching practices consistent with experiential learning theory- in a Business School in a developing country. The finding shows that using experiential pedagogical methods in entrepreneurship education stimulates innovation learning outcomes. Specifically, student business startups and the use of practitioners strongly inspire students' attitudes and affinity for innovative entrepreneurship. The contributions to entrepreneurship education theory and implications for practice are discussed.

Towards a Theory of Experiential Pedagogy

Author: **Victor Udeozor**; Nottingham Business School, Nottingham Trent U.

Abstract The logic of experiential pedagogy has been inadequately explained. We present a theoretical exploration of experiential pedagogy. We position experiential pedagogy as a function of engaged-faculty and out-of-class experiences constructs. Grounded on the experiential learning theory, we present a parsimonious typology of the forms of experiential pedagogy used in entrepreneurship education. The robustness of this typology is assessed using criteria that have been proposed for evaluating classificational schemata.

The papers in this session include detailed historical analyses of the shifting boundary between public and private domains and the fragmented role of government in legalizing historically prohibited substances and in enabling entrepreneurial empires.

From Antagonism to Protagonism: A Historical Perspective of Legalization in an Emerging Industry

Author: **Shalini Bhawal**; U. of North Texas

Author: **Manjula S. Salimath**; U. of North Texas

We explore the legalization of the cannabis industry in the US, and point at the conflicted path through which this emerging industry has traversed. In particular, we highlight how this industry has navigated controversy to become one of the fastest growing industries in the world. The paper also offers a theoretical model that explains the role played by social movements to propel and shape early antagonism towards increasing protagonism. Evidence of the latter is seen in the form of cannabis laws passing at the state level in the US. We posit that resource mobilization and shaping effects were instrumental in laying the grounds for legalization. A detailed timeline of the legalization for over one and a half centuries (from 1840-2019) is also provided. In keeping with the theme of broadening our sight, and calls to create synergistic approaches, we integrate a historical perspective with a theoretical approach (social movement theory) to address a relatively new and under examined phenomenon in the emerging legal cannabis industry.

The Canadian Enterprise of W.H. Smith: An Analysis of Government Policy on International Operations

Author: **Thomas Buckley**; Sheffield U. Management School

Bargaining models have been the primary analytical lens for examining Host Country Government (HCG) – Multinational Enterprise (MNE) relations.

Well-Being (session 1581)

Organizations that focus upon the development of positive emotions, from the individual to the organizational culture level, improve employee well-being, engagement and attitudes, as well as experience performance payoffs by reducing employee withdrawal, burnout, absenteeism, and risky out-of-work behavior (Barsade & Gibson, 2007; Barsade & O'Neil, 2014; O'Neill & Rothbard, 2017; Tsui, 2010; 2013; Rynes et al 2012; Van Looy, 2010). Yet there are various organizational countervailing forces, such as financial pressures, geographic distance, performance pressures, and the belief that anger leads to better performance, that can prevent employees from experiencing positive emotions and enhancing them in others. In this symposia, we examine the influence of the tensions between these countervailing forces and the building of positive affect from the individual-level to the organizational level of cultures of companionate love. We also seek to provide solutions, such as "micro- moments" and gratitude, through which organizational members at all levels of the organization can help promote positive emotions and gain their associated benefits.

Bargaining models, however, provide only a limited explanation for the rich interaction between HCGs and MNEs. To better capture the complexity and nuance of firm-state interaction, this research integrates insights from New Institutional Economics into bargaining models. To illustrate the insights possible with this approach, I analyse archival data related to the operations of the British retailer W.H. Smith in Canada. The findings demonstrate how an HCG can protect a nation's sovereignty, while simultaneously being open to foreign direct investment, and the adverse effect this may have on MNEs.

Blending Public and Private: British Municipal Trading c. 1889-1975

Author: **Kevin D. Tennent**; U. of York

Author: **Alex Gillett**; U. of York

Author: **James Fowler**; U. of Essex

Author: **David A. Turner**; Uni of York

Municipal trading was the dominant delivery form for transport and utility services in the late nineteenth and early twentieth-century Britain and saw local authorities operate these services on a profit-making basis. This paper uses historical evidence and the ideas of contemporary theorists of municipal trading to demonstrate how these bodies formatively brought hybridity into the public sector, using blended public, corporate and market institutional orders. It demonstrates that in order to gain institutional legitimacy for municipal trading local authorities had to fall back on antecedents in the transport and infrastructure industries, notably in the turnpike trusts, canal and railway industries.

Author: **Christine Chi Hye Hwang**; Wilfrid Laurier U.

There is growing consensus among behavioral ethics scholars that ethical leadership is a potent solution for addressing unethical and deviant behaviors in the workplace. However, while the evidence to date shows that ethical leadership generally reduces employee misconduct, it is not clear how ethical leaders influence those most likely to engage in misconduct – i.e., dispositionally dishonest employees (or low Honesty-Humility, HH; Ashton & Lee, 2004). Drawing on Brown et al.'s (2005) theory of ethical leadership, we test two distinct theoretical explanations: a) the moral

OB

MOC

Interpersonal Processes of Power Dynamics (session 1582)

Power is an interpersonal phenomenon. Because high-quality relationships are beneficial for the development of individuals and functioning of organizations, how to foster high-quality unequal-power relationships is an important topic to study. Drawing on the psychology literature on interpersonal relationships and power, more recent research has started to examine interpersonal processes in unequal-power relationships. This symposium presents four lines of research that use diverse methodologies and samples to explore various interpersonal processes between high-power and low-power individuals, such as prosocial behavior, expected trust, reactions to trusting behavior, self-disclosure, and controlling and autonomy-supporting behavior. This symposium aims to provide an opportunity for knowledge sharing and discussion among researchers who are interested in the interpersonal processes of power.

The Allocation of Indirect Reciprocity within a Power Hierarchy

cognitive perspective, which argues that ethical leaders reduce the unethical behaviors of low HH employees by positively shaping their moral cognitions (e.g., moral attentiveness and awareness, moral judgment, moral motivation, and moral disengagement) of low HH employees or b) the trait suppression perspective, which argues that ethical leaders simply suppress or constrain low HH employees' natural expression of unethical behavior through reinforcements. Across four studies investigating five moral cognitions, we found little support for the moral cognitive explanation. In contrast, we find evidence that ethical leaders primarily mitigate low HH employees' unethical behaviors by influencing their perceptions that deviant behaviors are not tolerated (i.e., suppressed) in the workplace. We discuss the implications of these findings.

The Emergence of Ethical Leadership in Rural China

Author: **An-Chih Wang**; China Europe International Business School

Author: **Jen-Her Wu**; National Sun Yat-Sen U.

Author: **Qi Li**; Xi'an Jiaotong U.

Author: **Lifang Peng**; Xiamen U.

We investigate the emergence of ethical leadership in "Taobao villages," or clusters of rural entrepreneurs, that consist of at least 100 online shops in the Taobao Marketplace within a single town and create an annual transaction volume of at least 10 million RMB (1.5 million USD). Using multi-source qualitative data, our analysis suggests that, during every phase of the development of Taobao villages, conflicts among villagers motivate bellwethers to take a moral stance on how villagers should interact with each other and to claim a moral identity by engaging in ethical actions consistent with the identity. Strengthened by other villagers' recognition and support, bellwethers' moral identity moves from one motivated by sympathy to one that involves prosocial motivations, followed by a duty orientation. This evolving moral status eventually causes villagers to claim a follower identity that further strengthens bellwethers' ethical leader status. The proposed model hence shows how

**Do Servant Leaders Create Servant Followers?
Exploring Social Learning and Social Exchange
Processes**

Author: **Karryna Madison**; Monash Business School
Author: **Nathan Eva**; Monash Business School
Author: **Alexander Newman**; Deakin U.

Servant leadership researchers have continuously sought to confirm Greenleaf's oft-quoted statement that servant leaders foster servant-like behaviors in their followers. A disconnect, however, emerges between how researchers theorize this phenomenon, choosing either to focus on whether followers internalize then emulate (a social learning process) or simply reciprocate (a social exchange process) the behaviors shown by their servant leader. By highlighting the theoretical mechanisms by which servant leadership transmits its effects, the present study determines whether servant leaders influence their followers to emulate or reciprocate their behaviors. Drawing on a longitudinal survey (n = 209) and a vignette experiment (n = 158) we find that servant leaders influence their followers' helping behavior through fostering social exchange rather than social learning. In doing so, this study brings into question our current understanding as to how servant leaders foster servant-like behaviors amongst their followers. Our findings suggesting that the positive behavior displayed by followers might simply result from them reciprocating the good behavior of their leader, rather than a transformation of character, are concerning in that they suggest that servant leadership might not result in the creation of more servant leaders.

**Ethical Leadership and Team Ethical Outcomes:
The Roles of Team Moral Efficacy and Ethical
Climate**

Designated as a "Best Paper" for OB
Author: **Dongkyu Kim**; NEOMA Business School

Author: **Christian Vandenberghe**; HEC Montreal

In recent years, unethical conduct (e.g., Enron, Lehman Brothers, Volkswagen) has become an important issue in management; relatedly, there is growing interest regarding the nature and implications of ethical leadership. Drawing from social learning theory (Bandura, 1986; 2000), we posited that ethical leadership would positively relate to team ethical voice and organizational citizenship behavior (OCB) through team moral efficacy. Furthermore, building on social information processing theory (Salancik & Pfeffer, 1978) and the social intuitionist model (Haidt, 2001), we expected these effects to be accentuated in teams with a strong ethical climate. Using survey data from subordinates and leaders pertaining to 150 teams from the Republic of Korea Army, ethical leadership was found to indirectly relate to increased team ethical voice and OCB directed at individuals and the organization through team moral efficacy. These relationships tended to be amplified among teams with a strong ethical climate. Additionally, these findings persisted while controlling for transformational leadership, thereby highlighting the incremental value of ethical leadership for team outcomes. Theoretical and practical implications are discussed.

The Imprinting Perspective on the Origins of Leadership

Author: **YeunJoon Kim**; U. of Cambridge

Author: **Soo Min Toh**; U. of Toronto

Author: **Yingyue Luan**; U. of Cambridge

The current research offers an imprinting perspective on the origins of leadership styles by investigating the imprinting of childhood social class on directive and empowering leaderships. With multi-wave and multi-source field data from 188 leaders at a health food company in Korea, we find that leaders from low childhood social class, relative to those from high childhood social class, tend to be imprinted with a stronger motivation to control organizational resources in the workplace. The motivation in turn relates positively to directive leadership – leader behaviors that maintain tight control over organizational resources by making elaborate plans for employee activities and allocations of budget and task materials as well as closely monitoring the executions of the plans –, but negatively to empowering leadership – leader behaviors that share the control of organizational resources with employees. In addition, the availability of organizational resources moderates the mediated relationships between childhood social class, motivation to control organizational resources, and leadership, such that the leader’s

Does Socioeconomic Status Predict Affective Motivation to Lead, and Why? (WITHDRAWN)

Author: **Shani Pupco**; Smith School of Business, Queen's U.

Author: **Julian Barling**; Queen's U.

Author: **Nick Turner**; U. of Calgary

Author: **Julie Weatherhead**; U. of Calgary

Author: **A. Wren Montgomery**; Ivey Business School

What motivates people to want to become leaders? In the first study, the results of an experimental vignette study show that HR professionals use information gleaned about applicants' affective motivation to lead (but not normative motivation to lead) when making leadership selection decisions. In a second study using a socioeconomically heterogeneous sample of young Canadians (N = 466, M age = 19.02 years; 66% females), we isolate four distal factors (namely parenting quality, socioeconomic status, extraversion and neuroticism) that indirectly predict affective motivation to lead through two separate proximal factors (viz. sociometric status and self-esteem). Practical (e.g., enhancing the leadership selection process) and conceptual (e.g., understanding the process underlying why people want to become leaders) implications are discussed.

Paradoxes and Paradoxical Leader Behaviors: Evidence from the 35-Year Corporate Development of Haier

Author: **Liguo Xu**; School of Management, Xi'an Jiaotong U.

Author: **Ping Ping Fu**; U. of Nottingham, China

Author: **Xianjing Zheng**; School of Management, Xi'an Jiaotong U.

Author: **Yunjie Zhou**; Haier Group

Author: **Boxiang Lin**; U. of Nottingham, China

Organizations in the current highly volatile, uncertain, complex and ambiguous era (VUCA, Bennett & Lemoine, 2014) face multiple paradoxes (Smith & Lewis, 2011). How to clearly identify and effectively manage these paradoxes is a challenge for leaders. This study identified three types of paradoxes (root, driving, and derived) and their corresponding paradoxical leader behaviors (explained below) based on data collected from multiple sources from the Haier Group, the largest global household appliance manufacturer, over its 35 years development. The three types of paradoxes evolve over time and systematically promote organizational development. We also discovered paradoxical leader behaviors can be both constructive and reconstructive. Based on one leader's response and changes in the tension intensity (from weak to polarizing), we divided paradoxical leader behaviors into four categories: constructive and polarizing, constructive and weakening, reconstructive and polarizing, reconstructive and weakening. Paradoxical leader behaviors are contradictory but situational, which can help leaders effectively respond to paradoxes. Based on our findings, we generate propositions for future empirical studies.

model that explains how two components of death awareness (i.e., death anxiety and death reflection) influence organizational citizenship behavior (OCB). We draw from terror-management theory (TMT) and post-traumatic growth (PTG) theory to argue prosocial motivation as an underlying mechanism for this relationship. We supplement this model by examining organizational identification (OI) as a potential moderator of the indirect relationship proposed. Data were collected from 241 employees at 3 time points over the course of 3 months. Our findings support the mediating role of prosocial motivation. Specifically, the more emotional death anxiety was negatively related to prosocial motivation, whereas the more cognitive death reflection was positively related to prosocial motivation. In turn, prosocial motivation was positively related to OCB. Interestingly, lower levels of OI were found to strengthen the indirect effect of death anxiety, but not death reflection, on OCB through prosocial motivation. These results highlight the conceptual differences between death anxiety and death reflection that have yet to be explored in the organizational literature. Further, these findings provide evidence for the relevance of assessing death awareness in the workplace.

A Multi-Level, Sequential Mediation Model of Union Citizenship Behavior

Author: **Liqian Yang**; Renmin U. of China

Author: **Qian Zhang**; U. of Toronto

Author: **Yanyuan Cheng**; Renmin U. of China

Author: **Yiheng Xi**; School of Labor and Human Resources, Renmin U. of China

A growing body of literature explores the effects of unions on union members' behaviors. In this study, we offered a full picture of union members' within-person psychological process via which union practices affect their members' discretionary behaviors. Specifically, we utilized cognitive-affective processing system (CAPS) and social exchange theories to explore the effect of union practices on union citizenship behaviors and the affective and cognitive mechanisms explaining such effect. Using a sample of 287 employees and managers from 30 state-owned and foreign-invested firms in China, we

Ethics Position Theory (EPT) (Forsyth, 1980) states that people have relatively stable implicit moral philosophies in terms degree of idealism and relativism. The present study hypothesizes that the complexity of a situation might lead to shift in their ethical ideologies. The level of complexity a situation poses is assessed based on centrality approach i.e. stakeholder centrality (self/other) and situational centrality (rational/emotional).The extent of shift in various ethical positions has been examined in detail in this study and individually assessed for all four Forsyth's dimensions i.e. absolutists, exceptionists, situationists and subjectivists. A 2X2 between group experiment is designed and traces the shifting patterns of 224 professionals with a mean age of 24.4 years. The results show that mobility and retention of ethical moral personalities and states that individuals tend to anchor high idealism in rational situations when it directly impacts their selves. However when the situation impacts others, there is more reliance on relativism. The study also states that when emotions are involved in situations, people tend to anchor more towards high relativism.

Moral Antecedents of Status Self-Misperceptions

Author: **Feng Bai**; Department of Management &Marketing, Faculty of Business, Hong Kong Polytechnic

Author: **Jin Wook Chang**; HEC Paris

Recent research has shown that individuals' self-perceptions of status can, and perhaps often, diverge from their actual status socially conferred by their groups. Status self-misperceptions, especially in the form of self-enhancement, furthermore, can evoke important consequences for individuals and groups, such as reduced efforts and task performance. Yet, it remains unclear what causes people to misperceive their own status in the group, despite a potential price in losing social acceptance and affection. Drawing on recent development in status and morality research, we theorize an individual's symbolic moral characteristics (e.g., identities and behaviors) as a crucial antecedent of status self-misperceptions, and the individual's

empirically tested a multi-level, sequential mediation model of union citizenship behavior. Our findings show that unions affect their members' citizenship behaviors via affective commitment first, and then, through the cognitive mechanism of union instrumentality. This study contributes to the literature by improving our understanding of how unions influence employees' valuable noncontractual behaviors. It gives a first attempt to unpack the "black box" of union members' citizenship behaviors by empirically examining the mediating roles of both affective and cognitive mechanisms. This study also provides theoretical guidance for stimulating the vitality and development of trade unions in Chinese enterprises.

Author: **Xueqing Wang**; College of Management and Economics, Tianjin U.

Author: **Mark Griffin**; Curtin U.

Author: **Ziying Wang**; College of Management and Economics, Tianjin U.

Author: **Keyao Li**; Curtin U.

Although research has thoroughly established that employees' safety citizenship behavior (SCB) is critical to workplace safety in high-risk work environments, less is known about the patterns by which safety stressors affect SCB. This study aimed to assess the mediating effects of felt responsibility and affective commitment in the relationships between safety stressors and two types of SCB, i.e. proactive and prosocial safety behaviors. In total, 408 frontline construction workers and their safety supervisors in China had their data analyzed, revealing that safety stressors had a slightly stronger negative impact on prosocial than on proactive safety behavior. Safety stressors hindered proactive and prosocial safety behaviors through differential patterns that felt responsibility (i.e. proactive safety-role orientation) mediated the relationship between safety stressors and proactive safety behavior, and affective commitment (i.e. prosocial safety-role orientation) mediated the

narcissistic personality as a moderator. Based on a multi-source survey on student friendship dyads, we find that symbolic moral identity, but not internalized moral identity, can indeed evoke status self-misperceptions, mainly in the form of self-enhancement. We, moreover, find that narcissistic individuals with high symbolic moral identity are most likely to have overly positive status self-perceptions, lending initial support to our theory.

Moral Foundations and Attitudes Toward Informal Paid Time-Off Accommodations

Author: **Yeong-hyun Hong**; U. of Alabama

Author: **Michael Thomas Ford**; U. of Alabama

The question of which individual and contextual differences influence employee's attitudes toward paid time-off policy has rarely been addressed in the literature. Drawing on moral foundations theory (Haidt & Graham, 2007), this paper examined how individual differences of moral foundations and situational factors that align with the moral foundations collectively impact employees' attitudes toward providing paid time-off accommodations. Scenario-design experiments in Study 1 and Study 2 demonstrated that factors that vary in their alignment with care, fairness, and respect for authority foundations influence employee's attitude toward paid time-off provisions. Furthermore, individualizing moral foundations at the between-individual level strengthened the positive effect of care-triggering situations on employee attitude toward paid time-off. Study 3 investigated an archival dataset of 7,963 respondents and showed that individuals' political self-identity, which is aligned with individualizing moral foundations, is associated with attitudes toward paid time-off.

When and Why Will the Political Perception of Employee Foster OCB? A 3- Way Moderated Mediation Model

Author: **Jiaojiao Qu**; Taiyuan U. Of Technology
Author: **Yongxing Guo**; Hebei U. of Technology
Author: **Xia Cao**; Shanxi U. of Finance and Economics
Author: **Man Cao**; Nanjing U.
Author: **Ling Ma**; Hebei U. of Technology
Author: **Lixiao Hao**; Hebei U. of Technology

The influence of organizational politics on organizational citizenship behavior (OCB) has been controversy. Based on impression management theory integrating the perspective of self-monitoring and time, we build up a three-way moderated mediation model to explore their complex relationship. With a large sample of 2,596 employees from various industries and areas in China, our results reveal that perceiving high level of organizational politics will elicit employee's impression management motivation, in turn, induce OCB; this linkage is most salient among tenured high self-monitors. Our findings indicate that organizational politics may lead to employee's altruistic behavior (i.e., OCB) through their self-serving motivation (i.e., impression management motivation), this indirect effect is also contingent on one's self-monitoring evolving over time, implying the dynamic nature of such relationship. We then discuss the theoretical and managerial implications, as well as future research directions.

[view paper \(if available\)](#)

While the recent research addressing the micro-foundations of corporate social responsibility (CSR) has often built on the theory of deontic justice to explain why employees care about their organization's CSR, the mechanisms underlying this deontic justice path have not yet been examined. To address this gap, we study moral elevation – an other-directed moral emotion that, according to deontic justice theory, could help us understand better why employees may react positively to their organization's CSR even when this CSR does not offer employees any instrumental or relational benefits. We hypothesize that moral elevation will help explain why CSR targeted at a secondary (as opposed to primary) stakeholder translates into organizational citizenship behavior supporting this CSR. We also examine a boundary condition to this mediation effect as we expect that the deontic justice path will be stronger when employees perceive their organizational identity orientation to match its CSR towards secondary stakeholders. We tested our moderated mediation model with data collected from 298 full-time employees, using a three-wave longitudinal design. Overall, by identifying moral elevation as a mechanism underlying the deontic justice path, our research provides empirical support for the deontic argument that employees care about CSR because CSR is the moral thing to do. Our work also supports the existence of a virtuous circle whereby an organization's initial investments in CSR targeted at a secondary stakeholder generate larger benefits for this secondary stakeholder because they bring employees to contribute to this CSR, thereby benefiting this stakeholder beyond the initial investments.

Paradoxes of Social Networks (session 1573)

Empowering or Burdening? The Short-Lived Benefits and Costs of Upward Networking at Work

Author: **Song Wang**; Zhejiang U.

Author: **Kun Luan**; China U. of Petroleum

Author: **Xin Qin**; National Sun Yat-Sen U.

Research on social networking has primarily focused the long-term consequences of upward networking on actors (e.g., Higgins & Kram, 2001; Lankau & Scandura, 2002), and upward networking has been furthermore found to be uniformly beneficial for actors in the long term. However, we have limited knowledge of in what ways upward networking impacts actors in the short term or immediately. Drawing upon conservation of resources theory, we focus particularly on upward networking – the pursuit of social ties with leaders in support of task and professional goals, and have developed a dual-pathway model that simultaneously examines the immediate benefits and costs of upward networking for employees on a daily basis. In Study 1, we have developed and validated a reliable scale of upward networking using 6 separate samples. In Study 2, utilizing a time-lagged experience sampling methodology across 82 employees who completed twice-daily surveys for 10 consecutive workdays, we examined the immediate effect of daily upward networking on work engagement through a resource gain of perceived impact and a resource loss of ego depletion. We found that the strength of the relationships between daily upward networking and its positive and negative outcomes was moderated by employees' trait of self-control. Specifically, employees higher in self-control experienced greater impact after engaging in upward networking while those lower in self-control experienced greater ego depletion. Overall, the current study suggests the complex two faces of upward networking, empowering and burdening, on employees' immediate work outcomes.

Pro-Organizational Unethical Behaviors (session 1571)

The Curse of Loyalty: Cultural Interdependence and Support for Pro-Organizational Corruption

Author: **Priyanka D. Joshi**; San Francisco State U.

Author: **Nathanael Fast**; U. of Southern California

Author: **Peter H. Kim**; U. of Southern California

Corruption thrives when individuals fail to take actions to stop it. We draw on research on culture and social roles to illuminate when and why interdependence leads to corruption. Three studies indicate that cultural interdependence creates social and psychological conditions that foster corruption. Interdependent cultures emphasize norms associated with benevolence and intra-group benefit and, as a result, individuals in interdependent cultures are less likely than others to speak up against pro-organizational corruption. In Study 1, analysis of an archival dataset of NCAA violations reveals that a culture of interdependence at universities was associated with reduced monitoring of deviance and greater group level violations, which further predicted deviance severity. In Study 2, we demonstrate the mediating role of social role expectation of group members on lower punishment of pro-organizational corrupt behavior. Finally, In Study 3, we use experimental methods to test the proposed mechanism. Consistent with our theoretical model, interdependence leads to greater protection of an unethical group member, but only when the unethical behavior met role expectations of benevolence. Implications for research on the culture, roles, and corruption is discussed.

“Managing Errors” in the Perception of Workplace Social Networks: The Case of Workplace Cooperation

Author: **Patrizia Vecchi**; U. of Cambridge

Exchanging help with one’s coworkers is essential to survive the demands and pressures of modern organizational life. But individuals have a limited amount of resources to trade for others and thus necessitate to identify reliable exchange partners with whom the exchange can be beneficial. At the same time, individuals have reputations for cooperation to protect that they need to consider in deciding whether and to what extent they should make themselves and their resources available to colleagues. I argue that these evaluations are informed by the structure of the informal exchanges as the individual perceives it, and I examine the consequences of perceptions that over- versus under-estimate the presence of ties within the structure. I argue that the costs of these two errors are asymmetrical such as for certain outcomes one error is more costly than the other. In particular, I argue that errors of underestimation are more costly in terms of status and reputation as an exchange partner, and that which type of error is more costly for job performance depends on the level of resource dependence of the individual. Overall, this work points to a thus far unrecognized source of advantage in network perceptions: the asymmetric costs of alternative errors. I conclude with a discussion of the theoretical implications of this new line of research and its practical implications.

The Connector’s Paradox: Revisiting the Social Psychological Value of Connecting in Social Networks

Author: **Michael Hahn**; Stanford

For years, many network theorists have argued that connecting (previously unacquainted) people in one’s social network comes at a structural disadvantage to ego: connecting closes holes in the

Author: **Liane Young**; Boston College
Author: **Adam Waytz**; Northwestern Kellogg School of Management

Across two actor and four observer samples we assess actor-observer asymmetries and judgment accuracy in contexts of immoral behavior. We examine the motives immoral actors ascribe to their own behavior, whether immoral actors can accurately predict the moral motive attributions third-party observers will make of their behavior (meta- perception), and the extent to which observers can accurately predict the self-reported motives of immoral actors (observer-accuracy). Using a direct approach where we solicit written instances of immoral behavior and accompanying motives and meta-motives, then provide those accounts to separate samples of observers, we find that immoral actors have low levels of meta-perceptive accuracy, whereas observers exhibit low to moderate levels of accuracy in judging the self-reported motives of immoral actors. Actors also exhibit a pattern of meta-perceptive inaccuracy we dub moral overconfidence: they systematically overestimate the positive attributions and underestimate the negative attributions that are made of them and their behavior. Further componential analyses of judgment accuracy reveal several trait moderators of accuracy among actors and observers.

Paved with Good Intentions: Self-Regulation Breakdown After Altruistic Ethical Transgressions

Author: **Xin Lucy Liu**; Columbia Business School
Author: **Hongyu Zhang**; Central U. of Finance and Economics
Author: **Jackson Lu**; MIT Sloan School of Management

Unethical pro-organizational behavior (UPB) is the unethical behavior driven by intention to help the organization. Among the first attempts to examine its consequences, we argue that such behavior may induce failure in self-regulation, and thus ironically lead to more counter-productive work behavior (CWB). Building on self-regulation theory, we theorize that breakdown in moral standards,

social structure, which may lead to the emergence of dense and cohesive/homogenous networks around ego, often associated with increased informational redundancy, reduced access to novel information, and a loss of control benefits. Instead of connecting, network theorists and business strategists often advise to network, which I define here as the building and developing of new ties by ego. Networking not only expands ego's network; it may also diversify it if the new contact is non-redundant. Unlike connecting, which closes structural holes around ego, networking can lead to the creation of new structural holes, resulting in immediate brokerage benefits. Here, I advance a social psychological critique of this structural de-emphasis of connecting in network theory, by suggesting that the structural payoff difference which networking might provide (compared to connecting) is offset by the social psychological rewards which connecting might provide (compared to networking): unlike networking, perceived by many as instrumentally motivated and strategic behavior which is solely carried out for personal gain and professional advancement, connecting might be seen as more authentic, cooperative, and communal behavior – a signal of generosity and altruism – resulting in the rewarding of higher social status. I propose that the social psychological rewards of connecting are causally linked to downstream structural benefits: connectors, due to being seen in a more positive light, will experience higher levels of direct, as well as indirect reciprocation by alters and social observers. My main thesis, called “The Connector’s Paradox”, states that there is a hidden structural value in connecting/closing social structures: the withholding of immediate structural rewards by the connector comes to be associated with social psychological rewards which in turn might mediate the mid-to long-term structural payoffs which connectors will accrue. Paradoxically, the closing of local social structures might – over time – lead to their very opening: connecting triggers more future network exchanges than networking, resulting in the potential expansion, and diversification of connectors’ social networks, *ceteris paribus*. As such, the Connector’s Paradox might not only be a social mechanism through which cooperation in networks (i.e., connecting) becomes sustainable, and, ultimately, rational; it might also be key to understanding how social psychological and

monitoring and discipline are the three key mechanisms that explain the linkage from UPB to CWB. A two-week experience sampling study among 90 hairstylists (Study 1) and a scenario experiment of 126 MBAs (Study 2) supported our model. In sum, transgressions committed with the intentions to help an organization may nonetheless put the organization down “the road to hell”.

Where the Boss Sits Matters: Work Interactions Among Employees and Physical Proximity in the Office

Designated as a “Best Paper” for OB

Author: **Ramon Lecuona Torras**; Duke U.

Author: **Jonathon N. Cummings**; Duke U.

This paper examines how work-related interactions between employees are shaped by two elements of the formal organizational structure: office space design and hierarchical relationships. We exploit the relocation of the headquarters of a multi-national company that made quasi-random assignment of employees to desks. We conduct a field study around this event and examine the mechanisms by which physical proximity to bosses shapes the interaction patterns of 141 employees. Consistent with prior work, we find that employees whose desks are in close proximity tend to interact more frequently and argue that they are more aware of each other, more inclined to become socialized in their location, and experience more opportunities to interact. We also find that the physical location of bosses shapes the interactions of employees. On one hand, due to monitoring, we find that when employees sit near their bosses they are less likely to engage in work-related interactions with others in the office. On the other hand, due to transitivity in relationships, we find that employees tend to interact more frequently with others located in close proximity to their bosses. We elaborate on the implications of our findings for the literatures on physical space, social networks, and organizational design.

Psychological Contracts (session 1574)

When and Why Psychological Contract Overfulfillment is Not Appreciated (WITHDRAWN)

Author: Yuen Lam Bavik; Deakin U.

Author: Kawon Kim; Hong Kong Polytechnic U.

This study advances research on psychological contract by examining social dominance orientation as a boundary condition that influences employees' cognitive and affective responses to psychological contract overfulfillment. Drawing on social projection theory, we propose that psychological contract overfulfillment increases employee gratitude through attribution to employer prosocial motive, particularly among employees low in social dominance orientation. We testify our predictions in the context of individualized employment relationships. Data from exploratory interviews, a field survey study, and an experiment provide support for our predictions. This research contributes to the psychological contract literature by illuminating the psychological processes and outcomes associated with the positive end of psychological contract fulfillment. The findings also provide important managerial insights by highlighting the feature of power inequality in employment relationships and the role of ideology in shaping employee reactions to psychological contract appraisal.

Rethinking Employment Relations in the New World of Work: A Psychological Contract Perspective (session 1585)

In the new world of work, employers are increasingly favoring flexible work arrangements in order to minimize labor costs, and technological advancements are also making it easier for corporate employers to pursue efficiency and productivity at the expense of humanness in the workplace. As such, more workers are faced with new challenges in their employment relations, especially regarding how to make sense of their relationships and mutual obligations with the organization and then act accordingly. Against this backdrop, our symposium seeks to shed new light on issues of employee-organization relationship in the new world of work, particularly taking a psychological contract perspective. Conceptual and empirical studies in this symposium aim to advance our understanding of psychological contracts in relation to workplace changes, technological disruptions, individual emotions, and identity in the new world of work. Specifically, these studies highlight the potential influence of new technology (e.g., integration of artificial intelligence into the workplace) on the development of psychological contract currencies, the implications of different types of psychological contracts for human experience at work (e.g., in terms of emotional regulation and authentic self-expression), and possible ways for organizations to enrich employment relations in today's workplace (e.g., through expressed gratitude, organization-sponsored causes).

Ki-Won Haan; Carnegie Mellon U. - Tepper School of Business

1117 observations. We found five theoretically relevant OC trajectories for employees who experienced PC breach: Continuous Decline, Positive Accommodation, Re-Commitment, Sustained Commitment, and Continuous Elevation. In contrast, we found two for employees who did not experience PC breach: Sustained Commitment and Continuous Elevation. The highest levels of PC breach accumulation were characterized by Continuous Decline, whereas the lowest were characterized by Positive Accommodation or Re-Commitment. Moreover, employees who demonstrated Continuous Decline had the lowest supervisor-rated performance and OCB, and the highest CWB. In contrast, those who demonstrated Sustained OC or Continuous Elevation, regardless of PC breach accumulation, had the highest performance and OCB, and the lowest CWB. Our findings challenge implicit assumptions in the PC literature, underscoring the importance of temporal research.

The Affective Processes Underlying Event-Based Psychological Contract Breach and Fulfillment

Author: **Tina Kiefer**; Warwick Business School

Author: **Neil Conway**; Royal Holloway, U. of London

Author: **Rob B. Briner**; Queen Mary U. of London

Psychological contract research has focused on entity-based psychological contract fulfillment (i.e., a generalized evaluation reflecting the degree to which the organization has typically upheld its perceived obligations). Integrating attribution and appraisal theories of emotions, we argue that examining psychological contracts from an event-based perspective (i.e., specific instances of broken or fulfilled promises) can reveal important processes that are distinct from an entity-perspective. Using a daily diary study with event sampling, we find that broken and fulfilled promises are associated with disparate attributions. In turn, breach elicited negative emotions, which prompted negative mood and counterproductive behaviors whereas fulfillment elicited positive emotions, which prompted positive mood and citizenship behaviors. Importantly, broken and fulfilled promises aggregated to influence downstream entity perceptions of psychological contract fulfillment via mood. Theoretical contributions include the

Social Perspectives on Burnout (session 1575)

Job Demands and Burnout: A Three-Way Multi-level Model of Boundary Conditions

Author: **Aldijana Bunjak**; U. of St. Gallen

Author: **Matej Cerne**; U. of Ljubljana

Author: **Noemi Nagy**; Kalaidos U. of Applied Sciences

Author: **Heike Bruch**; U. of St. Gallen

Burnout is an ever-pressing matter in contemporary workspaces. The current research investigates the relation of job demands to burnout and the extent that this relationship is moderated by unit collective trust and firm competitive pressure via a multi-level analysis of 5485 workers in 2872 units in 89 firms in Germany. A three-level model of three-way cross-level interactions is used in which employees are nested within units, which in turn are nested within firms. The study findings revealed that job demands were positively related to burnout at the individual level, whereas unit-level collective trust moderated the link between job demands and burnout. Moreover, results supported a three-way interaction among job demands, collective trust and

Author: **Frank H. Walter**; Justus-Liebig U. Giessen

Author: **Gerben S. Van Der Vegt**; U. of Groningen

Existing research suggests that boundary spanning can greatly advance team performance; yet, realizing boundary spanning's benefits is notoriously difficult. Our meta-analysis develops and empirically examines a conceptual framework of contingency factors to explain how boundary spanning is most likely to be effective for a team. Drawing from a configural perspective, we derive moderators of the team boundary spanning-team performance link based on different configuration of team boundary spanning (including the type, target, and primary carrier of boundary spanning). Synthesizing four decades of empirical research and meta-analyzing

competitive pressure for the three levels in the study (individuals, units, firms): High levels of collective trust at the unit level were able to mitigate the positive relationship between job demands and burnout at the individual level. Results also suggested that burnout was the lowest in the condition of high job demands, high collective trust, and low competitive pressure. The nuances of the interplay among employee job demands, collective trust, and firm-level competitive pressure in predicting burnout are discussed, contributing to shaping a multi-level organizational context preventing the occurrence of employee burnout. Keywords: job demands, collective trust, competitive pressure, burnout, multi-level analysis

Author: **Raymond Law**; Hang Seng U. of Hong Kong

Previous research suggests that individual employees tend to catch burnout from their coworkers and thus perform less satisfactorily. This primitive burnout contagion mechanism, however, cannot explain why some individuals may take pre-emptive actions to defend the potentially adverse influence of coworkers' burnout on themselves. We therefore go beyond the contagion view adopted in prior studies and advance knowledge by proposing a resource signaling perspective to understand the relationship between coworkers' burnout and employees' performance. We theorize that coworkers' burnout acts as a social cue that guides focal individuals in regard to how much effort they should put into their work in order to keep up with a high level of work performance. Two independent studies (Study 1: cross-sectional data; Study 2: three-wave data collection) support this new perspective. Results from Study 1 revealed that coworkers' burnout was negatively related to work performance for employees with lower levels of self-motivational resources when most (rather than a

71 primary studies (comprising 9,197 teams with more than 56,000 members), we find support for our conceptual framework in these configurational aspects to either strengthen (i.e., target of boundary spanning outside one's organization, team members as carriers of boundary spanning activities) or counteract (i.e., boundary spanning activities that are exclusionary toward external stakeholders) the positive effect of boundary spanning on team performance. These findings contribute to theory development on boundary spanning in teams by demonstrating how team boundary spanning can be implemented to be most effective.

On the Role of Network Structures in the Effectiveness of Boundary-Spanning Activity in Work Teams

Author: **Liliane Furtado**; U. Federal Fluminense
Author: **Filipe Sobral**; EBAPE/FGV

With the prevalence of team-based organizational structures, researchers have devoted considerable effort to figure out what makes teams effective. In this vein, boundary spanning activity – a set of team processes through which teams establish linkages and manage interactions with external parties – has been demonstrated to be a key determinant of team effectiveness. As a complement to previous research that has revealed the beneficial impact of boundary-spanning activity on team performance, this research addresses contingencies that drive the effects of boundary-spanning activity on performance. Specifically, following previous research showing the relevance of social network perspective in understanding team processes and effectiveness, this study addresses the role of social network structures, namely, spanners' network centrality and network connectivity, in the relationship between boundary-spanning activity and team performance. We empirically tested our hypothesis with data collected from 70 nursing teams. The results indicated that the level of connectivity augmented while spanners' centrality mitigated the beneficial impact of boundary-spanning activity on performance. The current findings point to the need to explore network concepts into boundary-spanning research.

few) coworkers experience similarly high levels of burnout (i.e., burnout signal consistency). This negative relationship was buffered when either burnout consistency was lower or self-motivational resource was higher. Furthermore, Study 2 showed that this conditional linkage between coworkers' burnout and performance was mediated by the work effort invested by focal employees. This resource signaling model remained significant even after controlling for the burnout contagion mechanism across both studies.

Coping with Interpersonal Stressors: A Meta-Analysis

Author: **Ying Zhang**; U. of hong kong

Author: **Yiwen Zhang**; U. of hong kong

Author: **Cangyan Li**; U. of hong kong

This meta-analysis examines the coping strategies employees adopt to deal with interpersonal stressors and how these strategies in turn relate to work and personal outcomes. We refer to the newly established taxonomy of promotion- and prevention-focused coping and extend this framework from coping with challenge and hindrance stressors to coping with interpersonal stressors. The term interpersonal stressor is broad, capturing situations in which one or more coworkers intentionally harm or isolate another coworker, taxing his/her personal resources. Typical examples include bullying, abuse, incivility, harassment, social exclusion, and ostracism. To better illustrate the relationships among interpersonal stressors, coping, and work and individual outcomes, we tested two meta-analytic models. The first model was based on our original meta-analysis, which included those studies that explicitly indicated that coping strategies were adopted to deal with interpersonal stressors. In total, 88 effect sizes were drawn from 27,433 employees. The second model incorporated data from existing meta-analysis on coping with work stressors in general. Through treating challenge and hindrance stressors as exogenous variables and controlling for their influences, we tested the unique effects of interpersonal stressors. The results converge to show that interpersonal stressors evoke

The Curvilinear Relationship Between Team Member Boundary Spanning Differentiation and Creativity (WITHDRAWN)

Designated as a "Best Paper" for OB

Author: **Jin Yao**; Xi'an Jiaotong U.

Author: **Jie Feng**; Rutgers U.

Author: **Xinmei Liu**; Xi'an Jiaotong U.

The positive effects of team boundary spanning on multiple team outcomes have been documented in the past decades, however, the influence of boundary spanning differentiation on team outcomes, especially creativity, has not yet been explored. Moreover, not all members may necessarily engage in boundary spanning, and involvement in boundary-spanning behavior may vary greatly within teams. The exclusive focus on the mean-level investigation of team boundary-spanning behaviors neglects the differentiation within a team that may contribute to team outcomes such as creativity. In this study, we integrate Categorization-Elaboration Model (CEM) and the information sharing literature to propose an inverted U-shaped relationship between team member boundary spanning differentiation and creativity which is mediated by information sharing. We also posit that team goal interdependence moderates the curvilinear relationship between team member boundary spanning differentiation and information sharing. Making use of survey data from a sample of 66 teams, we received general support for our hypotheses. Lastly, we discuss the implications of when and how team member boundary spanning differentiation affects team creativity

Is It Worth It? The Effect of Perceived Social Impact on Job Burnout

Author: **Alim J. Beveridge**; U. of Nottingham, China

This paper presents the results of an empirical study showing that perceived social impact, the perception that one's work positively impacts others, has negative relationships with the experience of exhaustion and disengagement, the two core dimension of job burnout, and that these relationships are moderated by employees' prosocial values. The findings indicate that perceived social impact is an important internal resource that can have a positive impact on employees' experience of their work and their well-being.

[RESEARCH](#) [PAPER SESSION](#) [ASYNCHRONOUS](#)

contributes substantially to team effectiveness, supervisors may not necessarily welcome such discretionary behavior. Drawing on self-protection theory, this paper examines how and when subordinate boundary spanning behavior may engender supervisor perceived status threat and the subsequent abusive supervisory behavior. Using a scenario-based experiment (Study 1) and a multisource two-wave field study (Study 2), we found that subordinate boundary spanning behavior is positively related to supervisor perceived status threat when supervisor has low rather than high managerial self-efficacy. Furthermore, the results indicated that supervisor perceived status threat provokes subsequent abusive supervisory behavior. These findings enable us to have a more comprehensive understanding of the social consequence of team member boundary spanning behavior, especially the negative reaction from the supervisor.

The Neuroscience of Decision Making in Organizations (session 1586)

The purpose of this symposium is to call organizational researchers' attention to the importance and possibilities of exploring the neural basis of organizational decision-making. A key role of managers is decision-making as noted by Henry Mintzberg (1979) who described managers as engaging in three primary activities: leadership, informational, and decision-making. Thomas

behaviors and polychronicity impact the boundaries we maintain around our work and home domains. Polychronicity refers to an individual's preference for doing several things at a time. Survey data was collected from 419 participants and analyzed through PLS-SEM modeling. Results showed that employees who were high in polychronicity, as well as those whose supervisors exhibited transactional leadership, had relatively weak boundaries around their work and home. Individuals high in polychronicity were seen to have higher life satisfaction. Transformational leadership of the supervisor was found to be positively associated with life satisfaction of the employee. Further, weak boundaries at work were positively associated with life satisfaction. Theoretical and practical implications of the results are discussed.

Bridging Temporal Divides: Temporal Brokerage in Global Teams and Individual Performance

Author: **Julija Mell**; Rotterdam School of Management, Erasmus U.

Author: **Sujin Jang**; INSEAD

Author: **Sen Chai**; ESSEC Business School

Temporal dispersion is an important characteristic of global teams, as members of such teams are often distributed across multiple time zones. This paper introduces the construct of temporal brokerage, which we define as being in a position within a team's temporal structure that bridges subgroups who have little or no temporal overlap with each other. Although temporal brokerage is not a formal role, we argue that occupying such a position makes an individual more likely to take on more coordination work than other members on the team. We suggest that while engaging in such coordination work has advantages in the form of greater learning, it also comes with costs in the form of increased effort relative to other members. We further argue that the increased learning and effort that result from occupying a position of temporal brokerage have implications that go beyond the boundaries of the focal team, spilling over into other tasks the individual is engaged in. Specifically, we predict that being in a position of temporal brokerage on global teams decreases the quantity

Davenport (2009) commented on the frequency of poor decision-making among managers and organizations in spite of an abundance of research on decision-making, decision-making models, and recommendations on how managers should make decisions. Davenport attributed a major cause of poor decision-making to a lack of insight into the individual decision-making process by stating: "Information goes in, decisions come out — and who knows what happens in between?" (p. 117). Davenport asserted that a focus on the mental processes of managerial decision-making and unpacking the black box of the mind can contribute to understanding and improving the decision-making process. Neuroscience research provides approaches to facilitate this effort.

Enrichment Between Leisure and Work via Psychological Resources: A Daily Diary

Author: **Ciara Kelly**; U. of Sheffield Management School

Author: **John Arnold**; Loughborough U.

Author: **Chris Stride**; U. of Sheffield

Although leisure is an increasingly valued life domain among employees, it has received little attention in the enrichment and work-life interface literature. This paper seeks to address the lack of work in this area by examining the enriching effects of leisure on work performance. We distinguish between different approaches an individual may take to their leisure activity by considering the effects of both serious and casual leisure. Drawing on enrichment theory, we examine whether day-level episodes of serious and casual leisure improve work performance through generating resources, specifically self-efficacy and positive affect. We collected daily survey data from 86 employees from a range of occupations over 10 working days. Results obtained via multilevel path analyses models supported our hypothesis that time spent on serious leisure predicted work performance on the following day via its effects on self-efficacy. In contrast, time spent in casual leisure did not have enriching effects on next-day work performance. These findings indicate that leisure is an influential non-work activity for work-life enrichment and highlight the importance of considering individuals' approach to the pursuit of leisure when examining its effect on the work domain.

**Effects of Failure on Self-Efficacy and Self-Set goals
Over Time: The Role of Max/Min Goal Standards**

Author: **Jacobus Alkema**; Rotterdam School of Management, Erasmus U.

Author: **Steffen R. Giessner**; Rotterdam School of Management, Erasmus U.

For managers, one of their main concerns is enabling continued motivation within subordinates, for which goal-setting provides one of the most valid and practical strategies at their disposal (Locke & Latham, 1990; 2002). When employees experience continued success (i.e. reach their goals), this positively impacts outcomes beyond higher levels of performance, such as higher self-efficacy (Bandura, 1991). But what happens with these beliefs when people are constantly failing to achieve their goals? How should managers go about setting performance goals that do not lower the subordinates' self-efficacy beliefs, yet simultaneously consider the mechanisms of goal specificity and difficulty that underlie the positive behavioural outcomes as put forward by goal-setting theory? The current research aims to provide a dynamic perspective on the effects of ongoing failure within individuals on self-goal setting and their efficacy beliefs development. By considering a theoretical framework of minimal and maximal goal standards (Giessner et al., 2018), we further show how framing such goals can influence this process by showing that maximal (versus minimal) goals can buffer against these expected negative consequences of not achieving a goal. As a result, we thirdly provide managerial recommendations of how to make use of (maximal) goal standards in organizational settings.

Institutional Complexity and Recombinative Innovation: Evidence from Hybrid Social Ventures

Designated as a "Best Paper" for OCIS

Author: Sophia Fu; Rutgers U.

Prior research has produced competing findings regarding the influence of institutional complexity on hybrid organizations. Although some organizations blend multiple logics well for positive innovation, others may experience extensive conflict that results in crises, failures, and even organizational demise. To address this puzzle, this research examines when and how the dialectical tensions that emerge from multiple institutional logics yield organizational innovation. Integrating the institutional logics perspective and recombination-based innovation framework, this research investigates how a hybridity of social and market logics influence innovation outcomes for social ventures. Program officers from three foundations assessed the novelty and quality of social innovation ideas reported in survey responses from 318 nascent nonprofit organizations, social enterprises, and benefit corporations in the United States. Structural equation modeling results provided support for the mediated moderation model proposed in this research. The degree of (in)compatibility and centrality of social and market logics interact with each other to determine the novelty and quality of social innovations. Moreover, an organization's entrepreneurial orientation fully mediates the relationship between institutional complexity and organization innovation. This study advances research on organizational innovation, hybrid organizing, institutional complexity, and entrepreneurship. It also has important practical implications for nonprofit leaders and social entrepreneurs.

How Do Knowledge Workers with Flexible Jobs Manage Constant Connectivity? An Affordance Perspective

Author: Farveh Farivar; U. of Tasmania

Author: Farjam Eshraghian; U. of Westminster

Author: Najmeh Hafezieh; Royal Holloway U. of

London

Knowledge workers' use of digital technologies and enactment of constant connectivity has been regarded an issue causing interruptions of their work. Such interruptions or distractions from work have been argued to have not only negative impacts but also some benefits to work. In this paper, we qualitatively studied how the use of different forms of digital communication technologies can have the outcomes specified in the extant literature. Drawing upon the concept of affordances, we have found that individual (self-efficacy) and organisational factors (nature of work, perception of Internet use policies, and organisational norms) play a role in the ways that knowledge workers perceive connectivity. We found that participants' perception of connectivity lead to attentive or preventive reactions to digital technologies.

Digital Anxiety in the Organization: Consequences and Mitigating Factors (WITHDRAWN)

Author: **Sebastian Firk**; U. of Groningen

Author: **Yannik Gehrke**; U. of Goettingen

Author: **Michael Wolff**; U. of Goettingen

While digital transformation pressures firms to realize the potentials of digital technologies, employees face high uncertainty regarding their future employment. This uncertainty may lead to digital anxiety among employees, which endangers the progress of digital transformation. Based on a large survey, we provide empirical evidence that digital anxiety indeed reduces work engagement and the outcome expectations of using digital technologies. However, we also reveal several factors that counteract these transformation barriers and reduce digital anxiety among employees. Specifically, we find significant negative relationships between digital trainings, the involvement in digital projects, as well as a transformational leadership style and digital anxiety. Taken together, this paper provides insights into the immense task of digital transformation by pointing to the crucial role of digital anxiety.

**Smartphone Addiction and Job Performance:
Exploring Mediation of Information Overload and
Work-Related Flow**

Author: **Marvin Dadischeck**; Alliance Manchester Business School, U. of Manchester

Author: **Masakatsu Ono**; Alliance Manchester Business School

In exchange for the convenience, an increasing number of people have been addicted to their smartphones and facing severe impairments of their performance in different life domains, including work. Organisations cannot ignore the potentially detrimental effects of smartphone addiction on employee job performance. It seems imperative to empirically investigate this relationship, which helps organisations ensure the expected productivity gains as a result of effective digitalisation strategies. Therefore, to get a fundamental understanding of the effects of smartphone addiction on job performance, based on a cross-sectional sample of 220 employees, the current research explores potential mechanisms through which the addiction-performance link operates. Hypothesised structural equation models revealed that smartphone addiction is weakly negatively associated with employee job performance and work-flow as well as it is strongly positively related to information overload. In addition, the findings provide clear evidence to suggest that information overload (36.6 % variance explained) partially mediates the negative effect of smartphone addiction on job performance (33.7% variance explained). In contrast, the indirect effects of flow at work were non-significant. The theoretical significance of the findings and subsequent practical implications are discussed along with limitations and further directions for future research.

**Measuring the Effect of Digitalization Efforts on
Bank Performance**

Author: **Johannes Kriebel**; U. of Muenster

Author: **Jörn Debener**; U. of Muenster

There is an ongoing debate on whether and under which circumstances digitalization can increase company performance (IT profitability paradox). Digitalization is of particular importance to banks. The debate to date suffers from a lack of structured reported information on digitalization efforts. As our main contribution, we suggest a new measure of these efforts in banks by applying text mining methods to exploit unstructured information from annual reports. We confirm this approach by showing that it predicts a substitution of personnel expenses with non-personnel expenses within banks and further predicts banks' IT patenting activity. Assessing the sentiment of reporting on digitalization, banks that report in a positive context, in fact, have a higher subsequent performance. This hints towards explanations for the IT profitability paradox linked to organizational capabilities.

Coping, Not Chocking under Pressure: Leadership Reactions and Support during a Terrorist Attack

Author: Synnove Nesse; Centre for Applied Research, Norwegian School of Economics NHH

Organizational crises, especially extreme ones that involve threat to survival and multiple deaths, are deeply psychologically challenging leadership situations. Yet to date, research has focused on how leaders effectively manage crises, without much regard to managing leaders' own crisis reactions. This study was carried out in the crisis management facilities at the headquarters of a multinational energy corporation while a terrorist attack was ongoing in one of its subsidiaries. I was present as a researcher and consulting psychologist, and this study is based on observations, interviews, conversations and support sessions with leaders while the crisis was unfolding. The unique data provide insights in to how leaders react (displaying stress arousal, basic, and complex emotional reactions) and how they seek support through different coping strategies (including through self-regulation, peer and expert support). I use an acceptance and commitment framework to present a three- phase model (acceptance, psychological flexibility, and commitment) for creating a holding environment for leaders in supporting them in coping, not chocking, under the pressure of managing a crisis.

Evolution of emotion-related practices in the context of radical change

Author: **Sandra Krisberga-Sinigo**; Cranfield School of Management

The purpose of this systematic review is to summarize what is known on how emotions and routines influence the organisational change process and to contribute to deeper understanding why change occurs insufficiently. Although, organizations need to know how emotions influence behaviour and social processes and how routines shape the way organisations adapt to changing environments, what we know remains fragmented. The findings of this study's systematic literature review reveal that little research has been conducted on how emotions relate to organisational processes and routines. We document the state of the art and develop a process view of how organisations can manage individuals' emotions and emotional expression and we explain how insufficient change results. Directions for future research are suggested.

Categories: Effects on Firms' Outcomes (session 1600)**"Category Thickness": Descriptive and Evaluative Ambiguities as Determinants of Strategic Category (WITHDRAWN)**Author: **Arnaud Cudennec**; HEC Paris

Research in market categories and in social evaluations underline that market actors use categories as strategic tools and that strategic categorization implies a certain degree of categorical ambiguity. While research on categories have mostly focused on the ambiguity regarding the category's meaning, or the "descriptive ambiguity", an overlooked dimension explaining strategic categorization is the ambiguity regarding the category's valence, or the "evaluative ambiguity". In philosophy, the categories that mix descriptive and evaluative ambiguities are called "thick", as opposed to "thin" that are either purely descriptive or purely evaluative. This conceptual paper studies how the combination of descriptive and evaluative ambiguities explains producers' strategic category affiliation. In doing so, it offers contributions in research on market categories and social evaluations.

Interorganizational Relations: Collaborations and Political Influence Across Boundaries (session 1601)**Inter-State Political Risk, Types of Political Ties, and International Joint Ventures (WITHDRAWN)**Author: **JungYun Han**; National Taiwan U.Author: **Xiaowei Luo**; INSEAD

Inter-state political conflict is an importance source of political risks that can deter firms' cross-border collaborations. While prior research has shown how business leaders' political ties can help firms access information and state-controlled resources, little is known about whether and how such political ties at home country can help firms cope with inter-state political risk. We differentiate two types of political ties, business leaders' social ties and family ties with government officials. We argue that social ties can alleviate the negative impact of inter-state political risk by helping the firms to navigate regulatory uncertainties, whereas family ties may worsen the negative impact by associating the firms with the state and tarnishing their legitimacy as viable foreign partners. We find support in the setting of Korean business groups' entry into China through joint ventures during 1990-2005. Our study contributes to the literature on political risks and corporate political ties by differentiating ties based on the nature of the relationship and revealing their different effects in coping with inter-state political risk.

Category-Featuring Names and Analyst Reactions to Corporate Environmental Actions

Author: Xiaoyu Zhou; ShanghaiTech U.

Author: Xiyi Yang; ShanghaiTech U.

Author: Yichuan Hu; Chinese U. of Hong Kong

Author: Haoyuan Ding; Shanghai U. of Finance and Economics

In this study, we develop a novel mechanism through which nonconforming organizations can survive and thrive. Building on recent developments in categories literature, we propose that audiences' category taken-for-grantedness, evoked by firms' category-featuring names, opens strategic opportunities for firms to escape from audiences' illegitimate discounts and even retain audiences' enhanced valuation. We test our predictions using security analysts' reactions to Chinese public firms' environmental actions between 2008 and 2014. Our findings demonstrate that a firm's explicit feature in its name that shaped by historical categorization can have profound impacts on analysts' legitimacy and value judgments of contemporary corporate behaviors.

[view paper \(if available\)](#)

ubiquitous trend that touched all corners of organization populations. What is unknown, however, is how inter-organizational relations contributed to corporate financialization. Traditional theories afforded by research on board interlocks and isomorphism would suggest that focal firms financialized similarly as their interlocks. But more recent research suggests that a focal firm's number of executive interlocks and the financial homogeneity of its board also played important roles in its financialization. My examination of S&P 1500 firms from 1996 to 2014 yields three important findings: First, focal firms indeed tended to financialize similarly to their interlocks, but (second) the financial homogeneity of those interlocks exacerbated their effects on the financialization of the focal firm. And third, boards seats filled by a greater proportion of executive directors limited the extent of the focal firm's financialization.

Soft Power Strategies: The Non-Market Interactions of Corporations and Governments (WITHDRAWN)

Author: Michael John Gill; U. of Oxford

Resource dependence theory and the field of strategy have drawn attention to corporations use of political action—attempts to shape government decision making in ways favorable to the firm. Yet scant attention has been paid to political action as a process, through which both corporations and governments participate and interact. Utilising recently declassified archival files, we develop an historical case study of how the U.K. government interacted with Moody's and Standard & Poor's to secure the highest possible credit rating in 1978, despite receiving an International Monetary Fund bailout two years earlier. Drawing on this case, we develop a process model to offer the first explanation of why and how governments pursue political action to influence corporations. By attending to how corporations and governments interact, we elaborate the unobtrusive function of soft power that has received limited attention in resource dependence theory and been overlooked in corporate political action.

Leadership and CEO Action (session 1596)

Responsible Leadership: An Emergentist Perspective

Author: **Elina Meliou**; Aston Business School

Author: **Mustafa Ozbilgin**; Brunel U.

Author: **Tim Edwards**; Cardiff U.

We studied the situated nature of the emergence of responsible leadership. Drawing on an emergentist perspective (Elder-Vass, 2005, 2008; Lawson, 2012), our analysis of observational and interview data in three organizations shows how responsible leadership emerges as participants' 'shared concerns', which are embedded in existing relations that give meaning to what is responsible and possible. In contrast to previous research, we show how relationality, in addition to individual moral duty, shape the emergence of responsible leadership. Our qualitative study shows how practical forms of responsible leadership emerge from four distinct types of shared and nested concerns of the study participants. We contribute to the theory on the emergence of responsible leadership by unpacking how the socio- relational context shapes leadership responsibility.

Legitimation Processes: Paradox, Innovation, and Knowledge Exchange (session 1595)

The Process of Repairing Organizational Legitimacy

Author: **Iris Seidemann**; U. of Hamburg

This paper aims to explain the persistent legitimacy loss of a highly institutionalized organization by analyzing the process of failing legitimacy repair. Therefore, I reconstruct the prominent case of the State Office of Health and Social Affairs (LAGeSo) in Berlin, which became a symbol of authority failure during the 'German refugee crisis' in 2015. My findings show that whereas media triggers the organization to take action by attributing a need for change of the legitimacy object, they at the same time perceive the actual effects of these changes as an impediment of legitimacy repair. Using a paradox lens, I argue that these tensions of restructuring, cooperation and communication originate from the duality of legitimacy object and subject and are rendered salient through media's paradoxical cognition. This contributes to our understanding of legitimacy repair in at least two ways: first, the revelation of a potential paradoxical downward spiral of legitimacy repair challenges the assumption that strategies of legitimacy repair mechanically produce desired outcomes; second, the paper contributes to the process perspective on legitimacy by revealing the fluid nature of the object of legitimacy, demanding for a more complex and dynamic lens when analyzing legitimacy processes.

Org. Legitimation in a Polarized Media Landscape: The Role of Robust Org. Impression Management

some referent firms rather than others based on the social structural attributes of the referent firm. We extend this prior research to argue that the imitability of referent firms' strategic actions will also be determined by the gender of the CEOs leading those firms. Based on significant domains in gender research, we formulate competing predictions about the role of CEO gender in driving inter-organizational imitation: gender serves as either a discounting or distinctiveness-based cue. We further posit focal CEO's political ideology – on the conservatism-liberalism continuum – as the reconciliatory boundary condition for resolving these two competing predictions. We test these ideas using a large, longitudinal sample of S&P 1500 firms during 1994-2017. Our findings provide generalized support for the discounting-based mechanism in focal firms' imitation of referent firms' advertising and R&D investments, suggesting that, all else equal, male CEOs' actions are imitated at higher rates, but also indicate that liberal-leaning focal CEOs may tend toward distinctiveness-cue, imitating female CEO- led firms at higher rates than their conservative-leaning counterparts.

Broadening our Sight of Leadership Relationships: Moving from Dyads to Triads

Author: **Zahira Jaser**; U. of Sussex Business School

In studying social relations, going from dyads to triads has the greatest impact on relational dynamics than any other change in group size. Yet triads are an underutilized unit of analysis in the appraisal of leadership relationships. This paper proposes that triads are a leadership configuration on their own right, which magnifies three leadership relational dynamics otherwise under- emphasized in dyads, groups or networks. These triadic leadership phenomena are: the role co-enactment (where the same person is concurrently a leader and a follower); the mediation of leadership (where one individual brokers leadership across triad constituents); and the skip-level relationships (where two constituents can form coalitions cutting through reporting lines). By utilizing main triadic theories and research this paper analyses these phenomena and their relevance for organizations, proposing

We conducted a longitudinal case study about the United States (U.S.) electronic vehicle manufacturer Tesla and its spokesperson Elon Musk to investigate how organizations can maintain organizational legitimacy through organizational impression management among a heterogeneous audience, as exemplified by the ideologically polarized U.S. media landscape. We uncovered that Tesla's spokesperson, Elon Musk, mobilized two different types of what we refer to as 'robust organizational impression management' (i.e., chameleon and diplomacy strategies). The 'chameleon strategy' portrays Tesla as ideologically open and appeals to different, highly polarized audience demands, while the 'diplomacy strategy' places Tesla in a diplomatic role that serves to de-polarize how the audience views the organization. Together, these strategies enabled Musk to both retain Tesla's good relations with the leftwing media and to simultaneously reduce its illegitimacy among the rightwing media outlets. In this way, Tesla maintained its legitimacy among a highly heterogeneous audience. Our study contributes to the literatures on organizational legitimation, organizational impression management, robust action, and political ideology.

Reframing Sequences and Revising Spaces

Author: **Dennis Van Kampen**; Vrije U. Amsterdam

Author: **Fleur Deken**; Vrije U. Amsterdam

Author: **Hans Berends**; Vrije U. Amsterdam

Author: **Rangapriya Kannan-Narasimhan**; U. of San Diego

We study how corporate innovators develop their frames over time to legitimize their innovations for internal and external audiences. Existing literature has focused on either internally or externally legitimizing innovations but not on how these processes interact. This interaction is important, however, as innovators often depend on diverse audiences simultaneously. By following four corporate ventures at a healthcare incumbent firm, we find that the initial frame and the sequence of

four theoretical types of triads, along the assumptions of formality (vertical vs horizontal), and symmetry of relationships (between leader and follower). The contribution to leadership theory is multiple because the triadic phenomena and the triads typology broaden our understanding of leadership away from heroic views onto more pragmatic and context-dependent ones. This paper offers practical insights of leadership as an adaptive activity, where the roles of leader and follower are interconnected, and effectiveness is centered on the capacity to shift roles according to the flow of influence.

The Cultural and Commercial Production of Leadership

Author: **Eric Guthey**; Copenhagen Business School

Author: **Nicole Ferry**; City U. of Seattle

Scholars have long criticized the commercialization of leadership, leadership education, and leadership development—some to distinguish what they consider legitimate research and practice from mass-market “bullshit,” others to characterize the whole notion of leadership as an ideological ruse or empty signifier. But neither critique rests on an adequate foundation of theory or empirical research regarding the actors, institutions, and industries that drive and profit from the commercialization of leadership. We therefore draw from the production of culture literature, Pierre Bourdieu’s sociology of cultural fields, Roger Friedland’s critique of Bourdieu, and our own work on leadership fashions to develop a theoretical framework fit to explore the cultural and commercial production of concepts, discourses, products and services via the leadership industries. A deeper understanding of the competitive and industrial dynamics behind these industries promises to contribute fresh perspectives on the proliferation of so many approaches to leadership; on the industrialized production rather than just the social construction of those approaches; on the continued predominance of romanticized and individualized prescriptions over against more sociologically nuanced theories of relational and collective leadership; and on the central role that scholars themselves play in the

frames determine whether internal and external legitimacy is gained and maintained over time. We found that it was particularly effective to initially emphasize novelty by framing an innovation as distinctive, because that created the most space for revising frames in the future. Familiarity frames, instead, constrained innovators because they inhibited innovators’ space to reframe their innovations and address emerging legitimacy threats. This illuminates that framing to gain and maintain internal and external legitimacy depended not only on innovators’ initial frames but also on the subsequent sequence of frames over time. For corporate innovators this indicates that they mostly benefit from emphasizing the novelty of their innovations as this enables them to address emerging legitimacy crises over time and maintain the legitimacy they previously acquired. We discuss implications for literature on framing and legitimacy.

Knowledge Leakage and Institutional Legitimacy in Competitive Dynamics

Author: **Geoffrey Borchhardt**; Yale School of Management

Author: **Balazs Kovacs**; Yale School of Management

Author: **Michelle Rogan**; Imperial College Business School

Interorganizational ties are ubiquitous and connect businesses to other organizations within their field as well as up- or downstream organizations such as patent prosecutors. In interacting with such parties, companies often must provide knowledge that lies at the core of their competitive advantage to receive the best service possible. Organizations might, thus, be inclined to avoid working with service providers via which indirect links to competitors are created, out of fear of knowledge leakage. However, we argue that forces of legitimation by association with reputable service providers, or even competitors, can counteract fear of knowledge leakage. At higher levels of connectedness to competitors, the selecting organization’s fear of knowledge leakage starts taking over and attenuates the probability of choice again. We test our theory studying patent prosecution in the field of computer technologies and find initial support for our proposition

leadership industries, and in the production and reproduction of leadership.

Configuring Interdependence: How Leaders Deal with Multiple Paradoxical Demands

Author: **Chris Moos**; U. of Oxford

Author: **Michael Smets**; U. of Oxford

Author: **Pegram Harrison**; European Business School London

Author: **Jonathan Schad**; King's College London

Recent management research has surfaced how today's organizational leaders experience a multitude of interconnected, yet persistently opposing demands in their work. Several literatures are conceptualizing these tensions and the need to reconcile them as ambidexterity, institutional pluralism or paradox. Common to all of them is the overwhelming tendency to conceptualise these tensions as operating between pairs of competing imperatives. However, many organizations operate in multipolar environments, requiring leaders to manage tensions between more than two demands. Drawing from a dataset that includes in-depth interviews with 42 Directors and CEOs of British National Museums, we inductively develop a framework of how senior British museum leaders dynamically engage culture, corporate and community demands to obtain economic resources, reach communities, and elevate the cultural relevance of their museums. Counter-intuitively, our data suggests that introducing a third demand may in fact ease tensions between coexisting elements and help leaders construct conflicting elements as interdependent. Through showing how leaders configure this interdependence, we make three contributions. First, by moving beyond duality, we show how considering more than two elements in a tension can be interdependent in a contradictory yet mutually constitutive manner. This contributes to a more realistic appreciation of the nature of interdependence, and the challenge of leading organizations in complex systems. Second, we direct attention to the relational and multifaceted nature of the poles of paradoxes. This provides a richer understanding of how poles of paradoxes, and tensions between them, are constructed and

Shared Values and Social Value Creation in a Nascent Organization

Author: **Henri Schildt**; Aalto U. School of Business

Author: **Farah Kodeih**; IESEG School of Management

Author: **Emma Sandström**; Aalto U. School of Business

Author: **Jukka-Pekka Heikkilä**; Aalto U. School of Business

We address a central gap in our understanding of social entrepreneurship by scrutinizing the processes through which nascent organizations create social innovation—new practices that create social value to beneficiaries. More specifically, our study examines the role that shared values play in a nascent social organization’s efforts to conceive, develop, and deliver social value. Our inductive analysis highlights how the purported social value emerged from organizational leadership’s initial vision that committed the organization to provide specific value to beneficiaries that motivated the development of related organizational practices. Initially, members of the organization formed negative value judgments, as they perceived the practices and outcomes to be misaligned with members’ salient values. Members’ judgments concerning social and private value shifted despite organizational practices remaining largely unchanged, as their salient shared values shifted

New and Disruptive Technology: Implications for Judgment, Voice, and Practice (session 1599)

Organizing the Wisdom of Crowds: How Wikipedia Helps to Theorize and Legitimize the Blockchain

Author: **Tino Schoellhorn**; U. of Mannheim / Germany

Author: **Achim Oberg**; U. of Hamburg

Many new community-based organizations rely on the assumption that platform technology can aggregate judgements of their members into results which are better than individual judgements. This “wisdom of crowds” effect is typically explained by stochastic effects which erase individual psychological biases. We deviate from this psychic-stochastic explanation by highlighting the relevance of organizing and technology: When applying a sociological institutionalism perspective on knowledge production, it becomes clear that institutionalized processes like typification, abstraction, legitimation, and objectification are mechanisms of organizing everyday knowledge in communities that go beyond stochastic effects. When distinguishing technological layers of platforms, the relevance of organizing principles for specialization, variation, and generalization becomes visible. How everyday knowledge production and technological layers are intertwined is demonstrated by analyzing Wikipedia in general and the development of “Blockchain” on Wikipedia in particular. We reconstruct how a dynamic semantic

from other-directed caring to reciprocal communality and personal achievement. Our study contributes by theorizing social value and elaborating how shared values amongst organizational members influence how social organizations develop.

The Role of Translation in the Formation of a Field: The Case of a Startup Ecosystem (WITHDRAWN)

Author: **Sara Ekberg**; Griffith Business School, Griffith U.

Author: **A. Paul Spee**; U. of Queensland

Author: **Anna Saies Jenkins**; U. of Queensland

How does the process of translation shape the formation of a field? While previous studies focused on the influence of top-down forces shaping the process of translation, few studies highlighted how translation processes shape the formation of institutions. By studying the emergence of a startup ecosystem, a manifestation of an institutional field; this paper theorizes the micro-processes and dynamics of field formation. We pay particular heed to, and advance the process of translation as the formation of a field is marked by a lack of stability, clearly defined roles and rules. This paper extends the translation literature, by elaborating on different types of 'translation work' and how these shift as the field forms and develops. Lastly, this paper contributes a better understanding of the roles of carriers in the translation processes, an area that is understudied to date.

Direct Versus Indirect Vendor Channels and the Scaling of Worker Voice Around Digital Technologies

Author: **Jenna E. Myers**; MIT Sloan School of Management

In this longitudinal, qualitative study, I follow the use of a digital production monitoring system in a manufacturing firm to study mechanisms for worker voice in the context of digital, networked technologies. As a complement to studies that situate mechanisms for worker voice in the relationship between workers and employers, I draw four conclusions regarding worker voice around these new technologies sometimes referred to as "Industry 4.0." First, worker voice can meaningfully occur long after the initial design and deployment phases of new technologies. Second, the effectiveness of worker voice may depend on the type of channel that exists between workers and third-party vendors. In particular, direct versus indirect vendor channels for worker voice can shape the practices by which workers draw attention to problems between the technology and the workflow, speak for the benefit of a key user, and pose technology solutions. Third, when workers have direct vendor channels, they can more effectively use voice practices to achieve worker-centric technological capabilities—improvements that expand the control of workers, including reducing surveillance and increasing worker access

to data. Finally, new worker-centric technological capabilities can be quickly and broadly distributed by the vendor across the field of firms using the technology.

Uncertainty as Generated Through Social Practices in Biotechnology Entrepreneuring

Author: **Irina Liuberté**; ISM U. of Management and Economics

Author: **Miriam Feuls**; Copenhagen Business School

In this paper, we extend the research on entrepreneurial uncertainty by applying a practice lens, and analyzing how uncertainty is generated in entrepreneuring practices. Contrary to the established notion of uncertainty as a characteristic of environment or as an individual knowledge problem, we analyze uncertainty as a social phenomenon and a part of social entrepreneuring practices. We draw on the entrepreneurship as practice approach and analyze how practices of creating “proof of concept”—the feasibility of a new technology— generate uncertainty, and how entrepreneurial firms organize in response to this uncertainty in order to break the tension that surrounds the creation of a “proof of concept”. Based on a comprehensive study of a large biotechnology firm and the network of entrepreneurial firms that are their partners or potential collaborators, we demonstrate how uncertainty manifests through contrasting understanding of time and knowing.

Reinventing Dominance: Temporal Work in Processes of an Incumbent’s Self-Disruption

Author: **Joakim Hans Netz**; Jönköping U.

Author: **Patrick Reinmoeller**; IMD

Seminal literature has shown how disruptive technology can be a cause for the demise of established firms and pointed out that new entrants—unencumbered by history—move quickly and disrupt industries, whereas incumbents run out of

time because they are pinned down by their past. We examine how history can serve as the basis for temporal work in enduring processes of self-disruption through an in-depth study of how ABB acted as a disruptor in the power transmission systems market by opening a new technology platform enabling cities' "smart grids". Findings from this study highlight a process that relies on the incumbent's past providing alternative uses of history to cope with evolving tensions—which are triggered by external and internal relationships, and synchronizing imaginative sediments and changes in routines. We explicate this process of self-disruption and discuss its implications for research on enduring disruptions by technological change and innovation.

The Doctor Will See You Elsewhere: Enterprise IS and the Changing Control of Firm Activities

Author: **Brad Greenwood**; George Mason U.

Author: **Russell James Funk**; U. of Minnesota

In this work, we examine how the adoption of enterprise information systems affects the ability of high agency organizational actors to control the activities performed by firms, including both what those activities are and where they are done. While extant research highlights the ability of managers to more carefully manipulate the activities performed by the firm when enterprise IT is adopted, work has yet to examine whether high agency subordinates will use such technology to appropriate rents. Empirically, we investigate whether surgeons reallocate patients to ambulatory care settings for treatment after the adoption of electronic health records (EHR). Findings suggest that while the adoption of basic EHR technology has limited effect, the adoption of advanced EHRs dramatically increases the number of patients treated in an ambulatory care setting. Interestingly, these relationships are strongly moderated by both the financial incentives of the physician and the profit motives of the hospital. Practical and theoretical implications are discussed within.

Optimal Distinctiveness, Innovation, and Organizational Character (session 1594)

Anchored Differentiation: The Role of Temporal Distance in the Comparison and Evaluation of New Pro

Author: Tian Heong Chan; Emory U., Goizueta Business School

Author: Yonghoon Lee; Hong Kong U. of Science and Technology

A new design can be compared with its contemporaries or older designs. In this study, we argue that the temporal distance between the new design and its comparison play an important role in understanding how a new design's similarity with other designs contributes to its market valuation. Construing the value of designs as a combination of their informational value and their expressive value, we propose the anchored differentiation hypothesis. Specifically, we argue that the market audience weighs the expressive value (which enhances with how much the new design appears different from others) more than the informational value (which enhances with how much the new design appears similar to others) when the comparison is made to contemporary designs. However, the market weighs informational value more than expressive value when the comparison is made against designs from the past. From a data set that combines US design patents and stock market reactions in the days subsequent to such a patent being granted, we explore how a new design's degree of similarity vis-à-vis contemporaries or predecessors affect its market value. We find that the market value for a new design decreases with its similarities to contemporary new designs (contemporary differentiation) but increases with its similarities to prior designs (past anchoring). Furthermore, we find that the value of contemporary differentiation is

Organizational Control: New Perspectives and Future Directions (session 1602)

Control is "management's most fundamental problem" (Van Maanen and Barley 1984: 290), and issues relating to control are apparent in many facets of organizational life such as organizational design, organizational culture, and everyday organizational routines. However, theory on organizational control has not kept pace with changes in both organizations and their environments. This may partially reflect the segmentation of control research from research on related theoretical concepts. Therefore, to advance our understanding of organizational control, this symposium aims to integrate a variety of theoretical perspectives — such as organizational learning, organizational change, and technology in the workplace — with more traditional organizational control theory. By integrating a variety of theoretical perspectives, we hope to both move forward current theory on organizational control while also encouraging scholars to broaden their understanding of what comprises and constitutes organizational control research.

Burning the Bridges: Authenticity, Innovation, and Transgression in Norwegian Black Metal (WITHDRAWN)

Author: **Stoyan Vassilev Sgourev**; ESSEC Business School

Author: **Erik Aadland**; BI Norwegian Business School

This study explores the dark side of an inherently positive construct - authenticity. Posing conformity (reproducing essential features) and differentiation (asserting distinctive features) as alternative routes to achieving authenticity, we document the escalation of the latter into normative violation. Escalation is the refusal of compromise as a way of reducing the gap between private self and public display. The research context is Norwegian black metal, unprecedented in music history in elevating extremity to a core principle of construction of artistic and collective identities. We examine two forms of escalation - as innovation in music and transgression (i.e. church burnings). Escalation was mediated through the exclusion and self-exclusion of actors with lower tolerance for extremity. Its substantive importance is in adding a layer of complexity to evaluation. That black metal's connection to crime has contributed to its endurance suggests that escalating action defying normative scripts can be attributed authenticity when interpreted as sincere and consistent embodiment of alternative values. We paint a large canvass of the escalation process by drawing on examples in history, fiction and politics.

Settle Down or the Struggle Within: A Multiple Case-Study of Organizational Character Development

Author: **Timo Fiorito**; U. of Twente

Author: **Michel Ehrenhard**; U. of Twente

Using a multiple-case study of two financial services firms in the Netherlands, we explain how organizational character develops when new commitments are articulated and extant commitments are maintained. We found that commitments become expressed as a result of the perceived organizational past, envisioned organizational future, and as a result of pressure from internal subgroups. Because these commitments were made salient to managers, tensions became manifest, leading to various forms of struggle. Four interrelated dynamics underlie this state of struggle, which we termed emerging dilemmas, organizational identity clarity, ambiguous or superficial commitments and structural differentiation. In such context, the enactment of three stabilizing practices, specifically, substantive integrative work, routinizing a collective conscience and leaders' modeling behaviors, contributed to commitment affirmation or commitment violation, providing the opportunity for further anchoring these commitments in organizational character. In elaborating theory around these actions, we contribute to scholarly and practitioners understanding around how organizations may improve in embedding contradictory commitments within organizational boundaries and rejuvenate the study of organizations as value-infused social actors.

Categories and Exploration

Author: **Thomas Woiczyk**; U. Pompeu Fabra

Author: **Franziska Sump**; U. of Southern Denmark

Author: **Gael Le Mens**; U. Pompeu Fabra

Understanding how novel ideas are evaluated and recognized is important for organizational prosperity. A systematic evaluative bias against novel options after a negative experience - known as the 'hot stove effect' - may prevent organizations from engaging in enough explorations to identify novel ideas. We show that the adverse

consequences of the hot-stove effect can be reduced by manipulating how novel options are categorized. The core of our mechanism is that categorization of options in more categories reduces the generalization of negative experience to other options, whereas categorization in fewer options favors such generalization. We develop predictions based on a computational model and test these in a behavioral experiment (N=302). The task environment is a setting in which participants decide between a known 'status quo' option and six unknown, novel options. Participants are randomly allocated into three conditions that vary in terms of the number of categories to which the novel options belong. If the six novel options belong to six distinct categories, the propensity to explore is significantly higher than when options belong to fewer categories. When all novel options belong to the same category, participants are most likely to avoid exploration. Our findings suggest new ways managers could favor, or prevent, exploration of novel options by organizational members.

Material Identity Work and Reinforcement of Collective Identity in Times of Loss

Author: **Innan Sasaki**; Warwick Business School

Author: **Johanna Raitis**; U. of Turku, School of Economics

Author: **Ileana Stigliani**; Imperial College Business School

The death of a central figure, like a charismatic founder, can dilute the sense of collective identity among the various stakeholders of a local community. Maintenance of collective identity can be a difficult task, because the organization needs to then simultaneously deal with multiple identity drifts. We conducted an inductive study of Finnish company Ponsse, the founder recently passed away. The second-generation chairman took the lead to articulate the values that implicitly prevailed during the leadership of the founder. Our findings show that organizations that experience a loss can maintain and strengthen their collective identity after the passing of a charismatic leader by engaging in material identity work. Our study highlights two phases underlying the process of reinforcing the collective identity: creating the material environment and enacting material experiences. We contribute to deepen current understanding of how collective identities can be reinforced after a major loss by illuminating the material underpinnings of identity work.

[view paper \(if available\)](#)

evoked in the description of a problem's symptoms prompt managers to turn to specific coordination safeguards (e.g., contracts and professional roles). Through the study of hasty coupling, I generate insights into when managers take the route of formulating the actual problem versus when they seek off-the-shelf formulations. However, each route has distinct implications for the quality of problem formulation and ultimately the project's time and cost overruns. Although the managers worked together in the first project, prior experience did not enhance problem formulation between them in the second project. The findings bring together research on problem formulation and problem solving and the interorganizational coordination literature under a generalized process of problem formulation between organizations.

When Advice Can Harm

Author: **Sheen S. Levine**; U. of Texas at Dallas

Author: **Michael Prietula**; Emory U., Gozuieta Bus Sch

Strategic decisions can be hard, and when facing hard problems, decision-makers commonly seek others' advice. But finding a good advisor is tricky: People are biased judges of skill, even more so in the wicked environment that typifies strategic decisions, where data can be incomplete, outcomes ambiguous, and causality foggy. Relying on empirical data, we model when and how person-to-person sharing can cause bad advice (or ideas) to spread, even without conformity pressures or malintent. We begin by reviewing how people systematically misjudge relative skill: misestimating how their own skill compares to others'. We show that if skill misjudgment is assumed away, advice taking is always beneficial. But under realistic assumptions, advice sharing benefits the low-skilled while harms highly skilled decision-makers, degrading collective skill and potentially eliminating top performers. We test an organizational design solution: When decision-makers are clustered, paying more attention to close associates, the range of practices increases. There lies a trade-off: Encouraging advice exchange homogenizes skill whereas discouraging it benefits diversity. For scholars of organizations and

From Shelter to Emancipation: How Disabled Workers Found Their Own Voice Through Identity Work

Author: **Patricia Helena Hein**; EBS U. für Wirtschaft und Recht

While studies have examined individual and organizational identity work, we focus on the dynamic interplay between the two. Drawing on a six-year longitudinal study of disabled workers in a sheltered workshop in Germany, we show how the disabled found their own voice to be seen as active members of society and changed the organizational exclusionary identity of the workshop. We develop a process model with three different phases of "guided emancipation:" maintenance of identity constraints, external validation, and forging a new disability identity. Our findings advance our understanding of individual and organizational identity work processes in the workplace. First, engagement in purposeful identity work is not just performed by managers and leaders, but also by marginalized actors to empower themselves in an organization in which their role is highly constrained. Second, by illustrating the dynamic interplay between both individual and organizational identity work, we show how changes in individual identity work can precipitate an overall change in organizational identity. Third, we show how disabled workers engaged in identity work to change the socially constructed view of disability imposed on them by sheltered workshops as part of an institutionalized welfare system through expressing a positive disability identity based on their self-concept.

Framing and Complexity: Evidence from the Federal Reserve

Author: **Joosef Valli**; Aalto U. School of Science

This paper investigates the role of cognitive framing in decision makers' ability to perceive complexity. Qualitatively studying the Federal Reserve's monetary policy making committee, the FOMC, and conceptualizing its policy as a complex set of separate but interdependent choices, the paper finds that framing both enables committee members to attend complexity and hinders their ability to do so. By focusing a decision maker's attention on a few features of the environment, a cognitive frame can effectively push her to perceive interdependencies not visible without that focus. However, by screening out many other features of the environment, interdependencies amongst these are ignored. A (single) frame therefore helps one to perceive low-levels of complexity but hinders the attainment of higher-levels of complexity. In highly complex environments, decision makers should thus exhibit frame heterogeneity, allowing them to attend the problem at hand through multiple frames. The paper has practical implications to the design of a broad range of decision making groups: it is argued that if the group is confronted with complex problems, individual members ought to exhibit sufficiently varied frames on their own: heterogeneity at the group-level is not enough. Finally, the paper complements recent research on frames in the FOMC.

[view paper \(if available\)](#)

as heroes who appear from nowhere to change the world, and sheds little light on the formative factors in their identity. Therefore, I applied a phenomenological methodology to study the experiences of select institutional entrepreneurs and compared these with that of actors who did not act as institutional entrepreneurs in similar situations. I found that institutional entrepreneurs had developed an identity with certain values as a reaction to crucial experiences during their first socialization. In line with their values, they had embraced various institutional contradictions throughout their lives and thus developed skills that enabled them to initiate institutional entrepreneurship. Additionally, their early established identities influenced their motivation to respond to prevalent institutional contradictions by realizing their key values during opportunities for change. The findings reveal that institutional entrepreneurs are disembedded actors only when seen from the outside: from their own perspective, they legitimize their behavior vis-à-vis their past experiences. This insight contributes to the debate on the paradox of embedded agency.

Organizational Risk-Taking in the Context of Ambiguity

Author: Emanuel Ubert; U. della Svizzera Italiana

How do firms adjust their exposure to local market risks when those risks suddenly become ambiguous? Behavioral theories of risk-taking (e.g. Audia and Greve 2006, March and Shapira 1992) offer little guidance. They implicitly assume that the interpretations of organizational performance problems that trigger changes in risk-taking are unambiguous. This paper argues that firms that are confronted with ambiguity produced by rare shocks ignore historic performance feedback when adjusting their risk exposure to the affected region. Instead, firms rely on firm-wide insolvency thresholds, local social performance comparisons, and local market signals to guide their risk adjustments. The statistical analysis of an original panel dataset of homeowner insurance underwriting behavior in the U.S. between 1992 and 2012 supports this argument. Critically, however, it also demonstrates that a greater reliance on social learning in such circumstance is contingent on the unavailability of legitimized means of forecasting future risk exposure. The institutionalization of hurricane forecasting models in insurance markets reduced reliance on such social learning and directly altered risk-taking. The paper contributes to efforts to better understand the scope condition and dynamics of problemistic search and learning processes and their impact on organizational risk-taking and adaptive behavior.

Although emerging industries are increasingly seen as the outcome of social movement processes, protests have seldom been studied as sources of the liabilities of newness. We find that that anti-technology protests exert two effects: on the one hand, they amplify perceptions of risk about the new technology and impede entrepreneurial entry, but on the other hand, protests create a demand for regulation, and in turn, regulations authorize a new technology and facilitate entrepreneurial entry. Thus, protests are a double-edged sword in emerging industries; they produce liabilities of newness by constructing risk, but attenuate the liabilities of newness due to their effects on regulation. We discuss the implications for social movements, entrepreneurship, and science and technology studies.

An Agenda-Setting Model of Stakeholder Influence

Author: **Daniel Waeger**; Wilfrid Laurier U.

Author: **Sebastian Hafenbrädl**; IESE Business School

Existing research has shown that when multiple demands from stakeholder activists are directed at a firm in a sequential manner, the multiple demands build on each other to magnify activist pressure and thereby enhance activists' capacity to influence firm outcomes. However, in many instances, multiple demands from stakeholder activists are not directed at a firm sequentially, but simultaneously. Yet, when multiple activist demands are directed at the same firm at the same time, these demands compete for attention from decision makers in the firm and risk crowding each other out, thereby hampering the ability of any individual activist demand to influence firm outcomes. Building on this premise, we propose an agenda setting model of stakeholder influence where multiple activist demands compete for space on the agenda of decision makers in firms. To test this model, we look at the shareholder proposal process in the United States and specifically examine the shareholder proposal campaign between 2006 and 2010 for the

introduction of Say on Pay – a corporate governance policy that consists in submitting a firm’s executive compensation plan to a vote from shareholders. Consistent with the crowding out hypothesis, we find that Say on Pay proposals were more effective when firms received fewer shareholder proposals on other issues in the same year. And once adopted as part of the regular agenda of the annual meeting, Say on Pay was more effective at curbing CEO compensation when firms received fewer shareholder proposals on other issues in the same year.

What the WUNC? Perceptions of WUNC and Social Movement Mobilization

Author: **Erica Bailey**; Columbia Business School

Author: **Dan Jun Wang**; Columbia Business School

Author: **Hayagreeva Rao**; Stanford U.

Author: **Sarah A. Soule**; Stanford U.

Charles Tilly (1994) provided a four-part framework that outsiders (e.g., targets, potential supporters) use when assessing a social movement: worthiness, unity, numbers, and commitment (WUNC). These attributes have been embraced, sometimes implicitly, by most scholars of movement recruitment and mobilization. However, this measure has never been explicitly tested as an evaluative schema used by outsiders in making mobilization decisions. Here, we first develop a measure designed to assess the four factors of the WUNC theory (N = 539). We then use this measure to test how individual variation in this evaluative schema predict actual social movement donation behavior (N = 361). Finally, we consider how movements make identity claims around (1) the issues they focus on and (2) the diversity of the movement’s participants affect WUNC and subsequent mobilization attempts (N = 380).

Enablers and Tensions of Voluntary Sustainability Standards' Successful Implementation Process

Author: **Lucrezia Nava**; U. Ramon Llull, ESADE Business School

Author: **Maja Tampe**; ESADE Business School

Voluntary Sustainability Standards (VSS) aim to encourage organizations to ethical behaviors and solid accountability for their actions, overcoming the inability of other forms of governance to regulate an increasingly globalized organizational world. Recent studies show that many organizations, despite formally adopting VSS, do not successfully implement the requirements. What hinders VSS requirements successful implementation? Given the prominent role of VSS as knowledge transfer tools, we build on insights from the knowledge transfer literature to articulate the VSS implementation process and identify the main barriers affecting the transfer phase (i.e. lack of acceptance of the new knowledge) and the post-transfer phase (i.e. lack of fit between the new knowledge and the context). We then discuss which characteristics of each of the element of knowledge (i.e. of the actors involved, of their relationships, of the VSS and of the context) help overcoming these barriers. What emerges from this framework is that antithetical characteristics of each of these elements are required respectively in the transfer and in the post-transfer phase. We argue that these tensions are responsible for the lack of VSS requirements implementation, and ultimately effectiveness, emerging from the literature. We conclude with the theoretical and practical implications of our work.

Experiments on Social Ventures' Legitimacy: The Role of Digital Identity and Legitimation Strategies (WITHDRAWN)

Author: **Felix Ostertag**; EM Strasbourg Business School, U. of Strasbourg, HuManiS UR 7308

Author: **Alicia Prochotta**; U. of Hohenheim

Social ventures are promising vehicles to address longstanding societal issues like poverty and long-term unemployment while at the same time generating money. Yet, such organizations encounter several challenges and a lack of credibility often causes stakeholders to doubt such businesses' legitimacy. A promising avenue to become perceived as credible and legitimate is to provide stakeholders with information on the businesses' identity, for example, via their online presence. Building on established theoretical concepts of founder and organizational identity, legitimate distinctiveness, and organizational credibility, we apply a vignette study and an online experiment (2 × 2 factorial design) to investigate how different forms of social ventures' digital identities and legitimation-seeking behaviors affect stakeholder evaluations of credibility and legitimacy. Our results show that social businesses' legitimacy highly depends on well-orchestrated identity components. Furthermore, the pursuit of credibility demands leaders of social ventures for a delicate balance between emphasizing their ability to act like conventional for-profit entrepreneurs (to be perceived as competent), while at the same time being forced to meet the company's social objectives and to avoid mission drifts (to remain trustworthy). Finally, our study shows that social businesses are no homogeneous phenomenon and should thus be distinguished from another theoretically and empirically.

Avoid, Align, or Embrace: How Drivers Influence the Way Sustainable Entrepreneurs Solve Triple Bottom

Author: **Damla Diriker**; Vrije U. Amsterdam

Author: **Kayleigh Bruijn**; Amsterdam Business School, U. of Amsterdam

Author: **Chen Luyi**; School of Public Policy and management Tsinghua U.

Policy mixes integrate distinct policy instruments into one coherent policy package as a means to avoid the potentially counterproductive impacts of any given policy on another. Chinese local governments recently have pursued policy mix approaches to promote green industrial development in order to attenuate the apparent contradictions between manufacturing productivity growth and the mitigation of environmental impacts. However, there has been little research that has empirically examined the effects of policy mixes. The study presented here employed a model designed to examine firm-level total factor productivity (TFP) and green total factor productivity (Green TFP) as performance measures. This current study served to assess the impacts of municipal-level environmental policy mixes on the textile industry in 13 Chinese cities by using the difference-in-differences (DID) technique to analyze the micro-firm panel data of 12,133 Chinese textile firms during the period from 1998 to 2012. The results showed that these environmental policy mixes could significantly promote green performance without compromising productivity growth. The results also indicated that the impacts varied in the different cities. This paper offers insight into policy mixes and industrial policy literature as well as practical guides for policy makers and industrialists.

How Do Fossil Fuel Divestment Commitments and Environmental Policies Impact Oil and Gas Financing?

Author: **Theodor Cojoianu**; U. College Dublin

Author: **Francisco Ascui**; U. of Edinburgh

Author: **Gordon Clark**; U. of Oxford

Author: **Andreas Hoepner**; U. College Dublin, Smurfit

Author: **Dariusz Wojcik**; U. of Oxford

This paper explores how fossil fuel divestment commitments and environmental policies have shaped the geography of capital flows into the oil and gas sector, based on the analysis of syndicated lending, equity and bond underwriting across 33

Sustainable entrepreneurs strive to achieve economic, environmental and social objectives simultaneously (Schaltegger & Wagner, 2011), and thus, often face tensions to balance these often contradicting demands stemming from their business models (Davies & Chambers, 2018). Yet, despite being an essential task for sustainable entrepreneurs, how they manage these tensions remains under theorized. Thus, to advance our understanding of sustainable entrepreneurs, the current study sets out to investigate how different entrepreneurial drivers, an important factor that has been found to predict entrepreneurial behavior (Carsrud & Brännback, 2010), influence the strategies sustainable entrepreneurs use to handle the tensions inherent to the triple bottom-line. In order to answer our research question, we have followed a multiple case study approach, and collected data via in-depth and semi-structured interviews with the founder(s) of hybrid ventures. Our findings revealed that different entrepreneurial drivers impact the way the sustainable entrepreneurs operate their hybrid ventures, and more specifically how they handle tensions in their triple-bottom line. By identifying a typology of sustainable entrepreneurs on the basis of their entrepreneurial drivers, while linking different drivers to different strategies employed by sustainable entrepreneurs when handling triple bottom-line tensions, we contribute to the streams of research on sustainable entrepreneurship and sustainable management.

How Will B Corps Save the World? B Corps Using Frames to Mobilize Consumers to Solve Societal Issues

Author: **Damla Diriker**; Vrije U. Amsterdam

Author: **Kayleigh Bruijn**; Amsterdam Business School, U. of Amsterdam

B Corporations are increasingly trying to engage their prospective consumers in collectively contributing to their mission, i.e. they are trying to mobilize these consumers to solve the societal issue they stand for. To date, research on how B Corps can elicit this mobilization has been scarce. As social movements are known for using framing tactics to

countries from 2000 to 2015. We find that the value of total assets pledged for divestment in a given country is negatively associated with capital flows to domestic oil and gas companies, particularly when divestment is led by regional or sovereign governments. Amongst environmental policy instruments, emissions trading schemes and renewables feed-in tariffs have been most impactful in reducing oil and gas sector capital inflows.

Stakeholder Pressures and Local Government Environmental Sustainability Policy

Author: **Won No**; Shanghai U. of Finance and Economics

Author: **Nicole Darnall**; Arizona State U.

Author: **Justin Michael Stritch**; Arizona State U.

Author: **Stuart Bretschneider**; Arizona State U.

While previous research has studied cities' decisions to adopt environmental sustainability policies, little is known about how stakeholder pressures affect cities' adoption of different types of environmental sustainability policies. Some city policies (e.g., energy conservation and water conservation policies) are more cost-focused and typically designed to improve city governments' internal efficiencies, whereas other policies (e.g., city-wide sustainability policies, green building policies, greenhouse gas policies, participation in voluntary networks of leadership) focus more broadly on environmental sustainability concerns, and may or may not reduce a city's internal costs. Drawing on a nationwide survey of U.S. cities, and using seemingly unrelated logistic regression, this study takes an important step by evaluating how variations in stakeholder pressures are related to cities' adoption of different types of environmental sustainability policies. We find that only environmental stakeholders are associated with cities' more cost-focused policies. However, business, higher-level external government, and internal stakeholders are all associated with cities' adoption of general environmental sustainability policies.

[view paper \(if available\)](#)

get others to act collectively, we build on the social movement literature to propose that to successfully elicit mobilization B Corps have to construct collective action frames by performing three core framing tasks: diagnostic, prognostic, and motivational framing. We argue that whilst diagnostic and prognostic framing increase consensus mobilization, the use of prognostic and motivational framing is not sufficient for a B Corps to elicit action mobilization. Due to their for-profit nature, to elicit action mobilization B Corps should make additional use of what we call utility frames, which are dedicated to attractively positioning the product and communicating the product attributes. Furthermore, we theorize that, while these core framing tasks are preconditions for eliciting mobilization, the extent to which B Corps achieve mobilization also depends on whether the company is perceived as legitimate and their frames are perceived as credible.

Intentionality in Sustainable Entrepreneurship and Finance: A Portfolio Measure for Social Impact

Author: **Leonardo Boni**; U. of Bologna

Author: **Laura Toschi**; U. of Bologna

Author: **Riccardo Fini**; U. of Bologna

There is a growing interest in nearing finance to social impact: in the last 10 years, new classes of actors – impact investors – and strategies promoting investments in social businesses helped defining an institutional context in which investments seek blended value, a paradigm different from the mainstream context in which investments seek financial returns. However, the proliferation of mainstream actors investing in social impact suggests a deeper investigation. The purpose of the paper is to capture the heterogeneity of players by analyzing the influence of different institutional logics on their investment decisions. By introducing the concept of intentionality toward social impact, we develop an Impact Score for each investor, which assesses the extent to which investment portfolios of social- and financial-oriented investors reflect their orientations toward intentional generation of impact. Results evidenced that there is statistically significant difference between the Impact Score of social- and financial-oriented investors, and that the

Understanding Firms' Perspectives Toward Environmental Regulation

Author: **Jennifer DeBoer**; Ripon College

Why do some firms embrace environmental sustainability and others do not? Within any given industry, there are leaders and laggards. While extensive research has examined firms' perspectives regarding the motivations, strategies, and outcomes related to the voluntary realm, there is a dearth of research related to firms' perspectives regarding the regulatory realm. To better understand firms' attitudes toward environmental regulation, I examine compliance and noncompliance with environmental regulation in the context of the US pulp and paper industry (PPI). I employ an inductive, multiple case study methodology to study regulatory tensions associated with environmental sustainability, as well as examine differences between firms compliant and non-compliant toward environmental regulation.

Cognitive Strategies to Resolve Paradoxical Tensions in Sustainable Enterprises

Author: **Hendrik Niklas Thelken**; Groningen U. (RuG)

Author: **Margo Enthoven**; Groningen U. (RuG)

Author: **Berfu Ünal**; Groningen U. (RuG)

For sustainable enterprises tensions due to their goal plurality of reaching sustainable and economic goals are almost inevitable. Accumulating research has looked at the organizational implications and management strategies of these often paradoxical tensions. However, these organizational-level studies are often missing the micro-foundations of individual management strategies. In response, we take an individual approach to the cognitive strategies sustainable entrepreneurs use to deal with tensions in their enterprises. Using qualitative methods, we gathered insights from 20 sustainable enterprises in two industry sectors. We identified two distinct cognitive strategies: embracing the paradox through cognitive framing and accepting the paradox through external attribution. We also show that mission confidence – personal beliefs about the desirability and feasibility of successfully reaching the mission using business logics – can help sustainable entrepreneurs to successfully implement both strategies.

Navigating the Tensions Between Standardized and Professional Work

Author: **Marianna Frangeskou**; Tilburg U.

Author: **Michael Lewis**; School of Management, U. of Bath

In this study, we investigate the tensions found in knowledge intensive operations: between the autonomy of professional workers (to make judgments whilst complying with independent, externally enforced standards: Lewis and Brown, 2012) and the standardized work systems that allow operations to be effective and efficient. The research is built upon an in-depth longitudinal case study that investigated the adoption of national standardized stroke care process in a UK general hospital. This study identified many tensions previously discussed in the OM literature, reinforcing the idea that the challenges of standard work must be understood via multi-level tensions lens and any implementation mechanism must also be multi-faceted and dynamic. Detailed observation of pathway implementation confirms the vital influence of professional autonomy on flow and we show how not considering this in the process design and implementation mechanism is contested. Our analysis reveals novel insights regarding the improvisation of professionals in managing tensions and supporting standardized work.

Combining Profit and Purpose: Managing Mission Drifts with Organizational Evolution

Author: **Vishal Gupta**; Indian Institute of Management Ahmedabad

Author: **K V Gopakumar**; Indian Institute of Management, Ahmedabad

While extant research identifies strategies to prevent or counterbalance mission drifts at an organizational level, the examination of entrepreneur level responses to manage such drifts remains limited. The present study, borrowing from paradox theory and using the case of an Indian nonprofit organization which gradually evolved into a social enterprise, identifies factors which helped the entrepreneur to make sense of, and manage multiple mission drifts with the organizational evolution. These factors, namely, ability to integrate idealism and pragmatism, awareness of contextual factors, and ability to navigate contradictory forms of organizing helped the entrepreneur manage two different types of drifts – referred to as sustenance drift and mission drift. We conclude with implications for paradox theory and mission drift literature.

The Potential of Social Enterprises as Milestones for a Place-Based Inclusive Innovation Strategy

Author: **Mario Calderini**; Politecnico di Milano

Author: **Magali Fia**; U. of Bologna

Author: **Francesco Gerli**; Politecnico di Milano School of Management

Several classes of inequalities have emerged as a consequence of the territorial polarization generated by the knowledge-based economy. Place-based policies implemented so far have demonstrated scarce effects in leveraging the underlying potential of left-behind places. In this paper, we explore whether social enterprises can be the actors of a rejuvenated innovation policy able to convey the value of knowledge and innovation to society. Despite their weak technological endowments, social enterprises, through their territorial distributive patterns and organizational

and how to provide this care most effectively. Our study sheds light on this issue by empirically examining how country and technology integration influence patient care quality (PCQ) delivered in hospitals in the three contiguous countries of North America—the US, Canada and Mexico. We use survey methodology to empirically test a moderated mediation model, whereby country moderates the mediating role of technology integration on PCQ. The results support our proposed model. Our study has implications for operations, healthcare and international management literature by highlighting the important role of a country's institutional and cultural attributes on PCQ as well as the role of technology integration and quality leadership in this process. Given the increase in globalization, travel and migration among both healthcare workers and the general population, the results imply that physician and nursing staff should be sensitive to cultural and institutional differences in healthcare stakeholder definitions of quality care, which may ultimately affect hospitals' ability to provide care for all patients.

Mindful Behavior in Hybrid Organization and its Impact on Value Formation

Author: **Christelle Trabouli**; U. degli Studi di Cagliari

Author: **Ludovica Moi**; U. of Cagliari

Author: **Moreno Frau**; Corvinus U. of Budapest

Author: **Francesca Cabiddu**; U. of Cagliari

The aim of this study is to explore how visitors and service providers' mindful behavior impacts value formation process in Social Entrepreneurship environment. To unfold this study, we adopted a qualitative research design and performed a theory-building process based on an in-depth exploratory single-case study. We focused on the case of Souk al Tayeb, a hybrid Lebanese organization actively committed to protect and revive culinary traditions by empowering small scale farmers, producers, cooks, and underprivileged communities. Drawing on interviews with main stakeholders (producers and visitors), a model of mindful behavior is presented. Our findings extend current research and practice by showing how mindfulness may facilitate or hinder customers' involvement in service production and value formation in hybrid organization.

Practices of Transcendence - Supporting Empowerment with Integrative Practices in a Social Enterprise

Author: **Tea Lempiala**; U. of California, Merced

Author: **Taylor Fugere**; U. of California, Merced

Author: **Sanni Tiitinen**; Tampere U.

Drawing on literature on paradoxical tensions, particularly in the context of hybrid organizations with a social mission, we analyze practices of transcendence, that is, the reframing of seemingly conflicting opposites in a way that dissolves the experienced tension. We examine this in the context

solving gaps by applying different models to solve the problem through reducing idle time, over time, and cancellation hours to represent optimized OR utilization. The simulation model by Arena helps with generating real-life scenarios with considering 3 KPIs that are utilization, cycle time, and throughput; therefore, the overall utilization is improved from 45% to 51% after applying 30 scenarios related to arrivals percentage and delay factor compared to the original model. Also, the optimization model is used to generate a weekly schedule for each department in blocks that yields in 71% overall utilization. Moreover, the optimization model output is used as an input for the simulated annealing model to schedule specific surgeries in different ORs for each day that further improves utilization to 85%.

Modularizing Services Based Upon an Actor-Oriented Logic

Author: **Kaat De Pourcq**; Ghent U.

Author: **Katrien Verleye**; Ghent U.

Author: **Bart Larivière**; KULeuven

Author: **Jeroen Trybou**; Ghent U.

Author: **Paul Gemmel**; Ghent U.

The present research investigates how actor-oriented service modularity (here, decomposing services in packages delivered by single versus multiple service providing entities) impacts the formation of customer experiences in relation to the focal service provider (i.e., the service provider engaged in modularizing services). To test our hypotheses in the context of cancer care, patient observations (n=640) and a patient survey (n=377) were used to gather respectively service package and customer experience data. These data were analyzed using hierarchical Bayes models. Our results show that customer experiences with the focal service provider are shaped by waiting time, interactional and environmental quality in case of single service provider packages. Multiple service provider packages, in turn, divert customers' attention from waiting time and interactional quality with the focal service provider, but not from environmental quality. A notable exception involves multiple service provider packages with high time

of a social enterprise that seamlessly combines strict quality standards and a culture of unconditional love and support. These seemingly opposing forces are integrated through three practices: integrative, holistic narratives; combining separation and integration, and integrating the social, personal, and the professional. This study contributes to the paradox theory by investigating transcendence practices in a social enterprise as well as seeks to more deeply understand the role of the integration of social and business goals role in the empowerment process through the lens of perceived organizational identity (POI).

Different Actions for Similar Behaviors: Teachers Construct Socio- Semantic Networks of Categories

Author: **Gabriela Lotta**; Fundação Getulio Vargas - EAESP

Author: **Charles Kirschbaum**; Insper Institute of Education and Research

This study aims to analyze how frontline workers use systems of categorization through the association of different types of categories and how these systems subsequently determine different policy deliveries. Using a semi-experiment, we provided vignettes to 40 teachers in Sao Paulo public schools to observe how they categorize similar behavior using different categories and types of actions. We analyzed the uses of these categories and actions to construct socio-semantic matrices and clusters that constitute a relational symbolic system where groups of codes might be close, far, and opposed to each other. The results suggest that the way frontline workers organize and deploy categories coalesces into culturally shared, "relational schemata." In this way, the same categories gain different meanings and are related to different actions when the student's context is changed. Consequently, different systems of categorization constructed by teachers to evaluate similar behaviors generate distinct actions and policies. This may have important implications for

How to be a Good Reviewer? A Competency Framework for Reviewer Development (session 1609)

The act of reviewing is the backbone of the academic enterprise, as it ensures high-quality outputs. A number of scholars in the early stages of their academic career find themselves in reviewer positions, though it may not always be clear what they need to do or not do when reviewing. With little formal training and the pressures of completing multiple reviews in a timely manner, most scholars learn how to review through a process of trial and error. There is also a need to invest effort in developing the competencies required to be a responsible reviewer. This panel symposium session provides participants with knowledge of the key competencies required in reviewing. These competencies are useful for all types of reviewing of academic research, including both quantitative and qualitative methodologies. We invite expert reviewers and journal editors to serve as panelists and discuss (1) what it means to be a good reviewer in relation to these competencies; (2) practical and ethical challenges of reviewing; and (3) tips to handle tricky situations that present ethical and/or pragmatic constraints when serving as a reviewer. Following the panel discussion, the audience will engage in a series of interactive, hands-on exercises where hypothetical scenarios highlighting prevalent

policy access and inequalities in treatment.

How Social Resources Build Team Serving Culture in Extreme Law Enforcement Environments

Author: **Amanda Christensen-Salem**; U. of Cincinnati

Author: **Marco Zanini**; Brazilian School of Public and Business Administration

Author: **Fred Ochieng Walumbwa**; Florida International U.

Author: **Ronaldo C. Parente**; Florida International U.

Research on extreme environments has highlighted the necessity of having response teams with a culture of serving both the community and the team. Though several researchers have discussed the need for “unit solidarity” or a “communal code,” our research is one of the first to empirically examine communal solidarity—that is, the building of unity in both the community and the team by serving both, which we operationalize as team serving culture—in an extreme environment. We use social contagion and social resource theories to develop a processual model showing how team serving culture starts with department servant leadership. We theorize that department servant leadership trickles down to influence team leader servant leadership, which enhances social resources including trust in team leader, team cohesion, and trust in team, which then relate to team serving culture. Finally, we show how team serving culture influences outcomes such as team service performance and team member work engagement. We test our model using a sample of 344 officers and 104 leaders enlisted in Brazil’s Battalion of Special Operations Police. Results support our theoretical model. Implications from this study inform work on team serving culture and how it can be enhanced even in non-extreme settings.

This paper examines frontline officials' coping strategies in enforcing environmental regulations. By integrating the street-level bureaucracy and coping literatures, we examine two coping strategies — moving towards and moving against regulatees— and how they relate to officials' personal factors, work situations, and institutional environments. We developed a unique data set consisting of in-depth interviews with enforcement officials in China and two rounds of surveys conducted in 2000 and 2014. Results suggest that officials who are satisfied with their pay are more likely to move towards the regulatees, and this relationship is stronger in a more adversarial environment. Officials who face stricter situational constraints are more likely to move against regulatees, and this relationship is weaker in a more adversarial environment. In addition, the institutional environment shape how coping relates to frontline workers' (1) intention to work for the organization in the long run and (2) their perceived enforcement effectiveness.

Do Socially Responsible Firms Walk the Talk? CSR Performance and Defined Benefit Pension Policies

Author: **Maretno Agus Harjoto**; Pepperdine Graziadio Business School

Author: **Indrarini Laksmana**; Kent State U.

This study examines whether socially responsible firms are more likely to have well-funded employee pension programs. It also examines the relationship between corporate social responsibility (CSR)

process of actualizing potentiality, a metaphor proposed by Pragmatists. Based on an ethnographic study of scale up firms in a consultancy-led accelerator program, we investigate how entrepreneurs in these firms experience the process of acquiring resources and, in particular, how they construct the linkage between the envisioned potentiality and the perceived actuality inherent in such a process. We identify three patterns of configuring, reconfiguring, and disorienting in acquiring resources, through practices of envisioning, enacting, and reflecting as the process unfolds. We find that entrepreneurs envision the offered resources differently, which foreshadows their practices of realizing those resources and, if unsuccessful, reconstructing them. We uncover different sets of practice in shaping the resource-acquiring process, which are shaped by reflexive engaging. We also problematize the notion of process and outcome as perceived experience and revisable script rather than undisputable objective and fixed target.

How Do Innovation Ecosystem Actors Complement: The Perspective of Prospective Resourcing

Author: **SHENGXI YANG**; Zhejiang U.

Based on the case study of Haier Group's innovation ecosystem, this paper opens a black box of how does platform coordinate actors' participation in complementary innovation. This study dissects characteristics of various actors from two dimensions: resource endowment and organizational location. This research pays special attention to the interaction process between actors and focal firm when they complement each other. We also focus on the focal firm coordination behavior of prospective resourcing processes with different types of participants. This study found that ecosystem participants with different resource endowments will complement innovation activities through spontaneous prospective resourcing, targeted prospective resourcing and collaborative prospective resourcing processes, while focal firm will incline to adopt diverse coordination mechanisms upon them considering their resource

performance and management discretionary choice of pension accounting assumptions. Signaling theory suggests that managers use CSR performance as a credible signal of firms' commitment to engage in socially responsible business practices to the stakeholder.

Correspondent inference theory suggests that the stakeholder attributes CSR performance to firms' reputation of serving the interests of stakeholder. To protect their reputation, firms must take actions that are consistent with the signal they send via firms' CSR commitment. Maintaining responsible employee pension policies is a socially responsible action because the defined benefit plan is voluntary and employers have to bear greater investment risk and cost associated with the plan than the alternative retirement plan. Using panel data of 13,099 firms-years across 1,428 U.S. firms from 1992 to 2015, this study finds that firms with higher CSR scores are less likely to have underfunded pension and they report higher pension net assets than their counterparts. More socially responsible firms also adopt more responsible (i.e., conservative) pension accounting assumptions (discount rate and rate of compensation increase) to compute estimated pension benefit obligations.

The Sounds of Silence: A Multimodal Approach to Silencing Strategies in Corporate CSR Discourse

Author: **Heidi Streb**el; U. of Lausanne, HEC Lausanne

Author: **Deborah Philippe**; U. of Lausanne

The aim of this paper is to better understand how multimodal organizational discourse on corporate social responsibility (CSR) and corporate sustainability (CS) silences many of the most significant negative impacts of those organizations on society. Drawing on theories of the rhetoric of silence and using a social semiotic approach, we examine how the corporate production of a series of interconnected reports, webpages and social media posts abstract, simplify, minimize and omit important people, actions and events. Moving beyond the concept of greenwashing, our analyses of the tactics deployed at the granular and the ideological levels uncover organizations' strategies

endowments and locations in the ecosystem. Therefore, this study summarizes the logical relationship between the actor roles in the innovation ecosystem, the prospective resourcing process with focal firm and corresponding coordination mechanism, and finally provides an integration framework.

Dynamics of Constraints and Organizing Practices for Business Model Innovation

Author: **Su Hua Ou**; Soochow U.

Author: **Yuliani Suseno**; U. of Newcastle

This research examines how organizational ingenuity enables organizational actors to turn constraints into new organizing practices for business model innovation. Adopting the case study method utilizing observations, interviews and internal meetings with key stakeholders of the popular 'Lady First' TV program in Taiwan, we analyze how, in the face of constraints, organizational actors ingenuously develop new organizing practices that enable the program to transform its business model in terms of value creation, value communication, and value capture. These organizing practices involve leveraging the knowledge of organizational actors to create value, incubating potential lead users to communicate value, and converting social capital into economic capital to capture value. Our paper contributes to the business model innovation literature by linking organizational ingenuity, constraints, and practices for business model innovation in the context of a creative services firm. The theoretical and practical implications of the study are also discussed.

The Role of Disability and Accessibility in Corporate Sustainability Reporting

Author: **David Martin Herold**; WU Vienna U. of Economics and Business

Author: **Jasmin Mikl**; WU Vienna U. of Economics and Business

Author: **Kamila Pilch**; Cracow U. of Economics

Author: **Marek Cwiklicki**; Cracow U. of Economics

Author: **Clemens Schuhmayer**; WU Vienna U. of Economics and Business

Although companies increasingly focus on the social dimension in corporate sustainability, there seems to be a lack of understanding how and to what extent disability & accessibility (D&A) frameworks and activities are integrated in corporate sustainability reports. In this article, we aim to close this gap by a) analyzing the disability & accessibility activities from the largest 50 companies in Europe based on their corporate sustainability reports, and b) advancing a simplified conceptual framework for disability & accessibility that be used in corporate reporting. In particular, we provide an overview about corporate disability & accessibility reporting and associated activities according to three identified areas: a) workforce, b) workplace, and c) products and services. Our findings are twofold: First, the majority of the companies address disability & accessibility in their corporate sustainability reports mainly under the diversity umbrella, but lack a detailed debate about the three identified areas. Second, we found that existing frameworks for D&A are hardly used because either there are not focused on corporate reporting or seem too difficult or complicated to complete. Thus, our framework not only represents a first opportunity to foster the implementation of a

and foreignness. I employ a strategy-as-practice perspective to conduct an autoethnography on a born global in Mexico and Canada. The findings present micro-foundational insights on a sequence of pivots that changed the business model radically. The pivots are an outcome of the entrepreneur's internal strategizing. The paper contributes to the dynamic capabilities literature by illuminating the process of strategizing as recursive and consisting of imagining, abandoning and reconstituting strategy. Additionally, for the strategy-as-practice literature, the paper contributes needed research on the domain of individual and macro levels of praxis.

Changing the Rules of the Game: The Legitimacy of CSR Standards

Author: **Jilde Garst**; Erasmus School of Economics, Rotterdam

Author: **Vincent Blok**; Wageningen U.

Author: **Onno Omta**; Wageningen U.

In order for Corporate Social Responsibility (CSR) standards to promote socially responsible behavior in industry, they need endure over the long-term by responding to the dynamics of society. Revisions of their content are thus necessary to maintain both their input legitimacy – the socially constructed norms are accepted as fair and effective by society – and their output legitimacy – the extent to which standards are actually able to standardize the behavior of its adopters. By studying the effects of the standards underlying a front-of-pack label indicating the healthiness of food products, our study shows that a) making CSR standards more aligned with the views of civil society can increase the average social value created, but that b) de-certifications of products due to stricter standards demotivates firms to invest in enhancing compliance. The article concludes that revisions of CSR standards can only improve both types of legitimacy if the subsequent changes in firm behavior are visible and transparently reported by the standardization organization.

Ethical Decision Making: Influences and Processes (session 1611)

Ethical Blindness: A Routine-Based Perspective and an Unlearning- Oriented Cure

Author: **Barbara Kump**; WU Vienna U. of Economics and Business

Author: **Markus Scholz**; FHWien der WKW U. of Applied Sciences for Management and Communication

Ethical blindness, the temporary inability of a decision-maker to see the ethical dimension of a decision at stake, can cause severe harm for both companies and society. Earlier research identified self- defense mechanisms, bounded ethicality, and moral unawareness as potential sources of ethical blindness. This article suggests that behavioral aspects have only been treated as a side-note so far, and complements existing perspectives of moral awareness by highlighting organizational routines as an additional source of ethical blindness. Routines (a) implicitly legitimize behavior, (b) they are automatic (rather than deliberate) ways to achieve desired outcomes, and (c) they are based on distributed action, leading to the diffusion of knowledge and responsibility. Based on an analysis of the micro- processes of routine formation and retention, and by drawing on earlier work on unlearning established organizational routines, the article develops implications for how organizations can intentionally discard potentially harmful routines, and acquire more favorable ones. Thereby, this work is amongst the few studies in the literature that seeks to draw ways out of ethical blindness.

Overcoming the Dichotomy in Micro-Level CSR Research (session 1612)

Traditionally focusing on the macro-level of analysis (e.g., CSR and organizational financial outcomes), CSR scholarship in recent years has shifted to studying the micro-foundations of CSR (micro-CSR); that is, looking at the role of individuals in relation to CSR. Although this research has been growing, limited efforts have been made to engage in dialogue across the two core disciplinary research streams in micro-CSR (i.e., psychological and sociological). In order to bridge this gap, the current symposium brings together an internationally- and disciplinarily-diverse group of scholars. The symposium includes four presentations followed by a discussion. With this symposium, we aim to: a) expand our understanding of the micro-foundations of CSR, with a particular focus on attending to both streams of research; b) develop avenues for further interdisciplinary research on the topic; and c) contribute to knowledge on the processes and boundary conditions shaping employees' perceptions and reactions to organizational CSR, as well as shaping the experiences and efforts of CSR managers implementing CSR in organizations.

What's the "Micro" in Micro-CSR? A Review of Sociological Micro-CSR Research

Building on previous research on the collaborative root of corruption, we propose and conclude that people cheat more when they collaborate with another person in comparison with an artificial intelligence (AI) robot. We suggest that people infer that a human collaborator would cheat more than an AI collaborator when working together. Having drawn this ethical inference about a collaborator's behavior, people are more likely to cheat subsequently in human-human collaboration than in human-AI collaboration. Therefore, the ethical inference about a collaborator's behavior is the reason why people are more inclined to cheat in human-human collaboration than human-AI collaboration. We tested our theory in two lab experiments. Additionally, in two online experiments, we showed our findings were counterintuitive with regard to the common belief of laypeople. Managers are unaware of the positive effect of human-AI collaboration on reducing cheating behavior in organizations. Our research contributes to the microperspective of organizational corruption and has implications for anticorruption and compliance policies in organizations and society as a whole.

De Beauvoir's Theory of Moral Agency: Individual Pluralism and Moral Disengagement in Organizations

Author: **Helet Botha**; U. of Virginia

Author: **Robert Edward Freeman**; U. of Virginia

Most often in business ethics, pluralistic approaches to decision making in organizations have been advanced in the context of groups, or collectives. To the end of expanding our theories on pluralism to the relatively unexplored individual level of analysis, we rely on Simone de Beauvoir's Ethics of Ambiguity (1948). Firstly, we derive De Beauvoir's Theory of Moral Agency. When then apply this theory to the phenomenon of moral disengagement in organizations to show that it is one and the same thing as avoiding one's moral agency, as described by De Beauvoir. Building on De Beauvoir, we define a "pluralistic attitude" as a position an individual consciously adopts to cultivate an awareness and sensitivity to their own multiple, irreducible values

Research on the Decision-Making Mechanism Underlying Insurance Agents' Intention to Disclose Frauds

Author: **Jianming Bai**; School of Management, Lanzhou U.

Author: **Xuefeng Wang**; School of Management, Lanzhou U.

Author: **Wanjie Niu**; School of Management, Lanzhou U.

Author: **Haizhen Wang**; School of Business, Xi'an International Studies U.

Author: **Xin Ai**; Lanzhou Branch of Shanghai Pudong Development Bank

Insurance fraud erodes the profits of insurance companies and damages the rights and interests of honest policyholders, and thus is a severe unethical behavior. A handful of literature suggest to designing effective contract to motivate agents to identify and report such fraud claims. However, what is the insurance agent's potential gain and loss from reporting fraudulent claims remains unknown. Examining such gain and loss is notable, which constitutes the foundation of an effective contract design. To fill this research gap, drawing on principal-agent theory and social exchange theory, we analyzed the decision-making mechanism of insurance agents when they are faced with fraudulent claims. With two experiments, we found that value of policyholder negatively affected disclosure intention, return expectation of concealing the fraudulent claim mediated such relationship. Furthermore, we found that reciprocal belief strengthened the relationship between value of policyholders and return expectation of concealing fraudulent claims. The theoretical and practical implications of decision-making mechanism underlying insurance agents' intention of reporting fraudulent claims were discussed.

CEO Gender and CSR-Oriented Shareholder Proposals

Author: **Guoli Chen**; INSEAD

Author: **Juan Ma**; INSEAD

Author: **Christian Schumacher**; WU Vienna U. of Economics and Business

While prior studies view shareholder activism as expression of shareholder dissatisfaction with managerial inadequacy, we argue that it can well be a manifestation of activists' favorable readings of the CEO's inclination, that is, when activists anticipate that the CEO is more likely to take a favorable stance on a given proposal. We specifically consider the implication of CEO gender for CSR-oriented shareholder proposals. We argue that as women are generally perceived as more prosocial, activists will target with female CEO with a higher number of CSR-oriented proposals, and once submitted, CSR-oriented proposals targeting female CEO garner more support from shareholders. Further, the proposed relationships are stronger if the female CEO received a social award, there is a higher female representation in the top management team, and the firm exhibits superior past CSR performance. We find support to our hypotheses using a large sample of publicly traded U.S. firms.

The Main Street Dilemma: How Journalists Cover Incumbents' Adoption of Discontinuous Technologies

Author: **Richard Banfield**; U. of Passau

Author: **Markus E. Rauch**; U. of Passau

Author: **Lorenz Graf-Vlachy**; ESCP Business School

Author: **Andreas Sebastian Konig**; U. of Passau

Scholars investigating incumbent inertia have recently begun to examine the role that external constituents play in incumbents' adoption of discontinuous technologies. However, this research stream has primarily focused on the role of securities analysts and investors while neglecting other important constituents, particularly journalists. We expand the literature by empirically examining how incumbents' adoption efforts affect coverage by journalists based on a rich sample of 352 product launches in the automotive and photography industries. We find evidence that, in contrast to financial-market-oriented constituents, journalists dedicate more attention to technological initiatives the higher the extent of discontinuity, but also cover them more controversially. We also find an important distinction among different types of hybrid technologies. Specifically, journalists perceive hybrid technologies that try to establish a technological alternative to the discontinuous technology as more controversial than hybrid technologies introduced to ease the transition to the discontinuous technology. Overall, our study provides a more nuanced understanding of infomediary responses to discontinuous technological change. Most importantly, we highlight that incumbents are not only confronted with evaluation challenges from Wall Street, as has previously been highlighted, but also face distinct pressures from Main Street, particularly as journalists cover discontinuities more controversially.

Governments routinely seek to control the firms in their jurisdictions in order to align corporate behavior with public policy objectives. In democratic countries, governmental control of firms tends to be effectuated primarily through the formal mechanisms of state ownership and legislation. In this paper, however, we show that in autocratic societies, the informal control mechanism of political- ideological exposure of the corporate elite is commonly used as a “third way” of establishing firms’ compliance with government-mandated objectives. We theorize that through political-ideological exposure, individuals are “prepared” for business careers in which they become “agents of the state” and help implement state policies by influencing boardroom decision making. We capitalize on China’s recent (2012) political-ideological shift from pro-market “Dengism” to corporate social activity- focused “Xiism” to assess how political ideology is used as an instrument of implementing state policies. We test our ideas on a longitudinal (2008–2016) dataset of 848 Chinese listed firms. Results show that boards with politically exposed directors make the shift to Xiism-congruent behavior faster. This transition proceeds even more rapidly when firms are located in “politically imprinted” regions representing the historical power base of President Xi, but unfolds slower in regions with high-quality public governance, which are more resistant to policy swings. Our study advances the literatures on the role of political ideology in management and political institutional theory.

Signaling in a Competitive Selection Process: What is the Winning Scientific Research Trajectory?

Author: **Sandra Barbosu**; Alfred P. Sloan Foundation

Author: **Charles Ayoubi**; EPFL

Author: **Fabiana Visentin**; Maastricht U., School of Business & Economics

Author: **Michele Pezzoni**; U. of Nice and Bocconi U.

Central to all innovation processes is the selection of candidates with the highest potential to succeed. The selection procedure is usually based on an analysis of the signal given by the candidate’s past endeavors as well as the projects proposed. In this paper, we focus on the selection of scientists applying for academic funding of their research proposals. We argue that two core dimensions of a scientist’s application affect the probability of funding success: the coherence of the proposal submitted with the applicant’s previous work, and the alignment of the proposal with articles published in top generalist science journals. Employing a neural network algorithm, we analyze the text of 2,494 research proposals of applications for the Sloan Research Fellowship, a prestigious fellowship awarded to promising early-stage North American researchers. We find that, on average, scientists are rewarded when they pursue research aligned with the current general interests of the scientific community. We also find field-specific heterogeneity in the type of scientific features rewarded by an evaluation committee. In life sciences and chemistry, evaluators value coherent research agendas, particularly coherence between a research proposal and the scientist’s recent work, and place little importance on bibliometric achievements. Conversely, in physics, examiners give more weight to bibliometric indicators and less to applicants’ research coherence. Our results show that the degree of coherence in a scientist’s research agenda acts as a strong signal in the screening process. Managerial implications can also be derived for entrepreneurs and managers submitting project proposals to investors.

[view paper \(if available\)](#)

exacerbate or weaken the bias they face. In particular, we argue that because corporate social responsibility (CSR) conforms to the prescribed female stereotype, the relationship between CSR and market reactions will be more strongly related for female CEOs. Results from our study indicate that while such conformity to stereotypes of engaging in CSR do not provide an added benefit, violating these gendered expectations and engaging in irresponsible activities however, can lead to market penalization. In a post-hoc study, we further found that female CEOs who are perceived to be communal face a more severe penalty for engaging in irresponsible activities, while agentic female CEOs face a penalty, even when they do engage in responsible CSR activities. This study aims to make several important contributions to the upper echelons and gender-role literatures, as well as provide important managerial implications for female CEOs.

CEO Political Ideology, Shareholder Primacy, and Dividend Policy

Author: **Ali Bayat**; U. of Aberdeen

Author: **Marc Goergen**; IE Business School

We argue that CEOs have different attitudes toward the firm's stakeholders and that these differences in attitudes affect the firm's decision making. We hypothesize that these differences stem from differences in political ideology: Liberal CEOs, as compared to their conservative counterparts, pay less attention to shareholders and this is reflected in dividend policy. To test the validity of our hypothesis, we measure CEO ideology by political donations. We study the CEOs of S&P 500 firms during 1997-2014 and find that firms with liberal CEOs are less likely to pay dividends and have significantly lower dividend payouts. In contrast, conservative CEOs pay more dividends, even if this requires redundancies.

Learning Within & Across firms (session 1615)

Do Individuals Learn Differently from Senior Versus Junior Colleagues' Failures in Organizations?

Author: **Sunkee Lee**; Carnegie Mellon U. - Tepper School of Business

Author: **Jisoo Park**; Carnegie Mellon U. - Tepper School of Business

Organizational learning research has shown that individuals learn from other individuals' failures. However, do individuals learn equally from all others' failures in organizations? We propose that in organizations in which professional tenure largely determines one's relative seniority, individuals will learn more from their senior colleagues' failures than from their junior colleagues' failures. We test this main hypothesis using data on 288 cardiothoracic surgeons who performed coronary artery bypass graft (CABG) surgeries in 127 Californian hospitals from 2003 to 2016. We find evidence that—in fact—individuals do learn from their senior colleagues' failures but do not learn from their junior colleagues' failures. We examine three plausible mechanisms for this finding, of which we offer evidence through statistical analyses and semi-structured interviews with currently practicing cardiothoracic surgeons. Our paper contributes to the literature on learning from failures, organizational learning, organization design, and microfoundations of organizational performance.

Microfoundations of Capability in Times of Change (session 1618)

Strategic Agility – Decision-Making Beyond Speed (WITHDRAWN)

Author: **Christiane I. Prange**; School of Economics & Management, Tongji U.

Many companies consider agility a panacea to survive in turbulent environments. Agility centres on flexibility, transformation, and speed. Despite the attention, there is little clarity of what agility exactly means and how companies can launch agile transformation projects. This article defines agility as the capability for decision-making that involves far more than high speed and flexibility. Based on a review of the literature and interviews with managers from different industries, we develop a conceptual model (Agility Transformer) that extends current notions of strategic agility by integrating slowness, reflection, and resilience, as survival parameters in uncertain environments. The model specifies agility on three levels (resilient, versatile, transformational) and provides a framework for diagnosing it along eight dimensions. The article offers guidance for managers to define how much agility their companies need when facing different environment scenarios. Two case studies from the mobility and clean energy industry are used to illustrate the model.

The Superstitious Heuristic: Conceptualization and Measurement

Author: **Jing Liu**; Northern Kentucky U.

The use of superstition as a heuristic in strategic decision-making is a phenomenon that commonly exists in different cultures and influences firms' strategic behaviors and performance. In spite of its prevalence and importance, the phenomenon has been largely neglected in the strategy literature. As a first step toward filling this research gap, this study introduces the construct of superstitious heuristic and develops its conceptualization and measurement. Synthesizing literature on

knowledge generated via LBD tends to have low levels of transferability and fungibility . We also maintain that to the extent they do diversify, firms in high-LBD industries are likely to choose high-LBD industries as diversification targets because they tend to possess the fungible second-order capability to manage LBD processes. We further claim that since accumulating experience in entering high-LBD industries also contributes to developing the second-order LBD capability, firms with such experiences are better able to overcome the diversification challenges posed by LBD-based knowledge. Hypotheses are tested using data from over 350 US manufacturing industries.

Learning within Hierarchies: Corporate Proximity and Business Unit Response to Adverse Events (WITHDRAWN)

Author: **John Kim**; U. of California, Irvine

Author: **Colleen Cunningham**; London Business School

Author: **John Joseph**; U. of California, Irvine

This paper examines how a business unit's proximity to its corporate office influences its learning from and response to experience of adverse events, or market failure. We argue that corporate proximity provides attention and knowledge to the business unit which, in general can be detrimental to overall responsiveness to market failure, but is helpful in the presence of adverse events because it focuses corporate attention and knowledge on particular problems and solutions. We examine three types of proximity – hierarchical, geographic, and cognitive – and also examine the conditioning impact of product novelty. Empirical analysis of business unit's product market reentry activities in the U.S. medical device industry from 1984 to 1996 provides support for our hypotheses. Our paper contributes to theories of organizational learning, organizational design, and product market entry.

[view paper \(if available\)](#)

Experiential Learning, Inter-Firm Imitation, and Advice-Seeking During Corporate Restructuring (WITHDRAWN)

superstition and heuristics, I explore the definition and dimensionality of the superstitious heuristic, map it into the existing literature, and differentiate it with other traditional heuristics. I develop a Superstitious Heuristic Scale (SHS) that is applicable in different cultures and decision settings and validate it in the strategic decision context. In doing so, this study advances heuristics research in strategic management and offers a new angle to explain firm strategic behavior and performance. In a broader sense, it contributes to behavioral strategy research in response to the call for more endeavors that build the psychological underpinning of strategic management.

Individual Cognitive Capabilities, Strategy Tools, and their Combined Impact on Strategic Options

Author: **Remco Siebelink**; U. of Twente

Author: **Erwin Hofman**; U. of Twente

Dynamic capabilities are vital for a firm to survive and prosper in changing economic contexts. Prior research has substantially advanced our understanding of dynamic capabilities, but little is yet known about their microfoundations. In particular, the cognitive underpinnings of individual capabilities have received little attention, yet they ultimately contribute to performance differences on the organizational level. The present study addresses this gap by exploring the interplay among various individual cognitive capabilities and strategy tools, and it examines their impact on the generation of high-quality strategic options. Taking into account that cognitive capabilities form complex combinations of skills that need to be considered holistically, we adopt a configurational perspective. In specific terms, we conduct an experimental study and we rely on fuzzy-set methodology to analyze how various individual cognitive capabilities, in the form of analytic skill, strategic intelligence, and level of creativity combine with scenario analysis or SWOT analysis to affect the generation of high-value and high-novelty strategic options. Our results provide compelling evidence for the existence of specific high-performing configurations, whilst emphasizing that excellence in generating high-quality strategic options is highly dependent on the specific set of individual mental

Author: **Sana (Shih-chi) Chiu**; U. of Houston

Advice-seeking is an integral part of decision-making for upper echelons and has important implications for firms' strategic actions and performance. However, factors leading to firms' advice-seeking behavior remain poorly understood in the management literature. Using the context of corporate divestitures, this study conceptualizes firms' advice-seeking as a function of experiential learning (divestiture experience), interfirm imitation (industry peers' practices), and task types (sell-off or spin-off). The results show that direct learning from past experience decreases, while industry peers' advice-seeking practices increase, the likelihood of firms' advisor engagement during divestitures. Also, firms' cumulated divestiture experience helps to reduce their tendencies to imitate industry peers' advice-seeking behavior. These relationships, however, are weakened when a divestiture event is classified as high in uncertainty, variation, and complexity. This study contributes to the organizational learning and restructuring literatures by offering insights into the antecedents for firms' advice-seeking during critical corporate change events such as asset divestitures.

Author: **Jonathan O'Brien**; U. of Nebraska

The consequences of CEO narcissism have become

Author: **Sucheta Nadkarni**; -

Despite the emerging strategy research on the psychological time of upper echelons, we know little about how the individual temporal orientations of senior executives configure at the top management team (TMT) level to affect firm strategies. Because TMT members' temporal orientations configure in a complex way and trigger significant temporal interactions within the TMT, we integrate faultline and time interaction performance (TIP) theories to address this fundamental question. Specifically, we introduce the notion of TMT temporal faultlines and develop a model explaining how TMT temporal faultlines affect the intra-TMT interactions of temporal planning and, in turn, two facets of firm strategic flexibility (reactive versus proactive). Based on three-wave survey data from 221 TMTs of Iranian high-tech small- and medium-sized enterprises (SMEs), our study found that TMT temporal faultlines had a positive effect on reactive strategic flexibility but a negative effect on proactive strategic flexibility through inhibiting TMT temporal planning. The results expand the nascent upper echelons research on psychological time by advancing the temporal perspective to the TMT level and revealing its strategic ramifications.

Revisiting the Locus of Experience

Author: **Lisa Tang**; The Wharton School, U. of Pennsylvania

Understanding how firms learn to make better strategic decisions and achieve superior performance is a question of significant concern to managers and scholars, especially in the context of mergers and acquisitions (M&A). While a long history of research has been conducted on the role of organizational-level learning in shaping M&A outcomes, limited attention has been paid to the individuals who are specifically dedicated to this process. In this study, I introduce and argue that Corporate Development Executives (CDEs), the M&A-specific human capital leading inorganic growth inside companies, are particularly critical for M&A learning and performance. Through a comprehensive, hand-collected dataset on the

a popular topic in several management streams of late. Although it has been suggested that narcissistic CEOs are inclined to engage in greater corporate risk-taking, scholars have not considered how CEOs manage to enact these intentions in light of a critical mediating factor: CEOs generally must gain approval for such endeavors from the board of directors. Using the attention-based view, we theorize that narcissistic CEOs shape the board's attention to and opinion of firm risk-taking by exercising their ability to manipulate the inclusion, framing, and discussion of risk-taking during board meetings. Utilizing a unique data set encompassing 88 public firms and 197 CEOs over 20 years, we tested our hypotheses by using corporate board minutes to observe how narcissistic CEOs influence boardroom discussion of risk-taking. Our results indicate that the tendency of narcissistic CEOs to increase firm risk-taking depends upon their ability to control the dialogue of board meetings. Moreover, we find that narcissistic CEOs influence the board of directors not so much by controlling the amount of attention devoted to risk-taking, but rather by shaping the type of attention (i.e., the positivity of the tone) given to risk-taking.

Political Relations and Foreign Director Exit

Author: **Xiacong Tian**; Shanghai U. of Finance and Economics

Author: **Yuehua Xu**; Shandong U.

Author: **Daphne Yiu**; Chinese U. of Hong Kong

We extend director exit literature by introducing bilateral country political relations and hold that foreign director exit from emerging markets is nontrivially impacted by the political relations between foreign director's home country and firm country. We apply social identity theory to elucidate how local top managers categorize foreign directors based on nationality. Using foreign directors of Chinese listed companies from 2000 to 2018 as our research sample, we find that bilateral country political relations is negatively related foreign director exit in emerging markets. In addition, regional government-business closeness, firm foreign ownership, and foreign director tenure can moderate the negatively relationship between

heads of corporate development in S&P 500 information technology companies, I shed light on who CDEs are, what they do, and whether and how they impact M&A outcomes. Specifically, I find evidence that an inverted U-shaped relationship exists between CDEs' prior M&A experience and subsequent M&A performance. Context variability moderates this relationship, while firm-level and CEO-level M&A experience serve as important boundary conditions for the effectiveness of CDEs. Overall, this study contributes to the corporate strategy literature by unveiling novel insights regarding the locus of experience and learning in M&A.

How Do CEOs Make Strategy?

Author: **Mu-Jeung Yang**; U. of Utah, David Eccles School of Business

Author: **Michael Quinn Christensen**; Harvard Business School

Author: **Nicholas Bloom**; -

Author: **Raffaella Sadun**; Harvard Business School

Author: **Jan W. Rivkin**; Harvard U.

We survey 262 CEO alumni of Harvard Business School and gather evidence on three aspects of each executive's business strategy: how formalized it is, how it is developed, and how it is implemented. We report three main results. First, CEOs use a wide range of markedly different processes to make strategic decisions; some follow highly formalized, rigorous, and deliberate processes while others rely heavily on instinct and habit. Second, more structured strategy processes are associated with larger firm size and faster employment growth. Third, using a regression discontinuity centered around a change in the curriculum of the Harvard Business School's required strategy course, we show that differences in strategic decision making can be traced back at least partly to differences in managerial education.

How Do CEOs in Stigmatized Industries Cope with the Stigma Transfer?

Author: **Mohamad Hasan Sadri Karami**; IE Business School

Author: **Caterina Moschieri**; IE Business School

This study examines how CEOs react to the threat of stigma transfer from their firms. Building on stigma research and upper echelons literature, we propose that the threat of stigma transfer increases the likelihood that CEOs join the board of other firms as a hedging strategy. We explore the boundary conditions of CEOs' board-joining and examine the factors that make the CEOs vulnerable to the harm of stigma transfer and factors that influence the severity of this harm. We test our hypotheses using a dataset of 416 CEOs in 208 firms in the global arms industry, between 1998 and 2016. Our findings on how firms' upper echelons cope with the stigma attached to the core of business advance current knowledge on organizational stigma, which has mainly focused on firms' lower echelons' responses to core stigma or on the consequences of failure stigma for firms' upper echelons.

How Do Firms Respond to Board Political Capital Loss?

Author: **Jyun-Ying Fu**; National Chengchi U.

Author: **Pei Sun**; Alliance Manchester Business School, U. of Manchester

Politically connected firms may rely primarily on political capital to compete, but a sudden, irrevocable loss of such capital poses a critical challenge for focal firms and prompts them to explore new strategies to compensate for this loss. Drawing upon resource dependence logic and nonmarket strategy literature, we examine how firms tackle this challenge by focusing on two types of strategic reactions: activities to nurture market-based capabilities – R&D investment, and activities

Strategic Decision-Making with Artificial Intelligence Implications for Decision Speed and Quality

Author: **Deepak Nayak**; Fox School of Business, Temple U.

Author: **Charles Dhanaraj**; Fox School of Business, Temple U.

Artificial Intelligence (AI) has infiltrated board rooms and holds promise to fundamentally alter strategic decision-making. Drawing a multiple bodies of related literature, we first offer a framework to classify the procedural modes decision makers adopt when they make strategic decisions and use this framework to derive our propositions. In this framework, decision makers facing use simplification strategies – by decomposition and by use of heuristics or choosing simpler problems – to make strategic decision. Using this framework, we propose that the use of AI in strategic decision-making has heterogeneous effects on the decision-making speed and decision quality. Specifically, in scenarios where delegation is the main mode of decision making, the use of AI to augment human decision makers leads to faster and better-quality decisions, whereas the replacement of heuristics and problem simplification strategies leads to slower and perceived lower quality decisions. Finally, we discuss the implications for future empirical research.

to develop alternative channels with socio-political actors – bribery. We predict focal firms to substantially increase their R&D and bribery expenditures after a negative shock. This prediction is confirmed in a sample of Chinese public corporations in the 2010s, during which the focal companies experienced an exogenous shock from the central government requiring independent directors with recent government background to resign from their current board positions. These increases are found more salient in firms whose board chairs and CEOs lack political capital. Moreover, organizational slack and institutional environment lead to different patterns of strategic adjustments: While firms with more organizational slack and located in a better institutional environment prefer more R&D investment post shock, those with less slack and in a weaker environment opt for more bribery activities. Our study contributes to governance and strategy literatures by demonstrating how firms may react to unexpected weakening/loss of social and political capital at the board level and beyond.

Design Thinking in Responding to Disruptive Innovation: A Case of Cork Stopper Industry Veteran

Author: **Soumodip Sarkar**; U. of Évora

Author: **Amir Bahman Radnejad**; State U. of New York

How can the design thinking approach assist incumbent firms in developing response strategies

resource allocation influence their common value creation and value capture strategies in the co-competition alliance, and further affect alliance formation and termination decisions. We develop a three-stage game-theoretic model and find that first, although the improvement of outside option encourages a firm to allocate more resources on common value capture, it would result in less bargaining power in the alliance due to its partner's escalated value capture efforts as a response. Second, as the outside option improves, the strong firm tends to allocate more resources for common value creation, while the weak firm tends to "free ride" and allocate less resources to the alliance. Therefore, as the gap between firms' outside option increases, it becomes harder for firms to form the alliance. Third, we find that synergy effects will not always play a positive role on alliance formation, showing a "non-linear" relationship. Once it reaches the alliance formation threshold, the larger synergy effects, the less resources both firms will contribute to the alliance. On the contrary, the resource allocation cost serves as a valuable commitment and positively influences firms' resources allocation for both common value creation and value capture after alliance formation. Finally, we provide additional comparative static analyses to shed lights on mechanisms through which these factors would affect firms' co-competition incentives.

Value Creation and Value Appropriation in Strategic Alliances: An Experimental Study of Coopetition

Author: **Yimei Hu**; Aalborg U., Department of Business and Management

Author: **Huanren Zhang**; U. of Southern Denmark, Odense, Denmark

Strategic alliances are coopetitive in nature as they incorporate both cooperation and competition: partners cooperate to use their complementary resources for joint value creation while simultaneously compete to appropriate the created value. We study this tension between value creation and value appropriation both theoretically and experimentally by modeling coopetition as the interaction between two players. The experimental results demonstrate that, contrary to the game-

to gaining momentum disruptive innovations, along the lines of effective exploiting the established technologies and corresponding product/service? Such exploitative response strategies, implying successful strengthening and leveraging the disrupted firm's existing technology without embracing the disruptive elements, have been to a large extent overlooked in the disruptive innovations literature. Using an inductive analysis of a critical case (a major cork-stopper veteran), the current study aims at developing a systematic understanding of exploitative strategic options and the role of design thinking in enabling them. The findings shed light on the effectiveness of the design thinking mindset to respond to disruptive innovations. In addition, we present evidence that a design thinking method can be successfully applied to process innovation. Finally, we demonstrate that to achieve a radical innovation based on design thinking principles, the establishment of design discourse is required.

Hype or Hope: How Individual Perceptions Affect the Adoption of Potentially Disruptive Technologies

Author: **Ruth van Bracht**; RWTH Aachen U.

Author: **Patrick Pollok**; RWTH Aachen U.

Author: **Frank T. Piller**; RWTH Aachen U.

Additive manufacturing is a continuously discussed and potentially disruptive technology, having the potential to reshape manufacturing but also bearing uncertainties. These kinds of technologies are increasingly penetrating organizations, driving them to change. Proven to be potentially fatal for incumbents plagued by inertia, pitfalls of adoption need to be overcome. Employees must face similar issues, going through sensemaking processes resulting in perceptions of threat or opportunity which influence individual-level engagement intentions and action. We analyze how perceptions of varying degrees of threat and opportunity towards newly arising technologies influence behavioral decisions regarding technology adoption. An individual's cognitive style further influences decision-making in this context. We strive to find information on how cognitive style influences the

theoretical analysis and to the conventional wisdom, existing competition does not undermine value creation within the alliance. Instead, initial experience has shown to have a significant influence on alliance performance and sustainability: relationships that successfully establish trust at the start are likely to sustain high cooperation level and achieve the efficient outcome even after the market condition has changed. The persistent effect of past experience can be explained by conditional strategies: players adjust their allocation of resources in the direction matching their opponents' investment level in the previous round. The results imply that a positive mindset towards cooperative alliance, especially in the presence of intense competition, is the prerequisite for a conducive alliance. The study makes one of the first attempts to employ the experimental method to enrich our understandings on the trade-off between value creation and value appropriation, and it contributes to the literature of cooperation and strategic alliances.

Does Difference in CEO Overconfidence Propensity Create Value in Strategic Alliances? (WITHDRAWN)

Author: **Jung-Ho Lai**; National Taipei U. of Business

This study examines complementarity of firm leaders' psychological attributes in terms of their inclination towards overconfidence in cooperative activities. Examining the high-tech industry setting which is characterized by rapid obsolescence of products and technologies, frequent innovation activities, high unpredictability and volatility, we find that alliances formed between overconfident and moderate CEOs create the greatest value. The complementarity between firm leaders exhibiting distinct overconfidence attributes is further positively moderated by the degree of environmental munificence, R&D intensity, and market dynamics, whereas; it is negatively moderated by the degree of environmental complexity. Our research contributes to the alliance literature by presenting the first evidence of the value arising from the complementarity of psychological attributes of firm leaders, which contrasts with extant alliance literature which studies only the complementarity of resources

adoption endeavor by looking at it as a potential lever. We apply survey method and gathered 561 responses from a sample of German engineers. Results showed that threat and opportunity are not singular, one-dimensional constructs but show degrees and nuances that have different effects on intentionality. We find that perceptions of Critical Threat and High-Impact Opportunity predict Engagement Intentions, and that an intuitive Cognitive Style is favorable for team compositions when a perception of High-Impact Opportunity is present.

Regulation as a Source of Collective Inertia in Technology Emergence: Evidence from Fintech

Author: **Tatjana Schneidmueller**; Rotterdam School of Management, Erasmus U.

Author: **Henk W. Volberda**; Amsterdam Business School, U. of Amsterdam

We apply a paradox lens to technology emergence to explore incumbents' ability to simultaneously attend to competing demands. Departing from the notion that incongruous tensions are not only socially-constructed but importantly also structural and innate to industry contexts, we study industry regulation as a source of collective inertia for incumbents' ability to engage with emerging technologies. We propose that rigid regulation locks incumbents in on a compliance trajectory at the expense of future-oriented engagement with new technologies. We hypothesize that deviations from such compliance-focused strategies (temporarily) relax social constraints and enable incumbent experimentation. With our sample of 105 commercial banks in the context of fintech (financial technology) in the United Kingdom from 1999 to 2018, we find strong support for our hypotheses.

RESEARCH

Author: **Mohammad Nasir Nasiri**; Amsterdam Business School, U. of Amsterdam

Author: **Niels G. Noorderhaven**; Tilburg U.

Author: **Henk Akkermans**; Tilburg U.

How can some incumbent firms proactively navigate technological change while others fail to do so? We explore this question by studying the dynamics of incumbents' engagement in an era of ferment, in which new technological options challenge the dominance of the current technology generation. We take a real option theory and focus on a successful incumbent firm, ASML, in a period when varieties of new technological options were threatening the dominance of the optical-lithography regime. Our findings show that ASML managed this turbulent period in such a way that it gained the core position in both existing and new technological regimes. First, ASML organized an agile, highly authorized core research team to explore new technological options within and outside of ASML. Second, as the experimental development of technological options progressed, ASML persistently relied on the scientific rules of physics and economics in the assessment of the long-term feasibility and extendibility of technological options, rather than on their current performance. Finally, the timely management of commitment and abandonment of technological options in its portfolio enabled ASML to play an active role in the dynamics of transition to the next generation of lithography technology.

Collaboration: Governance of Interorganizational Relationships (session 1621)

[Exploring the Key Successful Factors of Energy Service Companies](#)

Author: **KAI YIN HSU**; National Taichung U. of Education

This paper analyzes the role of organizational capabilities in the success of a new business model. In particular, it is argued that when a firm engages in the process of adopting a new business model, existing capabilities are activated and new capabilities are developed that lead to improving company performance. In this regard, the moderating role of managerial and creative capabilities on the assumed positive relationship between a new business model and company performance is analyzed. Furthermore, it is argued that a firm's business group affiliation can influence its capabilities and hence play a role related to value creation from a new business model. The proposed framework is analyzed using data from the advertising industry. The study contributes to the literature of business models by shedding light on the role of organizational capabilities and business group affiliation.

How Does Servitization Affect Firm Performance?

Author: **Zelong Wei**; Xi'an Jiaotong U.

Author: **Wengao Huang**; School of Management, Xi'an Jiaotong U.

Author: **Lulu Sun**; Xi'an Jiaotong U.

Although the trend of servitization of manufacturing firms continues to grow in recent years, there are still on-going debates and controversial arguments on whether servitization can increase firm performance, which implies a great need to gain further insights into underlying mechanisms linking servitization and firm performance. Using a survey data set of 334 Chinese manufacturing firms, we examine how servitization affects firm performance, as well as the contingent role of platform-based innovation. Our results show that servitization enhances the latent needs identification while increases the dominant logics conflict. We also find the double-edged sword effect of platform-based innovation on moderating the servitization-performance relationship. This research contributes to extant literature by identifying underlying mediating effects between servitization and firm performance to explain how servitization affects firm performance. The findings also contribute to the

Energy usage and energy costs have gained attention in recent years. Prior research has primarily focused on the energy management services provided by energy service companies (ESCOs) and have neglected energy demanders in a transaction structure. This study investigated the ex ante and ex post transaction costs with respect to contracting between ESCOs and energy demanders. This study conducted a large-scale survey of 835 manufacturing firms and one focus group. Four key determinants of energy management services were identified: asset specificity, task complexity, market competitiveness and institutional support. The results showed that asset propriety and task complexity significantly increase transaction costs and reduce demand intentions for energy management services. However, market competitiveness and institutional supports are negatively related to transaction costs and increase demand intentions for energy management services. This study further verified the importance of formal control mechanisms, which not only strengthen industrial development but also increase demand intentions for energy management services.

Disciplinary Regime or Freedom Strike? Termination Rights in R&D Alliances

Author: **Marvin Hanisch**; U. of Groningen

A central challenge for the governance of interorganizational relationships is the implementation of safeguards against opportunistic behavior while ensuring post-contractual adaptation. Previous research has highlighted the possibility of mitigating opportunistic hazards and achieving adaptation through administrative controls such as boards and steering committees. An aspect that has received insufficient attention though is that the authority of administrative control is tied to the underlying contract and can therefore be undermined by contractual termination rights which revoke the contractual obligations. Based on this idea, we argue that termination rights offer an important discriminant for interorganizational governance choices. We further explain when and

addressing of “service paradox”.

The Double-Edged Sword of Servitization in Radical Product Innovation

Author: **Yanping Wang**; School of Management, Xi'an Jiaotong U.

Author: **Jie Gao**; School of Management, Xi'an Jiaotong U.

Author: **Zelong Wei**; Xi'an Jiaotong U.

Author: **Wengao Huang**; School of Management, Xi'an Jiaotong U.

Author: **Lulu Sun**; Xi'an Jiaotong U.

Although servitization literature has identified the difficulties in combining products with services to improve firm performance, it has offered limited insight into the effects of servitization on radical product innovation performance. To address this gap, in this study we investigate how servitization affects radical product innovation performance through latent needs identification. Based on organizational knowledge creation theory and social structural embeddedness theory, we proposed four hypotheses and tested them with data from 208 Chinese manufacturing firms. The results show that servitization enables a firm to identify latent customer needs, and thus helps the firm to exploit more radical product innovation opportunities. However, a high degree of servitization can lead to an overembedded customer relationship, which reduces the firm's willingness to capture such opportunities. Furthermore, we find that the overall effect of servitization on radical product innovation performance is inverted U-shaped. Our findings enrich the servitization literature by identifying two roles of servitization in radical product innovation performance.

Provable Transactions: Exploring the Boundaries of Trust in Smart Contracts on Blockchains

Designated as a “Best Paper” for TIM

Author: **Daniel Obermeier**; Technical U. of Munich

Author: **Joachim Henkel**; Technical U. of Munich

Trust is generally considered a precondition for successful transactions. Yet, it becomes dispensable if a party can ex-ante comprehend and ascertain the mechanism by which its counterpart will fulfill its contractual obligations; in that case, the focal party can obtain proof and trust is replaced by certainty. We refer to such transactions as provable, and extend the theory of trust by developing a three-

One factor affecting business model innovation is the original template of what gets innovated. There isn't much work on how it originates, and especially how new business models affect resource reconfiguration. This paper provides a process model of business model innovation. It centers on the sponsor-based business model through which firms monetize their offering through sponsors instead of setting prices to their customer base. We conduct an exploratory study of a business model innovation occurring in the GPS navigation industry. The results suggest eight distinct subprocesses that were grouped into three aggregated business model innovation processes enabled via resource re-configuration. This study contributes to the literature on strategic entrepreneurship by incorporating the ramifications of business model innovation into the theory on firms' resource configuration and its underlying processes to enable strategic entrepreneurship.

[view paper \(if available\)](#)

Patterns of Knowledge Flow: Cycles of Divergence and Convergence in Printers

Author: **Shih-Chang Hung**; National Tsing Hua U.

Author: **Jiun-Yan Lai**; National Tsing Hua U.

Author: **John S. Liu**; National Taiwan U. of Science and Technology

This paper considers technological trajectories as a series of problem-solving activities, manifesting the pattern of divergence-convergence knowledge flow. We propose that technological trajectories diverge when new knowledge is able to solve the problem of most concern. Relatedly, technological trajectories converge when existing knowledge becomes obsolescent in the face of new problems. To

common OLM features including contracts with virtual monitoring, multi-freelancer projects, and simultaneous projects by a client trigger the perception of psychological contract breach among OLM participants and reduce perceived project success for both participants. We test these hypotheses using an extensive dataset with more than 143,000 transactions on the world's largest freelancing platform, Upwork, and find that – contrary to predictions from agency theory – projects equipped with strict freelancer monitoring (hourly-pay contracts) and projects enabling peer comparison (multi-freelancer projects or multiple simultaneous projects), lead to lower perceived project success both from the freelancer's and the client's perspective. Our work implies that transactions on online labor markets should not be viewed solely as agency relations, and that some features that supposedly reduce agency costs and improve efficiency on OLMs come at the cost of triggering the perception of psychological contract breach.

Identifying Base-Moving Strategies: Learning Mechanisms and Barriers in Project-Based Organizations

Author: **Georg Windisch**; TUM School of Management, Technical U. of Munich

Research has established that learning at and across different level is of utmost importance for project-based organizations (pbo's) to identify and develop new strategies. At the same time, pbo's face inherent weaknesses in exactly these areas: organizational learning and firm-level strategizing. Literature to date has created a large body of knowledge on learning and capability building in support or in consequence of pursuing new strategies, that is a new strategy is already defined and firms improve on executing it through vanguard (also called "innovative") projects. Yet, apart from few conceptual attempts, a profound empirical analysis of learning mechanisms that lead to the identification and development of new strategies – as prerequisite to initiate innovative projects - is missing so far. Consequently, the question this study aims to answer is the following: How does learning in project-based organizations lead to the development of new strategies? We put particular emphasis on which learning mechanisms occur throughout strategy development and which obstacles might lead to the difficulties on organizational learning, as identified by previous research. To answer this question, the author conducted a 16-month ethnographic case study on a pbo in the rail transport industry that faced a fundamental change in its business environment and, over a period of almost two decades and with

several platform roles, if several revenue sources exist, and if platforms offer their value proposition via website as well as mobile application. Contrary to expectations, several key revenue streams have a negative impact on the company's success. We observed negative influence on success in the absence of certification of the providers on the platform. It is therefore likely to be a hygiene factor and not a success factor. With our research results, we contribute to the evaluation and comparison of digital marketplaces and their underlying drivers using a mixed-method approach.

Platform Venture Capital Investments and the Introduction and Withdrawal of Complementary Products

Author: **Joey Van Angeren**; Vrije U. Amsterdam
Author: **Arvind Karunakaran**; McGill U.

Many platform providers are involved in corporate venturing. Increasingly, platform providers stake out minority equity investments in complementors from their own platform ecosystem as an act of ecosystem governance, a practice that we refer to as platform venture capital (PVC). We study how other complementors respond to such investments, as it pertains to their decisions to introduce and withdraw complementary products. Building upon the triadic exchange structure and contingent adoption nature that are characteristic for platforms, we advance theoretical arguments that position PVC as a powerful proxy for customer demand in the platform ecosystem. We explore the implications of PVC for complementary product introduction and withdrawal by assessing the consequences of 24 PVC investments in the context of Salesforce's platform ecosystem. Consistent with our theoretical arguments, we show that complementors tend to view PVC as a signal of opportunity rather than as a potential threat, such that they are more likely to introduce and less likely to withdraw complementary products in product categories affected by PVC. We also show that these effects are weaker for complementors with greater platform ecosystem experience and multihoming complementors that are better positioned to access information on the preference of platform

the extensive help of internal consultants, managed to successfully identify and develop a new strategy to adapt to its new competitive landscape. Building on this, we put forward the concept of a self-locking cycle, which hindered the firm to conduct strategy development by their own efforts. Further we identified three learning mechanisms conducted by the internal consultants that allowed to overcome this self-locking cycle in our focal firm and finally enabled successful strategy development: project-oriented, business environment-oriented, and organization-oriented learning.

Abandonment of Patented Inventions in an Emerging Economy: How Would Peers' Decisions Matter?

Author: **Lipeng Ge**; U. of Groningen

This study applies the inter-organizational imitation perspective to analyze a firm's decision of abandoning invention efforts in a technological space. In particular, a growing number of peers' abandonment decisions in a technological space would impose the institutional pressure on the focal firm to follow the crowd, and has implications for its abandonment decision in the same technological space. Moreover, the impact of peers' abandonment decisions is contingent on how the focal firm frames its abandonment decision in the gain versus loss domain. Studying Chinese publicly listed firms' abandonment decision, we document a higher likelihood of the focal firm's abandonment decision in a technological space where it observes more peers' abandonment decisions. Moreover, the imitation impact is weakened when firms have superior downstream capability or are financially performing well.

Orchestration of a Platform-Based Ecosystem and the Role of Complementor Exclusivity

Author: **Vidya Oruganti**; Grenoble Ecole de Management

To build an ecosystem around it, a central platform firm needs to bring both sides on board –the end users and the complementors. Price subsidisation and complementor exclusivity have been traditional ways to trigger indirect network effects and gain volumes. However, exclusivity comes with its share of risks as it can lead to complementor monopoly and high costs to the platform. Additionally, a central platform also needs to balance the quantity vs the quality of complementors because crowding of complementors can drive down quality of the platform. Despite this conundrum, the role of exclusivity in platform strategizing has received limited attention. I address this issue in this study, through a single in-depth case study. I highlight the degree and directions of exclusivity through the evolution phases of a platform, and underscore the persistent role of exclusivity in a platform’s strategy.

the firm has found that underperformed firms are likely to engage in the problemistic search, little is known about how firms re-allocate their innovation resources according to performance feedback. This study aims to uncover the microfoundations of problemistic search by elaborating on the linkages of firm performance aspirations to firms’ patent portfolios. Combining the related literatures on performance feedback and innovation portfolios management, we argue that it is more likely for underperformed firms to adapt a triple portfolio strategy in managing innovation activities - reducing radical innovations, strengthening incremental innovations, and reducing trivial innovations in the portfolios. Our empirical patent analysis of U.S. public companies largely supports our predictions on the triple portfolio strategy.

R&D Team Composition and the Internal Versus External Diffusion of Inventions

Author: **Martin C. Goossen**; Old Dominion U.

Author: **Holmer Kok**; Stockholm School of Economics

Many makers join online makerspace communities to develop their own inventions. These online platforms often encourage makers to collaborate by modifying existing 3D-based designs, a co-creation practice known as 'remixing'. Still, there is little empirical evidence that such co-creation practice is beneficial for developing user innovations. Are products derived from prior designs more creative than designs created from scratch? Does remixing facilitate the diffusion of user-generated products in online user communities? This study is based on a quantitative analysis of the genealogy of more than 67,000 3D-based designs in the world's largest online 3D printing community. Findings reveal that, on average, products derived from prior designs are more novel and diffuse better in the online community than the products created from scratch. A second finding is that the number of prior reused by the makers is important. We find that the number of prior reused designs significantly increases product uniqueness. We find that the more prior designs are re-used, the more unique the design. However, we find that too much remixing is detrimental to product novelty and product diffusion. Product novelty and product diffusion both increase with remixing but start to decrease when more than three prior designs are re-used.

Many Hands Make New Design? Exploring Consumers' Design Newness Perceptions of Crowdsourced Products

Author: **Lukas Maier**; Friedrich-Alexander U. of Erlangen-Nürnberg

Author: **Christian V. Baccarella**; FAU Erlangen-Nürnberg

Author: **Kai-Ingo Voigt**; Friedrich-Alexander U. of Erlangen-Nürnberg

This research builds on consumer inference theory to examine consumers' design newness perceptions of crowdsourced products. Over the course of two experimental studies, we find that consumers perceive higher levels of design newness for products that are labeled as crowdsourced (selected and/or designed by users). In turn, these positive

Extant literature has demonstrated how R&D team composition influences the diffusion of new inventions. Yet, this literature has largely overlooked whether these benefits stemming from subsequent inventions are captured by the originating firm or by its competitors. In this study, we explore how R&D team characteristics influence diffusion within the same firm as well as beyond, arguing that the organizational position of the team, its size, and its tenure affect internal and external diffusion differently. An empirical analysis of 19,719 patented inventions developed by a large electronics conglomerate provide robust evidence for the differential effect of R&D team composition on subsequent diffusion within and beyond the firm. The findings of this study contribute to literature on knowledge diffusion, value creation and capture, and team compositions.

The Exaptive Channel of Innovation: An Historical Analysis

Designated as a "Best Paper" for TIM

Author: **Pierpaolo Andriani**; Kedge Business School

Author: **Renata Kaminska**; SKEMA Business School, U. Côte d'Azur (GREDEG)

Theory of technological change fails to account for innovation stemming from affordances of previously developed artefacts. Building on Arthur's model of invention, we develop a model based on three channels, we term - need, theory and exaptive. A historical analysis of instances of emergence of new technologies stemming from a single compound, the coal tar, shows that the exaptive channel plays a role in all innovations and, in some cases, it is the main determinant. Our main contribution lies in highlighting the ubiquity and the importance of the largely neglected exaptation channel in generating radical technologies.

[view paper \(if available\)](#)

Commercialization Barriers and their Characteristics in Innovation Projects

Author: **Helle Aarøe Nissen**; U. of Southern

design newness perceptions increase consumers' purchase intentions. Furthermore, our findings reveal that the design newness effect of crowdsourcing exists for both products with an aesthetic focus and products with a functional innovation focus. By examining the role of product design newness, these findings help us to further understand the underlying mechanisms driving consumers to value crowdsourced products.

Quantifying Open Innovation: A Machine-Learning Textual Analysis Approach (WITHDRAWN)

Author: **Thomas Schäper**; WWU Münster

Author: **Christopher Jung**; WWU Münster

Author: **J. Nils Foege**; WWU Münster

Author: **Stephan Nüesch**; Westfälische Wilhelms-U. Münster

While the concept of open innovation has drawn the attention of scholars and practitioners alike, it still remains difficult to capture it particularly in a quantitative, longitudinal setting where data about open innovation activities is largely absent. This impedes an adequate assessment of open innovations' long-term implications for firms' innovation and financial performance. While researchers have extensively examined the former link, the latter is controversially discussed against the backdrop of the costs and benefits of open innovation but remains largely unexplored. In this study, we develop and validate a longitudinal, text-based measure for firms' open innovation activities, and probe related performance implications in a longitudinal, cross-industry setting. Combining machine-learning content analysis to create an open innovation dictionary, we analyze the 10-K annual reports of 8,491 publicly listed firms in the U.S. between 1994 and 2016. Our results support our theorizing that curvilinear relationships that take an inverted U-shape exist both between open innovation and innovation performance, and open innovation and financial performance.

Denmark

Author: **Mette Praest Knudsen**; U. of Southern Denmark

Innovation research most often focus on innovation barriers from a firm-level perspective, and it is well-recognized that commercialization barriers are an important hurdle for innovating firms. However, current research lacks to investigate the more fine-grained characteristics of specific commercialization barriers occurring in firms' innovation projects. Based on a multiple case study of 12 firms, this study dives into commercialization barriers experienced during innovation projects to provide a detailed picture of their characteristics. This is important as commercialization is a particularly challenging part of innovation projects. The findings characterize 16 specific commercialization barriers and order them in accordance to their occurrences across cases. Furthermore, the study demonstrates which innovation project-specific barriers are related to the firms' internal organizational structure and which ones are related to their external environment.

Small and Seasoned - The Capacity of Firms to Build Upon their Inventive Breakthroughs

Author: **Charles Connaughton**; U. of Washington

Author: **Anna Fung**; American U., Kogod School of Business

Author: **H Kevin Steensma**; U. of Washington

Breakthrough inventions are a key driver of growth in many industries. However, the inventing firm does not always benefit from their discovery. Building upon the knowledge-based view of the firm, we investigate which firms are more likely to benefit from their own inventive breakthroughs. Utilizing machine learning on 5.5 million USPTO patent abstracts, we identify 1,644 breakthrough inventions on which we conduct our analysis. We find that experienced firms tend to benefit more from their breakthrough inventions than younger firms, while smaller firms benefit more from their breakthrough inventions than larger firms. This implies the growth accumulated by older firms may inhibit its capacity to benefit from its experience.

Openness of Technological and Nontechnological Innovations

Author: **Fernando Sanchez**; U. del Desarrollo
Author: **Fariborz Damanpour**; Rutgers U.

Research on open innovation has mainly focused on the management of flows of knowledge sources across organizational boundaries and its effect on technological (product and process) innovations. This article aims to extend the study of open innovation to nontechnological (organizational and marketing) innovations. We argue that extending the study of open innovation to nontechnological innovations gives an opportunity to create a theoretical bridge between the emerging open innovation literature and the expansive literature on organizational innovation, with useful implications for managerial practice. Empirical models are estimated using 3,977 firms from three consecutive panels of Chilean's Community Innovation Survey, 2009-2014. The findings suggest that external sources have a u-shape relationship with technological innovations but a direct relationship with nontechnological innovations, showing that the limits of external knowledge sources on innovation outcome depend on the type of innovation organizations pursue. We discuss the implications of the findings and propose a conceptual model for future research.

Performance of Ethnically Diverse Startup Teams: An Empirical Test

Author: **Sean Evan Wise**; Ryerson U.

Author: **Andre O. Laplume**; Ted Rogers School of Management, Ryerson U.

Author: **Sepideh Yeganegi**; Wilfrid Laurier U.

Extant literature suggests that network diversity can generate positive outcomes for startups. We

multi-stakeholders' value assessment make research and innovation (R&I) regarded as responsible comprehensively as well as exclusively. The study adopts two constructs – “responsible comprehensiveness” and “responsible appropriability” of S&T – to illustrate the responsible ambidexterity of R&I, and explores the relevant antecedents from an agency perspective. Upon 19707 individual-level poll data, it explores the relationship of three typologies of agency (involving iterational agency, strategic agency, ethical agency) on the responsible comprehensiveness and responsible appropriability of S&T. Results entail positive relationship between iterational agency and responsible appropriability, and between strategic agency and responsible comprehensiveness; And U-shaped effects of iterational agency on responsible comprehensiveness, strategic agency on responsible appropriability, and ethical agency on both responsible comprehensiveness and responsible appropriability of S&T. Moreover, ethical agency is found to be more important for the responsible appropriability rather than the responsible comprehensiveness of S&T.

Managing Climate Change by Managing Stakeholders? Information Processing in Urban Innovation

Author: **Julia Kroh**; Kiel U.

Author: **Carsten Schultz**; Christian-Albrechts-U. of Kiel

Urban renewal is increasing in relevance, mainly due to the need to address climate change. In pursuit of this goal, urban innovations target the development and implementation of collectively used infrastructures and resources in cities, like smart city solutions. These endeavors require the involvement of stakeholders to identify their needs and to garner their active support in urban environments. As a result, urban innovation projects can implement concrete solutions for ecological sustainability in local ecosystems that display multiple and frequent conflicting interests. Our study draws on stakeholder theory to investigate how the breadth of stakeholder involvement (the number of different stakeholder groups) and the depth of stakeholder

examine the case of ethnic diversity as a driver of network diversity and hypothesize that ethnic diversity increases startup acquisition likelihood. Furthermore, we hypothesize that the positive relationship between ethnic diversity and acquisition likelihood increases for teams with greater professional experience. We find empirical support for our hypotheses using a dataset of startups that participated in the Techstars accelerator program between 2010 and 2018. The implication of this study is that ethnic diversity in startup teams drives acquisition likelihood through the mechanisms of cognitive and network diversity which lead to information processing advantages, but that this effect is present mainly for more experienced teams.

Indigenous Female Entrepreneurs and entrepreneurial resilience. The role of Individual Traits (WITHDRAWN)

Author: **Antonio Padilla-Melendez**; U. of Málaga

Author: **Antonio Ciruela-Lorenzo**; U. of Málaga

Author: **Ana Rosa Del aguila-obra**; U. of Málaga

Author: **Juan José Plaza-Angulo**; U. of Málaga

In this paper, personal characteristics of female indigenous entrepreneurs (FE), in terms of their resilience to continue with their entrepreneurial activity, provided the common adverse situation they face in their lives at environmental, community, and family level, are studied. Self-reported entrepreneurial activities of 32 participants with activity in an organised market in the region of Cochabamba (Bolivia) are analysed to illustrate ways in which FE have overcome extreme conditions in their life. Self-identified critical incidents have being used to illustrate ways in which FE develop their businesses in order to survive. Resilience is found to be relevant not only at individual but also at community level. Surprisingly, we found a perceived discrimination for being a woman, but not for being indigenous, being relevant the factor of machismo, together with poverty. Most FE were engaged in community activities and had a general good family support, but needed to be better organised as a community. This work contributes to the Indigenous Entrepreneurship literature by revealing the main

involvement (the collaboration intensity with external stakeholders during the early innovation phase) affect the implementation orientation of urban innovation projects. Building on the perspective of information processing theory, we suggest that the efficacy of stakeholder involvement depends on the use of digital involvement and formalization tools. To explore these relationships, we analyze 106 urban innovation projects for energy efficiency improvements in urban districts. We use a text mining analysis of planning documents to assess the implementation orientation of targeted innovations and survey data to measure the independent variables. The results provide empirical evidence that (i) a broad involvement of stakeholders affects urban innovations' implementation negatively, but a deep stakeholder involvement has the opposite effect, and that (ii) intensive use of digital involvement tools support stakeholder involvement, while (iii) a high degree of IT supported project formalization weakens the positive effect of stakeholder involvement intensity on the implementation orientation.

Why Do Women Entrepreneurs Behave Dominantly in the Workplace, and What Does It Mean?

Author: **Dan Ni**; School of Economics and Management Tsinghua U.

Author: **Ning Li**; U. of Iowa

Author: **Jiixin Lin**; Guizhou U.

Today, a growing number of women are becoming entrepreneurs and holding a greater percentage of leader roles. We develop a research model, grounded in gender role theory and expectancy violations theory, about why and when women entrepreneurs behave dominantly in the workplace, and what consequences come of it. Utilizing a family embeddedness perspective, we propose that women's dominance in providing family income is positively related to venture performance via increased entrepreneurs' workplace dominance. Less industry experience strengthens the positive relationship between dominance in family income and workplace dominance, and also promotes an indirect effect of dominance in family income on venture performance through workplace dominance. Data collected from 58 women entrepreneurs and 271 members of their top management teams through a two-wave survey support our hypotheses. This study enriches the women entrepreneurship literature.

Becoming a Mompreneur: How Parental Leave Policies Prevent Mothers from Entering Self-Employment

Author: **Ruud Gerards**; Maastricht U., School of Business & Economics

Author: **Julia Kensbock**; Maastricht U., School of Business & Economics

Author: **Pomme Theunissen**; Maastricht U., School of Business & Economics

strategies, based on existing literature and firms' practices. Privacy-personalization strategies can be defined as strategies that maybe, or are, implemented by firms to manage privacy and personalization, i.e., encourage customers to release personal data by mitigating their privacy concerns and communicating personalization payoffs. Firms can use either adaptation or collaboration strategy to deliver personalization payoffs, whereas transparency and control emphasize on protecting consumer privacy during the process. Using trust theory, we conceptualize that privacy-personalization strategies impact consumer continuance behavior through firm's trustworthiness. Together, our studies will advance the literature on privacy and personalization strategies and provide insights for firms in designing effective privacy strategies.

The Impact of Mandatory CSR Disclosure on R&D Investment: A Quasi-Natural Experiment

Author: **Luu Thi Nguyen**; Tongji U.

Author: **Shouming Chen**; Tongji U.

Author: **Jian Wang**; Tongji U.

In this paper, we investigate how mandatory disclosure of corporate social responsibility (CSR) influences a firm's research and development (R&D) investment. The discussion is of interest since innovation is important for competitiveness and sustainability in both firm- and nation-level, and the disclosure of CSR could be, in part, regulated. The method of difference-in-differences along with propensity score matching technique are employed in the setting of a quasi-natural experiment based on the 2008 CSR disclosure mandate in China. The empirical results indicate a positive effect of mandatory CSR disclosure on the level at which a firm would invest in R&D. In addition, the effect is shown to be stronger in privately-owned than in state-owned firms, and in manufacturing than in non-manufacturing sector. We further discuss the insights of the findings, and suggest several managerial and policy implications.

[view paper \(if available\)](#)

To close the gender gap within entrepreneurship, research needs to explain what inhibits women to found businesses. We put a spotlight on "mompreneurs"—mothers who choose their path into entrepreneurship. Drawing on career development and female entrepreneurship literature, we argue that the time after childbirth is an important liminal phase enabling women to reflect upon their career, including the option to become self-employed. In a natural experiment in Germany, we show that contractionary parental leave policy reforms discourage mothers to become entrepreneurs. The effect is due to the reduced period of paid parental leave, not the amount of cash benefits.

Ecosystem 1 (session 1545)

It Takes a Village to Build an Ecosystem: Collaborative Governance of Entrepreneurial Ecosystems

Author: **Michaela Hruskova**; Adam Smith Business School, U. of Glasgow

Recent insights from the academic and practitioner literature suggest that entrepreneurial ecosystems are collectively governed by a wide range of stakeholders who have a shared responsibility for nurturing their ecosystem. Governing entrepreneurial ecosystems refers to ecosystem actors working collaboratively and in a self-organising way on the development of their local entrepreneurial environment, but the phenomenon is currently under-theorised. This qualitative study explores the phenomenon of governance of entrepreneurial ecosystems by studying the local ecosystem in Edinburgh, Scotland. This paper presents key emerging findings pertaining to the key ecosystem governance actors, structures, and processes. One, results show that different stakeholders have a different understanding of the notion of an entrepreneurial ecosystem, their role in it, and its value. Two, this study outlines the key mechanisms of governance and the role that various stakeholders play in governing their ecosystem, both formally and informally. Three, results also evidence the existence of 'metagovernance', i.e. a deliberate process of orchestrating the work and performance of the actors in the ecosystem. Finally, the study also makes a valuable contribution in relation to ecosystem leadership.

Entrepreneurial Orientation (session 1541)

Entrepreneurial Orientation as Experimentation and Advantage: Is there a Double-Edged Sword Dilemma?

Author: **Oleksiy Osiyevskyy**; U. of Calgary

Author: **Galina Shirokova**; Graduate School of Management St.Petersburg State U.

Author: **Karina Bogatyreva**; Graduate School of Management St.Petersburg State U.

This research seeks to explain why a metaphor of EO as a 'double-edged' sword is necessitated by exploring how and why EO is a driver of firm performance growth and variance. In doing so, we examine when, how, and why EO's two principle components, managerial attitudes toward risk-taking and firm-level entrepreneurial behavior, align with either an EO-as-experimentation and EO-as-advantage perspective as theorized by Wiklund and Shepherd (2011). Moreover, we explore the moderating effect of human capital upon the EO component-firm outcome relationships to advance our understanding of an essential performance boundary condition.

Designated as a “Best Paper” for ENT
Author: **Daniel L. Bennett**; U. of Louisville
Author: **Siddharth Vedula**; Babson College

We conceptualize regional entrepreneurial ecosystems (EE) as heterogeneous configurations of interdependent actors, resources, and capabilities with the potential to encourage various types of entrepreneurship. We develop a large longitudinal database for 358 U.S. MSAs over the period 2003-2014 to explore, using fuzzy-set qualitative comparative analysis, what EE configurations are most conducive to three distinct types of entrepreneurship: self-employment, formal entrepreneurship, and high-growth entrepreneurship. Our findings suggest that human & knowledge capital is an essential pillar for high-growth entrepreneurship, while a market-orientation and individualistic culture are essential pillars for both self-employment and formal entrepreneurship. They also suggest that regions face trade-offs with respect to the other EE pillars. We also explore the degree to which configurations are stable or change over time, contributing to the emerging dynamic EE perspective.

How Transaction Cost Economics Reveal the Dual Nature of Entrepreneurial Ecosystems

Author: **Philip J. Piercey**; Haskayne School of Business, U. of Calgary

The entrepreneurial ecosystems literature is marred by a reliance on vague causal explanations, preventing this burgeoning concept from adequately specifying how it supports entrepreneurial activity. To provide further insight into the functioning of entrepreneurial ecosystems, I interpret them as a form of market governance that generates economies for entrepreneurs' transactions. This relationship between entrepreneurs and the ecosystems they inhabit appears to be largely beneficial but is not without limits. An examination of the special case of nascent entrepreneurs points to ways in which elements of entrepreneurial ecosystems can also create diseconomies, particularly through over-embeddedness, congestion, and exclusion factors. I

and EO. Specifically, we disentangle and delve into the effect of the three distinct components of EA; scanning and search, association and connection, and evaluation and judgement on bricolage behaviors. Using a sample of 249 entrepreneurs from Ghana, we find support for a significant non-linear relationship of first two components with bricolage, whereas we do not observe a significant effect for evaluation and judgement. Furthermore, we demonstrate that the relationship between scanning and search as well as association and connection components of EA and EO is mediated by bricolage, especially in the dynamic environments. Our findings provide interesting insights on the cognitive and behavioral antecedents of EO.

How Entrepreneurial Orientation Affects R&D Alliance Performance

Author: **Wan Chen**; School of Management, Xi'an Jiaotong U.

Author: **Longwei Wang**; School of Management, Xi'an Jiaotong U.

Alliance success or failure has been one of hot topics in strategic management area. This study attempts to examine how the firm-level factor—entrepreneurial orientation of focal firm affects alliance outcomes. Furthermore, it also aims to investigate how uncertainty sources (competitive intensity and entrepreneurial orientation firm's dependence on its partner) condition the entrepreneurial orientation- alliance performance relationship. Survey data from 196 R&D alliances in China indicates that the relationship of entrepreneurial orientation and alliance performance displays an inverted U-shape. Meanwhile, this relationship is negatively moderated by competitive intensity and entrepreneurial orientation firm's dependence on its partner. This study highlights the dual role of entrepreneurial orientation in R&D alliance, providing new insights for explaining the inconsistent conclusion on the relationship between entrepreneurial orientation and alliance performance. Besides, it also has a more thorough understanding of how different levels of EO in R&D alliance affect alliance

conclude that an alignment of entrepreneurs' specific conditions with ecosystem elements is needed to maintain low transaction costs, introducing a key contingency for the efficacy of entrepreneurial ecosystems. Future research paths are suggested to further probe this relationship, particularly through case study approaches.

Towards a Better Entrepreneurship Ecosystem: A Critical Review

Author: **Elie Abi Saad**; École des Hautes Études Commerciales de Montréal - HEC Montreal

In this review of the literature, I develop an overarching framework through an integration of the previous body work on entrepreneurship ecosystem. This stream of research is growing rapidly, and while promising efforts are being directed towards improved theoretical and methodological contributions, the field can presently be described as undertheorized, fragmented and difficult to quantify. Through mapping the main determinants and outcomes contained in this wide literature, I provide a comprehensive organization of this domain and synthesize its respective findings. In doing so, I offer a practical and integrative framework with the goal of developing a more nuanced understanding of this stream of research. I hope the resulting integration will inspire scholars to continue examining how the entrepreneurship ecosystem can be an effective tool for entrepreneurship activity to emerge.

Institutional Imprints, Entrepreneurial Orientation, and Growth of Firms in a Transition Economy

Author: **Khine Tin Zar Lwin**; U. of Waikato

Author: **Paresha N. Sinha**; U. of Waikato

Author: **Jenny Gibb**; U. of Waikato

Entrepreneurial orientation is a key determinant for the performance of firms where a range of internal and external factors that affect the EO behaviour of the firms have been examined. Yet, there is no examination of the potentially important role that founding imprints may play in shaping EO. We examine how the past founding institutional environment, i.e. regulatory and market imprints, constrains the EO behaviour by deterring the growth of incumbent firms founded under the past non-market environment in a transition economy. Using the data from a cohort of 153 firms founded under a non-market environment in Myanmar, the current study demonstrates that both founding non-market regulatory and market imprints attenuate EO behaviour, and that EO promotes firms' growth. The findings also indicate that EO serves as an essential intervening mechanism that dismantles the transmission of negative influences of institutional imprints on the growth attainment of firms established under a non-market system.

Author: **Luis R. Gomez-Mejia**; Arizona State U.

Author: **Ivan Miroshnychenko**; Free U. Bozen, Bolzano

Author: **Fernando Muñoz-Bullón**; U. Carlos III de Madrid

Author: **Maria J. Sanchez-Bueno**; U. Carlos III de Madrid

Job security is increasingly valued by employees worldwide. This paper examines the effect of family involvement on employment changes over time in different institutional environments. Using an unbalanced panel of 3,322 listed firms from 40 countries over the 10- year period, we find that family firms on average are less likely to reduce employment compared to their non-family counterparts. Moreover, the superior ability of family firms to protect labor continues to hold even in weak institutional environments, characterized by high political, socioeconomic and investment risks. We also find that the negative effect of family influence on employment reduction varies significantly across different types of family firms in different institutional environment. These findings have important implications for theory and practice.

Employee Mobility in Family and Non-Family Firms: The Role of Family Firm-Specific Human Capital

Author: **Michael C. Withers**; Texas A&M U.

Author: **Francesco Chirico**; Macquarie Business School, Macquarie U.

Author: **Giuseppe Criaco**; Erasmus U. Rotterdam

Author: **Massimo Bau**; Jonkoping International Business School

Drawing on human capital theory of employee mobility, we develop theory regarding family firm-specific human capital. Specifically, we argue that nonfamily employees of family firms are less likely to change their job than employees of nonfamily firms. We then examine employees' mobility and the

Foreign Entrepreneurs' Social Networks and Business Performance: Contingent Effects of Political

Author: **Ali Ahmad**; School of Economics & Management, Tongji U.

Author: **Ali NAWAZ Khan**; School of Economics & Management, Tongji U.

Author: **Tahir Islam**; Tongji U.

Author: **Monika Katarzyna Zapala**; Tongji U.

This study explored how social networks of foreign entrepreneurs influence their business venture performance and how government policy uncertainty and political networking moderate this relationship. Using survey data from foreign business ventures in China, we find that foreign entrepreneurs' network structural holes significantly contribute to their business venture performance. However, government policy uncertainty moderates the relationship between network structural holes and business venture performance. In three way interaction, the findings suggest that the positive relationship between network structural holes and business venture performance is reinforced by political networking, especially when government policy uncertainty is low. This study contributes to the international entrepreneurship and social network literature and provides a profound understanding of the mechanism that facilitates foreign business venture performance.

Encouraging Non-Family Employee Voice in Family Firm: The Role Model Effect of Owning Family

Author: **Yingnan Zhao**; Nanjing U.; school of business

Author: **Yijie Min**; Guanghua School of Management, Peking U.

Author: **Zhi Liu**; Guanghua School of Management, Peking U.

Employee voice contributes to both individual- and firm-level performance, yet we know little about voice behavior in the family firm. In this study, we highlight the role of owning family's open communication style and propose it affects non-family employee voice via a role modeling mechanism. Then, we consider this process is interfered by owning families' socioemotional wealth (SEW) concerns, and test the joint moderation effect of family employment and altruism variables, which represent family influence and attachment dimensions of SEW, respectively. Data collected from 251 employees in 37 family SME support complex relations: (1) in the cases of high family employment with low family altruism, family open communication enhances non-family employee voice; (2) in the cases of high family employment with high family altruism, family open communication plays a hindering role; (3) meanwhile, family open communication does not have a significant effect when family employment is low. Theoretically, we integrate social learning theory and SEW model, and contribute to both SEW conflict and family heterogeneity literature. Practically, we make suggestions for owning family to enhance non-family employee voice.

[view paper \(if available\)](#)

dimensions of culture play a significant role in moderating the effect of regulatory burden on the growth of opportunity over necessity entrepreneurship across nations. We discuss our findings and suggest implications for public policy.

Entrepreneurs in Arctic Canada: Role of Social Networks and Impact on Capital Formation

Author: **Prescott C. Ensign**; Wilfrid Laurier U.

Author: **Chris McCluskey**; U. of Ottawa

Social networks, social capital, and community context/entrepreneurial ecosystem are important concepts in understanding entrepreneurship as a social process. This article expands our understanding of how entrepreneurs utilize such resources in a remote community to achieve success. Case studies of entrepreneurs in Iqaluit, Nunavut (territory in Canada) provide data on their social networks: characteristics; structures used in opportunity recognition and exploitation; and

"Wearing Two Hats": Exploring Non-Family Employees as Kinship Groups in Family Businesses

Author: **Julia Brinkmann**; Bielefeld U.

This paper focuses on a distinctive group of nonfamily employees in family businesses which I term as kinship group. This group is defined as a social group of employees who are blood- or married- related, do not belong to the owning family, and have been employed by the same firm for more than one generation. Drawing on identity lenses, I use an inductive, multiple case-study design with data triangulation to open new doors in examining how kinship group members navigate their belongingness to two (potentially) competing in-groups (kinship group and work group) in family firms. I examined 46 employees from 19 cases (kinship groups). As a result, first, I distinguish two categories of kinship groups (closeness-oriented versus business activities-oriented) based on their shared targets of organizational identification. Second, my analysis shows patterns and differences in their underlying identity boundary mechanisms which provide insight into the work identity of kinship groups. The two mechanisms which affect a collective positive work identity are (1) inner-group cohesion, and (2) private-work boundary creation. Finally, I offer a conceptual model of 'kinship group work identity perspective' and discuss the findings in linking them with identified patterns of kinship group work-related attitudes and behaviors. In that vein, I propose kinship group employment as attractive and challenging human resource management tool that need to be considered in further research. The findings contribute to the nascent stream of nonfamily employees' organizational identification in family businesses, and shed light on work identity construction of kinship groups not merely in the broader field of organizational and management research but also to owning family research.

impact on the creation of social capital – especially with regard to obtaining employees and generating business. A contextual perspective – describing the context or ecosystem of Iqaluit – is used as a foundation to comprehend the role and importance of an entrepreneur's social network. Following Anderson (2000: 91) "The objective is to reach an understanding of the entrepreneurial process within the context of the periphery," our analysis of the data supports the view that entrepreneurship is socially embedded, contextually impacted, and network dependent. Much of the data indicate the magnified role of social networks in this entrepreneurial ecosystem – particularly with respect to discovering opportunities and locating resources needed to support day-to-day operations. The study provides a picture of the challenges and dynamics of entrepreneurship in a context that includes insider and outsider entrepreneurs at work in a unique environment.

Socialist Legacy and Entrepreneurship: The Case of Vietnam

Author: **Michael Wyrwich**; U. of Groningen
Author: **Christian Fisch**; Erasmus Research Institute of Management
Author: **Joern Hendrich Block**; U. of Trier
Author: **Thi Lanh Nguyen**; U. of Trier

We study the case of Vietnam to assess the role of institutional and historical legacy on entrepreneurship outcomes. In particular, we investigate the detrimental effect of socialist institutions on entrepreneurship. Vietnam offers a unique quasi-experimental setting because the country was divided into a socialist North and non-socialist South in 1955. The country was reunified in 1976 and the South adopted the institutional framework conditions of the North. To assess the relationship between socialist history and entrepreneurship in this unique setting, we survey more than 3,000 Vietnamese individuals. We find North-South differences in a variety of entrepreneurship outcomes, highlighting the long-lasting influence of historical differences in institutional framework conditions on entrepreneurship. Specifically, more than four decades after Vietnam's reunification North Vietnamese respondents have lower entrepreneurship intentions, are less likely to select into entrepreneur-ship education programs, and are less willing to engage in business takeover.

How Entrepreneurs' Interpretations of History Influence their Understanding of Opportunities

Author: **Andrew D A Smith**; U. of Liverpool
Author: **Jennifer Johns**; U. of Bristol

How do entrepreneurs' interpretations of history influence the process by which they discover and evaluate opportunities? This paper answers this question to develop our understanding of the socio-cognitive processes associated with entrepreneurial ventures. The empirical basis of the paper is interviews with digital fabrication entrepreneurs in the UK who work with technologies others have

Configurations of an Entrepreneurial Mindset in a Corporate Environment

Author: **Dagmar Hattenberg**; Groningen U. (RuG)
Author: **Olga Belousova**; Groningen U. (RuG)
Author: **Aard J. Groen**; U. of Groningen center of entrepreneurship

This paper explores employees' entrepreneurial mindset (EMS) variations and dynamics within an organizational context. The entrepreneurship community embraced EMS as a new concept with regard to the interest in adapting to changes in our fast-paced work environment. However, how exactly EMS changes over time, requires further understanding. Through a ten-month participatory observation study within one organization, we find that EMS is both important, often necessary, and salient for individual employees, leading them to engage in entrepreneurial activities during "spike" moments. We create specific configurations of individual, organizational and opportunity characteristics, enabling these said spikes of entrepreneurial behavior. We lastly theorize about the process of activation and development of EMS, advancing research on entrepreneurial employees.

"I Put in Effort, But I am Still Not Passionate": The Influence of Person-Entrepreneurship Fit

Author: **Fei Zhu**; U. of Nottingham, China
Author: **Imran Syed**; Ball State U.
Author: **Dan K. Hsu**; North Dakota State U.
Author: **Daniel A. Cohen**; Wake Forest U.
Author: **Rachel Sheli Shinnar**; Appalachian State U.

Entrepreneurial effort has been found to be an important predictor of entrepreneurial passion: The more effort one devotes to entrepreneurial activities, the more passionate one becomes. Our work, however, extends prior research by offering contrasting empirical evidence. Drawing on fit theory and the person- entrepreneurship fit perspective, we conceptualize two types of fit: anticipatory person-entrepreneurship fit and perceived person- entrepreneurship fit and show that these two types of fit jointly shape the

described as part of a “Fourth Industrial Revolution”. The individuals we interviewed often made analogies to historical phenomena when asked to describe their ventures, although some of them disagreed with the widespread view that their ventures were analogous to those at the heart of the classic Industrial Revolution. We also document important differences in how entrepreneurs faced with similar problems use of historical-analogical reasoning. We identify directions for future research for entrepreneurship scholars interested in engaging with the emerging research stream in strategy on how decision-makers use history.

Ethics in Gothic Form: John Ruskin and Ethics of Entrepreneurship (WITHDRAWN)

Author: **Jean Siobhan Clarke**; EMLYON Business School

Author: **Robin Holt**; Copenhagen Business School

In this paper we introduce John Ruskin’s writings on the value of gothic architecture, using his study of mediaeval gothic craftwork as a means to reflect on the ethical potential of new organizational form. Ruskin understood gothic architecture emerging from the co-operative, on-going and expressive activity of workers explicitly committed to cultivating growth that sustains community life, functionally, intellectually and emotionally. As such ‘gothic’ served as a template for ethical organization. In this paper we examine these ideas in the context of entrepreneurship, often viewed as individualistic, self-serving and opportunistic, so the antithesis of Ruskin’s gothic. In line with Ruskin’s call to examine ethics as lived human experience, we employ a phenomenological approach to understand entrepreneurship as a ‘gothic’ condition, focusing on the everyday activity of twenty entrepreneurs. Our findings suggest that whilst the entrepreneurs were alive to the importance of commercial return, they demonstrated further concern for, and commitment to, collective production and consumption activities that enabled them to create and judge the conditions for “good labour”. We argue Ruskin’s work on gothic offers a means to understand what it is about entrepreneurial work that makes us human, that which ‘gives to life’.

entrepreneurial effort – passion relationship. Our results suggest that entrepreneurial effort reduces individuals’ perceived person-entrepreneurship fit as well as entrepreneurial passion when individuals anticipate a poor person-entrepreneurship fit before making an effort. Our research thus contributes to the entrepreneurial passion and person-entrepreneurship fit literature and offers practical implications for would-be entrepreneurs and entrepreneurship advisors.

The Impact of Venture Characteristics on the Relationship Between Entrepreneurs’ Displayed Passion a

Author: **Xianzhe Jin**; U. of Manitoba

Author: **Arran Caza**; U. of North Carolina, Greensboro

Although a growing body of research highlights the potential impact of entrepreneurs’ displayed passion on investors’ funding decisions, little is known about the conditions under which that passion is most influential in the investment process. We used the Elaboration Likelihood Model of Persuasion (ELM) as a theoretical framework to explore how venture characteristics shape the relationship between entrepreneurs’ displayed passion and projects’ funding performance in crowdfunding. Using a combination of archival and experimental evidence from 228 crowdfunding projects and 1,090 participants, we found that entrepreneurs’ displayed passion positively influences funding performance for ventures at the early conception stage, but not for ventures at the later commercialization stage. In addition, the results of a three-way interaction between entrepreneurs’ displayed passion, venture stage, and project innovativeness revealed that passion exerts the strongest positive effect on ventures that are at the conception stage and proposing highly innovative projects.

Scents of the Past: Strategic Renewal Through Historic Entrepreneurship

Author: **Diego Coraiola**; U. of Alberta

Author: **Vanusa Andrade Barankievicz**; -

Time pressures organizations for adaptation and survival. When new social trends and internal generational dynamics disrupt organizational sources of competitive advantage, organizations might engage in strategic renewal. That is, they focus on refreshing and replacing organizational attributes to generate competitive advantage. For long-established and multigenerational firms, this usually means getting out with the old and in with the new. This bias of the literature towards the new and the future attributes a premium on novelty and dismisses the past as an important source of resources for organizational renewal. In this paper, we theorize the role of historic entrepreneurship in organizational renewal. We present the process of strategic renewal of Granado Farmácias, Brazil's oldest pharmacy. We argue that entrepreneurs with a historical consciousness build on past legacies, narratives, artifacts, and traditions in order to continually renew their business in the present and to build competitive advantages for the future. We show how the change in family ownership introduced a distinct view about the past of Granado that guided the process of corporate entrepreneurship to leverage past organizational assets and develop new sources of competitive advantage.

The Perception of a Founder's Obsessive Passion and Potential Co-founders' Team Entry Decisions

Designated as a "Best Paper" for ENT

Author: **Yingzhu Fu**; Nanyang Technological U.

Author: **Frederic Delmar**; EMLYON Business School

Author: **Matthias Alfred Tietz**; IE Business School, IE U.

This paper investigates the impact of perceived passion of a founder on potential co-founders' decision to join or not a venture team. Employing a conjoint experiment, we find that co-founders are less likely to join when they perceive that the founder has obsessive passion for: (1) the founder's individual vision, (2) the engagement in multiple unrelated ventures, and (3) the achievement of high performance at all costs. Co-founders are more likely to join, when they perceive that the founder has obsessive passion for (4) improving team members' capabilities increases. Further, co-founders' self-esteem moderates the impact of perceived obsessive passion. These findings provide important theoretical implications for the role of passion in team formation.

USO Imprinting and Market Entry Timing: Exploring the Influence of University Ecosystems

Building Sustainable Business Models in the BoP: Evidence from Social Enterprises in East Africa

Author: **Andrea Sottini**; U.Cattolica del Sacro Cuore
Author: **David Littlewood**; U. of Sheffield Management School
Author: **Giacomo Ciambotti**; U. Cattolica del Sacro Cuore

Globally, an estimated 4.5 billion people live on less than US \$8 per day, in the 'base of the pyramid' (BoP). The last twenty years have witnessed growing engagement with the BoP by business, with it argued that a fortune awaits those firms providing needed products and services to BoP markets. However, other actors are also working in and with the BoP, including social enterprises. The activities of such social enterprises in the BoP remain under-researched. Scholars have identified a particular need for further study of how social enterprises in the BoP interact with their ecosystems to achieve their objectives. Drawing upon case study research with 10 East African social enterprises, this paper responds to this need. It sheds light on how social enterprises work with ecosystem actors to overcome challenges of doing business in the BoP, and to design and build community-centred business models. We introduce a multi-stage process model of learning, engaging, and harnessing to describe these activities of social enterprises. In so doing, we contribute to multiple literatures. We add to still limited work on the activities of social enterprises in the BoP. We provide novel empirical insights, and elaborate a theory of how social enterprises interact with their ecosystems to build sustainable community-centred business models. We further contribute to hitherto limited scholarship on social entrepreneurship in Africa. Additionally, Africa remains underrepresented in BoP research, with our study contributing to addressing this lacuna. Finally, our research has practical implications for social entrepreneurs in Africa and elsewhere looking to design and build community-centred business models.

Multilevel Intermediaries: Entrepreneur-Incumbent Interactions in Sustainability Transitions

Author: **Lisa Messina**; Queen's U. Belfast
Author: **Kristel Miller**; Ulster U., Department of Management, Leadership & Marketing, UK
Author: **Nola Hewitt-Dundas**; Queen's U. Belfast

University spin-offs (USOs) have attracted increasing attention due to being an important source of innovation, university income and job creation. To support their creation and growth, universities have developed university ecosystems of diverse actors. However, existing research has found mixed results on the effectiveness of these support mechanisms. In particular, there is a lack of research illustrating the impact pre-market support mechanisms can have on pre-market USO development and their strategic outcomes such as timing of the USOs' first market entry. The findings identify that both the university environment and ecosystem actors leave lasting positive and negative imprints upon USO founders'. USO founders who had positive engagement with university ecosystem actors and perceived their university environment as supportive, developed entrepreneurial skills and market knowledge earlier in the USO formation process. This resulted in greater market readiness and, consequently, contributed to an early first market entry. Conversely, USO founders who perceived barriers within their university environment and had negative experiences with ecosystem stakeholders developed more cautious and risk-averse behaviour, contributing to a late market entry. This research contributed new knowledge into the antecedents of USO market entry timing through the novel lens of imprinting.

Exploring the Role(s) of Researcher-Based Projects in Swedish University Incubators

Designated as a "Best Paper" for ENT
Author: **Linus Brunnström**; School of Business, Economics and Law U. of Gothenburg
Author: **Guido Buenstorf**; U. Kassel and U. Göteborg
Author: **Maureen McKelvey**; U. of Gothenburg

In recent years, university incubators have gone beyond directly supporting academic entrepreneurship by scientists to also support a variety of different activities related to academic

Author: **Adam Geoffrey Bumpus**; Department of management and marketing, The U. of Melbourne
Author: **Benjamin A. Neville**; U. of Melbourne

Accelerators are emerging as important intermediaries in innovation management and new venture creation. Despite a large body of work examining innovation intermediaries, there is still a relatively limited understanding of the specific meso-level interactions of how acceleration takes place as niche entrepreneurs interact with the existing incumbent market regime. This is especially true for complex sectors associated with entrepreneurship and grand challenges, such as clean energy and climate change. We apply the multilevel perspective (MLP) from the sociotechnical transitions literature to the role of innovation intermediaries to explore how accelerators mediate interactions between niche entrepreneurs and incumbent regime firms. We apply this framing to a detailed case study of a major multinational accelerator in the clean energy sector. The paper describes the specific 'input-interfacing-output' processes that enable niche-regime collaborative interactions, in contrast to presumptions of competitive dynamics. The paper contributes to understanding how accelerators play an important role as a 'multileveled intermediary', iteratively and collaboratively enabling dynamic interactions between new ventures and existing firms. We conclude with a conceptual approach for understanding multileveled approach of intermediaries in supporting entrepreneurship for sustainability transitions.

Motives and Selection Criteria of Social Impact Incubators

Author: **Mirko Hirschmann**; Trier U.
Author: **Jörn Block**; U. of Trier
Author: **Alexandra Moritz**; U. of Trier

Due to the large number of new social enterprises (SEs) established in recent years, social impact incubators (SIIs) have emerged globally. SIIs are a meaningful new organizational type of incubator that supports SEs in their early business stages to develop their hybrid objectives. However, research

engagement. One thing they do is to support a wide variety of projects, initiated by different types of potential founders. In this paper, we investigate which project and incubator characteristics explain the likelihood of different types of founders to turn their projects into knowledge-intensive entrepreneurial (KIE) firms. We address two gaps in the literature: how university incubators function and how the diverse backgrounds of different types of founders (researchers, students, other university employees, independent inventors and corporate spinoffs) may affect their likelihood of completing incubation and becoming a KIE firm. In line with previous research, we find that incubation projects initiated by researchers have a lower probability to complete incubation than the other types. More surprisingly, having research-initiated projects in an incubator seems to create spillover effects on all other projects, increasing their likelihood of survival. Moreover, the probability of projects successfully completing incubation increases if the university incubator has less breadth, as measured in admitting fewer types of project-founders, and if the incubator has more experience, as measured in age.

Exploring the Nature of Entrepreneurial Research Institutions: Perspective of Various Commercial Inv

Author: **Phil Yang**; National Taichung U. of Education
Author: **HUI WEN HU**; National Taichung U. of Education

Responding to the emphasis of innovation and entrepreneurship in this knowledge-based economy, the academic research institutions are changing their structures and functions. Moreover, along with the limited growth of governmental research expenditure, the academic research institutions are becoming the key actors to facilitate knowledge flows into the sources of industrial innovation. This study constructed the macro- and micro-level contextual dimensions of academia researchers in terms of institutional environments, organizational environments, network linkages, and personal conditions, and investigated the impacts on various commercial involvements. Through in-depth expert interviews with 8 project conductors

on SII is scarce, and little is known about SII's motives and selection criteria. Investigating the motives and selection criteria of 71 SII decision makers, we find that SII's main motives are spreading social entrepreneurship, their sense of duty to society, and learning from the innovations of others. Furthermore, using a Choice-based Conjoint experiment, we identify the authenticity of the founding team and the importance of the social problem as SII's most important selection criteria. These results contribute to prior research by showing that SEs are more likely to be supported if they signal social credibility and both idea- and entrepreneur-related criteria. We highlight the practical implications for SEs as well as for SII.

Mental Representation of Social and Commercial Entrepreneurial Opportunities

Author: **Sílvia Fernandes Costa**; U. of Groningen

Author: **Arjan Frederiks**; U. of Groningen

Author: **Susana Correia Santos**; Rowan U.; ISCTE-IUL

Commercial and social entrepreneurial opportunities share some communalities, but also some differentiating aspects. In this study, we investigate how individuals mentally represent these entrepreneurial opportunities in their minds. Additionally, we test where cognitively individuals draw barriers between social and commercial entrepreneurial opportunities and how fuzzy or distinct this separation is. This is important because understanding how potential entrepreneurs think about different types of opportunities has clear practical implications on how to promote and support opportunity identification for individuals who are commercially or socially oriented in entrepreneurship. Moreover, we contribute to a better theoretical understanding of how individuals identify opportunities based on different motivations. Building up on categorization and prototype theory, we use an experimental design to analyze how potential entrepreneurs identify prototypical characteristics of opportunity viability and opportunity distinctiveness for commercial and social stimuli. We conclude that a higher level of abstractedness, the two types of opportunities share several characteristics, such as the perception

from the 5 different research disciplines in the Ministry of Science & Technology (MOST) in Taiwan. The empirical results verified that the key dimensions in facilitating the commercial involvements for the academic researchers including network linkages, organizational environments, institutional environments, and individual conditions. Moreover, the common IPR and non-IPR commercial activities are verified. This study explored the various viewpoints of academic researchers in accordance with their academic status and research disciplines. The study discussed the implications of these results for university and government policymakers.

The Role of the Subjective Norm in Explaining the Performance of Entrepreneurial Universities

Author: **Jason Jahir Roncancio**; PhD Researcher

Author: **Nikolay Anguelov Dentchev**; Vrije U. Brussel

Author: **Abel Diaz Gonzalez**; Vrije U. Brussel

Author: **Thomas Crispeels**; Associate Professor at the Vrije U. Brussel

A plethora of studies, particularly in developed economies explain the diversity of variables that impact academic entrepreneurship and the fulfillment of the third mission of universities. These universities are in contexts where they receive support from the state and the private sector and therefore have a high dynamic of technology transfer activities. However, in developing economies, universities are fulfilling their third mission despite the absence of support from the state and the private sector. For this reason and in response to the call of other relevant scientific studies in the field of academic entrepreneurship, in this research we use as a theoretical lens the Theory of Planned Behavior to argue that the low levels of the Subjective Norm, accompanied by a high degree of Attitude Towards the Behavior, and Perceived Behavioral Control, explain the entrepreneurial behavior of universities in developing economies. We base our argument on data obtained from semi-structured interviews (39), focus groups (6), observation panels (1), and surveys conducted among university staff, located in the developing countries of Bolivia, Colombia, and Ecuador.

of its ability to solve customers' problems as part of the opportunities' prototypical viability. Additionally, being a superior product and having the ability to change the industry are common features identified for prototypical distinctiveness for both opportunities. At a lower level of abstractedness (i.e., the aspects that differentiate the two opportunities), we observe that the social opportunity's prototypical viability is characterized by its ability to address a social problem, while the commercial opportunity prototypical viability is characterized by generating cash flow. Additionally, the social opportunity prototypical distinctiveness is characterized by the perception of social value creation and generating community impact, while these are not relevant for a commercial opportunity.

Adaptive Entrepreneurial Action: Current Thinking and Future Research Directions (session 422)

Mirjam Knockaert

Research on entrepreneurial action and behavior has exploded since the publication of McMullen and Shepherd's (2006) seminal article published in the Academy of Management Review. Yet the majority of research on entrepreneurial action has maintained a static view of entrepreneurial action by looking at the decision to act or not act on an opportunity, and less research has focused on the dynamic, adaptive entrepreneurial action that founders engage in as they pursue and develop their ventures over time. We believe the time is right to step back and survey the landscape of research on adaptive entrepreneurial behavior. As a field, we need to mindfully consider what we have learned to date and in which ways we should push our work forward in the coming years to address gaps and fragmentation between different perspectives. This panel symposium will bring together prominent scholars who have published or are working in the area of adaptive entrepreneurial behavior to highlight the current state of this research stream, introduce new research ideas, and suggest future research opportunities.

Best Papers IV: Perceptions and Foundings (session 424)

He's Overqualified, She's Highly Committed: Gender, Qualifications, and Perceptions of Commitment

Designated as a "Best Paper" for OMT
 Author: **Elizabeth Campbell**; Carnegie Mellon U. - Tepper School of Business
 Author: **Oliver Hahl**; Carnegie Mellon U. - Tepper School of Business

Hiring managers make inferences from signals to determine if job candidates are capable and committed to performing the job to which they are applying to work. Building on how prior research has spoken about men in terms of their firm commitment and women in terms of their career commitment, we argue additional qualifications can be helpful for women in the labor market because they help overcome initial biases about women's reduced career commitment, but hinder men's outcomes because they heighten concerns about their firm commitment. To test our argument, we take a multi-methods approach combining four experiments and qualitative analysis. Results showed that while overqualified men were perceived to be less committed to the firm, and as a result, less likely to be hired, these same signals boosted women's perceived firm commitment, career commitment, and hiring outcomes (Studies 1-3a). We provide additional evidence that gendered assumptions about the agency of the job candidate may further explain these differences (Studies 3a-b). This research highlights the importance of distinguishing between perceptions of firm and career commitment and contributes to the growing body of literature on the different challenges facing men and women in the labor market.

Statistical Myths about Log-Transformed Dependent Variables: When, Why, and How

Author: **Anders Ryom Villadsen**; Aarhus U.
 Author: **Jesper Wulff**; Aarhus U.

Strategy and management researchers often employ log-transformed dependent variables (LTDVs). Such a transformation means that researchers estimate an exponential model, which implies estimating a non-linear relationship. We review 10 years of research published in SMJ and find the wide use of LTDVs to be based on statistical myths with possible detrimental effects for the validity of research findings. We identify three myths of major concern that are widely shared: 1) LTDVs should be used to make distributions more normal, 2) linear hypotheses can be tested with LTDVs, and 3) LTDVs are the best way to estimate an exponential model. We find that many researchers use LTDVs for the wrong reasons, and very often in a way that is misaligned with the hypothesis they intend to examine. Researchers also appear unaware of the severe shortcomings of LTDVs. We call researchers to exhibit caution when planning to use LTDVs. They are not relevant when a linear hypothesis is tested, and when the interest is in modeling exponential relationships, the Poisson Quasi Maximum Likelihood Estimator is a better alternative.

Designated as a “Best Paper” for OMT
Author: **Sean Buchanan**; U. of Manitoba
Author: **Trish Ruebottom**; Brock U.
Author: **M Suhaib Riaz**; Telfer School of
Management, U. of Ottawa

Why do some social issues remain salient over long periods while others fail to do so? We explore this question through a longitudinal qualitative study of the issue of economic inequality in discourse about capitalism. We find that an issue’s salience is impacted by the interplay of three key framing dimensions—axiological, causal, and ontological. We demonstrate how framing contests and their resolution related to these three dimensions unfold over time, and show how each provides a key link towards shaping how the issue is perceived, thereby facilitating changes in salience. Further, we show how the resolution of framing contests is informed by discursive resources in the broader cultural and political context that make some framings more resonant than others. In delineating this process, our study advances research on the dynamics of issues in organizational fields, interactional perspectives on framing, and social movements.

The Perception and Evaluation of Founder Experience by Hiring Firms: A Field Experiment

Winner of the OMT Division Best Paper on Entrepreneurship Award
Designated as a “Best Paper” for OMT
Author: **Tristan L. Botelho**; Yale School of Management
Author: **Melody Chang**; Yale School of Management

Founding one’s own venture is often seen as desirable; however, most entrepreneurs must subsequently enter wage employment. Although a transition to wage employment is common, it remains unclear how founder experience is perceived and evaluated by recruiters at hiring firms. We argue that current theory can be used to make a strong case for founder experience as an asset as well as a liability to hiring firms. We first discuss the advantages and disadvantages of founder experience for wage employment and then test these theories through a field experiment, namely a resume audit study. Specifically, we test

theory, RBV, competitive dynamics, and many more). Despite the inherent idea across strategy research that firm performance is heterogeneous, we have little knowledge about just how heterogeneous it is across samples of firms and how this might impact empirical tests of theories used by strategy scholars. We investigate performance heterogeneity by examining the distributions of firm performance measures (e.g., ROA, ROS, EPS, etc.). We find that extreme levels of both skewness and kurtosis vary substantively across different measures, samples, transformations, and years. We create simulations to mimic these distributions and find that such non-normality negatively impacts the efficiency of OLS, robust regression, and OLS with winsorized values. In contrast, we illustrate that quantile regression is more appropriate for modeling dependent variables following these types of extremely non-normal distributions and represents an attractive approach for researchers examining firm performance. The primary implication of our research is that the extreme non-normality of performance measures makes it difficult for researchers to find support for theoretical frameworks when using models that focus on average relationships (e.g., OLS, multilevel models, etc.). Instead, we suggest strategy theories could benefit from re-examining theorized relationships using the types of non-parametric techniques that are more appropriate for the non-normal distributions of firm performance.

Violation of Distributional Assumptions in Latent Interaction Models

Author: **Sirio Lonati**; Faculty of Business and Economics (HEC Lausanne), U. of Lausanne
Author: **Mikko Rönkkö**; Jyväskylä U. School of Business and Economics
Author: **John Antonakis**; Faculty of Business and Economics (HEC Lausanne), U. of Lausanne

Violating the distributional assumptions of latent interaction models can lead to biased estimates and invalid inference. However, no statistical procedure is readily available to verify whether these assumptions hold. We develop several specification tests contrasting consistent latent interaction estimators—which are robust to violations of

how those who started their career as founders fare relative to those who started their career as wage employees at the initial evaluation stage of the hiring process: receiving a callback for an interview. We find that former founders receive fewer callbacks than non-founders; however, all founders are not disadvantaged similarly. Former founders of successful ventures receive even fewer callbacks than former founders of failed ventures. Through 20 interviews with technical recruiters we highlight the mechanisms driving this founder experience discount: concerns related to the applicant's capability and ability to fit into and remain committed to the wage employment and the hiring firm. We also investigate three sources of heterogeneity: applicant gender, hiring firm age, and job location.

Founder Cognitions and New Venture Outcomes

Finalist for the OMT Division Best International Paper Award

Designated as a "Best Paper" for OMT

Author: **Natasha Overmeyer**; Stanford Graduate School of Business

How do entrepreneurs' cognitions shape their ventures? While research has established that founders' backgrounds and prior experiences shape their firms and firm outcomes with long-lasting consequences, these studies have largely taken for granted the underlying founder cognitions that transfer individual-level variation to the firm level. Little is known about how entrepreneurs think, and how their cognitions affect firm-level outcomes such as revenue. To uncover entrepreneurial cognition, this study uses a mixed methods approach. Using applications submitted online by entrepreneurs seeking funding from a large, nonprofit foundation, an inductive grounded theory analysis reveals two diverging cognitions – an "exchange construal" and an "organization construal" – that reflect differences in how entrepreneurs think about themselves and their ventures. These findings are then scaled across 139,806 applications, using a supervised machine learning method, to test whether and how these construals influence firm-level outcomes. The results indicate that entrepreneurs' construals are significantly associated with differences in firm

distributional assumptions (i.e., Extended Unconstrained Indicator Approach and Model-Implied Instrumental Variables method)—to an efficient estimator (i.e., Latent Moderated Structural Equations), which is inconsistent under non-normally distributed linear latent variables. We compare these estimators under a variety of conditions. The robust Hausman test we propose works well in identifying misspecifications due to violations of distributional assumptions of the latent variables. Moreover, our results indicate that the Latent Moderated Structural Equations method is severely biased under non-ideal conditions. Thus, it should not be used as the default approach and its results should always be compared to consistent estimators that are robust to distributional assumptions.

Examining the Use and Utility of Dominance and Relative Weights Analysis

Author: **Tyler Richard Kleinbauer**; Faculty of Business and Economics (HEC Lausanne), U. of Lausanne

Author: **Mikko Rönkkö**; Jyväskylä U. School of Business and Economics

Author: **John Antonakis**; Faculty of Business and Economics (HEC Lausanne), U. of Lausanne

How should researchers judge whether one finding is more important than another? Recent statistical methods purport to assess the relative importance of variables in an unambiguous and objective way. Relative importance analysis is a collection of statistical methods that decompose R² and attribute a share of the explained variance to each variable in a regression equation. The variables can then be ranked. However, do these tools deliver on their promise? In this study, we review the literature to see how these techniques are used and investigate if relative importance analysis techniques better assess the relative causal importance of variables as compared to OLS. We provide multiple intuitive explanations as well as a thorough Monte Carlo simulation comparing relative importance analysis techniques against regression analysis; we show that regression provides a more accurate ranking of the relative causal importance of variables across a

revenue. These findings suggest that entrepreneurial cognition is imprinted into the firm and impacts firm outcomes, illuminating a contributing factor to heterogeneity in new venture outcomes.

New Studies in Patient Engagement and the Patient Experience (session 1642)

Patient and Physician Perspectives on Training to Improve Communication Through Secure Messaging

Author: **Jennifer Hefner**; Ohio State U.

Author: **Cynthia Sieck**; Ohio State U.

Author: **Daniel M. Walker**; Ohio State U.

Purpose To incorporate the perspectives of both patients and providers into the development of training to improve the exchange of secure messages through a patient portal, as well as identify management strategies that support patient engagement. **Methodology** Three patient focus groups (17 patients) and interviews with 21 ambulatory physicians across 17 outpatient clinics at a large Midwestern Academic Medical Center using Epic MyChart. Rigorous thematic analysis was guided by the Systems Engineering Initiative for Patient Safety (SEIPS) 2.0 framework adapted to patient portal implementation. **Results** Patients and physicians identified strategies at the patient, portal, physician, and health system levels that could help each group navigate the portal to communicate via secure messages more efficiently. Patient-focused training strategies included multi-modal materials addressing how to navigate portal features and direction on when, what and how to message. Changes to the format of the messaging feature and pop-ups with communication tips were also frequently mentioned. Physician and clinic-level strategies focused on how the clinic and health system management could enhance physician training on the patient-facing portal features and on how to manage patient care within the portal. Physicians also requested that the health system administration standardize physician and care team work processes related to secure messages within the portal, and communicate clear management expectations of physician portal management. **Conclusion** As communication via secure clinic-level management and training strategies to enhance patient portal use. **Practice Implications** Health

New Perspectives on Developmental Sequences and Cycles in Creative Work (session 1651)

The purpose of this symposium is to bring together emerging empirical research that examine creativity highlighting new ways of theorizing the development of creativity over time. We present five papers that investigate (a) new ways of thinking about sequences and development within a creative project, (b) how personal history shapes engagement in creative work, and (c) how and when one creative project leads to another. The presentations cover how the team that built one of the world's first social robot deals with ambiguity; how products made out of "dirty" materials are de-radicalized; how circus artists draw on their biographies as raw material; how creators in makerspaces switch from one project to another; and how "one-hit-wonders" affect cookbook authors' creative careers.

The Association Between an Established Chief Experience Officer Role and Hospital Patient Experience (WITHDRAWN)

Author: **William Breen**; U. of Alabama, Birmingham

Author: **Seongwon Choi**; Trinity U.

Author: **Kristine Ria Hearld**; U. of Alabama, Birmingham

Author: **Nancy Borkowski**; U. of Alabama, Birmingham

The healthcare industry is currently reacting to multiple stakeholders demanding improvements to the patient experience. Some healthcare organizations are implementing new management structures, i.e., the role of Chief Experience Officer (CXO). This study statistically reviewed descriptors associated with hospitals that have and have not created and filled the role of CXO and, more importantly, measured the association between the CXO role and results of patients' perceptions of their experience of care as measured by publicly reported Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) results. This study was conducted utilizing primary research gather on hospitals in three states, California, Florida, and New York. The results of the study yield insight into the organization characteristics of hospitals and the market factors associated with those hospitals that have filled the CXO role. Hospitals with a formal CXO role are larger, more likely not to be not for profit, and operate in metro areas of these states with higher per capita income. In addition, hospitals that have a formal CXO role are also more likely to have higher HCAHPS scores as determined by the patient recommendation question as well as the hospital overall rating question included in the HCAHPS survey.

Battling Cancer or Fighting for Quality of Life? Role Theory and Patient Expectations in Cancer Care

Author: **Joanna Veazey Brooks**; U. of Kansas Medical Center

Author: **Claire Poague**; U. of Kansas Medical Center

Author: **Taynara Formagini**; U. of Kansas Medical Center

Background: Military metaphors have long dominated the cancer discourse in America, and patients are expected to be willing to endure anything in order to “fight” and “battle” cancer. In recent years, however, cancer care has expanded in response to a need to better holistically support patients as they undergo treatment. Patients are increasingly referred to psychology, nutrition, and palliative care for co-management. Coupled with the movement in healthcare to engage patients in their care and to provide care that is more “centered” to the patient, these shifts have the potential to radically transform patient experiences of cancer care. However, it is unclear how cancer patients currently view their own roles as well as those of their growing healthcare team. Objective: Using role theory, we sought to identify patients’ and caregivers’ current approaches to patient and healthcare provider roles, in the context of an outpatient cancer care with palliative care. Methods: A qualitative interview study was designed to investigate the perspectives, attitudes, and experiences of patients and caregivers surrounding cancer care, specifically with palliative care and symptom management. Thirty-one interviews were conducted and audio-recorded with patients (n = 18) and caregivers (n = 13). Following a grounded theory approach, we iteratively analyzed our data to develop a typology of approaches. Findings: Patients and caregivers conveyed three approaches to expectations and roles in the context of their cancer care experience. The conventional approach saw fighting cancer as the top priority, and oncologists as the most important healthcare professional. In contrast, the unconventional approach rejected this traditional view and placed more value on aspects of life and care that were outside of their cancer diagnosis; participants with this approach often described instances in which oncologists dismissed

critical components of their care. Finally, the ambivalent approach acknowledged gaps in current oncology care, but participants with this approach were quick to defend their oncologist and justify these oversights. Conclusion: Our study showed that patients with cancer are actively shaping the expectations and roles they ascribe to themselves and to their healthcare providers. Interestingly, however, some patients seemed content with a more traditional, paternalistic approach while others described some resistance when trying to advocate for their values and desired illness experiences.

Calling and Meaningful Careers (session 1631)

Trajectories of Calling in the Transition from University to Work: A Growth Mixture Analysis

Author: **Chunyu Zhang**; Shaanxi Normal U.

Research on the development of calling is still in its infancy and rarely focused on how calling changes during a major career transition. The current study examined the developmental trajectories of calling and its personality antecedents in the transition from university to work with a three-wave longitudinal study with 340 Chinese graduating university students. Results based on growth mixture modeling indicated three developmental trajectories of calling: high calling and stable (23% of sample), high calling but decreasing (74), and low calling and increasing (3%). Moreover, higher conscientiousness related to a higher chance of being classified into the high calling and stable trajectory. These findings add notable insights to the literature by exploring the previously neglected developmental trajectories of calling and its personality antecedents in the transition from university to work.

Just Gossip; Nothing Consequential, or is It?

Author: **Jiaqi Yan**; School of Economics & Management, Tongji U.

Author: **Jinlian Luo**; Tongji U.

Author: **Jianfeng Jia**; Northeastern U. China

Workplace gossip is ubiquitous and leader humor is highly valued. Based on cognitive evaluation theory we reason that perceived negative workplace gossip and leader humor provide informal yet important social cues to jointly affect employees' job insecurity and subjective career success. We test such reasoning empirically with three-wave surveys of 335 employees from a large Chinese information technology company. Our results show that gossip and leader humor, which may appear to be inconsequential to some, do matter in the workplace in terms of job insecurity and career success.

Peer Abusive Supervision and Newcomer Organizational Socialization: A Moderated

Forget about the Money? A Latent Profile Analysis of Calling and Work Motivation in Chinese Employees

Author: **Chunyu Zhang**; Shaanxi Normal U.

There is a growing recognition that calling is related to more intrinsic than extrinsic work motivation. This could give the impression that employees with a calling do not need or care about external rewards. To deepen the understanding of the relation between calling and work motivation, we tested how calling is combined with different types of work motivation and how such combinations affect work outcomes differentially. We applied latent profile analysis among Chinese employees with diverse occupations (N = 1,290) to identify calling and work motivation profiles and test their relations with work outcomes, assessed four months later. Four profiles emerged: external motivated low calling, moderately external motivated calling, moderately motivated calling, and highly motivated calling. Employees with weaker and stronger callings all indicated being extrinsically motivated for work. Employees in the highly motivated calling profile exhibited highest job satisfaction, lowest cynicism, and lowest turnover intentions, followed by employees in the moderately motivated calling profile, the moderately external motivated calling profile, and the external motivated low calling profile. Our findings imply that employees with a strong calling do not care less about external rewards and also benefit from external incentives to work. This study offers an important insight on understanding the relation between calling and work motivation.

Author: **Li Ling Hou**; -

This study examined how and when witnessing peer abusive supervision influences newcomers' socialization outcomes. We drew from the social information processing theory to explore the relationship between witnessing peer abusive supervision and newcomers' socialization outcomes, and regarded newcomers' information-seeking behavior as the mediator. Through applying the interactionist perspective, we also theorized how this relationship is moderated by newcomers' future work self. We collected data at three time points from newcomers and their managers at a drug store chain in Northern China. Consistent with our theoretical framework, the results revealed that newcomers witnessing peer abusive supervision was negatively related to their information-seeking behaviors, with newcomers' future work self salience moderating this relationship. Moreover, newcomers' information-seeking behaviors acted as the mediator in the negative relationship between newcomers witnessing peer abusive supervision and their socialization outcomes. We discussed the implications of our research for future theory and practice in regard to abusive supervision and newcomer socialization.

How Leaders React to Employee Constructive Voice: An Investigation Through the Resource Lens

Author: **Angela Jie Xu**; Jinan U.

Author: **Raymond C.H. Loi**; U. of Macau

Author: **Zhenyao Cai**; Shanghai U.

Acknowledging the importance of employee constructive voice to organizational survival and innovation, considerable research has been devoted to reveal how to encourage such proactive attempt. Relatively, we know little about how leaders, one of the main recipients of employee voice, would on earth reward or punish those who speak up. On the

the relationship between leader- employee work calling fit and employee innovative behavior from “three-level interactive” perspective. Using polynomial regression and response surface methodology of 208 leader-employee dyads, we found that the relation of (middle and first-line) leader-employee congruence in work calling with innovative behavior conforms to the characteristics of “supplementary fit optimum”. Specifically, the higher the congruence an employee’s and his or her leader’s levels of work calling are, the better the employee innovative behavior. The optimal position of innovative behavior is the (middle and first- line) leader-employee “high-high” work calling. As for incongruence, the employee produces better innovative behavior in case of first- line leader-employee high-low work calling fit; there is no significant difference in innovative behavior between “middle leader high - employee low” and “middle leader low - employee high”.

Crafting without Boundaries for Meaningful Work Experience

Author: **Yiluyi Zeng**; U. of Warwick

Driven by foundational needs for control, interpersonal relations and positive image, individuals job craft to create meaningful work experience. In organisations, employees job craft by changing tasks and relationships, as well as by creating and bringing desired identity to work. However, job crafting for individuals who work independently remains unexplored. Unlike employees, independent workers don’t have formal job obligations, though the universal desire for meaningful work experience remains. The study is the first to investigate job crafting outside of organisation for meaningful work experience. Based on analyses of 68 in-depth interviews with freelancers across industries, the findings showed that, job crafting for independent professionals is by default a rejection to boundaries. It is a conscious and evolving process to create an ideal work structure for meaningful experience. In this process, individuals constantly make sense of work and adjust work structure accordingly. To achieve a work meaningful experience that is viable and

basis of Foa and Foa’s (1974, 1980) resource theory, this study explores how leaders react to employee constructive voice from the resource perspective. We contend that constructive voice could provide both information and affect resources to the leader, which in turn promotes the resource-based exchange relationship with the leader (i.e., leader-member exchange; LMX). Drawing on theories of cognitive style, we further propose that leaders with an original cognitive style are more likely to capture the resource value of constructive voice whereas leaders who closely follow rules might not see constructive voice in a positive way, which in turn would affect their LMX relationships with the focal employee. Through a two-wave multi-rater field survey among 199 leader-follower dyads in China, we found support for most of our hypotheses. This study contributes to extant voice and LMX literature and carries important practical implications for organizations to capitalize on employee constructive voice as well.

The Spillover Effect of Abusive Supervision Across Two Jobs

Author: **Brian Webster**; Ball State U.

Author: **Bryan D. Edwards**; Oklahoma State U.

Author: **Mickey B. Smith**; U. of South Alabama

Author: **Mackenzie Miller**; Ball State U.

The current study extends a growing body of literature examining dual jobholders by assessing the spillover effects of abusive supervision across two jobs. Previous research suggests abusive supervision can extend beyond one’s job and spill over into other life domains (e.g. family life). However, it is unclear if and how abusive supervision may extend into other domains beyond simply family life. No research has examined the effects of abusive supervision in the context of dual jobholders. Given that roughly 7.2 million Americans are dual jobholders, it is particularly advantageous to examine the ways in which the negative effects of abusive supervision manifest among dual jobholders. We examined the if abusive supervision occurring at one job spills over and negatively affects an individual at their second job, in the form of burnout. Results suggest negative mood mediates

sustainable, individuals craft a work structure, or a work eco-system, comprised of intrinsically and financially rewarding tasks.

Women Leaders' Resilience: How Women Reach and Succeed in Leadership Positions

Author: **Stephanie Duchek**; BTU Cottbus-Senftenberg

Author: **Charlotte Foerster**; Evangelical U. of Applied Sciences Dresden

Author: **Ianina Scheuch**; TU Dresden

Although there are preliminary indications that resilience is a key capability for women on their way to leadership, research in this context is extremely rare. In particular, there is a lack of empirical studies on the specific role of resilience in achieving top leadership positions and on the factors that help to develop high levels of resilience. To narrow this research gap, we provide an exploratory interview study. We conducted 52 in-depth, semi-structured interviews with women leaders from upper, middle, and lower leadership positions in different industrial sectors. Based on our qualitative content analysis, we identify women's main challenges on their way to leadership, resilience factors in three categories (experiential, individual, and contextual factors), and opportunities for promoting resilience. Our study contributes to women leaders and (women) leaders' resilience research and offers a substantial starting point for future empirical research. Furthermore, it provides insights into the development of women leaders' resilience in practice.

Work-Family Enrichment and Conflict: A Comparison of the Diversified and Unified Approaches

Author: **Wai Hung Thomas Ng**; U. of hong kong
Author: **Chang Su**; U. of hong kong

Research on the work-family interface has extensively examined employees' work-family enrichment (including both work-to-family enrichment (WFE) and family-to-work enrichment (FWE)) and work-family conflict (including work-to-family conflict (WFC) and family-to-work conflict (FWC)). The predominant approach is to adopt a diversified perspective that makes a distinction between work-to-family and family-to-work influences and between enrichment and conflict experiences. An overlooked alternative is to adopt a unified perspective that considers higher-order latent constructs signifying groups of variables with convergent theoretical content. Such aggregate constructs represent the broader cognitive categories that individuals use to conceptualize their career experiences. There are three ways in which the unified perspective can be applied to work-family interface research: (a) in examining the overall work-to-family (WFE and WFC) versus family-to-work experience (FWE and FWC), (b) in examining the overall enrichment (WFE and FWE) versus conflict experience (WFC and FWC), and (c) in examining the overall work-family experience (WFE, FWE, WFC, and FWC) as an aggregate. This study evaluates the relationships among social support, work-family variables, and well-being using both the diversified and unified approaches. Meta-analytical structural equation modeling shows the diversified approach to outperform the unified approach, suggesting that future studies should focus on capturing employees' specific work-family experiences.

Broadening Work-Family Conflict Scholarship: Gig Workers' Sensemaking of Context-Grounded Pressures

Author: **Mina Beigi**; Southampton Business School, U. of Southampton

Unexpected Consequences of Gendered Stereotypes (session 1640)

Although women are still overall more likely to experience career disadvantages relative to men at work, empirical analyses have shown how socialized and cultural expectations about gender in work settings can produce positive and negative career outcomes for both genders. This symposium offers novel insights on the conditions under which gender stereotypes can help or hinder careers in unexpected ways. Specifically, we bring together a set of five papers that examine how cultural beliefs about gender, gendered differences in social tie formation, and the gender composition of teams and organizations can positively and negatively influence the career trajectories of men and women. Identifying these consequences of gender stereotypes serves as a starting point for finding practical ways to promote gender equity and improve working conditions for both men and women throughout professional organizations.

Not all workers, navigating varying institutional contexts, experience work-family interface similar to a typical Western employee examined in the extant literature. In this qualitative study, drawing on institutional logics and sensemaking perspectives, we theorize the impact of institutional context on 64 App-based taxi drivers' (ABTDs) work-family conflict (WFC) in a non-Western unconventional context. We contribute to work-family theory and practice by developing a process model that (a) identifies work and family pressures grounded in institutional context in which our participants navigated their work and family; (b) demonstrates how ABTDs make sense of context-grounded work and family pressures by interpreting them as first-order WFC and enacting them through the implementation of alleviating strategies at work or family; (c) conceptualizes first-order WFC defined as an incompatibility experienced when context-grounded pressures from one domain (e.g., work) constrain participation in the other domain (e.g., family), and (d) extends WFC to reflect how macro-level context can be manifested in workers' WFC experiences.

There's Two Sides to Every Tale: Enabling – Enclosing Work-Life Policies and Autonomy Satisfaction

Author: **Sarah Bourdeau**; UQAM U. of Quebec in Montreal, Canada

Author: **Nathalie Houlfort**; UQAM U. of Quebec in Montreal, Canada

Author: **Léandre-Alexis Chénard Poirier**; UQAM U. of Quebec in Montreal, Canada

Work-life policies are offered to employee to help manage conflicting demands stemming from work and life. Yet findings on the actual outcomes of such policies are mixed. Indeed, most research tends to bundle different work-life policies instead of taking into consideration their differential nature. One exception is the enabling – enclosing conceptualisation of work-life policies (Bourdeau et al., 2019). In this paper, a series of four cross-sectional studies with various samples of potential

Sanaz Mobasseri; Boston U. Questrom School of Business

RESEARCH

DIVERSITY

SYMPOSIUM

ASYNCHRONOUS

and actual work-life policies users was conducted, in order to 1) empirically validate that work-life policies can be classified using the enabling – enclosing proposition; 2) investigate how the use of enabling, mid-range and enclosing policies relates with various intraindividual outcomes; and 3) integrate the self-determination perspective (Ryan & Deci, 2017) in order to explore the mediating role of autonomy satisfaction in these relationships. Confirmatory factorial analyses in all 4 studies confirmed the 3-factor model, both for projected use (Study 1, N = 292; Study 2, N = 168) and actual use (Study 3, N = 284; Study 4, N = 251) of work-life policies. Furthermore, structural equation modeling analysis showed that higher use of enabling policies leads to higher levels of satisfaction with life, career, and work-life balance, whereas higher use of enclosing policies leads to higher levels of burnout and turnover intentions, both directly (Study 3) and through the mediating role of autonomy satisfaction (Study 4). We discuss theoretical and practical implications of this research.

Reaching Your Career Goals: Will it Make You and Your Partner Happy? A Dual-Earner Perspective.

Author: **Elisabeth Abraham**; KU Leuven

Author: **Marijke Verbruggen**; KU Leuven

Author: **Lynn Germeys**; KU Leuven

This paper investigates the impact of career goal progress on career and life satisfaction in a dual-earner context. We explore three competing perspectives on the role of partner's career goal progress: partner coordination, reinforcement and hindrance. Hypotheses were tested using the Actor-Partner Interdependence Model (APIM) on two-wave data of 98 dual-earner couples (i.e., 186 employees). Our results establish a direct effect between individual career goal progress and individual life satisfaction for men, but not for women. We also found a negative covariance between individual and partner career goal progress, which supports the partner coordination perspective. Implications for future research are discussed.

Leadership by Gender Stereotypes: Systematic Examinations of Culture and Gender of Leaders

Transnational Research Best Paper Award

Author: **YeunJoon Kim**; U. of Cambridge

Author: **Sooyun Baik**; London Business School

Author: **Soo Min Toh**; U. of Toronto

Author: **Yingyue Luan**; U. of Cambridge

We investigate how leadership behaviors are contingent on the cultural context and the gender of leaders and followers. Drawing on the theoretical lens provided by the gender stereotype literature, we propose that cultural tightness may shape leaders' perception that their groups have negative attitudes toward stereotypically feminine leadership behavior, which in turn leads them to counter the stereotype by displaying more directive and less empowering leadership behavior. Counterintuitively, these mediated relationships may be stronger for female leaders than for male leaders, as female leaders may feel a higher threat caused by such stereotypes and thus attempt to counter this threat by engaging in even more directive and less empowering leadership behavior than male leaders. Lastly, the counterintuitive behavior predicted for female leaders in tight groups may be further strengthened when they lead male-dominated groups than when they lead female-dominated groups (three-way interaction). We test these hypotheses in a multi-source and multi-wave field study with 159 middle managers in 159 bank branches, and the results supported our hypotheses.

The Unintended Outcomes of Performance Management Systems: Gaming in British Universities

Author: **Btissam Aboubichr**; U. of Bedfordshire

Author: **Neil Conway**; Royal Holloway, U. of London

There are growing concerns in the literature about the deficiencies of performance management systems in achieving their intended outcomes and that they can lead employees to engage in behaviors that go against the outcomes intended by the designers of the systems. Despite calls to understand the negative outcomes that can unintentionally arise from performance management systems, little is known about what these outcomes are and how they arise. Using data collected from 65 semi-structured interviews with academics working in 13 research intense business schools/schools of management in the United Kingdom, this paper demonstrates how performance management systems can encourage employees to engage in a range of behaviors termed as gaming, used by academics to circumvent the systems. It categorises six features of gaming behaviors: gratuitous proliferation, cooking the books, hoarding performance, collusive alliances, pandering to customers, and playing safe. The paper then examines the distinctive features of each behavior and illustrates how the behaviors arise as a response to performance management systems. Given the widespread use of performance management systems and the close similarities in the way they are implemented in different public

Perspectives Develop: A Case Study in Autism Employment

Author: **Jennifer R. Spoor**; La Trobe U.

Author: **Darren Hedley**; La Trobe U.

An organization's diversity perspective affects how diverse groups are integrated into the organization, and the extent to which the organization can leverage its diversity (Ely & Thomas, 2001). However, prior research has not examined diversity perspectives with respect to neurodiversity or autism employment, which may be an underutilized source of competitive advantage (Austin & Pisano, 2017). There is also limited research on the processes that underlie the emergence of specific diversity perspectives. We propose that intergroup contact mechanisms (Pettigrew, 1998; Pettigrew & Tropp, 2006) are an important mediator in the emergence of specific diversity perspectives. The research draws on a case study of an Australian autism employment program. We analyzed the program design and themes that emerged from qualitative data collected from 32 employees working with trainees with autism. The analysis revealed that multiple diversity perspectives were intended and emerging in practice. The focus group themes identified both positive and negative effects of the program, and suggestions for improvement, consistent with the intergroup contact mechanisms. This research extends the theoretical base of diversity perspectives and provides practical insights into the barriers, facilitators, and mediating factors associated with successful organizational diversity programs, particularly in relation to disability and neurodiversity.

Reframing to Reduce Resistance: Using System Affirmation to Improve Gender Bias Training

Author: **Lauren R. Hotchkiss**; U. of Guelph

Persistent gender gaps in the workforce prove difficult to change without looking at the role of implicit gender biases. The proliferation of training designed to address implicit bias has left inconclusive findings, ranging from minimal effects (e.g. minimal changes to attitudes) to no effect to negative effects (e.g. increased use of negative stereotypes). The present paper focuses on gender

and private sector organizations, the derived categories are relevant to contexts beyond the university setting.

Dazed and Confused: Reconsidering the Relationship Between Drug Testing and Firm Performance

Author: **Erik Taylor**; East Carolina U.

Author: **Jeremy Bernerth**; San Diego State U.

As the United States nears its 50th anniversary in the War on Drugs, societal attitudes toward substance use have changed drastically, especially with respect to the substance most commonly tested for in the workplace: marijuana. Despite the changing tide of attitudes toward substance use, about half of medium and large corporations still test employees for drugs as part of employment screening, ongoing employee management, or both. Moreover, despite the prevalence of workplace drug testing, little research has investigated how drug testing relates to firm performance. In this work, we draw from the behavioral theory of the firm and to predict that drug testing is a perceived violation of employee's rights and privacy, and that these violations affect employee attitudes and, subsequently, employee performance. Moreover, we argue that drug testing represents a disregard on the part of management for the rights and privacy of employees, which in turn informs how employees interact with other stakeholder groups, negatively affecting firm social performance. Findings reveal that organizations utilizing drug testing regimes do indeed experience decreases in financial performance and tend to have more extreme outcomes on social performance dimensions, with both positive and negative dimensions of social performance increasing or decreasing simultaneously.

biases and aimed to test how a common form of implicit bias training can be framed to improve outcomes. Using a between-subjects experimental design with 481 undergraduate students, we tested if a system affirmation manipulation following training could help overcome resistance to training. We found a positive effect of training on knowledge of gender privilege and beneficial behavioural intentions. The interaction effect of training and system affirmation was not significant for attitudes towards learning, nor intentions to challenge gender privilege and engage in discussions with aggressors. In sum, this study provides insight to the usefulness of brief interventions and how system affirmation framing may be a method to improving training outcomes for organizations.

Unified Holism Versus Granulated Integration: Managing Performance in Emerging Market MNCs

Author: **Ashish Malik**; Newcastle U. Business School

Author: **Pawan S. Budhwar**; Aston U.

Author: **Charmi Patel**; Henley Business School, U. of Reading

Analyzing qualitative case-study data from two emerging market multinational corporations (MNCs) from Indian pharmaceutical industry, we develop two conceptual frameworks for analyzing performance in an indigenous and a modern pharmaceutical MNC. The indigenous Ayurveda pharmaceutical firm focused on a holistic approach of managing multiple stakeholders. Its overarching performance goal was of all stakeholders collectively contribute to the patient and others' holistic wellbeing. The unified and singular efforts of all employees and stakeholders dovetailed to achieve physical, mental, emotional, spiritual and environmental wellbeing as a proxy for performance. Organizational values, culture, and contextual influences of informal learning,

Newcomer Socialization (session 1645)

How Two Motivational Orientations Forge Newcomers' Cohort Network Centrality and Emotional Support

Author: **Jinyi Zhou**; U. of Science and Technology Beijing

Author: **Ning Li**; U. of Iowa

Author: **Wei Chi**; Tsinghua U.

Social connections play a vital role in helping newcomers fit into a new work environment. In addition to seeking important information from organizational "insiders" such as coworkers and leaders, newcomers also need social support from other newcomers with similar experiences during the socialization process. In the current study, drawing on socioanalytic theory, we propose that newcomers with a competitive or cooperative orientation will follow different networking patterns within their friendship cohort network. Newcomers with a high competitive orientation will gradually enter the core of the friendship cohort network, while newcomers with high cooperative orientation

empowerment and task variability helped in achievement of its overarching goal. The second case's contrasting scientific approach of an atomistic, granulated and objective way of assessing and evaluating performance focused on cost-effectiveness, innovation and high-performance. Performance coaching and task invariability adversely affected individual outcomes. Implications for future research and practice are also discussed.

Performance Management and MNEs: The Impact of Different Economies

Author: **Elizabeth Houldsworth**; U. of Reading

Author: **Marianna Marra**; U. of Sussex

Author: **Chris Brewster**; Henley Business School, U. of Reading

Author: **Michael Brookes**; U. of Hertfordshire, UK

Author: **Geoffrey T. Wood**; U. of Western Ontario

We investigate whether certain performance management practices are used more in some national contexts and amongst MNEs rather than in other national contexts or in indigenous companies. We use data from Europe collected as part of the comparative Cranet survey data of HRM practice to focus on the use of performance appraisal, adopting the lens of comparative capitalisms. We find that, in comparison to firms operating in the Anglo-Saxon liberal market economies, performance appraisal (and, notably, systems linking pay to rewards) is considerably less used in the various categories of coordinated market economies found in continental Europe. This may be a reflection of systemic restraints on effective people management, although a look at national productivity rates might suggest otherwise. As expected, foreign owned MNEs tend to use performance appraisal more than organizations in our sample; this may be a reflection of either country of origin pressures (with most originating in LMEs). However, even in the latter, MNEs were likely to make usage of more comprehensive forms of performance management than their domestic counterparts, infusing elements that went beyond rewards, to encompass training and development and career planning. This may either reflect the superior resources MNEs may have at their disposal and/or an emerging best practice

will have a higher increase of in-degree centrality. A cohort with 438 newcomers in a large manufacturing company was tracked for eleven months (six waves) after entering the company to test our hypotheses, showing that competitive orientation is positively related to newcomers' increases of coreness centrality, and cooperative orientation is positively related to increases of in-degree centrality. Further, the increase of coreness centrality is positively related to newcomers' perceived emotional support from other newcomers, which in turn reduced their work-related emotional exhaustion.

Flock Together or Fly Alone: Cohort's Influence on Newcomer's Job Search and Turnover

Author: **Koustab Ghosh**; Indian Institute of Management, Rohtak

Author: **Amit Jain Chauradia**; Indian School of Business

Author: **Chandrashekhar Sripada**; Indian School of Business

In this paper, we identify and study the influence of a specific group of others, the newcomer's cohort of peers, on newcomer's turnover and job search. While a cohort will have similar effects on a newcomer as predicted by the on-the-job embeddedness literature, we find two other relevant moderators—newcomer-cohort closeness ties and newcomer location preference—as moderators that enhance or curb newcomer's job search and turnover. We studied responses from 656 recently graduated newcomers who are divided into twenty cohorts in an information technology (IT) services and consultancy organization. We found cohort's job search partially mediated the relationship between cohort's job embeddedness and newcomer's job search, and between cohort's job embeddedness and the newcomer's voluntary turnover. Newcomer-cohort closeness network relations, characterized by small network size and high network tie strength and density, positively moderated hypothesized relationships between cohort's job search and newcomer's job search as well as turnover. By contrast, newcomer's job placement in a preferred geographic location offsets

model. We found little no tendency for firms worldwide to default to the LME model indicating the continued relevance of national institutional recipes.

Organizational Responses to Competing Institutional Logics: The Moderating Role of Type of Wasta

Author: **Alissa Hankache**; ESCP Business School

This study explores how subsidiaries of Western multinational companies (MNCs) and private local organizations in Lebanon respond to competing market and culture logics. It investigates the different elements that constitute market and culture logics in a given context. Furthermore, this paper provides and answers to why organizations choose specific responses in the way they do. 33 semi-structured interviews with 36 human resource (HR) professionals and line managers provide an answer to the how and why questions. This paper brings forward the importance of different type of wasta that plays a moderating role in choosing the optimal response to competing logics. Results show that “good” and “bad” wasta affect differently organizational responses. Therefore, insights generated from this study contribute to international human resource management (IHRM) knowledge and institutional logics perspective.

The Effect of Applicants’ Reaction to Selection Process on Post-Entry Organizational Socialization

Author: **Se-ung Park**; Agency for Defense Development, South Korea

Author: **Kyoungmin Lee**; U. of Minnesota - Twin Cities

Author: **Junseok Song**; U. of Minnesota - Twin Cities

Author: **Sunhee Lee**; Chungnam National U.

We examine the process by which employees’ reactions and attitudes toward selection process influence newcomers’ socialization outcomes. We collected data from applicants for a Korean company during selection process as well as after entry into the organization. Partial least-square structural equation modeling analyses on a sample of 358 pairwise deleted data generally supported the notion that applicants’ psychological experience during selection process has a significant impact on post-entry socialization. Specifically, the results showed that two types of applicants’ reactions to the selection procedure (i.e., justice perception and negative emotions to selection process) had indirect effects on emotional exhaustion and life satisfaction after job placement through serial multiple mediators (overall attitude toward selection process, organizational justice expectation, and perception of person-organization fit at the time of entry). However, positive emotion toward selection tests did not have a significant effect on the subsequent socialization process. Findings from the current study contribute to our understanding of how applicants’ experiences shape their initial adjustment to organizations, as well as point to implications for HR managers in practice.

[view paper \(if available\)](#)

this study developed and tested a model of how self-initiated expatriates (SIEs) perform well. We collected data from 276 superior-subordinate dyads and which was analyzed using structural equation modeling (SEM) to examine the hypotheses of the study. The model posed that SIEs' job performance depends on interplay of perceived organizational support and role clarity that, however, do not influence job performance directly. The results were in line with the idea behind the model: a). role clarity mediates the influence of perceived organizational support and work adjustment; and b). work adjustment mediates the influence of role clarity on task performance and organizational citizenship behavior. The implications of the findings for theory, practice and for future research are discussed.

HR Practices for Managing Aging Employees in Organizations: The Case of Thailand

Author: **Chaturong Napathorn**; Cornell U. / Thammasat U.

This paper examines human resource (HR) strategies and practices considered particularly beneficial for aging employees in organizations in Thailand, an under-researched developing country. Based on a cross-case analysis of seven organizations across industries, the evidence draws on semistructured interviews and focus groups with aging employees, semistructured interviews with top managers and/or HR managers, field visits, and a review of archival documents and web-based resources, including newspaper reports and magazines. This paper proposes that HR strategies for managing aging employees at Thai organizations can be classified into 4 groups: growth, maintenance of the current level of functioning, recovery from losses, and regulation of losses. Each group includes

Individual Differences in Expatriate Mentoring Benefits

Author: **Haiying Kang**; RMIT U.

Author: **Jie Shen**; Shenzhen U.

Author: **Quan Jin**; Shanghai U. of International Business and Economics

We hypothesized the moderating effects of cultural distance between home and host countries, protégé biological sex, and length of international assignment on expatriate work performance on international assignment. The results of analyzing the multi-sourced data supported the hypotheses. This research extends social learning theory and evolutionary psychology and has significant practical implications.

[view paper \(if available\)](#)

several HR practices appropriate for managing aging employees. Furthermore, one of the most important HR practices that is specifically appropriate for managing aging employees in Thailand and other developing countries with high levels of personal debt is the facilitation of financial planning, categorized as maintenance of the current level of functioning because it helps aging employees maintain their standard of living after retirement. The proposed HR strategies and practices are particularly beneficial for aging employees because they help individuals achieve higher levels of functioning, maintain the current levels of functioning despite new challenges, return to previous levels of functioning after loss, and organize adequate functioning at lower levels when maintenance or recovery is impossible.

Cognitive Schemas of Multicultural and Multilingual Employees

Author: **Tomke Jerena Augustin**; Eberhard Karls U. Tübingen

Author: **Markus Pudelko**; U. of Tuebingen

This study explores multicultural and multilingual individuals as two employee groups that gain increased importance for globally operating organizations. Companies have recognized the valuable resources these employees bring to their cross-cultural and cross-lingual ventures. As such, this study investigates their cognitive schemas as an important resource for outcomes in the workplace. Cognitive schemas are organized knowledge structures and influence individuals' thinking, behaviour, emotions and how information is interpreted. Based on the analysis of 154 semi-structured interviews, we develop a framework of multicultural and multilingual schemas within individuals. Our inductive theory building concluded that their schemas are developed through external influences and internal dealings and consist of unique compositions of cultural and language elements. The schemas highlight the importance to consider varying degrees of knowledge in their multiple cultures and languages, specifically related to the professional and private contexts. In addition, they further our understanding about the individual

Modes of Cross-Cultural Leadership Adjustment: A Study of Anglo Expatriates in Latin America

Author: **Chris Hugh Carr**; U. of Edinburgh business school

Author: **Zoe Gallon**; U. of Edinburgh business school

This paper responds to the demand for further research into cross-cultural leadership adjustment (CLA) (Shay and Tracey, 2009; Tsai et al, 2017) by examining the factors affecting the modes of CLA of expatriates in Latin America. It also uses data from a similar CLA study in Thailand (Tsai et al., 2017) to compare and contrast their findings from worldwide companies in Thailand with our findings in Latin America, to ascertain whether the adjustment process is similar in different countries with similarly high levels of novelty of subordinate characteristics. It explores issues regarding expatriate failure, especially in developing countries (Desatanick and Bennett, 1978 as cited in: Zeira and Banai, 1985), but here in the context of Latin America to gain insight into the factors that influence the CLA of expatriates; distinguishing between the factors that aid adjustment, and those that prevent it. We highlight some similarities between geographically distant samples; therefore it supports the use of the framework by Tsai et al. (2017) as a borderless model that can be applied to any culture with high novelty of subordinate characteristics.

Biases in Financial Resource Allocation to Subsidiary Projects: The Role of Psychic Distance

Author: **Jelena Cerar**; WU Vienna

Author: **Phillip C. Nell**; WU Vienna U. of Economics and Business

Author: **Benoit Decreton**; WU Vienna U. of Economics and Business

This paper investigates biases of senior managers in the financial resource allocation process. In particular, we analyze the role that perceived psychic distance plays in headquarters (HQ) managers' decisions to fund entrepreneurial initiatives stemming from their subsidiaries. We used an experimental vignette approach with 109 managers from 35 countries. We find that psychic distance to a subsidiary country is negatively related to resource allocation of HQ managers only when proposals were submitted by expatriates. A potential explanation is that expatriates are perceived to lack relevant contextual knowledge for such initiatives to be valuable. This result is particularly striking because the payoff functions of our experimental design were clearly not dependent on these characteristics. We contribute to the literature on psychic distance, biases and resource allocation within multinational corporations (MNCs).

Arranged Friendship: A New Construct, Instrument, and National Rankings

Author: **Vas Taras**; U. of North Carolina, Greensboro

Author: **Ola Taras**; U. of North Carolina, Greensboro

The study introduces a new construct labeled here "arranged friendship" (AF). Based on an international sample of 7,481 people from 141 countries, an instrument for measuring AF is developed and

negative impact on expatriates' work well-being. Moreover, we found work-to-life interference factors to negatively correlate with expatriates' work well-being and spouse support to have positive effects. Work-life interference factors have negative impact on expatriates' general well-being. Thus, we find a spill-over effect from private life to work well-being; the spill-over effect from work life to general well-being remains underexplored. The antecedents with the highest relative effect size on expatriates' well-being are job factors at the negative side and perceived organizational support on the positive side. Work adjustment and work-family interference are the variables with the broadest impact on both work well-being and general well-being and work adjustment shows to have the potential to both induce a resource gain, but also contribute to resource losses.

Investigating Expatriate Adjustment with Cultural Sensemaking: The Case of Expatriates in Australia

Author: **Elise Goiseau**; I'U. Paris-Dauphine (Paris IX), PSL

Author: **Lucy Taksa**; Macquarie U.

The scholarship on expatriate management and specifically on expatriate adjustment has paid little attention to expatriates' day-to-day experiences in their host organisations and to the contexts in which this experience takes place despite the numerous calls for more contextualised studies in international management research. This paper is based upon an exploratory empirical research among French and American financial auditor expatriates in Australia. First, it sheds light on the areas of difference encountered by the expatriates in their new work environment in Australia, thus offering to deepen the domain of expatriate adjustment to work. To do so, it emphasises, in two distinct case studies, the work experiences of French and American expatriates in Australia. Second, drawing upon the notion of cultural sensemaking, this paper offers to explain why the American and French expatriates' experiences of adjustment are different and argue for the importance of taking cultural contexts into account when studying expatriate adjustment.

validated, and national rankings are offered for the prevalence of AF beliefs and practices. In general, AF is empirically associated with, or predicted by, economic development of the country, such that less economically developed countries tend to display a higher preference for AF. However, the U.S. and Canada are notable outliers: while highly economically developed, the two countries score high on AF values and practices, similar to how these two countries score on religiosity. The data also indicate that AF is on the rise in the U.S., whereas such a tendency is not observed in the rest of the world.

Understanding Expatriate Adjustment in Bangladesh: An Examination of the Theory of Work Adjustment

Author: **SK Tasthekur Hossain Kowshik**; Monash U., Malaysia

Author: **Yin Teng Chew**; Monash U., Malaysia

Most of the cross-cultural adjustment (CCA) studies lacks theoretical underpinning in understanding how expatriates adjust in new cultural setting. This study is the first to apply the Theory of Work Adjustment (TWA) framework to examine individual and organizational elements that may contribute to CCA. Thematic analysis of 19 in-depth interviews conducted in Bangladesh revealed emerging themes and narratives that are consistent with the conceptualization of work adjustment in TWA. The two main themes that emerged for Abilities are learning exposure and learning experience which illustrated different ways of managing Demand (i.e., work-related, general living), Needs (i.e., work-related, general living), and challenges (i.e., coping, resilience, self-reflection). Expatriates who are resilient tend to rely on their intelligences and problem solving skills. The Supply-Needs Fit revealed that organizations can support adjustment by ensuring similarity in systems and sharing of personal goals of expatriates. Organization can also support by ensuring work autonomy, leadership trainings, and organizational support towards the family of expatriates. This study revealed that the TWA conceptualization should explicitly recognize the interlinked of Demand-Need and Supply-Abilities links that also has practical implications. In a developing country such as Bangladesh whereby life can be tough for adjustment, the context in which expatriates are exposed in the Demand of the work environment matters as certain new expatriate Needs may emerge during the assignment. Therefore, organization should continue to assess how they can play supportive role to enhance CCA of expatriates beyond pre-relocation stage and not assuming the sufficiency of accumulated international experience for CCA.

How Much Do Political Connections Matter for Firm Internationalisation? A Meta-Analytic Review

Author: **Xiaojing Lu**; Birkbeck, U. of London

Author: **Rong Zeng**; U. of Manitoba

Author: **Xiaming Liu**; Birkbeck, U. of London

Prior empirical studies provide indefinite conclusions to the political connection (PC) - internationalization link and the boundary conditions. In this paper, we conduct a meta-analytic review of the relationship between PCs and firm internationalization, and boundary conditions influencing their relationship. Based on a dataset from 59 papers encompassing 25,197 observations, our findings endorse the argument that PCs have a positive impact on firm internationalization. Specifically, our results demonstrate that PCs facilitate a firm's various international commitment modes, but not international diversification. PCs embedded in host countries have a stronger impact on firm internationalization than PCs originating from home countries. Furthermore, PCs promote firm internationalization more strongly in a late stage than in an early stage. PCs are perceived to play a much larger role in firm internationalization by managers than the effect sizes observed from objective data. Surprisingly, we do not find support for the effect size difference between developing and developed host countries. We point out the implications and directions for future research of PCs based on the findings and characteristics of the meta-analysed dataset.

Acquisition Completion of High-Tech M&As by Chinese firms

Author: **Monica Yang**; Adelphi U.

This paper draws upon institutional theory to incorporate multi-level influences of institutional environment (i.e., knowledge distance at the country level, industry attraction at the industry level, and government involvement at the firm level) to examine the determinants affecting acquisition completion. With 895 cross-border M&As in the high-tech industries initiated by Chinese firms from 1991 to 2018, we found that the likelihood of acquisition completion increases when knowledge distance between China and host countries decreases and when China shows high interest in the high-tech industries. In addition, we found that government involvement in acquiring firms as opposed to target firms has different influence on the likelihood of acquisition completion. Specifically, the likelihood of acquisition completion increases when an acquiring firm is with government involvement. It decreases when a target firm is with government involvement. The implications of the study of cross-border M&As by firms from emerging markets were thus discussed.

Author: **Sajid Awan**; CEO Capacity Building
International Islamabad

Author: **Longwei Tian**; Shanghai Jiao Tong U.

It has been challenging for entrepreneurs to exploit business opportunities outside of the native country borders and establish a business venture. From the social network perspective, we examine how and to what extent foreign entrepreneurs' – the individuals who pursue and exploit business opportunities across international markets – network structural holes do influence the business venture performance. Using survey data from 195 foreign entrepreneurs in China, we found that foreign entrepreneurs' social network structural holes in and outside the host country positively influence business venture performance. We explored a mechanism of opportunity recognition that mediates the relationships between network structural holes and venture performance. Also, social network diversity acts as a critical boundary condition that amplifies the effect of network structural holes on business venture performance. This study contributes to international entrepreneurship research and provides several implications for business ventures that embark on operating in emerging economies.

Global or Local Networks: Which Shape Firms' Opportunity Development in International Markets (WITHDRAWN)

Author: **Chia-Ling 'Eunice' Liu**; National Taiwan U.

Author: **Huan Zou**; SOAS U. of London

Author: **Pervez Nasim Ghauri**; U. of Birmingham

Considering international entrepreneurship as a process of opportunity development, we integrate the opportunity-based perspective and network theory to investigate how global and local networks influence opportunity development in the internationalization process of the firm. The empirical evidence is based on a cross-sectional sample of 199 Taiwanese firms. The results highlight that global networks have a significant impact on opportunity exploration, while local networks enhance opportunity exploitation. We also find that, when firms are active in opportunity development, they are capable of enhancing their international

The study examines home-country institutions as contextual factors influencing the process of international opportunity discovery in the case of born global companies embedded in two different institutional contexts: an emerging economy, China, and a developed country, Italy. Drawing on the opportunity-based view and institutional theory, the study explores and draws comparative insights into how home country institutions of born global firms can influence the international opportunity discovery process. Using a case study approach, we examine the international opportunity discovery process of six born global firms from China and Italy and show how home-country institutions can influence the process of developing cross-border opportunities in born global firms. The findings reveal that home institutions played an influential, yet, differentiating role on the international opportunity discovery processes of the Chinese and Italian firms. The institutional context of the Italian firms shaped their opportunity discoveries through product innovation, whereas their Chinese counterparts discovered opportunities mainly through networks embedded their home institutional context.

International Migrant Remittances, New Venture Funding, and Informal Economy

Author: **Peiyi Jia**; U. of Massachusetts Lowell

Author: **Li Sun**; UMass Lowell

Developing countries are characterized by a significant portion of informal economy which constrains the inclusive growth and entrepreneurship development, and a large inflow of remittances from abroad. There are continued and growing interests in international migrant workers remittances and informality among scholars and policy makers. However, these two concepts have not been connected in the literature. Based on theories of informality, we develop a mediation model linking migrant worker remittances to home country informality together and examine the mediating role of new venture funding availability. We adopt Baron & Kenny's (1986) four step approach to test the mediation

competitiveness. It also confirms that ambidexterity has a positive impact on firms' international performance.

Speed Up or Slow Down? Toward a Domestic Dependency Network Model (WITHDRAWN)

Author: **Heechun Kim**; U. of Calgary

Author: **Jie Wu**; U. of Macau

Author: **Douglas A Schuler**; Rice U.

Author: **Robert E. Hoskisson**; Rice U.

Author: **Sung Hun Chung**; Rice U.

The Uppsala model has been widely used to explain variations in firms' internationalization speed by focusing on foreign networks. To correct a potential geographic blind spot in the Uppsala model, we add a domestic dependency network viewpoint, concentrating upon political and business ties with domestic network actors, based upon resource dependence theory (RDT). We test the proposed model on a sample of 689 Chinese multinational enterprises (CMNEs) between 1999 and 2013. The results show that CMNEs politically tied to the central government internationalize faster than CMNEs without such ties. We also find that CMNEs with ties to local governments and to foreign JV partners internationalize more slowly than CMNEs without such ties. We also show how multiple domestic dependency network ties interact to influence internationalization speed. We discuss the implications of our findings for the Uppsala model and RDT.

Political Fragmentation and Firm Entry in the Mexican Maquiladora Sector

Author: **Arkangel Miguel Cordero**; U. of Texas At San Antonio

Although prior studies using a bargaining perspective have argued that political fragmentation has a positive impact on organizational outcomes and market entry, they have narrowly focused only one type of political fragmentation, horizontal, to the neglect of the other, vertical. By failing to consider the differences between these two types of political competition, prior predictions on the effects of political fragmentation on firm outcomes are likely to be more limited than previously posited. We examine vertical political fragmentation and argue that this will have a negative impact on firm decisions to enter geographic markets. Applying an institutional theory lens, we propose that vertical fragmentation will reduce the attractiveness of certain locations as potential sites for firms by augmenting institutional complexity and diminishing organizational access to resources. By examining market entry of all foreign manufacturing firms (maquiladoras) into Mexican cities from 1990 to 2006, the results show that vertical political fragmentation decreases firm entry, and that this effect is mediated by the amount of public resources that flow from upper to lower-level government jurisdictions, and is moderated by vertical fragmentation at other government levels and in jurisdictions where vertical fragmentation is a new phenomenon.

We Don't Need No Education: Moderators of the Startup Intent Entrepreneurial Education Link

Author: Tyler Burch; Idaho State U.

Author: Gregory B Murphy; Idaho State U.

Author: Neil Michael Tocher; Idaho State U.

While research has identified a consistent link between intent to start a business (i.e. startup intent) and willingness to seek entrepreneurial education (EE), studies also indicate that many entrepreneurs have little if any business education or training. However, research examining factors that explain why individuals who lack EE tend to pursue new venture creation is rare. Given this gap, we examine whether individual characteristics influence the startup intent EE intentions relationship on a sample of 199 American adults. Notable findings suggest that extroversion, openness to experience, agreeableness, entrepreneurial efficacy, and risk propensity reduce the chances that individuals with high startup intent will pursue EE. Study findings imply that individual characteristics may be a key factor which helps explain why many persons with high startup intent do not pursue EE, which in turn likely hinders their chances to successfully launch and operate new ventures.

Entrepreneurial Competencies in the Creative Industry: A Study with Music Professionals

Author: Tatiane Brum De Oliveira Reis; UNISINOS U.

Author: Amarolinda Klein; UNISINOS U.

Author: Danilo Dantas; École des Hautes Études Commerciales de Montréal - HEC Montreal

Despite the importance of the creative industry for the economy and the need for entrepreneurship education in this area (DCMS, 2001; UNESCO, 2013), there is still a limited understanding of the content and methods to be used in teaching entrepreneurship to creative industry professionals

Addressing Gender Performance and Advancement Gaps (session 1662)

The Objectification Spillover Effect: Why and How objectifying a Woman Affects Other Women (WITHDRAWN)

Author: Laura Guillén Ramo; ESADE Business School / Ramon Llull U.

Author: Maria Kakarika; EM Normandie Business School

Research suggests that objectification involves perceiving a woman as an object rather than as a human being and that focusing on a woman's appearance reduces perceptions of her humanness. However, the effect of such objectification on other women is under-examined. We bridge the objectification with social attractiveness and cognitive psychology literatures to theorize on how objectification of a woman influences perceptions about other women, suggesting a spillover effect. Across 4 studies, we found that objectification of women spills over and influences perceptions of other professional successful women, and this effect depends on the physical attractiveness of those women and the gender of the evaluator. Together, these findings are the first to establish an objectification spillover effect for successful professional women.

Congruence Between Self-Affirmation and Self-Construal Eliminates the MBA Gender Performance Gap

Author: Jennifer Kim; U. de los Andes, Colombia

Author: Joel Brockner; Columbia U.

Author: Caryn J. Block; Teachers College, Columbia U.

We examined whether greater congruence between participants' self-construals and the self-affirmation exercise in which they engaged would mitigate the tendency for women to perform worse than men in the MBA classroom. Participants varying in their self-construals were randomly assigned to one of three conditions: 1) an individual self-affirmation condition in which they wrote about a value that is important to them, 2) a collective self-affirmation condition in

(Damásio & Bicacro, 2017; Matetskaya, 2015). The present research aims to understand the needs and ways of learning of creative industry professionals, regarding the development of their entrepreneurial competences. Semi-structured interviews were conducted with 31 Brazilian musicians who have their own businesses. The results indicate that most musicians learn best through practice, searching for information and learning contents on Youtube and face difficulties to concentrate while learning. Regarding the learning needs of entrepreneurial competences, management skills, especially time management and organization, stand out. The article contributes to the understanding of entrepreneurial competences and learning in the creative industry. It brings evidence about the learning process of creative professionals (musicians) and reveals main development needs of entrepreneurial competences in this context.

Developing Resilience Through IP Literacy and Multidisciplinary Management Education: Nimble Project

Designated as a “Best Paper” for MED

Author: **Francine Schlosser**; U. of Windsor

Author: **Myra Tawfik**; U. of Windsor

Author: **Jill Urbanic**; U. of Windsor

Author: **Karima Bawa**; U. of Windsor

Author: **Po Kwan Tara Chan**; U. of Windsor

Intellectual property (IP) generation and protection have become essential components of entrepreneurial management. The nimble project case study examines students and professors from business, law, and engineering, faculties and a client who participated in a unique management training collaboration. Our qualitative research explores how multi-disciplinary teams working together from the inception of a business idea provide robust capacity for knowledge transfer and the development of IP literacy. Such collaboration develops resilience in both IP strategic skills development and the ability to respond to adversity. We identify four management learning outcomes related to the Nimble experience: 1) communication and knowledge exchange, 2) importance of IP literacy, 3) resilience, and 4) recognition of the professional

which they wrote about a value that is important to them and their ingroup, and 3) a control condition in which they wrote about a value important to someone else. We found that: 1) the gender performance gap, found in the control condition, was eliminated in the self-affirmation condition and 2) the gender performance gap was particularly likely to be eliminated under conditions of congruent self-affirmation (when those high in independent and low in interdependent self-construal engaged in individual self-affirmation and when those high in interdependent and low in independent self-construal engaged in collective self-affirmation). The discussion centers on: (1) specification of when wise interventions are more likely to be impactful, (2) consideration of cross-cultural differences in wise intervention effects, and (3) the practical value of allowing entering students to engage in self-affirmation.

When Gender Stereotypes Prevent Women from Networking Efficiently

Author: **Zoe Ziani-Francllet**; ESSEC Business School

While women network as much as men, they seem to benefit less from their networking activities, and no explanation has been provided to explain this gender gap so far. In the present paper, I argue that women network less efficiently than men because they renounce some networking actions for fear of being misjudged. I show that the existence of a specific stereotype painting women as able and willing to use their power of attraction to manipulate men makes certain networking strategies appear risky. In particular, I argue that women expect that actions aimed at deepening and strengthening relationships with their male supervisors will reflect negatively on their image. For this reason, they are less likely to engage in those actions, at the cost of valuable relationships and potential career rewards. I test this model in a pre-registered lab experiment based on vignettes, and find partial support for it, and interesting results about men.

Broadening Our Senses: The Aesthetics of Online MBA Studio-Based Education

MED Best Paper in Management Education Award sponsored by MOBTS and the Journal of Management Education for the paper that offers the most significant contribution to management education.

Author: **Kathy Mack**; U. of South Carolina-Aiken

Drawing from the traditions of arts, craft and aesthetics, both organizations and business schools are 'broadening their sights' to studio practices for creative and innovative ways to enhance knowledge. Studio methods engage participants in collaborative artistic methods that involve materializing artifacts to generate new perspectives on management and organizational issues. Research is needed to complement the growing interest in studio activities. This paper suggests that the field of organizational aesthetics opens up nuanced philosophical, theoretical and practical understandings on studio-making practices. Since 'business studios' are typically based on assumptions of physical co-presence, virtual studio inquiries require 'broadening our senses'. The current study explores my own experimentation with online MBA studio practices. Studio accounts from two online Organizational Behavior course iterations are studied through the lens of aesthetics. Excerpts from students' accounts reveal both artistic-aesthetic challenges and 'learning-by-making' insights associated with virtual studio-based management education. Practical implications, conference theme connections and suggestions for future research are considered.

The Role of Materiality in Student Learning about Strategy

Organizational Hurdles in Female Top Manager Appointments

Author: **Jia Li**; Eindhoven U. of Technology

Author: **Boris Lokshin**; Maastricht U., School of Business & Economics

Author: **Christophe Boone**; U. of Antwerp

Taking an integrative approach, we examine the interplays of institutional origins of gender biases in top management appointment. Two biases are studied: glass ceiling bias (lower likelihood of women in leadership positions) and glass cliff bias (higher likelihood of women in precarious leadership positions). Based upon role incongruity and social identity theories, we test the hypotheses in 211 market-leading firms across 19 OECD countries from 1998 to 2014. As expected, we find that masculine national cultures and male TMT representation lower the likelihood of female appointment but poor firm performance increases it especially when male TMT representation is high. Overall, women in feminine countries can break the glass ceiling when male TMT representation and/or firm performance are low. In masculine countries, albeit reaching top leadership positions in crisis times, women face "concrete ceilings" thereafter, as their sporadic presence does not lead to further systematic breakthroughs.

PAPER SESSION

Designated as a "Best Paper" for MED
Author: **Peisheng Huang**; U. of Queensland
Author: **April L. Wright**; U. of Queensland
Author: **Stuart Anthony Middleton**; U. of Queensland

Scholars have focused renewed attention on the importance of strategic management education and the need for further research into the learning experiences of students in strategy courses. Addressing this call, we ask: How do material objects influence student learning of strategy? We conduct an inductive qualitative study exploring how undergraduate students in a core strategy course undertake strategic analysis using two types of material objects: (1) whiteboards and (2) flipcharts. Our findings show how four properties of material objects – location, record-keeping, form, and sensation - influence particular aspects of student learning experiences about strategy. The study contributes new insights about the role of materiality in strategic management education and has pedagogical and practical implications for researchers and educators.

Emotion Regulation (session 1661)

Emotional Regulation, Emotional Intelligence, and Emotional Regulation Flexibility: What's the Knot?

Author: **Akhila Veldandi**; Indian Institute of Management Indore

This article is a study of emotional regulation and emotional intelligence in the organization context. The critical dimensions of both the constructs are discussed in the article. The possibilities of integration of emotional regulation and emotional intelligence are explored, and a novel construct, emotional regulation flexibility is elucidated in this regards. The impact of emotional regulation in the performance of groups at the workplace is examined. The effect of emotional intelligence on

the performance of individuals and groups is elaborated. The articles that tested these constructs in relation to work performance are listed. Emotions in groups at workplace and emotional regulation strategies are represented comprehensively with the help of figures.

A Lifespan Perspective on Emotion Regulation Repertoires at the Workplace (WITHDRAWN)

Author: **Elissa El Khawli**; U. of Groningen

Author: **Susanne Scheibe**; Groningen U. (RuG)

Author: **Anita Keller**; U. of Groningen

Emotion regulation at work has received considerable attention in recent years. According to lifespan-psychological theory and research, aging is associated with improvements in emotion regulation. Nevertheless, results regarding better emotion regulation strategy use with age in the organizational aging literature have been inconsistent. In the present study, we aim to reconcile some of these divergent results by studying emotion regulation strategies at the repertoire level as opposed to investigating the use of single strategies, and by investigating the role of work conditions as contextual affordances of these emotion regulation strategies. Using a sample of 980 participants, we first identified five work-related emotion regulation latent profiles and examined their associations with well-being outcomes. Second, using configural frequency analysis, we found that overall, emotion regulation profiles that were positively associated with well-being were more (less) likely to be afforded in favorable (unfavorable) working conditions, which calls into question the hypothesis of emotion regulation as a buffer to occupational demands. Third, older workers were more likely to be members of emotion regulation profiles that were positively associated with well-being, thereby replicating the older-age advantage in emotion regulation in the work context. Interestingly, older workers' emotion regulation strategy use seemed more stable across all work contexts than younger workers' strategy use, which points to the need for more research regarding younger workers' responses to work conditions. Keywords: Emotion regulation; age; latent profile analysis; well-being; job design

Surface Acting as a Mediator between a Perceived Emotional Demands-Abilities Fit and Disengagement

Author: **Irmgard Mausz**; Ludwig Maximilian U. of Munich (LMU)

Author: **Angela Kuonath**; Ludwig Maximilian U. of Munich (LMU)

Author: **Dieter Frey**; Ludwig Maximilian U. of Munich (LMU)

In this study, we examine the relation between the perceived emotional demands-abilities fit (ED-A fit) and the burnout dimension disengagement in the emotionally highly demanding profession of judges and the process in which surface acting is a potential harmful factor by mediating the forenamed relation. 713 judges in family and civilian court in Germany participated in a two-part online survey. As hypothesized, results imply that surface acting is mediating the relation between the perceived ED-A fit and disengagement. A low perceived ED-A fit was linked to the application of surface acting. Subsequently, the more surface acting was used by judges, the more they felt disengaged. Results help to gain a better understanding of the harmful role of surface acting, especially in judges. Also, the findings indicate the relevance of a perceived ED-A fit in emotional labour jobs. Theoretical contributions, future perspectives and implications for practice are discussed.

Daily Antecedents and Consequences of Deep Acting Toward Coworkers

Author: **Hadar Neshor Shoshan**; U. of Mannheim

Author: **Laura Venz**; Leuphana U. Lüneburg

In this diary study we tested reciprocal relationships between state positive affect and deep acting toward coworkers. We suggest that state positive affect in the morning will provide employees with the positive energy needed to engage in deep acting toward their coworkers during the workday. Deep acting toward coworkers will be rewarded; thus, we hypothesized that coworkers will reciprocate and

show more emotional and task support as a response. Coworker support, in turn, was expected to boost well-being, predicting higher state positive affect at the end of the workday. During a two-week diary study, 102 employees answered a general survey and 618 daily surveys. Multilevel path analysis showed that morning state positive affect was positively related to daily deep acting toward coworkers. Moreover, daily deep acting toward coworkers was positively related to more emotional (but not task) support from coworkers, which then predicted higher end-of-work positive affect. Findings highlight the importance in studying emotional labor toward coworkers, as well as the bright side of emotional labor and the potential positive feedback loops that employees can experience at work.

Giving and Receiving Helping Behaviors (session 1656)

Time to Help? Contextualizing Trajectories of Organizational Citizenship Behavior

Author: **Sabine Raeder**; U. of Oslo

Author: **Felix Anker Klein - Of Psychology**; Institute of Psychology, U. of Oslo

Author: **Knut Inge Fostervold**; U. of Oslo

Organizational citizenship behavior (OCB) has been found to vary over time, but its longitudinal development has remained unexplored. Drawing from event system theory and human capital theory, we investigate the development of OCB over time and contextualize it with events in the organization that affect employees and their work tasks and with resources provided through human resource management (HRM) practices. The longitudinal growth model was tested in a sample of 205 employees with monthly measures over one year. For each event, we found distinctive trajectories of OCB. Furthermore, the HRM practices of selective

staffing and training influenced OCB at the onset of an event, whereas the HRM practices of decision making, performance management, and promotional opportunities determined the level and the development of OCB after the event reorganization. Our contextual view of the development of OCB helps in understanding what motivates employees to perform OCB and what resources support discretionary behavior.

Am I Obligated to Pay It Forward? A Moderated Mediation Model of Employee Reactions to Received Help

Author: **Yuan-Fang Zhan**; Huazhong U. of Science and Technology

Author: **Lirong Long**; Huazhong U. of Science and Technology

Author: **Ye Li**; -

Author: **Jinfan Zhou**; Nanjing U.

According to social exchange theory, when employees receive help from their coworkers, they often “pay it forward” by helping their coworkers and organizations in turn. Although this direct effect is well-established, scholarly understanding of the types of help most likely to be paid forward is limited. Similarly, the mechanisms and boundary conditions of these effects are underdeveloped. In this study, we address these issues by proposing a contingent reciprocation model that explains when employees feel obligated to repay coworker help through a recipient-centric lens. Using a twice-daily experience sampling method (ESM) to collect multi-wave data from individuals working fulltime in a mid-sized technology company, we find that employees increase their OCBs in response to reactive help (i.e. help they requested), but not in response to proactive help (i.e. help they did not request). Furthermore, we demonstrate that these effects are driven by felt obligation, and stronger among women than among men.

The Dark Side of Escalating Citizenship: A Longer-Term Dynamic Perspective

Author: **Andrea Kim**; Sungkyunkwan U.

Author: **Youngsang Kim**; Sungkyunkwan U.

Author: **Yoonsung Cho**; Sungkyunkwan U.

Given the growing demand for organizational citizenship behavior (OCB) in contemporary organizations, this study delves into a mechanism through which OCB performers risk incurring personal and professional costs over time as well as its boundary condition. Drawing on conservation of resources (COR) theory, our study proposes that job demands mediate the linkages between long-term escalating OCB and negative outcomes and that these detrimental processes depend on organizational tenure. Our moderated mediation analysis using a four-wave dataset of 1,524 workers in a U.S. health care organization reveals that a growth trajectory in OCB accruing over time leads to emotional exhaustion and work-to-family conflict through job demands. Furthermore, the indirect effects of long-term escalating OCB on emotional exhaustion, work-to-family conflict, and turnover intentions are more salient among employees with longer organizational tenures. Our claims and findings provide theoretical implications for OCB with respect to its dark side and dynamics in a longer-term perspective. The results of this research also offer practical insight into how to effectively manage good citizens in organizations.

Interpersonal Trust (session 1659)

Examining the Independent and Joint Effects of Trustee Competence and Intention on Trust Development

Author: Xuchang Zheng; Dublin City U. Business School

Author: WANXIN WANG; Imperial College Business School

Author: Jonathan Pinto; Imperial College London

Trust research identifies two fundamental trustee attributes as important for trust development, i.e., intention and competence. In this paper, we examine the independent and joint impact of these two attributes on trust development. Results from an experiment and a field study suggest that trustors tend to prioritise cues about a trustee's intentions over the trustee's competence. For instance, we find that if trustors are unsure about a trustee's intentions, then it does not matter whether the competence cues are positive or negative. Also, incompetent trustees with positive intention are more trusted than competent trustees lacking positive intention. The impact of intention cues is not affected by the lack of trustee competence. We discuss the implications of our findings for both theory and practice.

moderating effect of leader respect to solve the opposite effect of help-giving behavior on subsequent dependent help-seeking behavior indicated by the two serial underlying mechanisms. We tested our hypotheses using a multi-wave data collected from 276 employees. Our results showed that the positive (negative) relationship between workplace help-giving behavior and dependent help-seeking behavior is serially mediated by personal reputation and reputation maintenance concerns (moral credits and help-seeking justification). Leader respect weakens such a positive relationship and strengthens the negative relationship. We discuss the theoretical and practical implications for helping literature.

Trusting Kind Friends and Fair Leaders: How Relationships Affect the Antecedents of Trust (WITHDRAWN)

Author: **Alexander Kentaro Moore**; U. of Chicago Booth School of business

Author: **Joshua Lewis**; The Wharton School, U. of Pennsylvania

While a robust literature explores the antecedents of trust in organizations, thus far, none has addressed how and why the nature of trust differs across relationships. In the present research, we demonstrate that the nature of trust in friends and leaders is fundamentally different. Specifically, trust in friends relies on perceptions of benevolence, whereas trust in leaders relies on integrity. We establish these results across one pilot study, three main experiments, and three replications (total N = 1387) that explore how individuals trust targets as friends and leaders subsequent to observing targets resolve ethical dilemmas that involve tradeoffs between benevolence and integrity. Across our studies, we use both attitudinal and behavioral measures of trust, and a range of ethical dilemmas. This research deepens our understanding of both trust as well as the relationship between morality, hierarchy, and relationship formation.

New Insights into OB Research (session 1654)

A New Perspective on Military Leadership

Author: **Oyvind Martinsen**; Norwegian Business School

Author: **Thomas Hol Fosse**; Norwegian Defense U. College

Author: **Rino B. Johansen**; Norwegian Defense U. College

Author: **Geir Ove Venemyr**; Inland Norway U. of Applied Sciences

In this paper we describe the development of a theory and a new measure of military leadership. Based on a definition of military leadership and Yukl's (2013) three metacategories of leadership (Task-, Relationship-, and Change-orientations), and military conceptions of Role Model, we identified an initial pool of relevant leadership constructs in military documents and in focus group discussions. The several constructs were operationalized and analyzed in four studies. A total of 5,374 military personnel participated. In the first study, we used exploratory factor analysis (EFA), applied a multisource perspective, and identified three correlated components. We labeled these Task Oriented, Development Oriented, and Role Model. In the second study, which was based on a single-source perspective, the three factors were cross-validated and compared to transformational leadership (TL), Ohio constructs, and leader-member exchange (LMX). In the third study, the three factors were analyzed using confirmatory factor analysis (CFA), multilevel and multitrait multimethod (MTMM) analyses, where leadership

New Perspectives on Workplace Ostracism: Examining its Dimensionality, Antecedents, and Outcomes (session 1653)

This symposium seeks to provide new perspectives on workplace ostracism with four papers addressing four different important research questions that have been largely overlooked by previous studies. These questions include how language-based exclusion impacts employees' deviant behavior, how task-related and personal-related ostracism have different impacts on employees, what causes workplace ostracism, and how workplace ostracism hinders employees' abilities. These four papers examine these questions using different theoretical perspectives and methods. Hopefully, this symposium can enhance a finer-grained understanding towards workplace ostracism, spark new research directions, and ultimately further move this field forward.

Language-Based Exclusion Increases Workplace Deviance Among the Morally Disengaged

A Meta-Analysis of Neglected Artifacts in Organizational Behavior Mediation Research

Author: **Juan I. Sanchez**; Florida International U.

Author: **Chen Wang**; Florida International U.

Author: **Ajay Rama Ponnappalli**; Florida International U.

Author: **Hock-Peng Sin**; Florida International U.

Applications of statistical mediation analysis in organizational behavior research are vulnerable to statistical and methodological artifacts whose actual influence on the results of primary studies remains largely undocumented. Unlike traditional meta-analysis, ours neither estimated nor corrected population parameters for statistical artifacts. Instead, we computed the magnitude of spurious variance associated with artifacts across primary studies focused on not only mediation and partial mediation, but also incremental non-mediation, which we defined as the amount of incremental variance explained by the mediator beyond that explained by the independent variable. Analyses of 268 primary studies covering four widely employed organizational behavior mediators – justice, support, leader-member exchange (LMX), and trust – published in high-impact journals revealed that artifacts accounted for up to 16%, 9%, and 17% of the variability in the mediation, partial mediation, and incremental non-mediation effects, respectively. Certain artifact combinations made the likelihood of a specific type of mediation more likely. For instance, partial mediation was larger when (1) the study employed the same method to gauge the

Broadening our Sight on the Decentralization-Organizational Performance Link: A Multi-Level Study

Author: **Hendrik Huettermann**; U. of St. Gallen

Author: **Stefan Berger**; U. of St. Gallen

Author: **Max Reinwald**; U. of Konstanz

Author: **Heike Bruch**; U. of St. Gallen

As organizations strive for more flexibility in their business procedures, decentralized organizational structures have reemerged as a topic of interest in recent years. Yet, despite its long-standing tradition, the literature on the implications of decentralization for organizational performance has remained inconclusive. Our study aims at illuminating prior ambiguous evidence by examining a central individual-level mechanism underlying the relationship. Integrating the perspective of organizational structure as opportunities and constraints with social information processing theory, we argue that transferring decision-making authority to lower organizational levels has a positive effect on employees' emergent leadership, however only to the extent that their direct supervisors act in accordance with decentralized structures. Findings from a multi-level, multi-source field study of 5,816 individuals nested in 145 companies support our predictions that organizational-level decentralization exhibits a positive effect on individual employee's propensity to emerge as an informal leader, but only when the employee's direct supervisor shows high levels of empowering leadership. Individual-level emergent leadership, in turn, aggregates to higher organizational performance. By examining an individual-level mechanism of the decentralization-organizational performance link, our study bridges macro- and micro-perspectives and helps to gain a better understanding of how organizations may reap the benefits of decentralized decision-making.

Organizational Justice (session 1664)

The Interaction Effect of Supervisor Justice and Coworker Justice on Task Performance via OBSE

Author: **Wei Si**; School of Economics & Management, Tongji U.

Recent research on organizational justice demonstrated that employees do not only react to fair treatment from authorities (i.e., supervisor and organization) but also that from peer relationships (i.e., coworker). Nevertheless, little attention has been drawn to whether and how justice from authorities and justice from peers can affect employees jointly. Drawing on group engagement model (Tyler & Blader, 2000, 2003), I hypothesize that supervisor justice and coworker justice interact to influence employees' organization-based self-esteem (OBSE), such that the positive effect of supervisor justice on OBSE is stronger when coworker justice is higher. OBSE is further hypothesized to transmit the interaction effect of supervisor justice and coworker justice to employees' task performance. The hypotheses were supported by a time-lagged survey study conducted with nurses in China. Implications for group engagement model and the organizational justice literature are discussed.

Personality and Dark Side Behaviors (session 1658)

Fuse and Fracture? A Dual-Pathway Model of Proactive Personality and Ostracism

Author: **Ruixue Zhang**; Rennes School of Business
Author: **Yaping Gong**; Hong Kong U. of Science and Technology

Author: **Anran Li**; Hong Kong U. of Science and Technology

Although there is consensus that the proactive personality is beneficial in the workplace, an unanswered question is whether proactive individuals are always appreciated by peers. This research depicts an "initiative paradox" by examining how peers respond to the focal proactive team member. Drawing upon trust literature and relative deprivation theory, we argued that peers respond to the proactive member in two different ways: showing trust to the proactive member or feeling relatively deprived of their common resources, and accordingly, less or more likely to ostracize the proactive member. The proactive member's prosocial motive and proself motive moderate these relationships. In study 1, we collected a three-wave hospital data (including 799 nurses nested in 116 nursing teams) and found that prosocial motive strengthens the positive effect of proactive personality on peers' trust and proself motive strengthens the positive effect of proactive personality on peers' feelings of relative deprivation. In study 2, we tested the full model (the first-stage moderated mediation model) with a three-wave data from 448 waiters in 132 restaurants in the catering industry in China. Results show that prosocial motive strengthens the indirect effect of proactive personality on ostracism through peers' trust and proself motive strengthens the indirect effect of proactive personality on ostracism through peers' feelings of relative deprivation.

[view paper \(if available\)](#)

that considers organizational justice as an endogenous variable that may be influenced by attributes of the employees themselves. Integrating the regulatory focus and social exchange theories, we test a model that links trait promotion and prevention foci with justice perceptions through work engagement. We propose that promotion focus is positively related with distributive, procedural and interactional justice with work engagement as the mediating factor. We further suggest that the association of prevention focus with the justice dimensions via work engagement depends on the extent to which the employee feels grateful at work. We test our hypothesized model in a two-wave study using a sample of 222 full-time working professionals. We find partial support for our model, as results indicate that high promotion focus employees perceive distributive and procedural justice due to high levels of engagement. On the other hand, we find that prevention focus is negatively related with distributive and procedural justice via engagement, but only for employees who experience lower levels of gratitude at work. Overall, our findings indicate that it is worthwhile to examine employee-based antecedents of justice perceptions.

Shooting for Fairness is Always Beneficial? Why and When Promotion Failure Affects Work Engagement

Author: **Zheng Zhu**; Renmin U. of China
Author: **Xingwen Chen**; U. of hong kong
Author: **Qingjuan Wang**; Nankai U.

Promotion, a part of the organization incentive and reward systems, drives employees to perform well and commit a lot to organizations. But we still know very little about the “promotion outcome—work state” relationship and its underlying mechanisms. Integrating resource-based perspective and attribution theory, we propose and test how and when promotion failure has detrimental effects on employee work engagement through cognitive and emotional resources mechanisms. Besides, we also examine the boundary role of overall promotion fairness perception. On the basis of three-wave data, our results indicate: (1) promotion failure is negatively related to employee work engagement

Development and Validation of the Vigilante Role Identity Scale (VRIS)

Author: **Maja Graso**; U. of Otago
Author: **Karl Aquino**; U. of British Columbia
Author: **Abhijeet K. Vadera**; Singapore Management U.
Author: **Lily Lin**; Beedie School of Business Simon Fraser U.

We report on the development and validity assessment of a new scale that measures the extent to which a person has adopted the vigilante role identity (i.e., someone who monitors the environment for signs of deviance and administers unauthorized punishment to those who engage in deviance). Four studies provide evidence for the construct validity of the vigilante role identity scale (VRIS). Study 1 presents an initial assessment of the factor structure and internal consistency of the VRIS. Studies 2 and 3 cross-validate the factor structure in new samples and show evidence of its discriminant validity with respect to measures of vigilante behavior, social vigilantism, and moral identity. Study 4 tests antecedents of VRIS scores based on DeCelles and Aquino’s (2019) workplace vigilante theory. We discuss theoretical and practical contributions that the scale offers to the study of workplace vigilantes. We discuss how it can advance scholars’ understanding of workplace vigilantism more broadly, which remains a poorly understood workplace phenomenon.

A Meta-Analysis of the Big Five and Dark Triad as Predictors of Workplace Deviance

Author: **Katherine Crawford Alexander**; Auburn U.
Author: **B. Parker Ellen**; Northeastern U.
Author: **Jeremy Mackey**; Auburn U.
Author: **Charn Patrick McAllister**; Northeastern U.
Author: **Jack Emery Carson**; Auburn U.

Despite the large and growing number of studies on workplace deviance, the field currently lacks a complete understanding of who perpetrates deviant behavior due to the presence of divergent perspectives. In one stream of research, scholars have examined the relationship between

through reduced self-efficacy and decreased positive affect; (2) the overall perception of promotion fairness strengthen the negative effect of promotion failure on employee cognitive and emotional resources (i.e., self-efficacy and positive affect) and work engagement. This research shifts our attention to the resource perspective to clarify the cognitive and emotional resource processes that relate promotion failure to employee work engagement, supports the potential dark side of the promotion fairness perception in explaining the impact of promotion failure, and provides practical advice for organizations and managers to effectively communicate the promotion outcome to promotion winners and losers.

Moral Heuristics of Fairness: How Interactional Justice Shapes Employee Moral Cognition and Deviance

Author: **Jin Song Li**; Shanghai U. of Finance and Economics

Author: **Yahua Cai**; Shanghai U. of Finance and Economics

Author: **Wang Haoding**; Shanghai U. of Finance and Economics

There has long been interest in how leaders' interactional justice influences their subordinates. Beyond the instrumental and relational model of justice, this research extends the interactional justice literature by revealing the moral implication of interactional justice that have impact on employees' moral cognition and behavior. Moreover, drawing on information processing theory that distinguishes between automatic and systematic modes, our research suggests that moral signals from ethical leadership are explicit and stable that could be automatically processed by employees. Therefore, ethical leadership reduce the employees' tendency to systematically process moral signals of leaders' interactional justice. 220 samples from field study shows that, leaders' interactional justice reduces employees' deviance by decreasing their moral disengagement. Under high level of ethical leadership, the relationship between moral disengagement and deviance is not significant. Further, ethical leadership substitutes

"traditional" personality traits (i.e., the Big Five, which consists of conscientiousness, agreeableness, emotional stability, openness to experience, and extraversion) and workplace deviance. In an alternate stream, scholars have examined malevolent personality traits (i.e., the Dark Triad, which consists of Machiavellianism, narcissism, and psychopathy) as predictors of workplace deviance. The purpose of our study is to integrate these two perspectives by examining the independent, additive, and incremental effects of the Big Five and the Dark Triad for predicting workplace deviance. Ultimately, our results contribute to the literature by painting a portrait of a workplace deviant through the use of meta-analytic techniques to explicate the effects of employee personality on both interpersonally- and organizationally-directed workplace deviance.

Team Competitive Climate, Creative Personality, and Unethical Behaviors (WITHDRAWN)

Author: **Xin Liu**; Renmin U. of China

Author: **Tae-Yeol Kim**; China Europe International Business School

Although creative individuals may engage in unethical behaviors, little is known about the conditions under which employees with a highly creative personality are more or less likely to engage in unethical behaviors. Utilizing a person-situation interactionist model, we theorized and tested the moderating effect of team competitive climate on the relationship between creative personality and unethical behaviors. In addition, we examined the indirect effect of team competitive climate on unethical behaviors through moral disengagement. Based on multilevel, three-wave data from 756 employees and their direct supervisors, we found that creative personality and team competitive climate interactively and indirectly enhanced moral disengagement via strengthening employee competitive orientation. We also found that employee competitive orientation (induced by team competitive climate) significantly amplified the relationships between creativity personality and moral disengagement as well as the indirect effect of creativity personality on unethical behaviors via moral disengagement. In addition, team competitive

the moral effects of interactional justice on employees' deviance. Together, our results suggest the moral cues from leaders' interactional justice have a relatively strong impact on employees' moral disengagement and deviance, and this impact will be influenced by ethical leadership as well.

Shame, Guilt, and Pride (session 1660)

Self-Doubt Goeth Before the Pride

Author: Anat Hurwitz; New York U.

Author: Katherine Thorson; New York U.

Author: Casey Hoffman; New York U.

Author: Joseph Magee; New York U.

In a two-week experience sampling study of 328 employees from a wide range of jobs and organizations, we find that the extent to which employees experience self-doubt at the start of the workday shapes the emotions they experience at the end of the workday. On days when they made substantial task progress, employees who had experienced more self-doubt felt more relief but also more pride than those who had experienced less self-doubt. We interpret pride as both a response to achievement and a trigger that initiates a process of self-restoration. Consistent with these interpretations, we also find that pride is positively associated with self-restorative attitudinal and behavioral outcomes. On days when employees feel more pride, they experience a larger boost in self-evaluations (i.e., self-efficacy and self-esteem) and are more likely to engage in self-expanding job crafting behaviors at work. These findings, related to mostly ordinary task accomplishment in the workplace, closely track those of the first author's qualitative interview study (discussed only briefly here) of employees' responses to mostly major pride-eliciting achievements. Thus, we are confident that our results generalize across many different

OB

Team Agility: Adaptation, Reflexivity, Autonomy, and Overload (session 1655)

The Consequences of Collaboration Overload

Author: Jeffrey T Polzer; Harvard U.

Author: Evan DeFilippis; Harvard Business School

Collaboration is a key ingredient to organizational performance, yet employees in many companies struggle to achieve the right balance of collaborative activities. A common problem occurs when employees collaborate in frequent and time-consuming ways that interfere with productivity. To study this problem, we develop hypotheses about how meetings and email -- two common conduits of collaboration -- increase organizational performance up to a point, beyond which they have diminishing and then negative returns. We test these hypotheses with a novel dataset containing firm-level meta-data on meetings and email in 216,096 de-identified organizations. We find that meeting and email behavior each exhibit an inverted U-shaped relationship with firm revenue, providing the first evidence of this phenomenon across a large sample of organizations. The harmful effect of too many meeting hours on performance is amplified in firms that also have high levels of email activity. Meeting and email activity combine to influence multi-tasking, the phenomenon of sending emails during meetings, which, when overdone, is negatively associated with revenue. We discuss the theoretical and managerial implications of these results for the relationship between collaboration

types of tasks and projects in many different kinds of workplaces.

Do Moral Disengagers Feel Guilt and Shame? Moral Self-Condemnation Following Immoral Work Behaviors

Author: **Babatunde Ogunfowora**; Haskayne School of Business, U. of Calgary

Author: **Clara Lee**; U. of Calgary

Author: **Viet Quan Nguyen**; Haskayne School of Business, U. of Calgary

Author: **Mayowa Babalola**; *United Arab Emirates U.

Author: **Shuang Ren**; Deakin U.

In the past decade, a number of studies have found a consistent, positive link between moral disengagement (Bandura, 1986) and immoral behaviors in the workplace. According to Bandura, this occurs because moral disengagement minimizes one's anticipation of moral self-condemnation - feelings of guilt and shame that normally arise when one contemplates wrongdoing. Although research shows that moral disengagement is negatively associated with anticipatory guilt, scholars rarely consider its impact on self-condemning moral emotions after wrongdoing. In this paper, we examine the relationship between moral disengagement and experiences of guilt and shame following three types of immoral work behaviors - interpersonal deviance, (low) interpersonal citizenship behaviors (OCBI), and (low) cooperation. Across two studies using mixed methods, we find that moral disengagers experience guilt and shame following interpersonal deviance, (low) cooperation, and objectively measured cheating, but not (low) OCBI. In a third study, we show that moral disengagers exhibit greater psychological distress, turnover intentions, social loafing, and lower task performance as a result of their guilt and shame. We discuss the implications of these findings with respect to advancing moral disengagement and moral emotions theory in organizational scholarship.

Putting the Team in the Driver's Seat: A Meta-Analysis on Team Autonomy and Team Effectiveness

Author: **Ji Woon Ryu**; Indiana U. - Kelley School of Business

Author: **Emily Neubert**; Indiana U. - Kelley School of Business

Author: **Erik Gonzalez-Mule**; Indiana U.

Autonomy is a ubiquitous team design feature, as it is purported to relate positively to team effectiveness. However, the theoretical link between team autonomy and team effectiveness is not well understood, and previous studies have found inconsistent relationships between team autonomy and various indicators of team effectiveness. To resolve the incomplete understanding of the effects of team autonomy and illuminate the "black box" by which it affects team effectiveness, we drew from the input-mediator-outcome framework to investigate task- and relationship-focused team functioning as mediators, while also testing the moderating effects of task interdependence, task complexity, and the autonomy measurement's referent. We also expanded the construct of team effectiveness beyond team performance to include behavioral and attitudinal team effectiveness outcomes. Our meta-analyses, based on 291 effect sizes from 58 studies conducted on 4,130 teams, revealed significant positive effects of team autonomy on team effectiveness and task- and relationship-focused team functioning. We found significant indirect effects of team autonomy on team effectiveness via both task-focused team functioning and relationship-focused team functioning. Task interdependence strengthened the relationship between team autonomy and team effectiveness, whereas task complexity weakened the relationship between team autonomy and task-focused functioning. Team autonomy was also shown to relate differentially to the effectiveness outcomes, and its relationship to team functioning was strongly influenced by the autonomy measurement's referent.

Qué Vergüenza: How an Organization Led National Scholarship Recipients to Become Ashamed of What Had Once Made Them Most Proud

Author: **Sandra Portocarrero**; Columbia U.

Research on shame — an unpleasant self-conscious emotion associated with a negative evaluation of the self — has been the purview of social psychologists and, more recently, of management scholars. While sociologists have made references to shame in their work, we lack a robust analysis of the social character of this emotion. In this project, I develop a processual framework that examines shame as a social phenomenon. I present shame as the internalization of stigma. Using the case of national scholarship recipients enrolled in an elite university, I reveal how different organizational actors deliver ambiguous messages through interactions, flyers, and mass e-mails that lead recipients to feel ashamed of their scholarship status. I draw from participant-observer and interview data to expand on four steps that create a sense of shame in national scholarship recipients. The findings have implications for understanding how well-intentioned organizational initiatives designed to foster the inclusion of disadvantaged people can backfire, negatively affecting individuals, groups, and organizations.

Team Adaptation Under Inconsistent Team Rewards

Author: **Cana Karaduman**; Tilburg U.

Author: **Nicoleta Meslec**; Tilburg U.

Author: **Leon Oerlemans**; Tilburg U.

Organizations use teams as an adaptive and flexible response to rapidly changing environmental conditions. Team adaptive performance, which is team performance under changing environmental conditions, can be facilitated by motivational mechanisms. In this paper, we investigated the effect of team rewards on team adaptive performance. Noting the temporal nature of team adaptation and emergent states, we hypothesized that team reward consistency over time (as compared to inconsistency) would result in higher team adaptive performance. We further posited that team efficacy beliefs and team distributive fairness perceptions would partially mediate this relationship. We used a between-subjects (team reward condition: consistent or inconsistent) experimental study with 43 3-person student teams who performed a coordination task with a change in the task at the midpoint. The empirical results supported our predictions. Team reward consistency led to higher team adaptive performance. Team distributive fairness perceptions fully mediated this relationship. Team reward consistency also resulted in higher team efficacy beliefs, which also contributed to team adaptive performance. Thus, our paper highlights the importance of team rewards on team adaptation.

Mixed Signals? Consequences of Dual Sources and Mis/Alignment of Empowering Leadership on Innovation

Author: **Natalia Lorinkova**; Georgetown U.
Author: **Qaiser Mehmood**; Muhammad Ali Jinnah U.

In recent decades, organizations have increasingly emphasized the importance of innovation to stay competitive and emphasized the value in empowering staff to do so. In this study, we integrate arguments from leader distance and social information processing theory to explain how empowering leadership behaviors coming from two different sources (dual empowering leadership) uniquely and jointly motivate employee innovation through employee psychological empowerment. Empirical results, based on 322 IT employees who report to 105 direct supervisor and 17 senior managers, suggest that empowering leadership from a direct (close) supervisor positively and significantly predicts employee psychological empowerment, and in turn innovative performance. The relationship between empowering leadership from a senior (distant) leader and employee

necessarily lead to error elimination and may even increase the error rate. Building on error orientations (i.e. error anxiety and error expectancy) and team reflexivity, we examine the relationship between individual and team characteristics on individual-level errors. Using data from 239 individuals from 38 teams in two organizations we found that error anxiety, error expectancy, and team reflexivity interact in their relationship with individual-level errors. Our results provide empirical evidence of the possible negative influence of error anxiety on individual-level errors and suggest that error expectancy and team reflexivity can mitigate this influence.

The Role of Mindfulness in Organizations (session 1663)

Between Mindfulness and Creativity: Conceptual or Experimental Creative Masters?

Author: **Aldijana Bunjak**; U. of St. Gallen
Author: **Guido Bortoluzzi**; U. of Trieste, Italy
Author: **Khatereh Ghasemzadeh**; U. of Brescia

Prior research indicated that mindfulness has the potential to enhance individuals' functioning in many ways. However, its relationship with creativity elicited contrasting results, remaining unresolved, and with a lack of clear understanding of its underlying processes. In this paper, we examine how two creative methods of solving open-ended problems – conceptual and experimental – as contrasting processes are acting in the relationship between mindfulness and creativity. We test our research model in three studies: two field studies (crowdwork Amazon Mechanical Turk workers, and employees from Italian and Croatian SMEs), and an experiment conducted at an EU-based university. The results of three studies converge in indicating that high mindfulness contributes to higher levels of conceptual creative method which, in turn,

innovation follows a J-shaped, curvilinear pattern. Further, what we call misalignment between a close and a distant leader empowering leadership relates positively to employee psychological empowerment. By contrast, we conceptualize and empirically find that mid-levels of empowering leadership coming from both sources (i.e., neither high nor low) are deleterious to employee innovative performance through the mediator of psychological empowerment. Theoretical and practical implications conclude our work.

Team Social Capital and Team Innovation: The Role of Task Conflict and Transformational Leadership

Author: **Amer Ali Al-Atwi**; Al Muthanna U.

Author: **Jakob Stollberger**; Aston Business School

Author: **Michael West**; Lancaster U.

Drawing on the input-process-output model of teamwork, this study examines team innovation using a social capital lens. We propose that team social capital, operationalized as bridging and bonding social capital, negatively influences team innovation via a team proportional task conflict, which is the level of task conflict teams experience proportional to relationship and process conflict. In addition, we expected group and individual-focused transformational leadership (TFL) to buffer the negative indirect effect of team social capital on team innovation. Results from time-lagged data collected from 324 employees in 45 research and development (R&D) teams supported most of our predictions. We found that teams with both bonding and bridging social capital are less innovative because they experience less proportional task conflict. Furthermore, group-focused TFL buffered the indirect relationship for teams with bridging social capital in that the negative effect on team innovation was only present for teams with leaders displaying low as opposed to high levels of group-focused TFL. However, a buffering effect of individual-focused TFL for teams with bonding ties was not detected. We discuss theoretical and practical implications of these findings.

Team Failure and the Creative Process: The Effect of Team Failure and Reflexivity on Creativity (WITHDRAWN)

Author: Tracy Barbera; U. of North Carolina, Chapel Hill

Author: Matthew Pearsall; U. of North Carolina, Chapel Hill

Author: Jessica Siegel Christian; U. of North Carolina, Chapel Hill

Teams in organizations often experience failures in pursuit of creative team and organizational goals. Experiencing a creative failure can disrupt important team processes that can decrease team motivation and creative performance. This reduction in performance happens through decreased team creative self-efficacy following a failure. Drawing on sensemaking theory, we propose that team reflexivity can buffer against the negative consequences of failure by enabling teams to foster productive team processes that will keep teams from experiencing a decline in creative performance. Using data from 95 teams, we found that teams high in reflexivity were able to maintain motivation after experiencing a failure.

Group Idea Generation and Selection: The Originality vs. Feasibility Battle & Intragroup Competition

Author: Ranran Li; U. of Amsterdam

Author: Matthijs Baas; U. of Amsterdam

Organizations often try to stimulate creative problem-solving by inducing competition among group members. This facilitative effect of intragroup competition lies in group members' enhanced motivation to outperform the others. Previous research, however, has mainly focused on idea generation, thereby overlooking the subsequent idea selection stage. In fact, groups are poor at selecting both original and feasible ideas (i.e., creative), which may be further exacerbated when group members compete against each other. Furthermore, while originality and feasibility are two key factors of creativity, people seem to have difficulty taking both into account. The current research investigated how intragroup competition,

received a complementary rise in criticisms such as overly secularized conceptualizations, insufficient methodological rigor, and the inaccurate casting of mindfulness as a universally salutary application. This paper applies a broader perspective to mindfulness research by assessing mindfulness through the balance framework (Gruman, Lumley, & González-Morales, 2018), which argues that all positive phenomena have nuanced natures and conditions that determine when they are, and are not, advantageous. Presenting a balanced perspective on mindfulness offers researchers a broader understanding of mindfulness, in addition to a stronger appreciation of its limitations and boundary conditions, and informs research to address growing criticism that mindfulness is an invariably salutary concept. Our balanced perspective on mindfulness provides a nuanced and comprehensive lens through which to study mindfulness at work and apply mindfulness in organizations.

Universal Panacea or Organizational Fad? The Role of Context on the Effectiveness of Mindfulness

Author: Neetu Choudhary; U. of Melbourne

Author: Carol Gill; Melbourne Business School

In the light of the increasing popularity and indiscriminate implementation of mindfulness in Western organizations concerns have been raised about mindfulness being perceived as a 'universal cure'. Consequently, we consider whether effectiveness of mindfulness is influenced by context. We examine mindfulness in self-managed teams which is an increasingly common and complex way of organizing work that may affect the well-being of team members. Specifically, we develop a multilevel model to examine how team trust influences the relationship between mindfulness, emotional exhaustion, and team member well-being. We test these relationships in a time-lagged, multi-source, survey study that involved 274 participants in 54 project teams. Our results support the proposition that mindfulness is effective in increasing affective well-being by reducing emotional exhaustion, however, we also find that it is not a 'universal cure' in that individuals

through incorporating a rewarding scheme, influences group idea generation and selection, and whether explicit instructions of focusing on either originality or feasibility (performance criteria) could steer groups' focus in the intended direction. An experimental study was conducted with 78 three-person groups. Results showed that overall, neither intragroup competition nor performance criteria influenced groups' generation and selection performance. Nevertheless, some interesting findings emerged - Originality and feasibility were indeed inversely correlated; idea quality at the generation stage predicted the idea quality at the selection stage; furthermore, certain group processes during the group task might have indirectly linked the competition-selection performance relationship. Study limitations, theoretical and practical implications were discussed.

You're Doing Less Good Than You Should: The Impact of Social Misprediction on OCBs (session 1666)

To be effective, organizations must have employees who go above and beyond their contractual obligations, performing extra-role behaviors for each other and their employer (Organ, 1988). With this in mind, many organizations hope to increase the rate of organizational citizenship behaviors (OCBs) — tasks that are not explicitly part of the job, but are critical to improve the performance of the firm and its workers. In the present research, we focus on what gets in the way of OCBs. We focus on a variety of different types of OCBs, from social support to constructive feedback, and a variety of psychological barriers, from fear of social retaliation to avoidance of social awkwardness to underestimating positive affect inspired in others. Across five presentations, we contend that social misprediction is a key driver of why individuals

Artificially Intelligent Futures: Technology, the Changing Nature of Work, and Organizing (session 1669)

Though beginning with deterministic views on how technologies affect organizations, organizational scholars have made significant progress since, providing a variety of nuanced frameworks by which to understand disruptive workplace technologies - such as AI - and what effects they may have. However, lessons learned about technology and organizing in the literature's development seem to have been lost in today's discourse on AI. For instance, Collins (2018) bemoans the state of this discourse, noting our tendency to view this technology deterministically: an unstoppable force which will consume everything in its path. Our symposium is an attempt at re-orienting the emerging literature on AI and their effect on work and organizing. It aims at leaving determinism behind to instead uncover the complex negotiations

engage in fewer OCBs than might be ideal. People often shy away from giving potentially helpful advice, and Preeti Srinivasan will show that this is in part due to an underestimation of the recipient's feelings of appreciation and closeness, and an overestimation of how awkward the interaction will be. Giving a compliment to a colleague is a particularly easy prosocial act, and Erica Boothby will contend that one reason individuals may deliver fewer compliments than they might like to is that they misforecast the positive emotional impact of the compliments they consider giving. James Dungan will discuss how individuals provide less social support to others than they could, because they mispredict how much an expression of social support will positively impact another person. Even OCBs that can be a little more critical, such as feedback, seem to suffer from social misprediction. Nicole Abi-Esber will examine why individuals underestimate others' desire for feedback and, thus, fail to give constructive feedback, thereby hindering those who would benefit from this feedback. Michael White will argue that punishment can be used to foster prosocial norms, yet individuals punish others less than they should because they overestimate the reputational backlash they will face. Taken together, these presentations shed new light on why we perform fewer prosocial acts than we could, and how we can work together to create more prosocial organizational environments.

Fake News: What Is It and Why Does It Matter? (session 1668)

“Fake news” is a term that is gradually finding its way into our conceptual lexicon in academia. This trend can be said to mirror the increasing usage of the term in popular parlance as well as the sociopolitical impact attributed to the increasing presence of fake news in our society (Allcott & Gentzkow 2017; Lazer et al. 2018). While many have argued for the existence of fake news since time immemorial (Allcott and Gentzkow 2017), the increasing attention that it is receiving can be related to the affordance of digital technologies to generate, spread, and affect behavior at a speed, scale, and extent that is unprecedented in history (Lazer et al. 2018; Moravec et al. 2018). Yet despite the growing interest in engaging with fake news both empirically and theoretically (Dennis et al. 2019), we still struggle to conceptually capture what exactly we mean when we invoke the fake news label. Although existing attempts at defining fake news have provided us with a useful foundation to build upon (Allcott & Gentzkow 2017; Gelfert 2018; Lazer et al. 2018; Tandok et al. 2018), many attempts either tend to swing the pendulum towards an extreme or adopt a pragmatic orientation that is useful as an empirical tool but lacking in its coverage of the phenomenon. This panel is designed to stimulate discussion on this topic and generate a reflective

ODC

Employees’ Reactions and Attitudes Towards Change (session 1670)

**Job Insecurity, Affective Commitment to Change,
and Resistance to Change**

Author: **Cailing Feng**; Ludong U.

Author: **Cherrie J. Zhu**; Monash U.

Author: **Lisan Fan**; Shandong Institute of Business
and Technology

This research sheds light on the role of job insecurity in employees’ resistance to change during organizational change by examining how and when job insecurity may undermine or strengthen resistance to change. Analyses of multiphase, multisource, and multilevel data show that affective commitment to change mediates the negative relationship between job insecurity and resistance to change. Change procedural justice moderates the relationship between job insecurity and positive affect, such that the relationship between job insecurity and affective commitment to change will be less negative at higher levels of change procedural justice. Environmental uncertainty also moderates the relationship between affective commitment to change to resistance change, such that the relationship between affective commitment to change and resistance to change will be less negative at higher levels of environmental

conceptualization of what fake news is, and unpack some theoretical and practical implications of scholarly engagement with this phenomenon. Lastly, it is important to understand the implications of a useful conceptualizing of fake news. Extant literature has identified at least four domains, among others, for which we can highlight practical and theoretical implications. These include domains such as understanding a) the generation of fake news (Shao et al. 2017); b) the detection of fake news (Gahirwal et al. 2018; Kim et al. 2019); c) the spread of fake news (Campan et al. 2017); d) and the behavioural implications (Moravec et al. 2018; Murungi et al. 2018), among others. A useful starting point in making meaningful progress towards engaging with these persistent issues lies in a conceptual clarification of what we mean by fake news. In setting up this symposium, we aim to provide an interdisciplinary platform where these questions can be tackled from different perspectives. These are questions that require engaging scholars from different disciplinary backgrounds within AoM.

Working in an Adaptive Organizational Culture, is Change Easier to Take?

Author: **Joan N. Shapiro Beigh**; DePaul U.

Author: **Dianna Akin**; doctoral student at DePaul U. Kellstadt Graduate School of Management

Author: **Tara Gerstner**; Illinois Wesleyan U.

Author: **Terry Ruhl**; DePaul U.

Author: **Yvette P. Lopez**; DePaul U.

In seeking to increase our understanding of the effect of organizational change on employee job outcomes, we considered employees' perceptions of, and attitudes toward, change within the context of organizational adaptability. Employees at three different North American organizations experiencing organizational change completed surveys on their perceptions, attitudes, organizational culture, and job outcomes of job satisfaction, organizational commitment, and turnover intentions (N = 807). Consistent with affective events theory, results revealed that attitudes toward organizational change are positively related to job satisfaction and organizational commitment, and negatively related to turnover intentions. Perceptions of organizational change, which encompass frequency of change and psychological uncertainty, are negatively related to job satisfaction and organizational commitment, and positively related to turnover intentions. Furthermore, an adaptive organizational culture is positively related to job satisfaction and organizational commitment and negatively related to turnover intentions. Interestingly, an adaptive organizational culture moderates the negative relationship between perceptions of organizational change and organizational commitment, such that the relationship is stronger (more negative) for employees with an adaptive (flexible) organizational

culture. Implications of these findings for research, theory, and practice on organizational change and job outcomes are discussed.

Antecedents and Outcomes of Employee Change Fatigue and Change Cynicism

Author: **Noufou Ouedraogo**; MacEwan U.

Author: **Mohammed Laid Ouakouak**; Gulf U. of Science and Technology

Organizations implement changes either to address real business imperatives or to follow trends in their industries. But frequent changes in an organization often lead to employee change fatigue and change cynicism. The purpose of this study is to investigate the impact of the change logic of appropriateness and the logic of consequences on change fatigue and change cynicism and the impact of change fatigue and change cynicism on change success. To carry out this study, we collected data on a sample of 320 participants from diverse organizations, and we used structural equation modeling (SEM) techniques to test our hypotheses depicted in the research model. We found that the change logic of consequences reduces both change fatigue and change cynicism, whereas the change logic of appropriateness increases change fatigue. We also found that change fatigue does not have any direct effect on change success, although it maintains an indirect negative effect on change success through change cynicism. Along with other practical implications, we recommend that change managers help employees understand any logic of consequences that sustain their change initiatives. Additionally, change managers should work to prevent change fatigue from turning into change cynicism, which is the real precursor of reduced change success. This study is among the first to show that employees experience change fatigue and change cynicism differently, depending on the reason underlying the change. It is also among the first to show that change fatigue does not affect change success directly but does so through the interplay of change cynicism.

Power to the People? The Limits of Equality-Based Involvement in Managing Strategic Change

ODC Division Best Paper Finalist

Designated as a "Best Paper" for ODC

Author: **Daniel Z. Mack**; Singapore Management U.

Existing research has highlighted the importance of involving a wide representation of organizational members in the strategic change process to manage it effectively. We conducted a real-time inductive study of a strategic change at an organization in the hotel industry. Our findings suggest that the equality-based involvement – designed to promote equal opportunities for voice among employees – unintendedly undermined the implementation of strategic change. Although wide organizational involvement provided frontline employees with greater voice and autonomy, it also instilled greater fear in middle managers due to more escalating complaints to top management and newly created constraints in middle managers' supervisory tasks. Consequently, top management had to devote unexpected significant efforts to address escalated issues rather than improving the organization's productivity. Our study contributes to the literature on strategic change by highlighting the limits of equality-based involvement practices when organizational members have asymmetric motivations and covert emotional reactions.

Categorical Visions, Aspirations, and New Market Formation (session 1681)

This symposium addresses the role of future-oriented aspects of a category, namely categorical aspirations - desired, imagined qualities that are to be realized in the future. Current research on category emergence has focused on the observation

Author: **Zografia Bika**; U. of East Anglia (UEA)

This paper conceptualizes social innovation as the process of creating novel and improved solutions for social problems that involve institutional change, and social innovators as change actors embedded in institutions. It explores the implications of institutional embeddedness of social innovators and seeks to understand: (1) how social innovators engage institutional logics to advance socially innovative institutional change; (2) how differences in actors' resources influence how they engage the logics. Based on a comparison of four examples of social innovations, it uncovers the interrelationships between actors' logic strategies, resources and institutional change. It summarises these interrelationships in a conceptual model for institutionally grounded social innovation and discusses implications for social innovation as well as institutional research.

Breaking the Mold! How Hybrid Partnerships Attain Institutional Change Through Paradoxical Frames

Author: **Renee Rotmans**; Rotterdam School of Management, Erasmus U.

Author: **Rick M.A. Hollen**; Amsterdam Business School, U. of Amsterdam

Hybrid partnerships that engage directly in both social and commercial objectives face the particular challenge of mobilizing social activists as well as commercial actors, who adhere to seemingly incompatible logics. The question of how actors in hybrid partnerships try to deal with this 'incompatibility' to attain institutional change has remained largely unconsidered. In a three-year case study of two regional hybrid partnerships, we study different symbolic and substantive actions performed by members of these partnerships in a multi-level process model across micro-, field-, and societal levels over time. The actions performed across these different levels of analysis are interlinked and eventually result in institutional change in HR policies at the societal level. We demonstrate that embracing the tensions around logic incompatibility enables hybrid partnerships to

and clustering of the objects that 'exist' at present. Yet various studies in management have suggested that inventions, innovations, and market categories are often motivated by imagined representations of futures. With prominent scholars in category dynamics and market emergence, the symposium aims to explore new theories about how categorical visions and aspirations affect the construction of new products, fields, and markets. Our panelists will discuss topics such as the social constructionist and phenomenological views, the theory of analogies, and movement analytics.

Changing Hybrid Organizations by Design

Designated as a "Best Paper" for ODC

Author: **Janina Klein**; Vrije U. Amsterdam, School of Business and Economics

Author: **John Matthew Amis**; U. of Edinburgh

Despite continuing interest in the study of hybrid organizations, we lack understanding about the ways in which organizational design can enable or constrain the enactment of multiple institutional logics. Past research has identified two strategies to structure multiple institutional logics inside organizations, differentiation and integration. Differentiation involves structurally separating logics, while integration involves bringing logics together. Both differentiation and integration and, more recently, a combination of the two, have been shown to enable organizations to manage their hybridity in some cases while creating conflict in other cases, leaving the question of more and less effective design options unresolved. Such insights are essential, however, as these will enhance our understanding of how organizations can accommodate potentially conflicting institutional logics and practices effectively. This paper begins to address this gap in our understanding by studying radical organizational change at Pathfinder, a preservation charity. We present and discuss the outcomes of different structural arrangements in terms of Pathfinder's ability to maintain incompatible institutional logics and practices. Building on our findings, we develop four ideal types of structural arrangements in hybrid organizations and illustrate the utility of these in different institutional settings. Our work thus provides novel theoretical insights into how hybrid organizations can be structured to minimize internal conflict and

how organizational leaders can strategically alter hybrid organizations through design.

Why Some Practices are Harder to Change than Others?

Author: **Jaco Lok**; U. of New South Wales

Author: **Richard John Badham**; Macquarie U.

Author: **Mark de Rond**; U. of Cambridge

We address a persistent question in organizational change research that has proven practically and theoretically generative: Why is it often so difficult to bring about planned organizational change? We argue that even ostensibly minor change initiatives typically involve the need to transform a bundle of different organizational practices at the same time. These practices are reproduced in different ways and for different reasons, making some more amenable to particular change strategies than others. To be effective, change interventions therefore need to take into account the varied process histories of the specific organizational practices involved. We introduce a theoretical framework for systematically analysing this practice specificity of organizational change. Through an illustrative application of this framework to the Cambridge University Boat Club (CUBC) we show how it can enable a substantively contingent understanding of organizational change to complement existing approaches.

Regulatory-Disrupting but Infrastructure-Freeing: Entrepreneurial Financing During the Arab Spring

Author: **Michelle K. Lee**; U. of Washington
Author: **Abhinav Gupta**; U. of Washington, Seattle
Author: **Donald C. Hambrick**; Pennsylvania State U.

We examine the effects of shareholder unrest on CEOs' career outcomes. Shareholder unrest –the overall scale of shareholder dissatisfaction with company practices, as manifested in support for shareholder resolutions – is a quintessential form of a broader class of performance indicators: stakeholders' publicly-registered assessments, which are distinct from customary metrics of managerial performance, such as profitability or share price. We theorize that shareholder unrest activates the mechanisms of settling up and executive job demands, with distinct outcomes from each. Drawing on the concept of settling up, we hypothesize that shareholder unrest negatively affects the careers of incumbent CEOs, reducing pay and increasing likelihood of dismissal. Applying executive job demands theory, we hypothesize that new CEOs of unrest-laden firms receive higher initial pay packages to deal with these inherited job demands. Finally, we unpack a distinction typically overlooked by studying two broad types of resolutions, those aimed at wealth maximization and those that are CSR-oriented, theorizing that these two types of unrest exert equal effects on CEOs' career outcomes. Testing our ideas on a longitudinal sample of U.S. corporations, we find considerable support for our hypotheses.

How do revolutions affect entrepreneurial financing? Prior studies argue that revolutions generate political uncertainty that decrease financing and that a more absent state breeds greater informality. However, the Arab Spring saw an increase in state financing actually, and these state institutions, rather than their absence, directly allocated such funding to informal firms. Using a novel dataset collected as the Arab Spring was occurring in Tunisia and Egypt, our study argues that prior work has predominantly focused on how revolutions erode state regulatory power (i.e., the degree to which the state can issue rules without consulting its citizenry). However, we argue that revolutions may also free state infrastructural power (i.e., the degree to which citizenry rely on state institutions for goods and services). More specifically, we find that firms founded during the revolution paid less in bribery payments ("regulatory-disrupting"), and informal firms received more of the state funding made available amidst the Arab Spring ("infrastructure-freeing"). In paying greater attention to state infrastructural power, this study brings greater nuance to how we understand the role of revolutions on entrepreneurial activity. More generally, this study heightens engagement of work in entrepreneurship with insights from political sociology.

Value Co-Creation and Distribution: A Contingency View on the Effects of Financial Slack

Author: **Yongcheng Fu**; College of Management and Economics, Tianjin U.
Author: **Nuno Gil**; U. of Manchester
Author: **David Watling**; U. of Leeds

This study develops a theoretical perspective on inclusive processes of value co-creation and distribution contingent on the financial slack in the organizational system. By focusing on the economic and institutional costs of slack, as well as on its benefits to support economic exchanges with social

relevant difference in external or internal pay gaps as the skills needed for promotion are similar across firms. However, considering the increasing prevalence of external succession in today's executive labor market, we challenge this theoretical assumption and argue that differences in internal and external pay gaps create two separate but simultaneous tournaments for CEO promotion and propose a dual tournament theory of executive promotions. By arguing that there are two tournaments that TMT members could attend to differently based on their individual characteristics, we highlight how the same motivational theory can suggest dissimilar types of actions across TMT members in the same firm. While traditional tournament theory suggests a large CEO-TMT pay gap can be an effective governance mechanism, our dual tournament theory explains how the actions taken by TMT members pursuing external tournaments may tend towards opportunistic behaviors resulting in increased agency costs and governance issues for firms.

Socialized to Redistribute? CEO Social Class Background and Corporate Social Responsibility

Author: **Robert James Campbell**; U. of Nebraska, Lincoln

Author: **Seung-Hwan Jeong**; U. of Georgia

Author: **Scott Graffin**; U. of Georgia

Author: **Elle Hyunjung Yoon**; U. of Georgia

Understanding firm investment in CSR is one of the most discussed and contentious topics in strategy research. Yet, there is no clear imperative about investing in CSR. It is thus important to understand: what influences the extent to which CEOs redistribute firm resources to CSR? We draw on the intra-family theoretical model and theorize an inverted U-shaped relationship between CEO social class background and CSR investment. We also theorize that CEO tenure and recent firm performance moderate this effect. The results of our analyses are consistent with our theorizing. This study provides insight about drivers of CSR and contributes to research on CEO attributes by focusing on a CEO attribute—social class background—outside of the traditional focus on

dimensions, we propose an inverted U-shaped relationship between slack and the co-created value. We preview our argument by analyzing how slack sustained a collective decision-making process to plan a new national railway, albeit the dubitable social gains of the solutions achieved by consensus. We then draw on organization governance literature using new institutional economics to theorize empirical observables, and probe the slack-value relationship with a game theoretic model that holds constant the essence of the governance arrangement. We show the value-slack relationship is moderated by the accrual of benefits from a negotiated settlement: if the benefits are low, the co-created value is maximized by increasing slack up to the point that maximizes the capital provider's share of value. If the benefits are high, the co-created value is maximized by increasing slack even more so as to maximize the enfranchised stakeholders' share of value. We also show that, up to a point, increased slack widens the space of mutually acceptable solutions. Also, the effect of slack is steeper if the costs of slack can be reduced by making credible commitments today to mobilize more resources tomorrow.

Converging Tides Lift All Boats

Author: **Xirong Shen**; Cornell SC Johnson College of Business

Author: **Huisi Li**; Georgia Institute of Technology

Author: **Pamela S. Tolbert**; Cornell U.

This paper investigates the consequences of an understudied yet prevalent phenomenon in emerging technology fields: consensus/disagreement among experts on the proper criteria to use in evaluating firms' technologies. While previous studies show that the emergence of evaluation criteria for a technology improves the life chances of well-performing firms in the new sector, we theorize that consensus in evaluation criteria increases investments to all firms and found supportive evidence from an experiment with 80 Chinese investors (Study 1). We further argue and found, in a second experiment with 412 U.S. participants (Study 2), that evaluation criteria consensus increases investments because it induces

workplace experiences and personality.

Institutional Entrepreneurship and Emergence (session 1678)

Perceived Differentiation and Audience Support to Institutional Change in British Politics

Author: Soorjith Illickal Karthikeyan; Indian Institute of Management, Udaipur

Previous research suggests that insufficient differentiation of organizations occupying central positions in an organizational field increases the possibility of a status quo threatening institutional change. Directly testing the relationship, the present study reveals a more complex picture of the linkages between organizational differentiation and institutional change. Drawing on developments in British politics, our study demonstrates that when the differentiation dimension of left-right politics was on decline, perceived differentiation of the major parties, instead of decreasing, increased audience support to a status quo threatening-electoral institutional change from FPPS (First Past the Post System) to PR (Proportional Representation). We further observe in a counter-intuitive manner that the increase in audience support to the electoral institutional change from FPPS to PR, however, weakened with the passage of time. We use both qualitative and quantitative evidence from the context of British politics to

Intra-Platform Competition: Promises and Pitfalls of Platform Research for Organizational Theory (session 1680)

Digital platforms such as Uber, Airbnb, Etsy, and YouTube now play a prominent role in the global economy, and scholars have been quick to take note. Digital platforms have become powerful intermediaries for organizing social and economic life, transforming entire industries and sectors and establishing new markets that bring together producers, consumers, and other actors. Early work on platform competition, much of which was driven by strategy and innovation scholars, took the perspective of the platform firm controlling the ecosystem. This literature focused on competition between platforms and how platforms allow the controlling firm to create and capture value (e.g., Gawer and Cusumano 2014; MacIntyre and Srinivasan 2017; Cennamo 2019). But platforms are not simply a neutral meeting space for producers and consumers — the platform owner plays an active role in facilitating and shaping interactions among users to maximize their own returns (Zhu and Liu 2018). This in turn shapes competition for the millions of user-entrepreneurs — ranging from eBay sellers to Airbnb hosts to Instagram

support and test our theoretical arguments. In particular, we found support for our theoretical hypotheses in analyses of data from British Election Surveys during the period from 1987 to 2001, which enabled direct measurement of the perceived differentiation of the two central parties (i.e., the Conservatives and the Labour) in British politics along the differentiating dimension of left-right politics and the voter support for an electoral institutional change from FPPS to PR.

Does Collective Always Mean Cohesive? Collective Institutional Entrepreneurship and Radical Flanks

Author: **Emma Gabriella Stendahl**; U. College Dublin

Author: **Susi Geiger**; U. College Dublin, Smurfit

Despite an expanding literature on collective institutional entrepreneurship, we know little about the mechanics and internal dynamics between different and potentially divergent entrepreneurial paths, the responses from actors outside the collective, and the effects that divergent entrepreneurial paths have on the outcome of the institutional change project. In this paper, we set out to explore how diverse paths in collective institutional entrepreneurship can contribute to institutional change. Informed by literature on collective institutional entrepreneurship and radical flank effects and relying on qualitative processual data on a collective attempt to change the standards in Type-1 diabetes healthcare, we show how multiple and diverse entrepreneurial paths interweave in the pursuit of a common institutional change project. We contribute to literature on collective institutional entrepreneurship by detailing the mechanisms that yield synergetic and dynamic relationships between entrepreneurial actors (creating urgency, creating the network and creating the cohesion) and by detailing how different types of institutional work undertaken by the different groups contribute to institutional change over time. We also contribute to literature on radical flank effects by demonstrating how emotional cohesion functions as a social glue that connects discrepant entrepreneurial paths in a common institutional change project.

influencers — who rely on these platforms for their business. Recognizing this, an emerging stream of literature takes the perspective of user-entrepreneurs rather than the platform firm and seeks to understand the dynamics of competition within platforms as opposed to between platforms. This work has taken on a wide variety of perspectives, theories, and methods. For example, Nambisan and Baron (2019) surveyed 234 new ventures participating in a platform-based ecosystem within the software industry to show how divergences in goals and strategies between the platform owner and the entrepreneurs populating the ecosystem generate conflict and high levels of stress. Kim (2018) uses a large quantitative dataset to study the transition from hobbyist to entrepreneur on a Ravelry.com, a platform for sharing knitting patterns, while Curchod et al (2019) interview eBay sellers to understand the effects of algorithms and rating mechanisms — which are ubiquitous in platforms — and how they generate power asymmetries between buyers and sellers. A central question that work on intra- platform competition must contend with is what, if anything, is fundamentally different about competing on digital platforms. Are new theories required to understand intra-platform competition or do existing theories of firms, markets, and networks suffice? Failure to clearly distinguish the unique features of intra-platform competition risks reinventing the theoretical wheel. This symposium seeks to contribute an emerging body of literature focused on identifying such unique features of platforms (e.g., Cennamo 2019; Cusumano, Yoffie, and Gawer 2019). Understanding how intra-platform competition differs from traditional settings is also critical for scholars who explore digital platforms as novel contexts and use them as “strategic research sites” to study more general organizational and social phenomena. For example, digital platforms have been used to test and develop theories of categorization (Leung and Sharkey 2014), cooperation (Diekmann, Jann, Przepiorka, Wehrli 2014), and entrepreneurial funding (Greenberg and Mollick 2016) intended to generalize beyond digital platforms. Understanding unique features of intra-platform competition can be a powerful opportunity for these scholars to get empirical and theoretical leverage on their phenomena of interest, but failing to do so will result in improperly specified scope conditions and limit the generalizability of their

view paper (if available)

Asynchronous

PAPER SESSION

ASYNCHRONOUS

results. These issues suggest the need for a “full-cycle” approach to platform research that travels back and forth between understanding the unique institutional features of platforms and more general theory to address important questions, including: (1) To what extent do we need new theories to understand intra- platform competition? What are the unique features of platforms that require theorizing in their own right? (2) What are the appropriate boundary conditions for research on intra-platform competition and when might we be able to generalize our theories to other settings, particularly non-digital settings? How can studies in offline settings inform our understanding of digital platforms and vice versa? (3) Insofar as platforms have unique features that must be accounted for, to what extent is it appropriate to use platforms as a “strategic research site” to test and develop more general organizational and social theory? This symposium thus has two aims: (1) to bring together recent research on intra-platform competition, and (2) open a dialogue about “full-cycle” platform research that builds a bridge between scholars who study digital platforms as objects of interest in their own right and scholars who use digital platforms as a strategic research site for testing and developing more general organizational and social theory. To this end, we bring together work on intra-platform competition that cuts across a range of theories, methods, and settings.

Labor Market Inequality, Career Mobility, and Entrepreneurship (session 1672)

This symposium aims to advance our understanding of how labor market discrimination influences individuals in their career choices by examining career decisions such as entrepreneurship, intrapreneurship, and career mobility. Each presentation in our symposium will focus on one of these career choices and elaborate on how and why individuals facing discrimination in the labor market make certain decisions. Furthermore, the papers will explore how such career choices help or hinder individuals to overcome the labor market discrimination that they face in the labor market. A notable feature of our symposium is that the four papers each examine a different population - formerly incarcerated individuals, racial minorities, and women (with children). Collectively, our symposium will present a unique opportunity to better understand the boundary conditions under which each minority group experiences and responds to labor market discrimination.

Market Valuation, Signals, and Volatility: Empirical and Experimental Studies (session 1675)

Indexical Judgment: The Construction of Valuation Devices for Art and Antiques

Author: Erica Coslor; U. of Melbourne

Author: Joel Barnes; U. of Technology Sydney

Author: Yuval Millo; London School of Economics

The growth of models, metrics and indicators is a hallmark of the modern economy and contemporary markets. Yet there is little empirical research on how designers balance their goals and beliefs with the constraints and politics faced when developing important valuation devices. The special features of artworks as unique, difficult-to-value, and with a value based on social consensus, make the art market an excellent context to study such processes. Using two pioneering art price indices, the Times-Sotheby and Sotheby Index, we develop a theoretical framework to examine market indicator development. Through interviews with key figures and extensive documentary analysis, we trace the entwined forces of epistemic beliefs about the nature of value and available resources in valuation-producing organizations. The result is a process through which different modes of justification and commensurability interact as designers develop a workable set of valuation practices into systematic valuation devices. Our research contributes to research on organizational and calculative infrastructures underpinning markets, particularly in creating market indicators, and extends a growing literature linking strategy and valuation, particularly since strategic modification of indices is constrained by the need to maintain established methods for

The Other Invisible Hand: How Markets Can Propagate Valuation Errors

Author: Sheen S. Levine; U. of Texas at Dallas

Markets are ubiquitous in modern society, a status often justified by their presumed ability to aggregate bits of incomplete information from many actors into a single, unbiased estimate of value. While acknowledging markets' unique role, we suggest that they can also be potent in spreading individual valuation errors, thus inflating collective mistakes — price bubbles. We offer a more sociological interpretation of bubbles by advancing the notion that the very ubiquity of markets can cause traders to overweight market signals in a manner that weakens the quality of individual decision-making. We examine this process empirically in laboratory studies of asset trading in experimental markets. We find that even when traders possess and comprehend the information needed to price assets accurately, they remain overly attentive to market signals (i.e., others' pricing). Thus, they are likely to mimic other traders' valuations — even if at odds with the asset's true value. We further predict and find that such overattention is also sensitive to differences in levels of ambiguity, as predicted by a perspective that theorizes markets as institutionalized practices. We conclude by highlighting the relevance of our perspective, empirical approach, and supportive findings for future research on valuation errors, price bubbles, market dynamics, and micro-institutional processes.

The (Relative) Effects of Typicality on Volatility: A Study Using Word Embeddings

Author: Paul Gouvard; HEC Paris

Studies on typical firms – firms which are aligned with the prototype of their industry – have focused on whether typicality leads to superior or inferior

valuations by audiences. They largely ignore the impact that typicality may have on the stability of audiences' valuations over time. This paper proposes that typical firms experience lower volatility in stock prices as investors can make meaningful inferences based on the information encoded in industry prototypes to value them. This effect is weaker in ambiguous industry categories, as the information encoded in prototypes is of lower quality. I test these hypotheses in the setting of publicly listed firms in the U.S. I measure typicality using a new method that relies on word embeddings and a corpus of over 80,000 annual reports to represent firms in a shared semantic space. Results largely support the proposed hypotheses. This has implications for the literature on market categories, for the literature on organizational approaches to financial markets, and for computational approaches to organizational phenomena.

Influence of Different Types of Reputation on Art Investments: An Experimental Study

Author: **Liudmila Ivvonen**; Grenoble Ecole de Management

In this paper we investigate how different types of reputation influence on the perceived investment potential of an artwork. To address this question, we conduct a 2x2x2 between-subjects anonymous online experiment. We examine the effects of expert, marker, and peer reputations of the perceived investment potential of an artwork. Moreover, we examine whether these effects depend on the visual attractiveness of an artwork. The results of our study extend our knowledge on the influence of social evaluations on art investments. We combine economic perspective on art markets (Campbell, 2009; Lovo, Spaenjers, 2018; Renneboog, Spaenjers, 2013; Worthington, Higgs, 2004) with research on social evaluations (Lange, Lee, Dai, 2011; Pollock et al., 2019; Rindova et al., 2005) by showing the importance of social evaluations for the investments decisions. Moreover, we extent research on multiplicity of reputations (Boutinot et al., 2017; Ertug et al., 2016; Fini et al., 2018; Jensen, Kim, Kim, 2011; Kim, Jensen,

OMT

Organizational Change (session 1673)

How Organizational Change Emerges from Everyday Work: The Role of Temporal Nexus

Author: **Tor Hernes**; Copenhagen Business School
Author: **Kätlin Pulk**; Estonian Business School

We address the puzzle of why some events of everyday activity in organizations generate organizational change, whereas others do not. Our study of ship design and construction company contributes to the understanding of how certain events of activity have a temporal orientation that enables them to be generative of organizational change. When comparing the temporal orientations of activities at different events we found that change was generated when the event (1) formed synergetic nexus between past and future activities; (2) combined a long temporal reach into past activities with immediate future application of ideas, which enabled actors to (3) project future activities that differed markedly from on-going activity. We develop the concept of “temporal nexus events” to explain how organizational change emerges through connecting dynamics at such events. We then extend our contribution further by showing how everyday activity at other events becomes vital support for the change process. We develop a model to explain how the two types of events of everyday activity interact in change processes.

Social Enterprises and Voluntary Organizations: New Theory and Research (session 1677)

Competing for Good? Conceptualizing How Social Enterprises Categorize and Respond to One Another

Author: **Wesley Helms**; Brock U.

Although there is a sizable literature on how organizations strategically respond to similar organizations, it is unclear how many of the associated prescriptions apply in the context of social enterprise, given these organizations’ focus on creating social value and assumptions of their cooperative propensity. Through a qualitative study of 46 leaders in the second-hand textiles market we surface a model of categorization in this setting that exposes how and why moral distinctions between organizations get noticed and thus encourage a broader set of inter-organizational responses. Our findings and model extend theory regarding how strategic managers form mental models of their competitive landscape, illustrating that rivalry does not merely entail attempts to appropriate value and generate competitive advantage but also political efforts involving collective identity maintenance.

Dynamic Inertia: How Organizations Avoid Adapting to Changes in the Environment

Author: **Mehdi Safavi**; U. of Edinburgh

Author: **Omid Omidvar**; Aston Business School

Author: **Vern Glaser**; U. of Alberta

What prevents organizations from adapting to substantial environmental changes? Research from a performative perspective has challenged traditional accounts of cognitive and structural inertia by highlighting how organizational actors dynamically enact routines in a manner that engenders change or stability. However, a puzzle remains: When responding to substantial changes in the environment, how do organizational actors generate inertia? We investigate this question by conducting an inductive, historical study of the credit rating routine of Moody's, an organization that failed to adapt to substantial changes in its environment in the run up to the financial crisis of 2008. Our analysis of the actions associated with the re-designing of central artifacts and the enactment of the routine reveals six mechanisms by which organizational actors generate inertia. First, when re-designing artifacts, actors generate inertia through bounded retheorizing of the model, the sedimentation of assumptions, and mythical modeling of the unknown. Second, when enacting routines, organizational actors generate inertia by justifying their response to environmental changes through maintaining comprehensibility, appeasing prevailing stakeholders, and exercising professional discretion. Our historical case study contributes to our understanding of organizational inertia, routine dynamics, and the financial crisis of 2008.

Need, Merit, and Script: How a Social Enterprise Moulded Defector Entrepreneurship

Author: **Yunjung Pak**; U. of Alberta

Author: **Suntae Kim**; Boston College

Author: **Hyo-young Lee**; Yonsei U.

Author: **Seongbin Yun**; Korea Development Institute

Where does a hybrid ideal for social entrepreneurship come from? Existing research's prevalent focus on the dichotomy between social and commercial logics left unexamined the possibility that the institutional environment for social entrepreneurship may be more complex. There can be multiple logics making the social enterprise generate different types of social values, and there may be distinct logics related to different aspects of its commercial viability. Through 10-month ethnography of a South Korean social enterprise supporting North Korean defectors, we find that hybrid organizing can be embedded in multiple logics that go beyond the traditional social-commercial dichotomy (e.g., social welfare, commercial, entrepreneurship, and national integration logics), and furthermore, responding to different challenges at separate times, a social enterprise may practice varying configurations of multiple logics. By adopting the 'logics-as-tools' view, we suggest that each hybrid organizing involves a constant process of specifying, embodying, and recombining multiple logics that pragmatically constitutes a unique hybrid ideal customized for particular organizing contexts.

Time and Punishment: How Individuals Respond to Being Sanctioned in Voluntary Organizations

Author: **Laura Doering**; U. of Toronto

Author: **Amandine Marie Ody-Brasier**; Yale School of Management

Although sanctioning is a common feature of social life, researchers hold different expectations about how members respond when sanctioned by their peers. One school of thought suggests that individuals respond to sanctions by becoming more cooperative, or prosocial, towards the group. Another line of research shows that individuals have negative emotional reactions to being punished and

resistance to organizational change (RTC)—in particular technology-related change—and its antecedents. We explore whether, and if so, how employees' identities at the interpersonal, intergroup, and interspecies level influence resistance to technology-related organizational change. Based on self-categorization theory, we develop a conceptual framework with an individual's perception of threat by recent technological advances as mediator. We test our model based on a mixed method design (interviews, pilot survey, field study). Analyses of the main field study show a mediated hampering effect of technological identity (interpersonal level) and a mediated boosting effect of (local) socio-linguistic identity in relation to management (intergroup level), and human identity (interspecies level) on RTC. We derive practical and theoretical implications for research on organizational change, on employee identity, and on change-related communication and foreign language in business.

Antecedents of General Manager Successions in Multinational Enterprise Subsidiaries

Finalist for the OMT Division Best International Paper Award

Author: **Liang Li**; Ivey Business School

Author: **Andreas P.J. Schotter**; Ivey Business School

This study examines the dynamics of general manager (GM) succession in the foreign subsidiaries of multinational enterprises (MNEs). First, drawing on insights from evolutionary theory and the organizational learning literature, we argue that MNEs are adaptive organizations such that prior subsidiary GM changes at the "intra" regional level decrease the probability of further GM change in the focal subsidiary. Our logic is that the accumulated context-specific knowledge may allow MNEs to further develop extant succession routines. Second, in the context at the "inter" regional level, given the high spatial transaction costs, what are more likely to be applied to the focal subsidiary are standardized succession processes, which are less likely to accommodate the situations specific to the focal subsidiary. Due to the reduced marginal costs of making similar changes, prior GM successions

become less cooperative. In this study, we offer an avenue for reconciling these seemingly-conflicting viewpoints in the context of voluntary organizations, where cooperation is crucial. We build on theories of dependence and propose that individuals' responses to sanctions shift over time as they become increasingly dependent on other members to achieve valued outcomes. We draw on unique data from microsavings groups in Colombia to develop and test this proposition, using qualitative data to flesh out the proposed mechanism and longitudinal, quantitative records to test the hypothesis. We find that individuals initially respond to being sanctioned by reducing their prosocial contributions, but that their responses become increasingly cooperative and prosocial over time. Taking social psychological concepts generated in laboratories and extending them to small groups in an economic development program, this study generates a fresh vision of sanctions as temporally- and relationally-dependent, while also revealing how processes of social control can shape inequality in voluntary organizations.

Cross-Pollinating in the Beehive: Embracing Hybridity at a Social Entrepreneurship Coworking Space

Author: **Julie Fabbri**; Cnrs - Ecole Polytechnique of Paris

Author: **Benjamin Huybrechts**; EMLYON Business School

How does participating in a coworking space enable entrepreneurs to embrace plural institutional logics and engage in "hybrid venturing"? To explore this question, our research draws on a longitudinal study of a French coworking space gathering entrepreneurs who seek to reconcile social and commercial logics in the context of a socially entrepreneurial project. As social entrepreneurs generally lack pre-established patterns specific to this "hybrid" venturing mode, we show that the interactions at the coworking space help them embrace hybridity through (1) identifying with a community of peer, like-minded entrepreneurs; (2) collectively learning about and experimenting with this venturing mode, through their own projects but

that occurred outside the region where the focal subsidiary operates accelerate the momentum for further GM change in this subsidiary. Third, we propose that when changing from a parent-country national to a host-country national GM, succession routines may be refined in order to accommodate particular candidates or particular search committees, which in turn decelerates the momentum for further subsidiary GM change. A fixed effects longitudinal analysis of 1,169 Japanese subsidiary firms between 1995 and 2013 provides empirical evidence to support these arguments.

The Boiled Frog in Organizational Learning: Sensing, Adapting to, and Surviving Environmental Change

Author: **Thorsten Wahle**; LMU Munich

Author: **Zur Shapira**; New York U.

Radical change in a firm's environment is often viewed as discontinuous. We introduce the concept of continuous radical change by which old beliefs are rendered fallacious at an incremental pace. We theorize that incremental change can be as harmful as discontinuous change because it can remain undetected for too long by incumbent organizations. Specifically, we argue for a curvilinear relationship between the pace of environmental change and the organizational lifespan. We test out predictions using data from some 31,000 restaurants in the New York City Metropolitan area between the years 2007-2018. We use a fixed effects regression model to test for differences in the lifespan of restaurants located in areas of slow but radical gentrification versus those located in areas with accelerated and radical gentrification. We find support for an inverted U-shape between the pace of gentrification and restaurant lifespan. We explore whether this relationship is driven by differences in restaurants' adaptation behavior.

Systems Change: Spatial, Temporal, and other Impact Mechanisms for a Sustainable Future (session 1679)

The world is changing fast. Technology, healthcare, education, climate, business – there is hardly anything in life that is not changing. Some changes are desirable, such as Artificial Intelligence or Shared Economy, while others create fear and anxiety, such as extreme weather periods and the massive loss of biodiversity. It is clear that we can no longer live in the same way we have been living so far. The problems we currently face have been stubbornly resistant to solutions. One promising approach forward for augmenting our solution-generation capacity is the idea of systems change. Over the last few years, systems change has gained momentum. Especially the social sector, including social entrepreneurs and foundations, has embraced a systems lens for positive impact. However, enabling systems change is easier said than done. Systems change is about addressing the root causes of social problems, which are often intractable and embedded in networks of cause and effect. System change enablers cannot just impose a design pattern on a complex adaptive system and expect the results that they were hoping for. To enable systems change time, impact, and society need to be considered together. Our proposed symposium moves us toward a better understanding of the interplay among these elements and their potential implications for systems change and today's grand challenges.

Circular Economy (session 1684)

Organizational Readiness for a Circular Business Model

Author: **Melanie Wiener**; WU Vienna U. of Economics and Business

In recent years, scholars and companies have increasingly engaged with the concept of the circular economy. Nevertheless, few contributions address under which conditions companies adapt a circular business model. This research takes a culture perspective on this issue. The leading assumption is that culture is a determining factor if and to which extent companies implement a circular business models. The Competing Values Framework is used for analyzing corporate culture and semi-structured interviews with representatives from top-management are used to investigate the role of leaders in supporting a change to a circular business model. Drawing on a sample of three case companies, cultural profiles of companies that have implemented sustainable business models to different extents are presented. In particular, we seek to analyse which cultural and managerial factors support a circular business model. The research contributes to the emerging research on circular economy in various way. First, it emphasizes the role that culture plays in creating an environment supportive for a circular business model. Second, the findings should help companies to predict, based on their organizational culture, whether they have the conditions in place to embark on a journey to a circular business model.

might enable a sustainable development approach depending on the how the managerial practices are framed by cognitive models of sustainable business and systems thinking. Differing approaches could enable reflexive or radical reflexive management practice and an orientation imbued by concern for others. Cognitive models are associated with vastly different assumptions regarding the extent of separation or embeddedness between social and material worlds. Radical-reflexive approaches and a concern for others are more likely associated with new business models for circularity, while a reflective and separatist approach combined is more likely associated with traditional efficiency-based and functionalist models for circularity. We suggest that exposure to a functionalist approach may set the foundations for future adoption of a more reflexive worldview.

Public Policies for Development in Renewable Energy for a Transformation to a Sustainable Economy

Author: **Jacobo Ramirez**; Copenhagen Business School

Multinational enterprises and public organizations will play a key role in fulfilling international policy regarding the 2030 Agenda for Sustainable Development, which provides a plan of action for people, the planet, and prosperity. Renewable energy investments could be a sustainable alternative toward reaching the goal of Energy for All, implemented under the understanding of Partnerships for the Goals. Based on a qualitative longitudinal study of wind energy investments in Mexico, I argue that the transition to an ecological and sustainable economic system is based on a dichotomy of neoliberal public policies concerning renewable energy investments that have left local communities behind. The dichotomy found in this research is explained through an economic system that facilitates the conduct of business within a politically independent country exclusively with private local and foreign organizations, supported by local and foreign governments and excluding partnerships with local communities. This study highlights the key role of partnerships between

private/public organizations and local communities in a decentralized model of renewal energy toward achieving the SDGs, and proposes guidelines to policymakers on partnerships in renewable energy.

Circular Economy, Organizations, and Business Models: A Literature Review

Author: **Renato Chaves**; HEC Montreal

Author: **Emmanuel Raufflet**; HEC Montreal

The circular economy is opposed to a linear model of mass production and mass consumption and is promoted as a model that could offer a wide array of opportunities for organizations, even though turning its principles into reality poses a number of challenges. Despite its potential, research on how the circular economy concept translates into organizational strategies, business models, and managerial practice is still limited. Indeed, organizations and management scholarship do not seem to have incorporated it into a comprehensive research agenda. This study attempts to give a meaningful contribution in that direction. By systematically reviewing literature on circular economy from 2010 to 2019, this research examines how this emerging concept is translated into organizational strategies, business models, and managerial practice and the roles played by business organizations in its implementation. Moreover, we examine how opportunities and challenges are addressed in the adoption of circular strategies and business models. Based on our findings, the paper concludes with a proposed agenda for research that might contribute to advancing knowledge on the circular economy concept and its organizational, managerial, and policy implications.

Author: **Francesca Ostuzzi**; U. Ghent

Author: **Andrea Urbinati**; LIUC U. Cattaneo,

Castellanza (VA), Italy

Author: **Raffaella Manzini**; LIUC, Cattaneo U.

Several actors – including governments, academics, and NGOs – are calling for an urgent shift to circular economy. Nevertheless, few research attention centers on tools or frameworks to support organizations engaged in the creation of circular value. This research leverages design thinking in the field of business model innovation, with the aim to uncover its implications for circular value co-creation. Based upon a multiple case study design, this research shows that higher levels of cybernetics coupled with a more circular mindset can contribute to the creation of circular value, but only the highest levels of cybernetics in combination with a highest circular mindset result in self-sustaining circular value in systems in which multiple stakeholders are engaged. The theoretical and managerial implications emphasize the contribution of design thinking in the process of implementing circular business models and the concept of circular self-sustaining value as central to their success.

How Members of Multi-Stakeholder Initiatives Use and Deliberate Shared Frames

Author: **Angelika Zimmermann**; Loughborough U.

Multi-stakeholder initiatives (MSIs) have been praised as vehicles for tackling complex sustainability issues, but their success relies on the reconciliation of stakeholders' divergent interests and perspectives. Yet, we lack a thorough understanding of the micro-level mechanisms by which stakeholders can bridge these differences. To explore such micro-mechanisms, we examine what frames - i.e. mental schemata for making sense of the issues and solutions at stake - members of MSIs use during their discussions on sustainability questions and how these frames are deliberated through social interactions. We draw on workshop observations, interviews, and a survey of an MSI concerned with the protection of peatlands, an ecosystem that contributes to carbon retention on a global scale. We analyse how shared frames dominated in this collaboration and were instrumental in bridging divergent views, and how frames became salient, were elaborated, and adjusted through the interactions. We contribute to research on MSIs by offering explanations for the dominance of shared frames and by proposing deliberation mechanisms that are characteristic to MSI settings where shared frames dominate.

Many grand challenges - climate change, poverty, and geographic dislocations – disproportionately affect disadvantaged communities. One way to address these challenges is to collaborate across sectors. In this preliminary paper, we explore the formation of one type of collaborative agreement between disadvantaged communities and other parties: Impact Benefit Agreements (IBAs) between First Nations communities in Canada and mining companies. We consider specifically the ways in which identity and institutional logics systematically combine with the relative power of the disadvantaged communities to result in various levels of agreement quality. We find that what seems to matter more than either power or logics is community identity and the degree of community subscription to that identity.

Organizations, Learning, and Sustainability: A Cross-Disciplinary Review and Research Agenda

Author: **Melanie Feeney**; Maastricht U.

Author: **Therese Grohnert**; Maastricht U., School of Business & Economics

Author: **Wim Gijssels**; Maastricht U.

Author: **Pim Martens**; Maastricht U.

Despite decades of attempts by government, civil society and private sector actors to tackle sustainability issues like climate change, progress is too slow, and we continue to see a tendency for actors across all sectors operating in their disciplinary silos. Addressing complex sustainability problems requires transdisciplinary action between private, public, and not-for-profit organizations. However, transdisciplinary action between cross-sector organizations involves inherent political and process-related tensions. Learning has been identified as a key organizing process for overcoming the challenges faced by transdisciplinary action. This paper explores the role

The purpose of this paper is to examine how CEOs as influential organisational and societal actors use language to construct meanings for corporate sustainability and the tensions within. Building on the integrative framework on corporate sustainability and strategic paradoxes and applying discourse analysis on the empirical data of CEO interviews, this paper sheds more light on the company elite's talk and their constructed understanding of the tensions in corporate sustainability. In doing so, the paper tells a story of the strengthening role of sustainability in corporate strategies. The preliminary findings of the paper are thematised in three discourses, instrumental, normative and change discourses. The discourses are contradictory, both with each other as well as within. The discourses consist of various tensions and competing demands that CEOs are trying to deal with. Furthermore, the findings of the study depict how the CEOs balance between the strategic objectives of exploiting and exploring while gradually incorporating sustainability more prominently into their businesses.

Forging a Greener Path: How Corporate Boards Impact Environmental Sustainability

Author: **Ashley Salaiz**; U. of Tampa

Author: **Klavdia Evans**; St Mary's U.

Author: **Seemantini Madhukar Pathak**; U. of Missouri, St. Louis

Author: **Dusya Vera**; U. of Houston

A growing majority of large, publicly traded firms incorporate sustainability (environmentally-friendly innovations) into their business strategies. This study seeks to understand how some firms can achieve more radical sustainability while other firms make only incremental achievements. Many firms have implemented organizational structures, such as sustainability-focused committees, among their board of directors. Uniting the resource dependence and organizational structure literatures, this study posits that the presence of a sustainability committee may or may not be instrumental in pushing firms toward the adoption of more radical sustainable developments, depending upon key attributes of the committee members and the

of learning in organisational and transdisciplinary responses to sustainability issues. In particular, we focus on formal and/or informal learning that occurs outside of formal education systems. We conduct a cross-disciplinary systematic review of the literature on learning for sustainability. The review incorporates perspectives from diverse disciplines including business, management, environmental science, sociology, policy, urban planning, and development. This review explores how, when and where different disciplines are using learning as a tool for tackling sustainability. We identify the common themes and challenges of learning processes in the context of sustainability and lay out a clear path for future research.

Mobilizing an Organizational Field: Network Activism for Expanding Cross-Sectoral Climate Action

Author: **Todd Schifeling**; Fox School of Business, Temple U.

Author: **Sara B. Soderstrom**; U. of Michigan

Climate change poses a severe challenge to business and society. Organizational reforms face resource challenges and the limits of tradeoffs with organizations' primary missions. Consequently, win-win solutions with a strong business case are an attractive path for reformers. However, these types of solutions are often limited to low-hanging fruit and peripheral changes. An important possibility that is not well understood is how this zone of readily actionable improvements can expand. We relax the assumption that the business case for reform has clear limits, and investigate how an activist network operates to expand the ambitions of organizations across sectors. The results illuminate a dynamic alternative to incremental and radical change.

The Impact of Strategy and Decision-Making (session 1685)

Broadening the Scope of Local Government: A Survey among Mayors and Public Managers (WITHDRAWN)

Author: Lisa Schmidhuber; WU Vienna U. of Economics and Business

Author: Dennis Hilgers; Johannes Kepler U. Linz

'Open government' refers to transparent, participative decision-making, and platform-based citizen-government collaboration and has emerged as a paradigm at the local government level in particular. However, substantial disparities exist in open government adoption among municipalities, and the empirical evidence on the determinants of open government adoption is sparse and mixed. This article considers open government adoption by integrating the resource- and knowledge-based views and decision-makers' open government willingness. We argue that the positive impacts of internal capacity depend on the municipal decision-makers' open government willingness. Using data from a survey conducted among local decision-makers, we investigate organizational ability to implement open government and their preferences and the adoption level. The findings indicate that organizational capacity is positively associated with open government. Further, the effect of ability on adoption is partially mediated by leaders' perceptions that open government is a meaningful opportunity for the municipality.

Addressing Critical Measurement Issues in Organizational Research (session 1686)

Conceptualization, Measurement, and Statistical Properties of Higher- Level Constructs

Author: Gordon W. Cheung; U. of Auckland

Author: Chang-Ya Hu; National Chengchi U.

Author: Suk Yin Rebecca Lau; The Open U. of Hong Kong

Despite the increasing popularity of studying higher-level constructs in organizational research in recent years, few empirical studies have clarified the conceptual, measurement, and statistical properties of their higher-level constructs. Based on the seminal work by Kozlowski and Klein (2000), we first summarize the differences in the conceptualization of the three basic types of higher-level constructs: constructs with global properties, shared properties, and configural properties. Then we differentiate the measurement properties for constructs with different conceptualizations. Finally, we demonstrate with simulation results that the multilevel latent covariate (MLC) approach is more appropriate for estimating higher-level constructs with shared properties while the multilevel manifest covariate (MMC) approach is more appropriate for estimating higher-level constructs with configural properties. We suggest future organizational researchers should first clearly define and specify the conceptual properties of the higher-level constructs, then use appropriate measurement that matches the conceptualization of the constructs, and finally adopt the proper statistical approach to aggregate individual observations to higher-level variables.

Evaluating Various Sources of Common Method Bias and Psychological Separation as an Alternate Remedy

Author: Alex L. Rubenstein; U. of Central Florida

Author: John Kammeyer-Mueller; U. of Minnesota

Author: Lauren Simon; U. of Arkansas

Author: Emily Sue Corwin; U. of Arkansas

escape from poverty. In-depth interviews of 27 individuals living in extreme poverty revealed the critical role of negative life events in lowering aspirations. We found that chronic poverty narrowed the aspirations window — the range of aspirations drawn from an individual's cognitive world based on the social structure they live in — as individuals grew older. While some individuals lowered their aspirations compared to their childhood, others had lost their aspirations completely. Negative life events were found to trigger this downward adaptation of aspirations. Individuals experiencing negative life events were found to have not taken advantage of opportunities such as financial support for education that would have helped them come out of poverty. We suggest that the scarcity mindset induced by these negative life events led to a reduction in the capability to reason. The consequence of the scarcity mindset was the adaptation of aspirations. Based on these findings, we build a conceptual framework linking negative life events and ensuing resource scarcity to adapting aspirations and capabilities.

How Strategic Decisions Impact the Success of Local Advocacy Interventions at Greenpeace

Author: **Yves Plourde**; HEC Montreal

International advocacy non-governmental organizations (NGOs) represent key actors of global governance. In this paper, we depart from the current paradigm that considers these NGOs as stakeholders to businesses and governments to investigate how they make decisions concerning their advocacy interventions. Our contribution is twofold. First, we develop a framework that explains how the national and regional organizations (NROs) at Greenpeace strategize their interventions. Second, we adopt a set-theoretic approach to investigate how the decision points associated with an intervention impact its success. Our findings show that the success of interventions largely depends on the choice of targets and tactics in relation to the particular context of an intervention. Our study calls for a greater understanding of the strategic management of international advocacy NGOs.

Author: **Hayley Morrison**; U. of Central Florida

Author: **Steven Whiting**; U. of Central Florida

Common method bias substantially impacts the way organizational scholars conduct and review empirical research. However, to date, there have been limited efforts to explicitly and systematically assess the extent to which various sources of common method bias affect both within-scale psychometric properties as well as between-scale intercorrelations. In this study, we address this gap by conducting multiple experiments intended to evaluate the extent to which social desirability, transient mood states, scale formats/anchors, item embeddedness, and item/scale intermixing impact these outcomes. Second, we also examine the utility of an alternative procedural remedy, psychological separation, which we believe holds considerable promise for addressing method bias concerns through research design. Results from Experiments 1-5 demonstrated that several sources of method bias can significantly influence participant responding and subsequent scale means/reliabilities, as well as intercorrelations among constructs. Experiment 6 revealed that playing a game of Tetris or completing a reading comprehension task and quiz resulted in construct intercorrelations commensurate with those seen in research designs utilizing temporal separation and distinct source measurement, but significantly lower correlations than in a cross-sectional design with no psychological separation manipulation. Implications of all six experiments are discussed.

Attitude Toward the Color Blue: An "Ideal" Ideal Marker Variable

Author: **Brian Keith Miller**; Texas State U.

Author: **Marcia Simmering**; Louisiana Tech U.

Researchers often turn to post hoc statistical techniques to identify common method variance (CMV) in same source data, and one viable option is to use a marker variable. The choice of marker variable is important, yet these variables are difficult to find, primarily because they must be theoretically unrelated to study variables, yet measured in the same way (e.g., perceptual; on a Likert scale). This

The Effect of Corporate Political Activity on Corporate Reputation Amongst Industry Professionals

Author: **Annika Müller**; Aarhus BSS, Aarhus U.
Author: **Robert Ormrod**; Aarhus BSS, Aarhus U.

Many firms have increased their expenditure on Corporate Political Activity (CPA) in an attempt to influence the public policy process, and to increase the Corporate Reputation (CR) of the firm. We first discuss the literature on the context and proactive political strategies involved in CPA, and the literature on CR. Our empirical study draws on the literature, examining the German food manufacturing industry, using expert interviews with nutritional scientists and NGO representatives analysed using a qualitative, thematic analysis. Our findings and managerial implications centre around the reputational effect on the firm and competitors, and upon the idea of 'issue islands'. Proactive CPA strategies and constituency-building, whilst seen as risky, had a positive effect on firm CR amongst the experts (but not all stakeholders) if adopted over the long-term. CPA strategies can also provide a first-mover competitive advantage; competitors that subsequently adopt the same strategy do not receive the same CR benefits. 'Issue islands' was an analogy used by one expert to describe how the stakeholder-specific perception of one issue does not necessarily affect another; for example, the nutritional scientists focused on product nutrition and not the firm's advertising when constructing a CR.

manuscript uses scale development best practices to create a marker variable that can be applied in a wide variety of social science research—attitude toward the color blue. Scale reliability and validity are addressed, discriminant validity with other measures that detect CMV is tested, and the Confirmatory Factor Analysis Marker Technique is applied with this scale. Recommendations to researchers for use of this new scale to detect CMV are provided.

Improving the Performance of ULMC in CMV Detection and Correction

Author: **Cherng George Ding**; National Chiao Tung U.
Author: **Chien-Fan Chen**; National Chiao Tung U.

In this study, we propose an approach to further improve the performance of ULMC by adding a single identifying variable together with the usage of Rindskopf's (1983) reparameterization of the CFA model for error variances and implicit constraints for correlations, based on the multi-dimensional ULMC model. The chi-square test for model fit and the chi-square difference test are used to test for the existence of CMV and to determine the number of method dimensionality. The simulation results have indicated that, given adequate sample size, the ULMC technique with the proposed approach performs well in detecting CMV and in yielding acceptable corrected trait loadings and trait correlations. Moreover, its performance in CMV correction is superior to the performance of the CFA marker technique. Therefore, we recommend that the ULMC technique with the proposed approach be used for CMV detection and correction.

Can High Numbers of Traits Solve the Ipsativity Issue of Forced-Choice Questionnaires?

Author: **Niklas Schulte**; Ulm U.
Author: **Paul-Christian Bürkner**; Westfälische Wilhelms-U. Münster
Author: **Heinz Holling**; Westfälische Wilhelms-U.

Münster

Forced-choice questionnaires can prevent faking and other response biases typically associated with rating scales. However, the derived trait scores are often unreliable and ipsative, making inter-individual comparisons in high-stakes situations impossible. Several studies suggest that these problems vanish if the number of measured traits is high. To determine the necessary number of traits under varying sample sizes, factor loadings, and inter-trait-correlations, simulations were performed for the two most widely used scoring methods, namely the classical (ipsative) approach and Thurstonian IRT models. Results demonstrate that while especially Thurstonian IRT models perform well under ideal conditions, both methods yield insufficient reliabilities in most conditions resembling applied contexts. Moreover, not only the classical estimates but also the Thurstonian IRT estimates remain (partially) ipsative, even when the number of traits is very high (i.e., 30). This result not only questions earlier assumptions regarding the use of classical scores in high dimensional questionnaires, but it also raises doubts about validation studies on Thurstonian IRT models because correlations of (partially) ipsative scores with external criteria cannot be interpreted in a usual way.

Author: **Zhe Zhang**; Xi'an Jiaotong U.

Author: **Ming Jia**; Northwestern Polytechnical U.

As corporate social responsibility (CSR) matters not

outsourcing is inefficient, results in monopoly and delivers poor value for money. Both sides of this debate have failed to consider a form of non-technical efficiency that is inextricably tied to social value, impacting a firm's ability to reproduce social value and, ultimately, succeed in the long term. Drawing on the ethics literature on public-private interactions, I propose a conceptual process model that illustrates how a lack of 'moral efficiency' leads to violations of social norms. By examining high-profile scandals and failures in government outsourcing, I demonstrate how scholars can uncover taken-for-granted social norms tied to efficiency, contributing a new ethical lens in public-private interactions.

Director Engagement with Corporate Purpose: The Contribution and Potential of Institutional Investor

Author: **Selina Neri**; Hult International Business School

I draw on strategic cognition theory to develop an improved conceptual understanding of when and how directors, as key corporate governance actors, engage with corporate purpose as a company's *raison d'être*, and how institutional investors contribute to their engagement. Little is known about how corporations and investors can enable director engagement so that directors can make a difference to their companies and corporations can create value for society as well as for investors. Drawing on 38 interviews and two participant observations of directors and investors in Swiss listed corporations, I conceptualize engagement as the extent to which directors commit their affective, cognitive and behavioral resources to purpose. Engagement emerges as affected by directorial, governance and organizational contingencies, and by the influence and focus of institutional investor stewardship. Corporate purpose is neither about the social role of corporations, nor about moral obligations, but rather is strategic in nature, emerging as sustainable value creation. Director engagement with purpose emerges as a transitory, strategic cognition process predicated along a continuum where individual effort and level comprehensiveness can significantly

only for firms' competitiveness, but also societies' sustainability, stakeholders prefer firms engaging in positive CSR. Yet, the effect of ex ante positive CSR communication on relationship between firms' irresponsibility events occurrence and investment decision is quite overlooked. Drawing on the dual processing theory, we posit that investors feel anger and form moral judgment in the context of moral dilemma. Furthermore, we distinguish between two dimensions of corporate social irresponsibility (CSIR) identified in prior work, CSIR type and CSIR-CSR domain, and propose that the ex ante positive CSR communication exerts a double-edged sword effect (a buffer or a liability) on investor responses depending on different CSIR events. Data from a lab experiment conducted by facial expression analysis technology (Study 1) and a scenario experiment (Study 2) generally support our hypotheses. Our research contributes to the theoretical and practical insights into how and when ex ante CSR communication may, trigger different investor responses, along with directions for future research on business ethics.

Does Mandatory CSR Reporting Regulation Lead to Improved Corporate Social Performance?

Author: **Muhammad Umar Boodoo**; Warwick Business School

This paper analyses whether mandatory CSR reporting regulation leads to an improvement in corporate social performance. Using a quasi-natural experiment where the Stock Exchange Board of India mandated all companies listed on the Bombay Stock Exchange to disclose their CSR activities and practices, this paper finds that companies significantly improved in all aspects of Environment, Social, and Governance performances. However, governance and social performance improvements were significantly greater than environment performance, which is attributed to the stakeholder salience typology. Potential harm from definitive, dominant and dangerous stakeholders was given greater consideration by management, which improved governance and social performances accordingly.

vary. Via a form of activism known as engagement on environmental, social and governance (ESG) topics, institutional investors can enable director engagement under certain conditions.

Beyond Primacy: A Stakeholder Theory of Corporate Governance (WITHDRAWN)

Author: **Pushpika Vishwanathan**; U. of Amsterdam
Author: **Jan-Willem Stoelhorst**; U. of Amsterdam

We develop a stakeholder theory of corporate governance grounded in classical property rights theory, adopting the view that governance should help free individuals maximize their collective economic welfare. Welfare is primarily created through team production and team innovation, and the firm is a legal fiction that enables individuals to govern joint value creation. Once a firm is established, however, other transaction problems arise as a result of incomplete contracting, information asymmetry, market power inequality and/or negative externalities. Essentially, corporate governance entails devising coalitional contracts that help stakeholders control their vulnerability to others' opportunistic behaviors. Our theory lays out how a specific allocation of property rights helps resolve each transaction problem. We extend earlier efforts to build a stakeholder theory of corporate governance by focusing on a more comprehensive set of transaction problems and articulating concrete governance arrangements suitable for different types of firm-stakeholder relationships. Our theory also contributes to the ongoing debate about the corporate governance of public firms. More specifically, applying our theory to public firms yields an allocation of property rights that is incompatible with the notion of giving primacy to shareholders, or any other group of stakeholders.

Sustainability Reporting: A Review and the Way Forward

Author: **Yah Ling Liew**; Singapore Management U.
Author: **Simon JD Schillebeeckx**; Singapore Management U.

Firms are in the epicenter of sustainability deliverables cascade down from stakeholders. Sustainability reporting is salient to stakeholders as actual non-financial performance is opaque. From an in-depth review of publications on sustainability reporting of the recent decade, this paper identifies three forms of disclosure: mandatory, voluntary and involuntary. Respectively, the regulating mechanism of each form of reporting is rules, market forces and social norms, and is regulated by either regulatory or normative institutional pressure. This review shows that depending on firms' ability to withstand institutional pressure, firms have discretion over varying degrees of symbolic and substantive reporting. The motives for discretionary reporting primarily stemmed from (1) demands for reporting do not meet the interests of the companies, (2) stakeholders' interests do not align with that of one another. This paper proposes an issue saliency framework that considers both stakeholders' and companies' concerns and to optimize value-add and reduce social cost in reporting. The optimal regulating mechanism for overlapped issues for (1) stakeholders and companies is market forces, and (2) multiple stakeholders is rules. For single stakeholder concerns, it is best regulated by social norms. This paper ends with a proposed future agenda.

ESG? A Framework for Corporate Governance and its Environmental, Social, and Financial Outcomes

Author: **Gary John Cundill**; Cranfield School of Management
Author: **Hugh Wilson**; Warwick Business School

ESG (environmental, social and governance) is an acronym used frequently by practitioners and

This paper draws on the corporate political strategy, social movements, and legitimacy literatures in proposing a conceptual framework that explicates the essential role of self-interest and moral inclination in firms' ability to engender political mobilization on the part of their stakeholders. In forwarding this theoretical model, I argue that firms can induce mobilization through appealing to constituents' self-interest in the traditional economic sense, as well as through embedding constituents' political modus operandi within the firm's political strategy. While with respect to moral inclination, I assert that firms will be able to induce mobilization by their stakeholders when they are perceived as possessing admirable dispositional characteristics, when their actions consistently lead to positive outcomes, when they utilize socially accepted structures, policies, and procedures for their operations that demonstrate a commitment to prosocial behavior, and when they have a charismatic leader who embodies the values of stakeholders. In substantiating our theoretical claims, I provide case examples of firms that have successfully mobilized their stakeholders through the aforementioned mechanisms (i.e. self-interest and moral inclination in their various manifestations).

Author: **Mohammad Fuad**; Indian Institute of Management Ahmedabad

responsibility to its stakeholders, little attention has been given to stakeholders' responsibility to organizations and to other stakeholders. We argue that organizations can create conditions and remove barriers that enable stakeholders to uphold important responsibilities that increase value creation. In order to better understand the organizational initiatives and practices that can reinforce stakeholder responsibility and the underlying mechanisms by which stakeholder responsibility may lead to value creation, we empirically explored a novel program implemented in a health care organization. Through a series of in-depth interviews with clinicians, patients, and health care organization management, we examined a structured health care program that focuses on motivating patients and health care professional, clinicians, and administrative staff to assume important responsibilities for health care outcomes. This occurred by increasing patient active participation in their own care and encouraging participation and coordination among health care professionals. We help narrow the gap between conceptual work and empirical inquiry into the value creation process and how it can be enhanced through innovations in stakeholder collaboration and responsibilities. We also contribute to the business ethics literature by emphasizing the role of multiple stakeholders in the process of value creation and better understanding stakeholder responsibility and value creation from multiple perspectives.

Author: **Daniel Laude**; U. of Applied Sciences in Business and Administration, Zurich
Author: **Canan Liedtke**; U. of St. Gallen

Stakeholder literature has only recently turned to analyzing troublesome relationships. Here we argue that this analysis can be enriched by introducing a concept that has been more prominently explored in organization studies: distrust as a distinct

Drawing upon the literature on organizational imprinting, we examine how a firm's history impacts its performance in subsequent periods. In an emerging market context of India, we argue and find support that the degree of imprinting of the pre-liberalization era is negatively related to the persistence of superior performance in the post-liberalization period. Furthermore, we investigate the role of imprinting attenuators and we find support that firm's listing status and its degree of internationalization weaken this base-line relationship. Empirical results based on a large unbalanced panel data set of 18,202 firm-year observations of Indian firms during the period of 1991-2005 provide robust support to our conceptual model. Complementing the growing literature examining the impact of contemporaneous institutional changes on performance, this study aims to bring attention to the important role of institutional history of the firms from the emerging economies.

Managerial Cognitions in the Wake of Underperformance

Author: **Varkey Titus**; U. of Nebraska, Lincoln
Author: **Jonathan O'Brien**; U. of Nebraska
Author: **Owen Nelson Parker**; UT Arlington

Extensive research drawing from the Behavioral Theory of the Firm indicates that performance below an aspirational threshold tends to produce a search response in the form of risky activity meant to rectify the problem of underperformance. However, the cognitions occurring between the underperformance stimulus and the ultimate search response largely remain a "black box" about which we know very little. We explore this black box by drawing on attribution theory and regulatory focus theory to examine how managers perceive and make sense of underperformance. We build on this by integrating problem classification logic and suggest that perceptions of stability and control act as moderators to the focal relationships. We test our theory on a sample of 539 firms in the information and communication technology industry, and results largely corroborate our theorizing.

concept. We introduce distrust by also differentiating it from related constructs such as suspicion, negative reciprocity and conflicts. We then develop a stakeholder distrust model, whereby we differentiate the most proximate antecedents of stakeholder distrust and how such distrust manifests in distrust-induced behaviors. Following this we explore distrust dynamics, that is, how distrust between stakeholders and the focal organization emerges and develops, spreads across levels and possibly transgresses from suspicion to distrust (or from trust to distrust). Finally, we offer first insights for further research on how stakeholder distrust as a distinct concept can enrich stakeholder analysis, lead to a new perspective on stakeholder engagement practices and enable a profound discussion of stakeholder relationship dynamics.

Shared Goals, Different Logics: Comparison of Multi-Stakeholder and Business-Led Initiatives

Author: **Erin Leitheiser**; Copenhagen Business School

Multi-stakeholder initiatives (MSIs) and business-led initiatives (BLIs) constitute prevalent models of private governance, yet little is known about their differences or the implications thereof. This study adopts an institutional logics perspective to compare MSIs and BLIs and theorize about their potential to address sustainability challenges. Is it better to give a hungry person a fish or a fishing rod, and when? Using the case of the Bangladesh garment industry, this study compares a MSI and BLI which arose simultaneously and shared the same broad goals, but conducted their work in very different ways. It develops a framework of differing logics of private governance, finding that MSIs embody a collective logic, best suited for addressing systemic issues and process rights, and BLIs exemplify a benevolent logic, befitting for narrowly-defined problems and measurable outcomes. Overall, this study contributes to our understanding of the distinctiveness and utility of different models of private governance.

Sentiment-Driven Merger Waves

Author: **Tian Han**; Henley Business School, U. of Reading

Author: **Abby Ghobadian**; Henley Business School, U. of Reading

Author: **Michael A. Hitt**; Texas A&M U.

Author: **R. Duane Ireland**; Texas A&M U.

Author: **Nicholas O'Regan**; Aston Business School

In this study, we examine the link between the industry-specific optimism and the formation of merger waves as well as the impact of firm-specific optimism on mergers' value destruction. Mergers and acquisitions are among the most frequently exercised strategic decisions, often occurring in waves. The extant literature draws on neo-classical or behavioral theory to explain the formation of merger waves. The neo-classical theory fails to fully explain post-merger waves value destruction. A void filled by the behavioral theory drawing primarily on the overvaluation concept and principally neglecting the function of sentiment, as a critical component, in the formation of merger waves and the post-wave value destruction. Through large-scale textual analysis of news releases, this study provides direct evidence that industry-specific optimism plays a pivotal role in the formation of merger waves. Further, we demonstrate that firm-specific optimism, fostered by industry-specific optimism, creates managerial overconfidence, leading to significant value destruction. Our research sheds new light on why merger waves occur and why merger waves result in inadvertent outcomes.

Alternative Identity Claims Enabling Strategic Renewal in the Face of Potential Disruption

Author: **Neele Petzold**; Münster U. of Applied Sciences

Author: **Peter Van Der Sijde**; Vrije U. Amsterdam

When faced with potential disruption, incumbents often need to engage in strategic renewal to survive.

Understanding Relationship with Stakeholders as a Microfoundation of Open Innovation

Author: **Fernanda Rosalina Da Silva Meireles**; U. of Sao Paulo (FEA/USP)

Author: **João Maurício Gama Boaventura**; U. of Sao Paulo (FEA/USP)

Author: **Jennifer Griffin**; Loyola U. Chicago

As the innovation process, specifically open innovation, does not occur in isolation, the interactions and interface between relevant stakeholders is an interesting object of study. As it seeks collaboration and access to valuable resources, an organization has to establish relationships with its stakeholders, something that has barely been explored from the open innovation perspective. By focusing on this, the present study aims to analyze the connection between different stakeholders' relationships and open innovation. Based on the microfoundations of Stakeholder Theory and the open innovation literature, we propose three hypotheses. Considering our objective, we examine 710 observations of Brazilian companies from between 2008 and 2017 and use a longitudinal multinomial logistic model to test the hypotheses proposed. Our results show the relevant role of positive reciprocity and justice in stakeholders' relationships in the development of open innovation. Therefore, our results suggest that by delivering more positive reciprocity and justice to stakeholders in their relationships, the organization receives mutually contingent bonuses that increase the probability of developing open innovation.

How Co-working Spaces Self-Organize to Novel Outcomes?

Author: **Wanyue Wei**; U. of Eletronic Science and

Yet incumbents' enduring core identities may inhibit such attempts. Given the recursivity between strategy and identity, we ask how incumbents circumvent their core identities to change their strategies to respond to potential disruption. We conducted a longitudinal study of Volkswagen, Daimler, and Porsche from 2002-2019 that adapted their strategies and identities to prepare for a future of connectivity, electrification, autonomous driving, and mobility. We theorize how incumbents circumvented their core identities by evoking alternative identity claims as substitute frames to legitimize adaptive strategic actions. These claims combined the organization's past with directions for the future. While the combination of the past and future enabled incumbents to shift, a focus on the future led to a reversion to previous paths. A focus on the past led to strategic inertia, necessitating a quick pivot to adapt. We contribute to strategy and identity literature by proposing alternative identity claims as substitute frames to legitimize strategic renewal and show how temporal sensemaking suggests stability during transformations.

Technology of China

Author: **Zheng He**; U. of Electronic Science and Technology of China

Author: **Lez Rayman-Bacchus**; Winchester Business School, U. of Winchester, SO22 HT UK

Previous studies on co-working spaces mainly focus on their spatial functions, while the investigation concerning the unique operation of co-working spaces is still nascent. To fill this gap, this study explores the self-organizing mechanism of two types of co-working spaces from an ecosystem perspective. Our findings reveal that within a co-working space: (1) at individual level, users' working, leisure and social activities may interweave to enhance their working efficiency and satisfaction; (2) at organization level, incumbent enterprises may reconstruct their boundaries to maintain their continuous innovation capabilities. This study mainly contributes to ecosystem self-organization theory. We not only develop a three-layer model to exhibit the similar self-organizing mechanism of co-working spaces, but also highlight the impacts of initial conditions and path dependency on two different self-organizing outcomes namely entrepreneurial ecosystem and innovation ecosystem.

The Downside of Staged Development: Evidence from Television Shows

Author: **Ankur Chavda**; HEC Paris

Firms often partially fund new projects for initial development rather than fully fund them to completion. This staged development yields early feedback which can improve an individual project through learning and a portfolio of projects by the termination of less promising projects. Although prior empirical studies have found a positive relationship between staged development and outcomes, these studies were limited to settings that only allowed for learning: projects were never terminated. To capture the full effect, this paper exploits a form staged development in the television show industry where a new show's first episode is filmed and evaluated before commissioning the full show. Using Netflix's entry into television show production as a source of randomization, a negative treatment effect of piloting on viewer ratings is measured for shows that are more likely to survive piloting. Mechanism evidence suggests piloting worsens shows by impeding their ability to attract actors and lowering planning of the full season. Hence, staged development can have a downside: the lack of commitment to projects can prevent them from getting the resources and effort necessary for success.

Legitimacy Lost: Regulative De-Legitimation

Author: **Douglas Miller**; Virginia Commonwealth U.

Author: **Kun Liu**; Kent State U.

Author: **Tera L. Galloway**; Illinois State U.

Legitimacy is a key concept in the research of management and organizations. However, little research has examined the loss of legitimacy. This study examines incidents of regulative legitimacy violation and focuses on the effect such incidents have on the alliance partners of the perpetrating organizations. We specifically examine three types of such violations—administrative law, criminal law, and civil law. Using a sample of 32 incidents that involved Fortune 100 companies, we show that the loss of regulative legitimacy negatively influences the stock market performance of alliance partners. More interestingly, we show that the effect of repair efforts by the perpetrating firm on the alliance partner differ depending on the nature of those violating incidents. Implications of our findings are discussed.

Hedge Fund Investor Activism and Human Capital Loss (WITHDRAWN)

Author: **Guoli Chen**; INSEAD

Author: **Philipp Meyer-Doyle**; INSEAD

Author: **Wei Shi**; U. of Miami

While prior studies have highlighted the benefits of hedge fund activism for targeted firms, we examine a potentially negative side-effect of hedge fund activism: the loss of strategic human capital in targeted firms. We find that targeted firms experience a greater loss of employees upon announcement compared with a matched sample of non-targeted firms. The effect is weaker for firms covered more positively by securities analysts and the media, and with stronger employee relations.

status. As a predictor of board member support, the CEO-COB relative status further relates to the CEO's motivation to seek external endorsement and guts to trade status for economic returns. Therefore, a firm is more likely to ally with a high-status partner when the CEO has a lower status relative to the COB. This effect also increases alongside the intensity of comparison between the CEO and COB. A sample of alliances in the U.S. computer industry between 1993 and 2010 generally supports our hypotheses.

Masculine CEOs and Alliance Partner Choice

Author: **Ribuga Kang**; Chinese U. of Hong Kong
Author: **Jingoo Kang**; Nanyang Technological U.
Author: **Andy Y. Han Kim**; Sungkyunkwan U.

To understand the influence of masculine CEOs on alliance partner choice, we examine how CEOs' facial masculinity relates to the firm's alliance partner choice. Using a sample of 1,098 alliances of US firms from high-tech industries between 1993 and 2010, we find that firms with masculine-faced CEOs are more likely to ally with relationally distant partners over close and existing partners. We also find that the partner firm's size and network centrality amplify the tendency of masculine CEOs to choose distant partners. Our findings suggest that masculine CEOs are more willing to take relational risks in alliances and that this tendency becomes stronger when the alliance is higher achieving and more significant. Our research speaks to the alliance and upper echelons theory literature by theorizing and empirically testing the role of CEO masculinity in alliance partner choice.

How Do Stakeholders React if CSR is Mandated?

Author: **Nishant Kathuria**; U. of Texas at Dallas
Author: **Cuili Qian**; UT Dallas
Author: **Mike W. Peng**; U. of Texas at Dallas

Integrating stakeholder theory and institutional logics, this study examines the boundary conditions of the impact of corporate social responsibility (CSR) on firm value. CSR can only provide competitive advantage and insurance value to firms when the firms have discretion to perform CSR. This study provides a clear evidence that CSR erodes firm value when the institutions force firms to do CSR. Leveraging a unique mandate that requires certain Indian firms to spend 2% of profits on CSR during 2010-2013, we show that firms that are affected by the mandate and do more CSR suffer a negative return in performance. However, both prior CSR engagement and better financial performance together help the affected firms to buffer from such events. The implications of mandatory CSR and the influence of institutional changes on value of firm strategies are discussed.

When Risk Management and Stakeholder Management Collide: A Financial Analysts Perspective

Author: **Eun-Hee Kim**; Fordham U.
Author: **Yoo Na Youm**; Loyola U. Chicago

Two of the popular lenses in examining corporate environmental strategy are 1) the risk management perspective and 2) the stakeholder management perspective. Although the risk management perspective suggests that the two views are

Community analysis in networks provides an important means to understand the structure of complex networks. Drawing on network theory and methods, we examine a compensation practice commonly used in the United States, namely peer benchmarking, by focusing on the community structure of the peer compensation network. The peer compensation network consists of thousands of associations between publicly traded companies through compensation benchmarking. Advancing research on peer compensation networks, we theorize and test the hypothesis that the peer compensation network consists of communities that are well-connected within and more sparsely connected between communities. We also theorize that firms that occupy key positions within and between communities pay higher CEO compensation compared to less-connected firms. We find support for our hypotheses using peer compensation data of S&P 1500 firms between 2006 and 2017 and discuss the implications of our findings for research on CEO compensation.

I am Gonna Sue... Again? Relationship Between CEO Characteristics and Firm Litigiousness

Author: **Nanhee Kim**; Seoul National U.

This study investigates the process in which CEO characteristics affect firms' litigation behaviors from the upper echelons perspective. Inter-firm litigation has been pronounced as major competitive phenomena of late despite the overall atmosphere of emphasizing cooperation among businesses. By combining regulatory focus theory and organizational identification theory within the awareness-motivation-capabilities (AMC) framework of competitive dynamics, it seeks to explain how CEOs' cognitive and emotional process can determine firms' actions and reactions in inter-firm litigation. The empirical test finds that CEOs with high promotion focus show a lower propensity for legal actions, while CEOs with high prevention focus do not manifest a clear tendency. On the other hand, it is demonstrated that CEOs' organizational identification is a key driving force in suing competitors, and the mitigating interaction effect between promotion focus and organizational

complementary—better managed firm-stakeholder relationships can serve as a buffer in times of difficulty, i.e., as a risk management tool, we argue that the risk management perspective can be at odds with the stakeholder management perspective when potential stakeholder synergy is low. Under such circumstances, well-received environmental sustainability effort by stakeholders (in particular, costly initiatives) may be considered a waste of resources and thus viewed negatively by financial analysts. By employing stakeholder receptivity to corporate environmental strategy demonstrated in corporate Twitter accounts, we find support for this argument. We further find that analyst perception and judgment about the potential costliness of environmental initiatives moderate this relationship.

Spillover Effects of Market Penalties for Foreign Corrupt Practices

Author: **Jisun Yu**; Concordia U.

Author: **Jinsil Kim**; College of New Jersey

We examine the spillover effect of market penalties for US MNEs' foreign corrupt practices on their closest industry peers, or rivals. Drawing on the recent development of signaling theory, we consider regulatory agencies as intermediary signalers and regulatory events as important signals that affect stakeholder perceptions on the accused firms as well as their rivals. We further distinguish the two regulatory events—the initiation of investigation and the actual enforcement—in terms of signal spillover and argue that in the stock market, the different levels of contagiousness involved in these events affect the signal receiver's (i.e., investor's) scope of attention differently. More specifically, we find that that upon investigation events, investors expand their attention to other similar firms in understanding and gauging the impact of these events, while upon enforcement events, they concentrate their attention on the focal entity (i.e., the targeted firm), thereby resulting in diverging spillover effects. Using the data of 168 events involving 91 publicly listed US MNEs accused of FCPA violation during years 1995-2017, we empirically demonstrate that despite the similar messages created by the two events, these events result in

identification is also suggested.

Strategic Leadership: Looking Inside the Box and Moving Out of It

Author: **Cristina Fernandes**; U. da Beira Interior

Author: **Pedro Veiga**; Instituto Politécnico de Viseu

Author: **João Ferreira**; U. da Beira Interior

Author: **Mario Raposo**; U. da Beira Interior

Research related to strategic leadership has risen swiftly in quantity but distributed across divergent academic fields and their respective literatures. Hence, this represents an appropriate time to put forward a wide reaching review that identifies, summarises and integrates the already produced research while highlighting shortcomings in the field and future paths for research. This methodical review of the literature resulted in the identification of 414 articles on the Web of Science database spanning the period between 1985 and 2017. Applying systematic and thorough content analysis, with recourse to bibliometric techniques, the authors here reviewed the articles, identified the core theories and methodologies applied in them. This review served to identify significant gaps in the knowledge in terms of the theoretical orientation and the central content under study. The authors correspondingly propose a broad range of suggestions on all of these topics to help in resolving these shortcomings in knowledge while also raising important questions for future research. The main contributions of this article are: defining and summarising the multi-level literature emerging around strategic leadership; integrating and extracting the potential theoretical contributions from this field; and informing on directions for future research. This article furthermore proposes an integrated model and in addition to a

Resource Allocation: The Response to Exogenous Shocks Across Ownership Types

Author: **Jorge Tarzijan**; Pontificia U. Católica de Chile

Author: **Cristian Ramirez**; Pontificia U. Católica de Chile

Author: **Gustavo Lagos**; Pontificia U. Católica de Chile

We evaluate how the change in the value captured by the focal firm, as a result of an exogenous shock in the price of its product, affects a firm's total capital expenditure and its allocation to sustaining and expansion investments. Different behaviors in investment decisions (and the allocation of investments in sustaining and expansion activities) can affect firm heterogeneity, competition, and the value distributed to stakeholders. Using data from the main copper mines in the world, we show that the sensitivity of total investments to exogenous changes in the price of minerals is higher in privately-owned firms. Even more important, we found that the difference in investment behavior is driven by a lower sensitivity of investments in expansion activities in the case of state-owned companies. In contrast, investments in sustaining activities are not significantly different across ownership types.

CEO Time Focus and Corporate Investments

Author: **Ali C. Akyol**; U. of Ottawa

Author: **Atefeh Maghzi**; Department of management and marketing, The U. of Melbourne

The literature in strategy has given less attention to chief executive officers' (CEO) temporal focus as a personality characteristic and its impact on investment activities and financing. We argue CEOs' temporal focus can account for corporate investment direction and the way by which CEOs finance their investments. We have tested our hypotheses drawing on the data from 20,416 firm-year observations from 2002 to 2016. We have measured CEOs' temporal focus using computer-aided text analysis of conference calls, and firms' investment and financing activities using financial data. Our results suggest future focus CEOs are more likely to invest in research and development and to acquire firms. In addition, to lesser extent, they tend to upgrade existing plant, property, and equipment related to capital expenditure more often than past focus CEOs. Furthermore, our findings show future focus CEOs are more likely use long-term debt to finance their investments in research and development, property, plant and equipment. They are also more likely choose private placement as a mean of financing over equity issuance. These findings are in line with previous

on a firm's propensity for discontinuous renewal. In addition, such effects would vary with firms' prior experience with strategic renewal. We found support for our hypotheses in the U.S. wireless telecommunications service industry, which faced the challenge of transiting from analog to digital technology between 1991 and 1998. By implication, our study sheds some light on the practical choice of managerial reshuffle in a firm's discontinuous strategic renewal.

Love Self so Shoot High? CEO Narcissism and Firm Competitive Actions Toward Industry Leaders

Author: **Tessa Recendes**; Penn State Smeal College of Business

Author: **Wenpin Tsai**; Pennsylvania State U.

Having an inflated sense of self and wanting to have that self-view continually reinforced, narcissistic CEOs are interesting characters and can be formidable rivals in interfirm competitions. Extending prior research on CEO narcissism, we investigate how firms with narcissistic CEOs engage in competitive actions. Using videometric survey methodology on 185 Fortune 500 CEOs from the years 2000—2017, we find that narcissistic CEOs tend to take on industry leaders by entering into the leaders' markets and competing more aggressively with higher volume of actions than the leaders. We also investigate how managerial discretion may moderate the effect of CEO narcissism on aggressive competitive actions toward industry leaders and find that narcissistic CEOs' aggressive competitive actions are not constrained by certain factors that are expected to reduce managerial discretion. Our findings contribute to CEO narcissism, upper echelon, and competitive dynamics research.

Measuring Artificial Intelligence Capabilities and Readiness

Author: **Simon Porcher**; Sorbonne Business School

TIM

Entrepreneurship & New Venturing: TIM Conversations - Tapping the Crowds (session 1698)

Do Timelines Matter? An Empirical Study Based on Reward-Based Crowdfunding

We construct an index of artificial intelligence (AI) capabilities and AI readiness for 80 countries. We define AI capabilities as capturing the extent to which a country has invested in AI and has endowed in human capital or skills relative to AI. For example, investments in research and development, tertiary education, the number of patents, publications and startups in AI-related fields are important features of AI capabilities. AI readiness reflects the country's readiness to adopt AI: it depends not only on capabilities but also on labor market flexibility, the quality of regulation, the density of robots in manufacturing, market and business sophistication or the implementation of open data, for example. Four countries lead the race in AI capabilities – USA, China, Japan and South Korea. China is an exception with high AI capabilities but low AI readiness. Emerging countries such as Brazil, India, Mexico, Russia and South Africa are in the middle of the distribution for both indexes. Most African, Asian and Latin American countries are not yet ready to absorb the benefits of AI.

Understanding the Architectural Control of Opened Complex Systems under Cooperative Standardization

Author: **Masanori Yasumoto**; Yokohama National U.
Author: **Jing-Ming Shiu**; National Cheng Kung U.
Author: **Tohru Yoshioka-Kobayashi**; U. of Tokyo

Drawing on the case of the mobile telecommunication sector, the article attempts to elucidate why and how leading firms can control opened technologies of complex systems under cooperative standardization. Different from the case of a proprietary standard by a leading firm, even leading firms can hardly control complex systems of technologies opened under cooperative standardization. Cooperative standardization and related patenting can widely cause technology spillover from leading firms to others including new entrants. However, at the same time, such spillovers are presumed to increase leading firms' control over technologies, architectural control, in the sector concerned. We conduct a longitudinal network analysis of patent citations by proprietary patents

Author: **Yinghuan Wang**; School of Business, Renmin U. of China

Author: **Baolin Wang**; School of Business, Renmin U. of China

Author: **Yan Yan**; School of Business, Renmin U. of China

This paper focuses on the effect of timelines in reward-based crowdfunding on its performance. Based on intertemporal choice theory, we adopted temporal framing as a theoretical lens and theorized and tested the effect of temporal framing set by founders in crowdfunding projects on their performance through its influence on consumer willingness to provide funds. We considered three temporal framing variables—temporal frequency, temporal vagueness, and temporal distance—which reflect the number of temporal cues, ambiguity or incompleteness of temporal cues, and the period from the end of a project to the estimated delivery time, respectively. We examined a sample of 20,604 technology reward-based crowdfunding projects on Kickstarter from 2009 to 2018, which revealed that the three variables individually and interactively influence project performance. We found that temporal frequency was positively related to project performance, whereas temporal vagueness and temporal distance were negatively related. Moreover, the interaction terms between temporal frequency and the other two temporal variables had negative impacts on project performance. These findings provide a deeper understanding of crowdfunding and reveal that temporal framing set by founders may affect the performance of crowdfunding projects.

Investors' Behavior in Reward Based Crowdfunding: Do Followers Actually Follow?

Author: **Gabriel Rodriguez-Garnica**; Department of Business Administration. U. Carlos III de Madrid
Author: **Maria Gutierrez**; Department of Business Administration. U. Carlos III de Madrid
Author: **Josep A. Tribo**; Stevens Institute of Technology

In reward-based crowdfunding, would-be entrepreneurs raise consumer- based finance for

(Non-SEPs) from standard essential patents (SEPs), which are declared as essential for the implementation of technology specifications to product systems. The data shows that even though the technology development and standardization become conducted more dispersively by a variety of firms, the networks of SEP citations have increasingly converged upon a few leading firms. While declaring a number of SEPs with causing technology spillovers, such leading firms have outstandingly accumulated system knowledge covering and interrelating multiple technology domains. The finding reveals that system knowledge as well as the number of patents (SEPs) helps firms nurture and preserve architectural control to drive technology development and innovation even under an open technology environment.

Digital Transformation in Complex Systems – Implications and Avenues for Further Research

Author: **Nicolette Lakemond**; Linköping U.

Author: **Gunnar Holmberg**; Saab AB and Linköping U.

Author: **Anders Pettersson**; Saab AB

Many complex systems increasingly include embedded digital technologies that are interacting with and constrained by physical components and systems. Although these systems play a central role in our society, they are ignored in contemporary research on digital transformation and innovation. Based on a longitudinal study of avionics development since the 1960s in the aviation industry, this paper explores the digital transformation and digital innovation in CoPS and its associated aspects. The findings emphasize the evolutionary nature of digital transformation and outlines the implications of the embeddedness of digital technologies in complex systems. These include (1) complexity emerging beyond human cognition, (2) tensions between criticality and generativity aspects, (3) multifaceted organizational designs and mirroring, (4) implications for openness with different time horizons and on different levels, e.g. related to open source and communities, and (5) integration capabilities and behaviors in the context of ecosystems (6) new conditions for

their prototypes from a crowd of small individuals or backers. This is a type of financing characterized by high informational asymmetries and sequential financing where backers (investors that provide financing) can observe the decisions of other backers before pledging their money. Such a setting allows testing the dynamics of informational cascades and herding behavior by investors in crowdfunding. This paper addresses this issue by investigating how backers make their funding decisions and to what extent they rely on the decisions made by early backers. We use a panel data from 3,923 projects crawled from Kickstarter to analyze this issue. We find evidence that followers make use of the information provided by early backers' funding decisions, but they also engage in active observational learning over the quality of the project and the entrepreneur to complement the previous information. In terms of managerial implications, our findings indicate that entrepreneurs will be more successful in project financing if they target their products to the demands of early backers, rather than to the tastes of the median consumer/backer. This strategy of focusing on early backers allows creating a positive informational cascade ending in a successful crowdfunding.

Two's a Company, Three's a Crowd: Contractual Compatibility Between Crowdfunding and Venture Capital

Author: **Michael Maximilian Moedl**; KU Leuven

Crowd-based means of funding are emerging as a valid novel way of providing scarce seed-finance for entrepreneurial ventures. In recent years, securities-based variants such as equity crowdfunding or initial coin offerings (ICOs) are increasingly attracting higher funding amounts than reward-based models, in particular for commercially oriented ventures. However, securities-based crowdfundings also come along with the more complex contracts, since they introduce a large set of new shareholders in the firm, possibly with voting, information and cash-flow rights. This might have implications for the ownership structure and future governance of a company, and in turn influence the evaluations by

decision making in an expanding design context. The paper contributes with important new insights and outlines several avenues for further research related to these issues.

Digital Innovation in Retail Platform Ecosystems: Transformation or Incremental Change

Author: **Tong HE**; Nottingham U. Business School
China

In the past few years, digital innovation has revolutionized organizational processes and outcomes in several industries. Previous studies emphasize the transformational nature of digital innovation in redefining the nature of competition and exposing incumbent industry players to a dire fate. In this paper the authors focus on the retail sector, where platform sponsors leverage digital innovation to intermediate the exchanges between buyers and sellers and orchestrate complementary innovations to make the platform ecosystem more valuable to members. This study investigates whether digital innovation in retail platform ecosystem renders established competencies of traditional intermediaries obsolete through a case study of Alibaba Lingshoutong, a business-to-business digital sourcing and distribution platform. The analysis shows the oppositional nature of digital innovation built from a transaction cost rationality and existing practices based upon social capital. This study reveals the incremental nature of digital innovation, a dimension which receives little attention thus far. Based on some preliminary empirical findings and conceptual rationale, we developed three propositions.

RESEARCH

PAPER SESSION

ASYNCHRONOUS

prospective investors. This paper is concerned with exploring potential knock-out criteria in securities-based crowdfunding contracts and to what degree they serve as a deal breaker for the investment decision of subsequent professional venture investors. Using an explorative mixed methods approach, we find empirical evidence that, e.g., an inflated capitalization table owing to crowd investors holding direct securities in a company, redemption and voting rights by the crowd, as well as the non-existence of a drag-along clause, lead venture capitalists and business angels to refrain from an investment in an otherwise attractive but such-funded start-up firm. We conclude that contractual frictions play a decisive role in whether entrepreneurs can combine crowd-based means of funding with traditional forms of venture financing. Theoretical and managerial implications are discussed.

The Principle of Self-Selection in Crowdsourcing Contests - Theory and Evidence

Author: **Nikolaus Franke**; WU Vienna

Author: **Kathrin Reinsberger**; WU Vienna

Author: **Philipp Topic**; Fraunhofer IPA

Self-selection has been portrayed to be one of the core reasons for the stunning success of crowdsourcing. It is widely believed that among the mass of potential problem solvers particularly those individuals decide to participate who have the best problem-solving capabilities with regard to the problem at question. Extant research assumes that this self-selection effect is beneficial based on the premise that self-selecting individuals know more about their capabilities and knowledge than the publisher of the task - which frees the organization from costly and error-prone active search. However, the effectiveness of this core principle has hardly been analyzed, probably because it is extremely difficult to investigate characteristics of those individuals who self-select out. In a unique research design in which we overcome these difficulties by combining behavioral data from a real crowdsourcing contest with data from a survey and archival data, we find that self-selection is actually working in the right direction. Those with

particularly strong problem-solving capabilities tend to self-select into the contest and those with low capabilities tend to self-select out. However, this self-selection effect is much weaker than assumed and thus much potential is being lost. This suggests that much more attention needs to be paid to the early stages of crowdsourcing contests and particularly to those the hitherto almost completely overlooked individuals who could provide great solutions but self-select out.

Opportunistic Litigation and Spillover Effects on Strategic Alliance Partners

Author: **Miryam Martin**; U. of the Balearic Islands

Author: **Abel Lucena**; U. of the Balearic Islands

Intellectual property literature has identified the detrimental effects of opportunistic litigation on accused companies. However, the extant literature has overlooked the potential negative consequences on other actors not directly involved in litigation. We fill this gap by examining whether the allegations of patent infringement against one party in an alliance triggers negative spillover effects on the non-accused partners. Intellectual property literature has identified the detrimental effects of opportunistic litigation on accused companies. However, the extant literature has overlooked the potential negative consequences on other actors not directly involved in litigation. We fill this gap by examining whether the allegations of patent infringement against one party in an alliance triggers negative spillover effects on the non-accused partners. Drawing on unique data on opportunistic litigation, alliances, patents, and financial information, we provide evidence of the heterogeneity of the spillover effects. Our empirical results determine that as technological overlap among partners increases, the non-accused firms experience greater

TIM

IP Strategy: TIM Conversations - Examiners and Patent Quality (session 1700)

Prevalence of Weak Patents in the United States and its Consequence for Invention

Author: **Seokbeom Kwon**; U. of Tokyo

Enhancing patent quality is a continuing agenda in the patent policy domain for the concern that a patent with questionable validity (i.e., weak patents) distorts incentives for innovation. This study examines whether issuing a weak patent discourages the patent owner's subsequent inventions and patent maintenance for the uncertainty in the validity of the patent claims. To this end, we propose a method of identifying weak patents. Our method reveals that about 13% of US patents filed from 2001 to 2010 are weak patents. Our multivariate regression analysis finds evidence showing that patent owners develop more subsequent inventions for a weak patent than they do for a non-weak patent. Additional analysis on the patent renewal finds that a weak patent is more or evenly likely to be maintained than a non-weak patent is. These findings indicate that the current patent system lacks the capability of eliminating weak patents ex-post. The concept of patent portfolio and the exclusionary nature of patents explain these findings. Implications for patent policymakers and firms are discussed.

market discounts if the alliance is horizontal. Likewise, R&D alliances and more complex lawsuits are also factors that impact negatively on the stockholders' perceptions of the non-accused partner firm.

Coopetition and Product Innovation: The Role of Intellectual Property Protection

Author: **Nina Karthaus**; Maastricht U., School of Business & Economics

Author: **Paul Huenermund**; Maastricht U.

Author: **Boris Lokshin**; Maastricht U., School of Business & Economics

We study how firms' engagement in collaboration with competitors (coopetition) affects their innovation outcomes and investigates the role of protection of intellectual property (IP) within this relationship. As prior research provides mixed results, we consider product innovation in general, and distinguish between new-to-the-firm (incremental) and new-to-the-market (radical) innovation. Moreover, we differentiate between formal IP protection mechanisms (patents, industrial designs, trademarks, copyrights) and informal ones (secrecy, complexity, lead-time). Using an ordinary least squares (OLS) approach, we analyze three samples (one per type of innovation). Each sample consists of around 7,500 German innovating firms from various industries over the years 2001, 2005, 2011 and 2013. The findings reveal that coopetition is beneficial for innovation in general and incremental innovation, while it does not directly affect radical innovation. Moreover, we find that coopetitors aiming at innovation in general or radical innovation benefit from making use of formal IP. Informal mechanisms on the other hand negatively impact those innovation outcomes. Coopetition for incremental innovation does not seem to require any IP protection. This study contributes to extant literature by advancing our understanding of the notion of coopetition and its meaning for firms' innovation.

Examiner Added Citations and the Validity of US Patent Data in Studying EMNC Knowledge Flows

Author: **Feng Zhang**; Pennsylvania State U. Abington

Author: **Guohua Jiang**; West Chester U.

Patent and citation data have contributed significantly to advancing our understanding of contemporary MNCs with geographically dispersed competence-creating subsidiaries. Whereas multinationals from emerging economies (EMNCs) have recently started and accelerated strategic asset seeking foreign direct investments abroad, empirical analyses of EMNCs have been a challenge because of the absence of systematic and consistent data. This study focuses on the impacts of patent examiner added citations on the validity of patent citations in measuring EMNC subsidiary knowledge inflows. The US patents of leading innovation-oriented EMNCs from China and India between 2002 and 2014 are analyzed, with a benchmark group of their major competitors from mature industrialized countries. We find that the values of subsidiary knowledge inflow variables in the current study are not significantly distorted by examiner added citations, and that the subsidiary knowledge inflow variables of EMNCs and their counterparts from mature industrialized countries are not differently impacted by examiner added citations. This study offers the validity evidence of employing the US patent and citation data to study EMNCs, contributing to a solution addressing the issue of lacking longitudinal and systematic data in studying EMNCs. The results also contribute to patent economics literature in general by testing the impacts of examiner added citations on citation measures of knowledge flows.

Strategic Citations to Prior Innovations: Can Firms Avoid Tough Evaluators? (WITHDRAWN)

Author: **Benjamin Barber Iv**; IE Business School

Author: **Luis Diestre**; IE Business School

Prior work shows that evaluators of scientific and technological innovation exhibit systematic biases,

Product Market Performance and Openness: The Moderating Role of Customer Heterogeneity

Author: **Do Yoon Kim**; Boston College

Increasingly, a firm's ability to create value depends on its ability to achieve alignment with its ecosystem of suppliers and complementors. In such contexts, a firm's strategy may encompass "opening" some parts of their intellectual property (IP) to facilitate innovation, capturing value from other proprietary assets. Alternatively, I propose an information imperfections view of openness and complement innovations. I hypothesize complement innovations attract users with greater absorptive capacity. These users reduce uncertainty for other customers, affecting purchasing decisions. The strategic implications of openness thus depend on the existing levels of information imperfections: products in markets with high levels information imperfections benefit from openness, while products in markets with low levels of imperfections do not. I test these hypotheses on a unique dataset of wireless routers, complement innovations (open source custom firmware), and product reviews. I utilize an exogenous shock to complement innovations from several exogenous "reverse engineering" events. I find that the availability of complement innovations increases review ratings by 0.67 stars. I find a strong sorting effect: customers who are more likely to use the custom firmware are more likely to leave reviews and leave more positive reviews. I find evidence of a strong information effect as well: these users provide longer and more helpful reviews, especially in enterprise router markets with greater levels of information imperfections. Consistent with the information imperfections framework, I find that complement innovations were more beneficial for enterprise router products than for consumer routers.

Author: **Elisabeth Eppinger**; professor

Author: **Jan Sternkopf**; Campana & Schott

making certain evaluators "tougher" than others. In this paper we explore whether applicants try to avoid these tough evaluators. Looking into the USPTO evaluation of patent applications, we propose that firms strategically omit citations to prior art in their applications as a way to avoid tough patent examiners. We show examiners are 279% to 316% more likely to be assigned to review an application if the applicant cites the examiner's prior reviews. In addition, we show specialist patent examiners are 4% to 12% more likely to reject patent applications than non-specialist patent examiners. Consequently, we find applicants are 29% to 45% more likely to omit citations of patents reviewed by specialists. Furthermore, we show that firms with more familiarity with the USPTO's system are more likely to strategically omit citations to specialists. Overall, we show how applicants strategically omit information to take advantage of the latent biases and heuristics in evaluation systems.

The Track One Pilot Program: Who Benefits from Prioritized Patent Examination?

Author: **Mike Horia Teodorescu**; Boston College

Author: **Jeffrey M. Kuhn**; U. of North Carolina, Chapel Hill

The America Invents Act reformed the US patent system in many ways, including by introducing the Track One pilot program allowing an applicant to accelerate patent examination for a fee. Through a unique dataset and textual analysis, we investigate the determinants and consequences of accelerated examination. We find that that small, young firms with limited patent portfolios are the most likely to pay for faster patent examination. Our results shed light on the strategic implications of the patent system for entrepreneurs, as well as on the impact of recent patent policy changes on firm decisions and outcomes.

PAPER SESSION

The body of literature addressing different types of intellectual property (IP) strategies is large but fragmented. This paper develops an IP strategy typology from a sharing perspective and applies across formal and informal IP assets. The typology is based on four dimensions: (i) degree of openness, (ii) IP ownership rights concentration, (iii) access and (iv) commercial usage rights. We follow a multi-dimensional, theoretical approach integrating the literature on IP management, (open) innovation, licensing, physical property rights theory and economic goods. Along the degree of openness, the proposed typology distinguishes four IP strategy types with sub-types existing for each of them: private IP, club IP, common IP, and public IP strategies. The proposed types are described using case examples. We further discuss that actors not necessarily adopt one, but multiple IP strategies either sequentially adjusting their strategy over time along lifecycles ('evolutionary' model) or employ multiple IP strategies in parallel at the same time, e.g. with different actors in their ecosystem ('co-existence' model). An IP typology of this kind contributes towards the ontology and theory of the firm-level IP literature. It thus provides a structured framework to aid future studies on the role of IP strategies for business, economic and societal growth.

With the rise of Industry 4.0, manufacturing

address the challenge of open innovation (OI) platforms to establish sustained knowledge exchange between platform participants by overcoming the fear of being exploited and the inherent lack of trust in a rather anonymous setting. Social capital theory provides a comprehensive framework for examining the nature of social connections through its focus on both structural networks and interpersonal relationships. Prior research has recognized that social capital is an essential stock variable to activate and maintain knowledge exchange between participants of a network – however, this construct is not yet established in the context of OI platforms. Results of an empirical study of 61 OI platforms show that a high level of decentralized control among seekers, solvers and the intermediary is positively related to social capital and that this effect is mediated by securing value capture for the crowd. The results suggest that it is crucial to (re-)design OI platforms in terms of decentralizing control during joint value creation, i.e. sharing power among stakeholder groups, while securing value capture in order to build social capital in a digital collaboration context.

Co-Creation in the Shadow of the Organization: A Comparison of Internal and External Crowds

Author: **Lisa Wimbauer**; U. of Passau

Author: **Fabian Hans**; U. of Passau

Author: **Patrick Figge**; U. of Passau

Author: **Carolin Haeussler**; U. of Passau

Crowdsourcing is increasingly gaining popularity to leverage the crowd's potential to develop ideas further through collaboration between crowd members, i.e. through co-creation. Although co-creation patterns are expected to vary, depending on whether a crowd is located within or outside an organization, research lacks insights into how the co-creation behavior within internal and external crowds differs. In contrast to external crowds, we argue that internal crowd members anticipate the consequences of their commitment for the organizational environment in their decision to co-create. We define this behavior as co-creation in the shadow of the organization. Using a unique dataset from two identically designed contests, conducted

ecosystems are undergoing a fundamental transformation. Machinery manufacturers attempt to transition from pipeline to platform business models, hoping for new profit opportunities and establishing themselves as the new ecosystem leader. While literature suggests using openness to achieve competitive advantage, we observe firms following tight coupling strategies. This paper analyzes how firms can successfully transition their business model by employing openness. To answer this question, we conduct a longitudinal ecosystem study in the agricultural industry. We explore an incumbent machinery company trying to position itself as the ecosystem leader by establishing a platform business model. Our findings show that openness leads to risks due to interdependencies in the ecosystem. As a result, the focal company's abilities to create network effects and to capture value from these are affected. We argue that the right configuration of control points can help to reduce or eliminate these risks. Subsequently, we show three transition journeys based on a combination of control points enabling a company to go from a pipeline to a platform business model, thereby positioning itself as the ecosystem leader.

Get Your Ducks in a Row: Serial Acquisition Strategies and Market Response (WITHDRAWN)

Author: **Menno Huisman**; Faculty of Economics and Business, U. of Groningen

Author: **Killian J. McCarthy**; U. of Groningen

Author: **Hendrik Leeendert Aalbers**; Radboud U. Nijmegen

Acquisitions are key to innovation in high-tech industries, yet markets see the acquisitions of serial acquirers more negatively than less frequent acquirers. Drawing on signaling theory this study investigates the effect of shifting acquisition behavior for serial acquirers as they select between exploitative and explorative targets. Considering configurational choice for a firm's serial acquisition portfolio relative to market appreciation, we test our hypotheses by investigating 204 serial acquirers, performing 1415 innovation oriented acquisitions of which the strategic intent backing the acquisition was identified. We find evidence consistent that exploration and exploitation oriented acquisitions

separately with an internal and an external crowd, our study aims to compare how members of these crowds initiate co-creation. Our results show that internal and external crowd members indeed differ in their co-creation behavior. As suggested, internal crowd members are less likely to form a team, take more time to coordinate their activities, but provide more often constructive feedback than external crowd members. We find that these different co-creation behaviors are strengthened the more uncertainty is associated with the proposed ideas. These results advance our understanding of the co-creation mechanism in general and contribute to the growing research on co-creation in crowds specifically. Since our study is one of the first providing empirical insights on behavioral differences between internal and external crowds, we add to the emerging debate on the advantages and disadvantages of these crowd types for co-creation.

Crossing Firm Boundaries: How Boundary Spanners Search Over Time and Across Organizational Contexts

Designated as a "Best Paper" for TIM
Author: **Ann-Kristin Zobel**; U. of St.Gallen
Author: **Stephen Comello**; Stanford Graduate School of Business
Author: **Lukas Falcke**; U. of St. Gallen

The success of open innovation depends on the individuals that stand at the interface of the firm and its external partners. These boundary spanners need to cultivate external search processes by searching broadly and deeply across knowledge sources, as well as transfer ideas and knowledge from external sources to their home organizations. While prior work has generated important insights into the performance implications of external search breadth, this research has remained largely cross-sectional in nature and we have limited insights into the temporal dynamics of external search openness. This study adopts a temporal perspective and makes three contributions to the literature on individual-level openness. First, we identify search trajectories and systematically analyze to what extent both external search breadth and depth can

should be balanced in order to sustain firm performance. More specifically, results show that investors are reacting positively on an exploratory acquisition after a more exploitative strategy, compared to a switch towards exploitative innovation through the focal M&A. Insights provide for a better understanding of market signaling in the context of innovation driven serial acquisitions.

The Differential Effects of a Firm's Innovation Intent on Innovation Effort and Outcome

Author: **Shufeng Xiao**; Peking U.
Author: **Ting Xiao**; Peking U.

There exists discrepancy in how we should decipher a firm's voluntarily disclosed information as it pertains to both its effort and outcome. Drawing on signaling theory, we argue that voluntarily disclosed relative (explorative over exploitative) innovation intent, defined as a firm's disclosed plans to conduct more explorative innovations over exploitative innovations, may help us predict a firm's relative innovation effort which can be controlled internally by the firm, but may not be effective in predicting its relative explorative innovation outcome which is far more uncertain. Using a sample of publicly listed firms in China, we find a positive relationship between a firm's relative innovation intent and its innovation effort, and a negative relationship between such intent and its patented innovation outcome. Moreover, we explore boundary conditions of signaling theory by examining contingencies of industry dynamism and munificence. The results show that industry munificence strengthens the relationships between relative innovation intent and both relative innovation effort and outcome, whereas industry dynamism weakens both.

Exploring Open Innovation and Digitalization in Services

Author: **Isaac Lemus Aguilar**; SPRU U. of Sussex UK

This study investigates the interlink between open innovation (OI) and digitalization in the service industry, particularly in consulting firms. OI is an emerging theory that has not been fully explored in the service industry. Consulting firms are example of knowledge-intensive business services and professional service firms, which are firms locating, developing, combining and applying various types of knowledge to solve the problems of their clients, which makes them an ideal sample to understand how the open innovation process is implemented. We have conducted 15 case studies in both Management and IT consulting firms in Spain and Italy interviewing people responsible of the innovation management process. The evidence suggests a new role for consulting firms in the open innovation process, the creation and coordination of innovation ecosystems and digitalization as a main driver for innovation. Implications for academics, managers and policy makers as well as an agenda for future research is also provided.

[view paper \(if available\)](#)

[RESEARCH](#) [PAPER SESSION](#) [ASYNCHRONOUS](#)

corporate social responsibility (CSR) to help solve societal grant challenges, and open innovation (OI) has been regarded as a feasible solution to these challenges. Since OI comprises various forms, how to choose an appropriate form to address CSR issues and simultaneously maintain a controllable level of knowledge sharing is an important issue. This study examines the question of how firms match their CSR problems to OI governance choices. We collected data from 587 publicly listed electronics firms for the period between 2012 and 2017. Our results show a match between CSR types and OI forms for superior performance. Specifically, the match indicates the following two distinct paths to achieve positive performance: the markets form of OI exclusively bridges responsive CSR and performance, while the partnerships form of OI otherwise links strategic CSR to performance. This paper contributes to the literature by identifying the importance of OI governance forms in the CSR engagement-performance link. Theoretical and practical implications are also provided.

The Relationship Between Institutional Ownership and Corporate Innovation: A Meta-Analysis

Author: **Sergio Canavati**; Sonoma State U.

Author: **Jong-Min Oh**; Sungkyunkwan U.

Author: **Dirk Libaers**; U. of South Florida

Author: **Tang Wang**; U. of Central Florida

Institutional investors have become the largest ownership group of public equity in the US and worldwide. Despite the relevance of institutional ownership for corporate innovation and the vast literature on this relationship, the dominant theoretical frameworks provide conflicting predictions about this relationship. Empirical studies of the relationship between institutional ownership and corporate innovation have also found conflicting results. Beyond conflicting empirical results, the failure of empirical studies to inform the theoretical frameworks on this crucial relationship has impeded the progress of this literature. This paper proposes a process model of the relationship between institutional ownership and corporate innovation that differentiates between innovation inputs and innovation outputs and tests direct, indirect, and total effects using a meta-analytic mediated model. Grounded in the agency theory of free cash flow perspective and incorporating developments on portfolio effects from cognitive limitations, our model sheds light on how distinct groups of institutional owners monitor the corporate innovation process. Our conceptual model and empirical results have important implications for theory, managerial practice, and policy.

An Abductive Examination of the Geographic Patterns of Green Technologies

Author: **Kerrigan Marie Machado Unter**; George Washington U.

Author: **Jorge Rivera**; George Washington U.

Research indicates that green knowledge can be distinctly different from nongreen knowledge. However, while there is extensive research on the agglomeration of knowledge, the research on the agglomeration of green knowledge is much more limited, and it is unclear whether green technologies will be more or less geographically concentrated than nongreen technologies. This paper focuses on exploring how the geographic patterns of green technologies differ from the geographic patterns of nongreen technologies. Utilizing US patent data in an abductive study with GIS software and geospatial statistical techniques, we found the following: 1) geospatial patterns of green and nongreen technologies are different, 2) green technologies are more geographically concentrated than nongreen technologies, and 3) geographic concentrations of green technologies consist of higher quality technologies. We then outline how these findings contribute to our understanding of green knowledge spillovers and institutional pressures for developing green technologies.

Affordable and Cutting Edge Innovation: Is Phronesis the Answer?

Author: **Nimruji Jammulamadaka**; Indian Institute of Management, Calcutta

Within innovation, systems based literatures focus on pursuit of cutting edge innovation and its impact on growth. They however do not closely examine resource scarce developing country contexts. Social innovation literature focused on such resource scarce contexts argues against cutting edge innovation instead advocating for affordability and access. As such for developing country practitioners, these schools of thought set up an impossible trade-off between affordability and cutting edge innovation. This paper through a study of three innovations in the medical field, proposes phronetic innovation as the mechanism to resolve the trade-

Specifically, we investigate the role of financial analysts for firms' propensity to engage in corporate science, i.e. the production and dissemination of scientific knowledge. While basic and applied research may enable firms to generate significant private returns, doing research is an inherently risky activity. Therefore, it remains ambiguous how financial market participants perceive and possibly influence firm strategies related to corporate science. Our econometric analysis relies on exogenous decreases in analyst coverage for US publicly listed firms caused by broker house closures and mergers. We provide evidence that reduced analyst coverage increases scientific publication outputs, whereas inventive outcomes decrease or stagnate, and R&D expenditures remain mostly unchanged. At the same time, we find a positive association between corporate science and firm performance indicators. These results are consistent with the view that analysts may encourage firms to engage in myopic behavior at the expense of long-run performance.

E-Government as Enabler of Good Governance via Corruption Control: Influence of Political Regimes

Designated as a "Best Paper" for TIM

Author: **Prakrit Silal**; Doctoral Student at IIM Calcutta

Author: **DEBASHIS SAHA**; Indian Institute of Management Calcutta

Good Governance, due to its close association with some of the Sustainable Development Goals (SDGs) concerning poverty, good health, well-being, inequalities, strong institutions, and economic growth, has the potential to solve some of the global challenges confronting humankind. However, attaining Good Governance continues to remain a challenge across countries. Acknowledging corruption as one of the major barriers to Good Governance, we explore the role of E- Government in controlling corruption and subsequently enabling Good Governance. Drawing from agency theory, rent-seeking theory, and institutional theory, we conceptualize the linkages in the E- Government-Corruption Control-Good Governance relationship. We further explore the influence of political regimes on the relationship between E-Government and Good Governance. Relying on political elasticity theory, we draw a link between the four political regimes and E-Government-Good Governance relationship. Using archival data spanning 153 countries, we first empirically demonstrate that E-Government is an enabler of Good Governance. Then, we show that although hybrid regime fails in utilizing E-Government towards achieving Good governance, interestingly authoritarian regimes are quite effective in using E-Government for Good Governance, while being purposefully selective in their approach. Based on our findings, we propose two frameworks to guide policy-makers in using E-Government for Good Governance attainment.

Does Stock Liquidity Kill Innovation Investment? Evidence from Chinese Listed Firms

Author: **Benlu Hai**; Henan Normal U.

Author: **Junxiao Yang**; Henan Normal U.

Author: **Ximing Yin**; School of Economics and Management Tsinghua U.

Stock liquidity is one crucial financial consideration for investors, which will inevitably affect the equity financing of innovation activities. It is urgent and necessary to investigate the role of stock liquidity on innovation behaviors. Employing the panel datasets that cover 5920 private manufacturing firms listed in China during 2013-2018, we empirically study the impact of stock liquidity on firm innovation investment. Results show that there is a significant inverted U-shaped relationship between stock liquidity and innovation investment, indicating that stock liquidity is a double-edged sword regarding firm innovation. Specifically, the increase of stock liquidity will reduce the cost of stock transactions and attract major shareholders, while active monitoring of major shareholders will promote firm innovation. However, excessive liquidity will increase the pressure on firms to be takeovers, which will lead to short-sighted behavior of firm executives to reduce their investment in long-term innovation activities. Therefore, maintaining moderate stock liquidity could drive firm's innovation, and the excessive stock liquidity could hurt firm's innovation. By bridging the financial market research with firm innovation literature, this study generates crucial empirical evidence for technology innovation management theory and practice.

The Social Value of a Ridesharing Platform: The Case of Uber

Author: **Yongwook Paik**; KAIST College of Business

Author: **Christos Makridis**; MIT Sloan School of Management

Ridesharing has become ubiquitous throughout the United States and a host of academic studies and policy debates pertaining to ridesharing have proliferated to better understand its welfare implications. However, the overall social value of a ridesharing platform is still unclear because prior literature focuses only on the supply-side (i.e., drivers) or the demand-side (i.e., passengers) of the platform when analyzing its welfare effects without taking into account non-users of the digital platform. In this study, we quantify the social value of a ridesharing platform using a hedonic pricing model by exploiting quasi-experimental variation in the staggered entry of UberX into different metropolitan areas between 2010 and 2016. We find that the entry of UberX into a metropolitan area leads to a 2.9% rise in median housing prices per square feet. A back-of-the-envelope calculation suggests that the entry of UberX is associated with a welfare gain of over \$795 million. We also find substantial heterogeneity across geographic locations. Markets with more educated people and with greater dependence on public transportation benefit particularly more after Uber's entry, while markets with higher vehicle ownership benefit notably less.

Is the Gender Gap in Venture Funding Driven by Biased Investors?

Author: **Manar S. Alnamlah**; Copenhagen Business School, Al Imam Mohammad Ibn Saud Islamic U. (IMSIU)

Gender disparity in entrepreneurship and venture capital funding has been documented in many economies across the world. This study aims to unfold whether gender disparity in venture capital funding is driven by discrimination. We conduct a randomized lab-in-the-field experiment in the UK and Europe and examine the behavior of venture capital investors towards female entrepreneurs during the screening stage of funding proposals. We find that male investors display no differential treatment or bias (taste-based discrimination and miscalibrated beliefs) against females. On the contrary, we find evidence of bias among female investors, where they positively discriminate in favor of their own gender. The study findings indicate that female entrepreneurs are not at a disadvantage when evaluated by male investors. Thus, the gender disparity in venture funding is not driven by biased male investors. The findings also suggest that increasing the number of female investors in the venture capital industry would increase females' share of the capital invested and positively contribute to closing the gap.

Adopting 'Place': How an Entrepreneurial Sense of Belonging Can Help Revitalize Communities

Author: **George Redhead**; U. of East Anglia (UEA)

Author: **Zografia Bika**; U. of East Anglia (UEA)

Entrepreneurial activities are strongly influenced by the context in which they occur. It is therefore important to understand the differentiated ways in which this can happen and what the impacts of this are. Whilst there have long been calls to increase research regarding entrepreneurship and context, to date we have seen few significant advances. This paper attempts to address this gap in the literature from the findings of a qualitative case study in Great Yarmouth, a depleted community on the coast of East Anglia, in England. We found that longer years of residence in place need not determine the strength of attachment and entrepreneurial engagement with place; instead, it was in-migrant, rather than locally 'born and bred', entrepreneurs who were willing to 'adopt' the context rather than bridge it by caring for it and engaging in socio-

by acting as a role model. Using data from the Global Entrepreneurship Research Network (GERN), we estimate the relative value of a match using Fox (2018) model and find that the Female-Female (where both mentor and founder are female) matches benefit more from the role-model aspect of the mentor-founder relationship, compared to Male-Male (where both the mentor and founder are male) matches. We also find that amongst all matches, Male-Male matches have the highest probability of receiving high funding, indicating that these founders gain more from the career development aspect.

Labour Market Changes in the Digital Era: UK Women and the Shift to Part-Time Self-Employment (WITHDRAWN)

Author: **Angela Martinez Dy**; Loughborough U.

Author: **Dilani Jayawarna**; U. of Liverpool

Author: **Susan Marlow**; U. of Birmingham, U.K

Existing research often obscures women's self-employment activity by considering the self-employed as a homogenous group. This paper sheds light upon the conditions under which UK women create and do business in the contemporary digital era by investigating surprisingly dissimilar patterns of self-employment participation for women and men. In particular, it focuses upon dramatic growth in the category of home-based, flexible self-employment, in which women's participation features highly. Using Office for National Statistics Labour Force Survey data, we use probit modelling techniques to explore employment modes, self-employment types, and work arrangements amongst different groups. We find that whilst the overall rate of self-employment in the UK is growing, women as a cohort are responsible for such growth. Rates of male and White British self-employment are falling, and part-time activity, particularly amongst BME women, is driving the overall increase. We explain these shifts by considering the persistent effects of gender and race structures on economic opportunities, and explore the implications of our findings for issues of policy and sustainability. The paper thus provides a theoretical and empirical foundation from which to examine how and why women's self-employment

economic practices towards the benefit of the community. Our middle-range theoretical contribution 'the entrepreneurial adoption of place' provides a non-binary mechanism of understanding entrepreneurial engagement with deprived places and enables a more integrated context-mechanism-outcome framework for researching everyday entrepreneurship in different contexts.

Entrepreneurial Intention and Gender: The Role of Psychopathy in Overcoming Gender Role Expectations

Author: **Joshua Victor White**; U. of Alabama, Tuscaloosa

Author: **Louis Marino**; U. of Alabama

This study examines the moderating effect of psychopathy on the relationship between gender and entrepreneurial intentions. Psychopathy is an antisocial personality trait that enables individuals to overcome social norms associated with gender and work roles. We employ role-congruity theory and a two-study approach with distinct samples in two countries, the United States and Russia, to test whether non-institutionalized levels of psychopathy increase intentions across both genders. Findings from both studies support our hypotheses that gender differentially influences entrepreneurial intentions, with men reporting higher entrepreneurial intentions than women. However, we find that psychopathy moderates this relationship, but more so in women. We offer future research directions and practical implications regarding the role of dark traits on promoting entrepreneurial intentions and activities.

National Culture and its Impact on Entrepreneurial Teams: A Gendered Perspective

Author: **Susana Correia Santos**; Rowan U.; ISCTE-IUL

Author: **Xaver Neumeier**; U. of North Carolina, Wilmington

Conducting resource combination activities can help new ventures act resourcefully and spark firm growth. Drawing on the effectuation theory and the theory of the growth of the firm, this study introduces entrepreneurs' decision-making logic as the mediators to address the question of how this logic guides firm-level resource activities and benefits new venture growth. It will thus explore the mechanism of resource combination activities and new venture growth. Based on the dataset of 250 new ventures in China, this study finds that effectuation plays a positive mediated role in the relationship between resource combination activities and new venture growth, while causation plays a negative mediated role. Furthermore, results also show that entrepreneurs' characteristics affect the mediated effect of causation and effectuation. Specifically, female and/or older entrepreneurs enhance the positive effect of effectuation, while male and/or younger entrepreneurs weaken the negative effect of causation.

Scaling Capabilities: How Entrepreneurial Firms Use Scaffolding to Enable Rapid Growth

Author: **Charlene E. Zietsma**; Penn State U.

Author: **Danielle Logue**; U. of Technology, Sydney

Author: **Farzad Haider Alvi**; Athabasca U.

Author: **Anna Elise Roberts**; Pennsylvania State U.

Significant prior research on entrepreneurial firm growth has examined how much firms grow, with surprisingly far less examination of how firms grow. In this article we examine how entrepreneurial organizations transform themselves to enable rapid growth. We identify four scaling capabilities: sensing misalignments, seizing resources, re(configuring) scaffolding and stabilizing scaffolding, that enable organizations to transform themselves recursively during periods of growth. From our findings, we produce a process model showing the emergence and development of scaling capabilities as organizations expand their capacity. In so doing, we contribute to both the entrepreneurial growth literature in detailing internal transformation processes for growth, and the dynamic capabilities literature in unpacking the 'black box' of scaling capability development.

Grounded in gender stereotype activation theory, this study examines how cultural perceptions towards women entrepreneurs affect team processes, namely team reflexivity and consequently the team's resources. We test our hypotheses combining data from 64 entrepreneurial teams comprised of members from different countries with measures of national culture from the Global Entrepreneurship Monitor. Results show that the proportion of women in a team is positively related to the team's resources via the mediating effect of team reflexivity. However, the effect of the proportion of women in a team on team reflexivity and, ultimately, on a team's resources, is stronger when team members are from countries with a more favorable national perception of women's entrepreneurship. These findings provide evidence for framing the quality of team processes as contingent to the interaction between the proportion of women in a team and national culture towards female's entrepreneurship and contribute to the literature on women entrepreneurship, entrepreneurial teams and culture.

What Holds a Regional Cluster Together in its Inmost Folds?

Author: **Elisabeth Mueller**; U. of Passau

Author: **Stefanie Fuchs**; U. of Passau

Working across companies in regional clusters has become a common practice, but research on the socio-psychological processes that bind cluster actors is surprisingly rare. This study investigates what holds regional clusters together in their inmost folds. We combine research on social identity theory and organizational citizenship behavior with cluster research, advancing knowledge on identification processes and citizenship behavior in regional clusters. Results from a survey of cluster actors in a sensor technology cluster in Germany show that not all antecedents of identification, found to be significant in the organizational context, are important for the cluster actors' identification with the cluster. While cluster distinctiveness, visible cluster affiliation, and group formation factors are relevant, cluster prestige, inter- and intra-cluster

Speed and Scaling: An Investigation of the Acceleration of Firm Growth

Author: **Maksim Belitski**; U. of Reading

Author: **Tatiana Romanova Stettler**; Kent State U.

Author: **William John Wales**; U. at Albany, State U. of New York

Author: **Jeffrey A. Martin**; U. of Alabama, Tuscaloosa

Most firms do not grow, while a small number of firms not only maintain their growth but are able to accelerate it over time. Researchers, practitioners and policymakers continue to question what factors facilitate or indicate that a firm has a greater chance to grow more rapidly and become a more powerful economic driver. Using a robust longitudinal dataset from the United Kingdom (UK) during 2000–2017, we investigate the propensity of firms to accelerate in sales, employment, labor productivity and relative market share growth. We find that firm, industry and regional level factors help explain whether organizations become scale-ups and achieve accelerated firm growth. This study adds new insights into the conceptual models available to policymakers and firm managers so that they can better understand the key factors of firm growth acceleration. In doing so, this study paves the way for further investigations into the speed of firm growth.

How Firms Grow? Contextual Factors as Determinants of Growth Mode Selection

Author: **Pubuduni Malika Jeewandara**; Queensland U. of Technology

Author: **Stephen D. Cox**; QUT Business School

Understanding firm growth has long been a key goal in entrepreneurship research. However, despite decades of research on determinants of how much firms grow, little is known about how firms grow, i.e., the different modes of firm growth (Dosi, Grazzi, Moschella, Pisano, & Tamagni, 2019; McKelvie & Wiklund, 2010; Wright & Stigliani, 2013). To date,

competition are not. Results also emphasize the importance of cluster identification for cluster actors' willingness to exhibit citizenship behavior, as well as the significance of these behaviors as predictors of cluster sustainability.

The Interplay of Conditions that Affect the Social Entrepreneurs' Organizational Mission

Author: **Marlies Koers**; U. of Groningen Centre for Entrepreneurship, The Netherlands

Author: **Aard J. Groen**; U. of Groningen center of entrepreneurship

Author: **Paula Danskin Englis**; Berry College

Our research investigates the interplay of the conditions producing either a dominant social, economic, or hybrid mission type. We examine how the mission of 133 (nascent) social entrepreneurs is affected by the interplay of various conditions. The objective of this paper is to accumulate more knowledge about the configuration of conditions associated with a focus on social entrepreneurs' social, economic, or hybrid mission and to determine whether and how they interact. Our research addresses whether and how personal unmet needs, entrepreneurial experience, social innovation, and attention paid to the social and economic objectives are sufficient to produce entrepreneurial mission types for social enterprises. In doing so, we do not only examine the conditions that converge, but also distinguish between the ways they affect each mission type. We use a configurational approach and a fuzzy set qualitative comparative analysis (FsQca) to explore different combinations of conditions with a dominant focus on the organization's social, economic, or hybrid mission as an outcome. Our findings show that all the entrepreneurs in our sample were hybrid social entrepreneurs, whose social and economic mission is not a dichotomy, but an interweaving of each other resulting in a blend with different mission nuances, best illustrated by 'sliders' that move on the continuum. Based on our findings we developed a typology which shows that the social and economic missions actually work together and that all enterprises are a hybrid form. By linking the various conditions to the social entrepreneurs'

firm growth studies have not examined the effect of contextual factors on growth modes, the central propositions of Penrose's theory of the growth of the firm (Davidsson, 2004; Penrose, 1959/1995). This is both theoretically interesting and practically troubling. From a theoretical perspective, distinguishing between the impacts of organic vs. acquisition-based growth modes is crucial to determining the aggregate-level employment contributions of growing firms. From a practical perspective, research on this important topic has been hampered because data sets in most countries cannot distinguish between organic and acquisition-based growth. Therefore, our study uses a special Swedish dataset to develop theoretical understanding and empirical evidence to show how two internal factors (firm age and firm size) and three external factors (industry, location and macroeconomic condition) influence the proportion extent to which growing firms' expansion is achieved through organic and acquisition-based growth modes, respectively.

mission, we gained a better understanding of the design features required to organize these different mission types. Our findings are specifically useful for entrepreneurship support by providing insights into the difference in the perceived importance of the organization's social and economic missions and how different conditions affect the mission subsequently. Moreover, these insights contribute to our understanding of the configurational approach's merits for social entrepreneurship research.

Passion 2 (session 1637)

New Ventures Fighting the Talent War: The Impact of Entrepreneurs' Passion on Applicant Attraction

Designated as a "Best Paper" for ENT

Author: **Silvia Stroe**; Politecnico di Milano School of Management

Author: **Evila Piva**; Politecnico di Milano

Talented employees are a crucial resource for new ventures, but attracting them to these firms is extremely difficult. Entrepreneurs likely play a prominent role in applicant attraction to their ventures; nonetheless this role has been under investigated. The present work advances our understanding of entrepreneurs' contribution to applicant attraction by exploring the effect of a salient characteristic of entrepreneurs, i.e. passion.

ENT

Social Entrepreneurship: Opportunity and Start-Up (session 1634)

An Alternative Perspective on Social Opportunity Identification and New Social Venture Ideation

Author: **Lauren Atkinson Zettel**; U. of Louisville

One fundamental concept at the heart of entrepreneurship research is that of the opportunity, or in the case of social entrepreneurship, the social opportunity. Although attempts at defining the process of social opportunity identification have been made, the explanatory power of these models was found to be lacking. Recognizing that the study of commercial entrepreneurial opportunities has experienced some of the same 'growing pains', I turn to three

We both theorize on the mechanisms through which entrepreneurs' passion affects applicant attraction to new ventures and empirically check the impact of passion. Our analyses reveal that the passion entrepreneurs display while presenting their ventures' offering to applicants has an inverted U-shaped direct effect on applicant attraction. Displayed passion has also an indirect effect; when entrepreneurs display greater passion, applicants perceive their ventures' offerings as more innovative, irrespectively of the actual innovativeness, and this increases attraction.

Relating Passion to Entrepreneurial Effort, Self-Efficacy, and Performance: A Meta-Analysis

Author: **Hao Zhao**; Rensselaer Polytechnic Institute
Author: **Qinglin Liu**; Rensselaer Polytechnic Institute
Author: **Dongge Zhou**; Rensselaer Polytechnic Institute

Entrepreneurial passion is becoming a hot research topic, and we perform a comprehensive meta-analysis based on 51 independent samples (N= 21,808) to synthesize empirical evidence and test a theoretical model. Our results show that entrepreneurial passion is related to entrepreneurial self-efficacy, effort, and performance, respectively. The structural equation modeling results show that entrepreneurial passion's relationship with performance is mediated by entrepreneurial self-efficacy and entrepreneurial effort in that sequence. We also took a closer look at a widely used entrepreneurial passion measure developed by Cardon and colleagues (2013), and found tentative yet non-conclusive evidence that it has larger effect sizes than a previous measure of work passion developed by Vallerand and colleagues (2003). When scholars deviate from this measure's usage guidelines (e.g., by combining passion scores across domains, or by not multiplying the identity centrality score with the feeling score), the effect sizes do not seem to drop. We discuss the implications of our work and ideas for future research.

[view paper \(if available\)](#)

well-known paradigms in that literature stream that have offered promising insights into the process of opportunity identification or development. Drawing on and integrating these models, I attempt to develop a framework for social opportunity identification, and I further incorporate additional elements that are salient and unique to the study of social opportunities and social venturing. The outcome is a framework that overcomes the dichotomization of social opportunities into 'creation' and 'discovery' opportunities, and allows for propositions to be developed about the process of new social venture ideation and the types of new social venture ideas that arise from the process. Several propositions are offered which demonstrate the model's functionality, and possibilities for future work and extensions are also offered.

Organizing for Hybridity: The Role of Self-Interest Motivations in Social Venture Creation

Author: **Alexandra Mittermaier**; TUM School of Management, Technische U. München
Author: **Holger Patzelt**; TUM School of Management, Technische U. München

Prior research has emphasized entrepreneurs' prosocial motivation as a trigger for social entrepreneurial action. However, social entrepreneurs also possess self-interest motivations which can impact new social venture creation and the organizing for hybridity with regard to social and economic logics. We report on the findings of an inductive study drawing on interviews with 52 nascent social entrepreneurs and secondary data to explore their motivation and organizing for hybridity. First, we identify specific types of self-interest motivations. Second, we develop a process model of how these self-interest motivations manifest in distinct venture missions that lead to dynamic hybrid organizing. We provide a novel understanding of (1) the role of self-interest motivations in social venture creation, (2) the interplay of individual motivations and venture-level outcomes, and (3) the dynamic development of social ventures' hybrid organizing.

The Impact of Emotion Regulation and Team Emotions on Leader Emergence in Nascent Venture Teams (WITHDRAWN)

Author: **Charlotta Agneta Siren**; U. of Queensland

Author: **Fang He**; ETH Zurich

Author: **Henrik Wesemann**; U. of St. Gallen

Author: **Zoe Jonassen**; ETH Zürich

Author: **Dietmar Grichnik**; U. of St. Gallen

Author: **Georg von Krogh**; ETH Zurich

This study advances a theory of how different aspects of emotion regulation influence individual leader emergence in the intensely emotional context of nascent venture teams. Despite the growing amount of research on the role of leadership in the entrepreneurial process, the emergence of leaders in nascent venture teams has rarely been explored. Drawing on theories and research on leadership emergence and emotion regulation, we argue that the two aspects of emotion regulation (i.e., reappraisal and suppression) exert opposite effects on the degree to which nascent venture team members come to perceive an individual as a leader. We also theorize that team emotions arising from affective events moderate the relationship between reappraisal and leader emergence in such teams. Data from 103 nascent venture teams without prior leaders show a negative relationship between individuals' trait disposition to suppress emotions and their emergence as leaders, and a positive relationship between their trait disposition to reappraise emotions and their emergence as leaders. Moreover, we find that negative team emotions magnify the positive association between reappraisal and leader emergence, while positive team emotions mitigate it. We discuss the implications of our findings for the literature on entrepreneurial leadership, entrepreneurial emotions, and leadership in general.

What's Holding Back Recovery from Failure? Insights from Entrepreneurial Passion and Coping Strategy

Author: **Yajie Li**; Shanghai U.

Social Entrepreneurship, Startup External Financing, and Societal Stereotypes

Author: **Agnieszka Kwapisz**; Montana State U.

Author: **Diana Maria Hechavarría**; U. of South Florida

In the nascent entrepreneurial context, firm and owner characteristics are often the main factors that lenders use to evaluate potential borrowers. Using the societal stereotypes perspective, the double hurdle estimation approach, and a nationally representative sample of U.S. nascent entrepreneurs' data, we find that social entrepreneurs receive less external financing than their counterparts. However, we find evidence that social entrepreneurs that have more startup and managerial experience are more likely to receive external funding. Also, nascent social entrepreneurs with startup experience receive larger amounts of external investment than their counterparts.

Social Entrepreneurial Intentions - A Thematic Analysis

Author: **Tamanash Ghosh**; LM Thapar School of Management Thapar U. Patiala (Punjab) India

Author: **Karminder Jit Singh**; LM TSM Thapar U.

The field of Social Entrepreneurial Intention (SEI) is evolving as an area of research and enquiry. A total of 43 papers have examined the influence of different variables on the formation of social entrepreneurial intentions (SEIs) from 2008 to 2019. However, a proper systematization seems to be still lacking, which calls for accumulating the currently available literature in the form of an organized thematic framework. The purposes of this paper are first to collate different variables influencing the formation of SEIs and then to develop homogeneous clusters that organize these variables under specific themes. To undertake that firstly, a systematic literature review of 43 articles specific to SEIs from seven different research databases and Google Scholar was conducted. Subsequently, thematic analysis was performed, which resulted in

Author: **Yida Tao**; Shanghai U.

What will affect corporate entrepreneurs to recover from project failure? This study theorizes that entrepreneurial passion before failure has influence on recovery from project failure. Drawing on the Dualistic Model of Passion, this study explores the relationships between dualistic entrepreneurial passions (harmonious and obsessive passion) and recovery from project failure, mediated by coping strategies (active and avoidance coping strategy). Using two-staged survey data from 257 project managers who had experienced project failure, we find that harmonious passion has positive effects on failure recovery, but obsessive passion has negative effects on failure recovery. Our results further reveal a set of pathways that active and avoidance coping strategies mediate the relationship between dualistic entrepreneurial passions and recovery from project failure, with results indicating that harmonious passion facilitates recovery from project failure through enhancing active coping strategy and reducing avoidance coping strategy, but obsessive passion hinders recovery from project failure through increasing avoidance coping strategy. This study has substantial implications for literature of failure recovery by giving attention to the affective antecedents before failure.

LMX: Pride and Proteges (session 429)

LMXSC and Paradoxical Coworker-Directed Behaviors: A Dual-Path Mediation Model Involving Pride

Designated as a "Best Paper" for OB

Author: **Benjamin Korman**; Rotterdam School of Management, Erasmus U.

Author: **Christian Troester**; Kühne Logistics U.

Author: **Steffen R. Giessner**; Rotterdam School of Management, Erasmus U.

We investigate the pride reactions and coworker-directed behaviors of employees with high leader-member exchange social comparison (LMXSC). An experimental vignette and a time-lagged field study across three time points provide robust support for our theory that LMXSC (i.e. the perception of having a better relationship with one's leader relative to the relationships fellow coworkers have with the leader) triggers feelings of hubristic and authentic pride in employees. Hubristic pride, in turn, promotes coworker-directed undermining while authentic pride promotes interpersonal citizenship behavior. Together, our studies demonstrate why and how LMXSC can have positive and negative effects on employees' coworker-directed behavior.

The Relation between Mentor-Protégé LMX Disagreement and Protégés' Turnover Intentions

OB Division Best Dissertation-Based Paper Award, sponsored by Wiley-Blackwell on behalf of the Journal of Organizational Behavior

Author: **Patrick Tinguely**; ETH Zurich

Author: **Fang He**; ETH Zurich

Author: **Shiko M. Ben-Menahem**; ETH Zurich

Author: **Georg von Krogh**; ETH Zurich

Voluntary employee turnover is of strategic importance for knowledge-intensive firms. Most of those firms have established mentoring programs devoted to providing protégés with psychosocial and career development support. Hence, the quality of relationships with mentors has a crucial impact on protégés' intentions to leave the organization. This paper develops a fresh theoretical perspective that explains how and why one vital aspect of mentoring—mentor-protégé disagreement on relationship quality—affects turnover intentions over time. Drawing on the conservation of resources and leader-member exchange theories, we argue that growth in mentor-protégé disagreement positively affects increases in protégés' turnover intentions. Our analysis of longitudinal data from a four-wave survey in a professional service firm supports this dynamic hypothesis. We also find that surface-level dissimilarity (in gender, but not age) positively relates to initial mentor-protégé disagreement, whereas deep-level dissimilarity (in future focus, but not present focus) positively relates to growth in mentor-protégé disagreement. Our study contributes to the literature on employee turnover by building theory and testing the extent to which mentoring represents a force embedding employees in their organization.

Enduring Effects of Nationalistic Ideology on Strategy Formation Process: The Case of Nippon Gakki

Finalist for the OMT Division Best International Paper Award

Designated as a "Best Paper" for OMT

Author: **Yusaku Takeda**; Harvard Business School

The enduring effect of the intense ideological experience of key organizational actors—top executives—on their subsequent strategic decisions is explored through a longitudinal archival case study of Nippon Gakki Ltd. (present-day Yamaha Corporation), a Japanese musical instrument manufacturer that pursued the motorcycle industry in the 1950s. An intense nationalistic ideology during WWII imprinted future top executives of Nippon Gakki, who, in the Post-WWII era, sought to expand their businesses driven by their imperative to pursue national prosperity and prestige. The ideology influenced three dimensions—organizational identity, organizational memory, and values—affecting managerial cognition and facilitated breaking out of their prior strategic frame to enable Nippon Gakki to explore a wide variety of strategic options unfettered by its extant product classes, industry affiliations, and technological competency. These findings invite further studies of the effects of political ideology on managerial cognition, their organizational mechanisms, and the managerial use of nationalistic ideologies.

Multivocality and Calculability in Field Emergence: The Case of Impact Investing in Spain

Designated as a "Best Paper" for OMT

Author: **Guillermo Casanovas**; ESADE Business School

Author: **Lisa K. Hehenberger**; ESADE Business School
Author: **Kyriaki Papageorgiou**; ESADE Business & Law School

Interstitial issue fields offer important opportunities for collaboration across sectors, but they also pose significant challenges because field members come with diverse and often opposed value systems and evaluative criteria. Recent research has shown that multivocality can enable collaboration in such contexts, as it promotes coordination without the need for consensus. We explore these issues in the context of the emergence of impact investing in Spain, where we have carried out a field-level study based on interviews and continued participant observation, with especial emphasis on the case of social impact bonds. We find that multivocality is indeed relevant in the process of field emergence, but that it is through its interplay with calculability – reaching consensus over new calculative practices – that field members acquire new roles and responsibilities. We hence contribute to the literature on field emergence by showing the complementarity between multivocality and calculability, and to the literature on impact investing by suggesting how impact measurement and social impact bonds can drive significant changes in actors' roles and accountability.

Virtue Transfer: Shedding Core-Stigma in the Canadian Wild Fur Industry

Finalist for OMT Division Best Paper on Environmental and Social Practices Award

Designated as a “Best Paper” for OMT

Author: **Johnny Boghossian**; FSA ULaval (Laval U.)

Author: **Jose Carlos Marques**; Telfer School of Management, U. of Ottawa

This paper contributes to the stigma management literature by examining the viability of stigma-challenge strategies in mature, harm-based industries – contexts characterized by intense public scrutiny and threats to the continued survival of the category. Drawing on a case study of the Canadian wild fur industry's response to anti-fur activism and a possible ban on its products, we show how such intense core- stigmas may be managed via collective action. Based on our findings we develop the concept of virtue transfer to describe a stigma-challenge mechanism whereby a virtuous identity – the positive attributes of a sub-group – is effectively transferred onto an entire industry category, in order to counter core-stigma.

When Do Predictions Become Performative? Evidence from Simulation Technologies in Urban Planning

Finalist for the OMT Division Best Student Paper Award

Designated as a “Best Paper” for OMT

Author: **Virginia Leavell**; UC Santa Barbara

This paper details a set of mechanisms that led to a novel conception of a precursor to performativity. We do so by drawing on data conducted through a year-long ethnography of urban planning processes in two major metropolitan regions in the United States. The urban planners that we studied employed a computer-based simulation technology specifically designed to make predictions that would facilitate long-term regional plans based on theoretical models of land use and transportation. We theorize that people must believe that a prediction is real for it to enable a performative cycle. We follow this theorizing to show how people come to their beliefs about predictions. When people experience predictions through simulations as granular and immersive they treat them as real. Immersiveness and granularity are not inherent properties of simulation, but rather they are constructed as organizations make decisions about structuring and the behavior of actors inside

them. .

Social Norms in Organizations: An Expansive View of Conformity and Deviance in the Workplace (session 432)

Norms are ubiquitous in organizations (Dannals & Miller, 2017a). Injunctive norms (how people ought to behave) and descriptive norms (how most people actually behave) are powerful influences on employee decision making, perceptions, and behavior (Cialdini, Reno & Kallgren, 1990). Research on social norms has burgeoned in the past decade, illuminating myriad organizationally-relevant findings. This symposium aims to deepen scholarship on the myriad ways in which norms influence employee perceptions and behavior in the workplace. Employing a combination of methods, the papers in this symposium examine a host of salient questions surrounding social norms and norms violations at work, with specific attention to normative influences on honesty, trustworthiness, moral behavior, rule-breaking, and leadership perception.

Data and Privacy Issues (session 434)

Corporate Data Governance: Are Data Subjects Investors?

Designated as a "Best Paper" for SIM

Author: **Tae Wan Kim**; Carnegie Mellon U. - Tepper School of Business

Author: **JooHo Lee**; Pepperdine U.

Author: **Joseph Xu**; Carnegie Mellon U. - Tepper School of Business

Author: **Bryan Routledge**; Carnegie Mellon U. - Tepper School of Business

This is a paper that explores the status of data subjects in the era of data capitalism. A data subject is a person whose personal data is being collected, held, or processed by data collectors or processors (e.g., Amazon, Google, or Facebook). Data-driven companies rely on data subjects offering personal information for training algorithms for services. In this article, we maintain that it is time to seriously investigate whether data subjects can be considered as investors. In what follows, first, we preview our thesis, followed by a functional definition of an investor. Then, we develop our argument that data subjects are better understood as investors rather than consumers or labor providers by examining the balance sheet impact of a data contribution to the data firm and the existing legal regime requiring data subjects to retain an ownership interest in their data even after it has been transferred to the data firm.

Networked Surveillance for Good? A Perception Study on Blockchain-Based Supply Chain Transparency.

Author: **Mario Schultz**; U. della Svizzera Italiana

Author: **Peter Seele**; USI Lugano

The purpose of this study is to investigate the controversial Janus-face of surveillance in the form of distributed ledger technology (DLT) and blockchain-based product identifiers within the Swiss luxury watch industry. We propose the concept of "networked surveillance," as a form of supply chain transparency, to address the currently under-researched novelty of DLT within the luxury watch context. In this exploratory study, an inductive approach to collecting and analyzing data is applied to gain insights into luxury watch experts' perceptions of the disruptive potential of DLT, against the background of current industry trends and challenges. The findings from a survey and in-depth expert interviews indicate salient industry challenges, along with four major themes that are characteristic for ongoing industry transformations: (1) new, younger consumer generations are becoming increasingly important; (2) higher standards with respect to quality, as well as ethical and sustainable product attributes are demanded; (3) personalization beyond the physical product is moving center stage, along with (4) digitalization and innovation. Building on these findings, the offered contribution highlights networked surveillance as a concept for digital transparency that goes beyond dichotomies of the surveillance concept. Networked surveillance can thereby inform an ethical luxury industry, with benefits of learning and control in three key areas: 1) black markets and counterfeits, (2) CSR standards and supply chains, (3) and personalization beyond physical products, toward virtual luxury identities. Keywords: Networked surveillance, Janus-faced, distributed ledger technology, ethical luxury, supply chain transparency, Swiss luxury watch industry, inductive study

The Ethics of Consumer Health Wearables: Convergence of Bioethics and Value Sensitive Design

Author: **Michele L. Thornton**; SUNY Oswego

Author: **William F. Martin**; DePaul U.

Consumer health wearables (CHWs) hold the promise to transform our lives and health outcomes exponentially. With a rapid expansion of users, the potential benefits of CHWs do not eliminate the need to consider ethical concerns surrounding their design, distribution, and adoption. Ethical implications include confusing privacy policies, the traceability of collected data, and potential harm to vulnerable populations. Despite all these concerns, regulations are sparse and ethical guidelines for the design and application of CHWs do not exist. We propose a grounded ethical framework that explores the threats of exponential utilization and growth of the CHW market to guide developers and the organizations that will use them in the ethical aspects of CHWs throughout their product life cycle. This model first uses the common bioethical principles to characterize risks and then incorporates the foundations of Value Sensitive Design as a strategy to alleviate negative impacts on users, particularly vulnerable populations and marginalized groups.

Setting the Expectations Right: Reassessing the Power of GDPR in Protecting Online Users' Privacy

Author: **Obaid Amjad**; U. Ramon Llull, ESADE Business School

Author: **David Murillo**; ESADE

Privacy violations against online users in the digital sphere are becoming increasingly salient and concerning. In a bid to protect its citizens, the European Union (EU) has implemented what has been called a ground-breaking public data protection measure – the General Data Protection Regulation (GDPR). In this article, we aim to analyze the GDPR through the lens of the social contracts theory perspective of privacy to analyze its potential and limitations in protecting online users from four major privacy controversies – namely ubiquitous data collection, misuses of data, as well as the lack of transparency and accountability of data collecting and processing entities. Furthermore, we discuss the role that the social contracts theory can play in encouraging a more dynamic, rather than static, understanding of privacy in the online sphere as well as its implications for the discussion on data ownership.

"Smile and Please Hide Your Sickness": The Role of Emotions and Sickness Surface Acting in a Present

Designated as a "Best Paper" for OB

Author: **Ana Catarina De Almeida Correia Leal**; Instituto U. de Lisboa (ISCTE-IUL), Business Research Unit (BRU-IUL)

Author: **Aristides Isidoro Ferreira**; ISCTE - Instituto U. de Lisboa

Author: **Helena Carvalho**; ISCTE - Instituto U. de Lisboa

The study of emotional labor and presenteeism climates in the hospitality industry is crucial due to nowadays context of economic uncertainty and the ambient of insecurity, that forces employees to continue to show up for work despite being sick. The aim of this research was exploring the effects of two antecedents of surface acting on hotel employees' burnout levels. Moreover, we introduced sickness surface acting – the voluntary effort to suppress illness symptoms or to fake a healthy health status - as a new construct to explain the relation between presenteeism climate and burnout. A total of 166 employees from Portuguese hotel chains completed a 5-day diary survey. From these, 58 reported at least one day working while being ill. Study 1 results showed that surface acting mediated the relationship between both anger and presenteeism climate and burnout. Study 2 revealed that, for sick employees, sickness surface acting mediated the relationship between presenteeism climate and burnout. These findings highlight the importance of policies creation to reduce and manage anger and presenteeism climates negative consequences, as well inform human resources managers of the negative impacts of "service with a smile" and sickness presenteeism in the hotel industry.

SYMPOSIUM

Author: **Jamie L. Gloor**; U. of Exeter Business School
Author: **Susanne Helena Braun**; Durham U.

Perceptions of others' work-family conflict (WFC) have typically been studied as a top-down phenomenon grounded in gender role theory. This work has consistently revealed negative career consequences for followers whom leaders judge to have higher WFC, particularly female followers. However, we know less about the conditions under which those lower in organizational hierarchies (e.g., followers) notice and respond to leaders' WFC, if these perceptions might be stronger for male leaders, and if these perceptions predict behavioral outcomes. Integrating insights from expectancy violation and social exchange theories, we propose that followers perceive more leader WFC when leaders work longer hours, have more family ties (i.e., a partner and young children), and are male. Furthermore, we propose that followers respond to male leaders' WFC positively—with extra effort at work—because family care expectations are traditionally lower for fathers than for mothers, and higher WFC for fathers is a positively violated gender stereotype. Results from a field study and two experiments largely support our predictions. This research highlights a new form of “fatherhood bonus” wherein leaders' ostensibly negative state-WFC—elicits positive behavioral effects in the form of extra effort from their followers/lower-level evaluators, particularly for male leaders.

The Disruptive Nature of Triggers in Psychological Contracts

Designated as a “Best Paper” for OB

Author: **Hermien Wiechers**; VU Amsterdam

Author: **Jacqueline A-M. Coyle-Shapiro**; London School of Economics

Author: **Xander Lub**; Nyenrode Business U.

Author: **Steven Ten Have**; VU Amsterdam

Psychological contracts are dynamic as employees deliberately shape, manage, and change their psychological contract. Triggers jolt employees' awareness to the contract terms, disrupting the ongoing routine. They mark the moment in the flow of stimuli, that attention is activated, signaling

personally relevant events within the employment relationship that necessitates attention, with the potential to create disruption in the psychological contract. Little is known about the nature and consequences of these triggers. To address this, we explore different triggers, their impact on the psychological contract and their frequency of occurrence as a way of capturing dynamism in psychological contracts. Over 600 triggers were reported from 117 lecturers using a (daily) diary study over six weeks in five universities. We then applied a concept mapping method with the input of independent researchers (performing the sorting task: $n = 33$) and stakeholders (performing the rating task: $n = 77$) in seven universities to analyze the nature of the reported triggers. We systematically classified positive (e.g., social support of colleague or having the ability or skills to act effectively in a working situation) and negative triggers (e.g., lack of recognition or perceptions of unfairness) and their impact on the psychological contract. This resulted in a taxonomy of 14 clusters that advance understanding of how and when messages and events may ultimately lead to disruption in ongoing exchange relationships. This perspective offers new insights into psychological contracts as dynamic processes and offers employers alternative modes for addressing, handling and managing psychological contract disruptions.

Competitive Strategy and Heterogeneity (session 437)

Race to the Top: Collective Reputation Crisis and Firm Certification Behavior

Designated as a "Best Paper" for STR

Author: **Yanying Chen**; Dalian U. of Technology

Author: **Liang Ping**; Srate

Author: **Feng Liang**; Western Kentucky U.

Firms use certification programs to improve operation efficiency and product quality, to advertise to customers, and to respond to market pressure. The number and frequency of certifications obtained should be a rational choice to maximize firm long-term profitability. However, when its reputation is threatened by an industry-wide

scandal, a firm may be distorted toward over-certification to compensate for the collapse of the regular reputation mechanism based on consumer demand and market transactions. This study constructs a theoretical model on firm certification behavior during collective reputation crisis and uses China's dairy industry after the baby formula scandal to conduct empirical test. We find that the collective reputation crisis has increased firms' incentive to obtain certification, and this effect is stronger for high-quality firms than for low-quality firms, even though under normal circumstances these high-quality firms don't need to deploy these certificates. Moreover, after exhausting industry-relevant certifications, the race to certificate expanded to weakly relevant or irrelevant certificates. This over-certification, however, didn't lead to improvement of product quality and transformation of the affected industry. Instead, the increase in certification cost offset the increase in sales growth and hurt firm profitability. This study provides insights on the mechanism through which collective reputation crisis impact firm certification behavior and welfare outcome, and offers implications for practitioners and policy makers to avoid collective reputation crisis and improve certification mechanism.

Smaller Slices of a Growing Pie: The Effects of Entry in Platform Markets

Designated as a "Best Paper" for STR

Author: **Oren Reshef**; Washington U. in St. Louis, Olin Business School

The entry of firms into a platform has an ambiguous effect on the profitability of incumbent firms' operating on the platform: While entry increases competitive pressure on incumbents, supply-side expansion may attract new consumers---effectively increasing total platform size and presumably benefiting all firms. Guided by a simple model, this paper explores how firm entry affects incumbents' outcomes in a two-sided market. Specifically, I focus on Yelp Transactions Platform, an online platform that connects consumers with local services. I study a quasi-exogenous increase in firms on the platform and exploit geographic variation to employ a difference-in-differences research design. I find that, on average, market expansion favors incumbents, though the average effect masks substantial heterogeneities: High-quality incumbent firms experience a positive effect, whereas low-quality firms perform unambiguously worse. Moreover, the relative magnitudes of these forces relate non-monotonically to platform maturity and size. These findings suggest that incumbent firms operating in platform settings will experience benefits and detriments from firm entry that vary dependent on the incumbents' and platform's characteristics.

Market Frictions and Competitive Positions: Lessons from the Mobile Telecommunications Market

Designated as a "Best Paper" for STR

Author: **Niloofar Abolfathi**; National U. of Singapore

Author: **Simone Santamaria**; National U. of Singapore

Author: **Charles Williams**; Bocconi U.

This study explores how multi-segment and single-segment competitive positions within an industry are affected by changes in market frictions. A multi-segment position can create value for customers in the form of flexibility to change between service configurations without the need to switch providers. Customers can start with the basic version of a service, then switch to a more advanced version as their preferences evolve. Such a value creation mechanism is effective only in the presence of high costs of switching from one provider to another. Thus, when switching costs fall, multi-segment firms will experience a larger penalty than single-segment ones.

Value Creation and Capture in Platform Business Models: An Information-Theoretic Perspective

Designated as a “Best Paper” for STR

Author: **Anparasan Mahalingam**; Purdue U.

Author: **Richard Makadok**; Purdue U., West Lafayette

Platform-based business models create economic value largely by lubricating longstanding frictions in markets. Our theoretical model considers three classic information-economics frictions – namely, coordination costs, search costs and transaction costs – and examines how synergies among the capabilities for solving these three problems can help platform businesses create competitive advantage over rival platforms or non-platform substitutes. As an extension, we consider how privacy concerns of users can reduce or even reverse these synergies.

Middle Management Experiences with Change: Implications for Consulting

Designated as a "Best Paper" for MC

Author: **Tricia P. Riedl**; Benedictine U.

Author: **Therese F. Yaeger**; Benedictine U.

Author: **Peter Sorensen**; Benedictine U.

Author: **Bryan McCusker**; Management Consultant

Today's environment is one of continuous, complex change, and has been found to be perceived by middle management as excessive (Falkenberg, Stensaker, Meyer, & Haueng, 2005). The goal of this research was to discover the conditions in which middle managers functioned during times of strategic initiative implementation. This discovery was approached through the words of the middle managers, as the manager is the interpreter and implementer of these strategic initiatives. Further, managers are highly involved in the human aspect of implementation and execution. This humanness was the perspective from which this research was approached. A qualitative study of existing data was undertaken involving secondary data retrieved from publicly available sources—doctoral dissertations. Library resources provided 23 rigorous and appropriate dissertations dated from 1999-2008. Each contained managerial data with verbatim quotes from managers involving strategic change. A grounded theory methodology was selected as most appropriate for theme generation. The iterative process for establishing the data set of quotations, including the thought process for developing the descriptive labels, sub-codes, and themes is outlined. Subsequently, the five higher-level themes of collaboration, human factors, internal discontinuity, situational awareness, and time arose as the conditions around which the core concept coalesced—the middle manager's ability to execute. Execution could not be separated out as a discrete theme; it crossed boundaries with the higher-level themes found, and as such, execution developed as the core, overarching concept within this data. Consultant opportunities during strategic change are discussed, to broaden our sight for collaborative opportunities.

Author: **Irina Boboschko**; U. of Cologne, Department of Media and Technology Management

Author: **Laurece Delcontee Abraham**; Academy of Management

Author: **Lifei Liu**; Shanghai SUIBE U.

This case study examined how a Chinese Japanese manufacturing company's communication problem between departments and the failure of the Corporate Information Systems (CIS), such as the ERP SAP or APQP, were

eased through the implementation of social media. Data was collected from top Chinese management team. Social media is, in fact, perceived to provide a higher level of support than CIS for boundary spanners, supporting the theory of power within Bourdieu's practice theory. This research offers practical implications to enhance a corporate informational infrastructure that not only combines social media and corporate information systems, but, spans the entire enterprise communication needs. Findings suggest that the social media WeChat was perceived to be the preferred technological support for all types of boundary spanners activities.

Community Sourced Research: A Watershed Ecosystem Approach to Management Research and Practice

Designated as a "Best Paper" for MC

Author: **Mariano Garrido-Lopez**; Western Carolina U.

Author: **Yue Cai Hillon**; Western Carolina U.

Author: **Mark Hillon**; Lafayette Institute

Defining, measuring, and actually creating impact with the world beyond academic stakeholders is an elusive objective for management scholarship. The value of a management degree has declined and other options to the business school are emerging. Confronting these challenges, we explore some of our field's internal barriers to practical impact from management education and research in a broader search for answerability. Evidence from practice reveals that there are viable alternatives to irrelevance, but change will require critical reflexive deconstruction and a break with tradition.

A Consultation in Workplace Incivility: The Deadly Inappropriate Smile

Designated as a "Best Paper" for MC

Author: **Alan Goldman**; Arizona State U.

A deadly inappropriate smile is the focus in a consultation prompted by a public conflict between a heart surgeon and a patient's spouse. Following a failed heart-surgery the surgeon delivers the devastating news of the patient's death with a broad smile on his face. Outraged and deeply offended the wife of the deceased aggressively vows to pursue formal grievances and a medical malpractice suit against the surgeon and the medical corporation. Concerned over the workplace incivility charges and the potential for damage to stellar professional reputations and the brand - HR and the executive board retains an external consultant. The consultant utilizes executive coaching, negotiations and conflict resolution in an effort to provide alternatives to litigation. The consultant unmaskes unexpected cross-cultural origins of the deadly inappropriate smile. An innovative negotiation method transforms adversaries into allies.

Organizational Hierarchies and Dynamics of Power (session 439)

Interrogating the Toilet as a Seat of Power and Privilege

Designated as a "Best Paper" for CMS

Author: **Ghazal Zulfiqar**; Lahore U. of Management Sciences

Author: **Ajnesh Prasad**; CMS Division Co-Chair Elect

In this article, we study the nexus between privilege and inequality. To do so, we conducted a set of exercises with students at an elite private business school in Pakistan with the intention of invoking reflexivity. We asked students of affluent backgrounds to consider how they relate to toilet cleaners—those untouchables doing the most culturally denigrated of work in Pakistani society. Through this study, we sought to answer two questions. First, we wanted to understand how privilege is discursively enacted by constituents of the elite class through the imbricated processes by which they make sense of self and other. Second, we wanted to investigate the possibilities of reflexivity to interrupt, or otherwise negate, the reified cultural assumption of privilege. On the latter point, we set out to determine whether reflexivity would prompt students of the elite class to problematize their own privilege. By juxtaposing these two questions against the toilet as the empirical location, we illuminate the subversive power of the knowledge produced at the most marginal of sites.

Doing Violence: Suffering Bodies in a Refugee Arrival Centre

Best Critical paper sponsored by the journal Organization.

Designated as a "Best Paper" for CMS

Author: **Philipp Arnold**; European Uni Viadrina, Frankfurt (Oder)

Author: **Jana Costas**; European Uni Viadrina, Frankfurt (Oder)

This paper draws on ethnographic research of private security forces in a German first arrival centre for refugees and asylum seekers to explore how non-private actors engage in practices of violence. Despite a lack of a distinct legal framework, private security forces were mobilized by the facilities management and state authorities to enforce house rules and formal regulations around the asylum process violently, if necessary. Drawing on Popitz (1999) notion of the interplay of the bodies capacity to harm and its simultaneous vulnerability to harm to analytically capture violence, this study illuminates how violence is done situationally, contrasting the rather abstract view on violence in the extant literature. We analyse how violence was normalized through an interplay of signalling and engaging in violence and how private security forces adjusted their practices of violence in relation to the legal circumstances, thus establishing a form of violent control that aimed at what we have termed suffering bodies, in cooperation with management and authorities.

Bumpy Rides: Sweating to Clean Occupational Taint in Dirty Platform Work

Designated as a "Best Paper" for CMS

Author: **Claire Le Breton**; EMLYON Business School

Author: **David Sanson**; EMLYON Business School

This ethnographic paper aims at unpacking the role of workers' social background in their response to identity threats. Especially, it brings together literatures on platform work and on dirty work to examine how French food-delivery couriers shield from occupational taint. This paper focuses on the middle-class, educated individuals, who have to cope not only with the taint specific to their dirty activity, but also with a low social status linked to their unexpected underclass occupation. The findings show that couriers craft an elitist aspirational identity standard based on moral and corporeal attributes, hence essentializing the image of worthy courier. To cope with the gap between their high-status projections and tainted activities, informants strive to distinguish from individuals who differ from this desired identity. Afraid of social demotion, they develop an aspirational identity standard that excludes otherness, hence strengthening the atomization of an heterogeneous low skilled platform crowd.

On Ableism and Anthropocentrism: A Canine Perspective on the Workplace Inclusion of Disabled People

Designated as a "Best Paper" for CMS

Author: **Eline Jammaers**; U. Catholique de Louvain

Although scholars have to some extent examined how disabled people become Othered in organizational settings through language, space and practice, and similar analyses have appeared with regard to animals, no analysis so far has focused on the potential double marginalization that takes place when disabled people come to work with their service dog. In filling this void, this paper acknowledges the role socio-materiality plays in creating a social order in which humans and able-bodied people are privileged over non-humans and disabled people. This study documents the in/exclusion of service dogs in the workplace and how it serves as a proxy for the dis/enablement of the owners with mobility and visual impairments, taking a spatial, discursive and affective form. In this way, inclusion and exclusion become materialized through spatial arrangements and artefacts, words and signs, and embodied, emotional performances. Contributions are made towards the literatures on ableism and anthropocentrism in the workplace by illustrating the embodied entanglement of human-dog in the daily organization of work.

Divergent Perspectives on Diversity and Inclusion: Reconceptualizing & Advancing Black Scholarship

Best Critical Management Learning and Education Paper is sponsored by the journal Management Learning

Author: **Penelope Muzanenhamo**; U. College Dublin, Smurfit

Author: **Rashedur Chowdhury**; U. of Southampton

Why does diversity and inclusion scholarship remain silent on epistemic injustice? This article demonstrates that a culture of wilful blindness embedded in historically racist academic structures breeds inequalities in knowledge production and dissemination that disenfranchises black scholars and denies them contribution to dominant discourse. Reflecting on the experiences of black academics in diverse disciplines, we conceptualize black scholarship as underpinned by epistemic struggle and epistemic survival, due to subjugation to epistemic injustice. We conceptualize epistemic struggle as striving to produce and disseminate knowledge in the face of difficulties and resistance generated by structural and agential power. Epistemic survival denotes the sustained presence of black scholarship through compromise, collusion and radicalism, within an academia founded on

the ideology of white supremacy. We argue that black scholarship struggles for survival not only for the sake of emancipating and integrating people of color, but also with the goal to bridge deep epistemic divisions. In reimagining black scholarship through the lenses of epistemic injustice, we aim to embed the concept into theoretical debates on diversity and inclusion in order to inform management practices in a nuanced way.

Advanced Technology and Creative Magic: How Technology Use Shapes the Creativity-Innovation Process (session 440)

Today more than ever, the use of technology is a daily experience for creative workers and inventors all over the world. While we know much about how technology shapes creative and innovative outcomes, we know less about how technology use shapes the creativity-innovation process. When faced with a new technology, creators and inventors have to navigate many tensions and puzzles, and how they do it is likely to change both the creative process and the way the technology is applied to it. The way individuals make sense of new technologies, decide whether or not to interact with them, and apply them to their innovative efforts has thus the potential to significantly shape the creative process and the innovation journey. As a consequence, a deeper, multidisciplinary look at the process of technology use is warranted in order to understand when the use of advanced technologies results in “creative magic”, and when instead they disrupt innovators’ efforts rather than helping them. This symposium includes four empirical papers focusing on these issues, either trying to understand how individuals and collectives make sense of new technologies entering their creative processes or whether and why they decide to apply new technologies in their work.

Formal Modeling in the Resource Based View (session 442)

This symposium presents formal models at the forefront of RBV research, covering a wide range of phenomena and modeling techniques, including game theory, stochastic processes, real options, and value-based strategy. Though the RBV (resource based view) is one of the core theories in the management field, its largely verbal nature has made it vulnerable to several fundamental critiques pertaining its logical structure. Formal models are the ideal method to alleviate such critiques as they provide rigorous and internally consistent descriptions in unambiguous mathematical language. Over the past years there has been a rise in formal modeling research published in leading management journals, and this symposium provides an overview of the most recent developments.

Strategic Entrepreneurship (session 441)

Is CEO Turnover Sensitive to Firm Performance? An Informativeness Perspective

Designated as a "Best Paper" for STR

Author: **Qian Gu**; Georgia State U.

Author: **Wei Shen**; Arizona State U.

Author: **Lin-Hua Lu**; National Taipei U. of Technology

This study advances an informativeness perspective to contribute to the understanding of how the sensitivity of CEO turnover to firm performance changes over the course of CEO tenure. The extant literature primarily suggests that the sensitivity of CEO turnover to firm performance weakens over time during a CEO's tenure and attributes this change to the power shift in the CEO-board relationship. Supplementing this dominant power perspective, we suggest that the attributability, informativeness, and impact of firm performance in boards' assessment of CEOs change during the early, mid-, and later stage of CEO tenure, even when there is no power shift in the CEO-board relationship. Using a sample of family-controlled firms in Taiwan from 1999 to 2015, we found that the effect of current firm performance on the turnover of professional CEOs was the strongest during the mid-stage and weaker during both the early and the later stages. These results provide support for our theoretical predictions from the informativeness perspective.

Subsidy Wars for Market Share: When and How Much to Subsidize?

Designated as a "Best Paper" for STR

Author: **Shan YIN**; School of Management, Xi'an Jiaotong U.

Author: **Jun LIN**; School of Management, Xi'an Jiaotong U.

Nownadays, many subsidy wars for market share have broken out among firms, especially in markets

with network effects. Although such subsidy wars are common and costly, there is a lack of research on firm subsidy strategies. We discuss the subsidy competition in a duopoly market where the entrant enters the market by subsidizing consumers, and the incumbent follows by setting its subsidy to maximize its competitive advantage in unit or total subsidy and simultaneously maintain its market dominance. We show that the incumbent can always find an optimal and fixed market point to subsidize when the competitive advantage in unit subsidy is considered. If the competitive advantage in total subsidy is considered, the optimal market point that the incumbent starts to subsidize increases with the entrant's investment. The incumbent cannot keep its advantage in market share with less total subsidy when the total subsidy of the entrant exceeds a threshold. Our results are robust when products are differentiated horizontally and vertically.

Decision Right Allocation and Platform Market Effectiveness: Evidence from Online P2P Lending

Designated as a "Best Paper" for STR

Author: **Anparasan Mahalingam**; Purdue U.

This study proposes that platform owners can mitigate problems of information asymmetry in platform markets and enhance market effectiveness through allocation of key decision rights among participants. We link decision right allocation to the governance role platform owners play, arguing that platforms can orchestrate the participation of complementors through governance design choices. Using a quasi-experimental design in online peer-to-peer (P2P) lending, we show that retaining the pricing right (right to set loan interest rates) with the platform owner increases platform market effectiveness (rate of loan requests being funded by lenders). Furthermore, this effect is strengthened by the financial information available in local environments, highlighting a complementarity between online and offline information in shaping platform market effectiveness.

[view paper \(if available\)](#)

Dual Signals: The Effect of Firm Publications on Venture Capital Financing

Designated as a “Best Paper” for STR

Author: **Yajing Li**; Rice U.

This paper investigates how the firm publications affect their VC financing. With information asymmetry about the quality of entrepreneurial ventures, investors are influenced by the signal of firm publications. However, firm publication can be a positive signal for the in-depth scientific knowledge and can be a negative signal for the knowledge leakage. Thus, this paper examines the effect of firm publications as “dual signals” in the VC financing context, and I argue that the positive or negative signaling effect of firm publications depends on the focal signal characteristics (journal quality) and other relevant signals (firm patent). When journal quality is high, publications are unambiguously positive signals to VC investors, and firm patents have a substitute effect with firm publications in top journals on the VC financing. However, publications in non-top journals send ambiguous signals, and firm patents would influence the sensemaking process of investors. Specifically, firms with more publications in non-top journals are perceived positively to VCs when firms do not have patents, but such publications would be a negative signal when firms have patents. Using the sample of around 1000 US biotech and pharmaceutical firms founded after 1980, findings support all the hypotheses.

Trust Between Individuals and Organizations (session 443)

Trust is a fundamental characteristic of organizational relationships and one of the most frequently studied concepts in management research today. This annual PDW is aimed at advancing research on trust by serving as a platform for scholars to discuss critical issues, engage in dialogue, and help further research-in-progress. The workshop consists of three segments: (1) The first segment starts off with a panel discussion, in which leading scholars share their thought-provoking ideas on this year's focal topic of "trust and control"; (2) For the second segment, attendees break into roundtables to discuss various relevant issues in current trust research. Each table will start out with a particular topic but may move on to other issues as the discussion unfolds. Topics may include (but are not limited to): trust asymmetries, trust violation and recovery, trust in teams, trust in interorganizational relationships, trust across levels of analysis, trust in networks, trust dynamics, and trust and contracts; (3) The third segment consists of a paper development workshop, in which the facilitators provide in-depth feedback on work-in-progress trust research previously submitted by workshop participants. These papers should be in an advanced developmental stage, targeted at a scholarly management journal, and no more than 40 double-spaced pages in length.

The Management Field in Light of the Climate Crisis: What Changes Do We Have to Make? (session 444)

Despite knowing for at least half a century that the unfolding climate and attendant ecological crises would be inevitable given "business as usual", the broad field of management has been ineffective in helping society avoid or effectively prepare for them. In this symposium, panelists will discuss specific changes to the field necessary for us to meaningfully help address humanity's most dire challenge: keeping the planet habitable. Panelists will address the question from their own perspectives and areas of expertise, and may discuss changes across different dimensions of the management field, including: scholarly inquiry, education, outreach to practitioners, and the structure of the field. The key parameter of the discussion is that the changes must match the scope and breadth of the crisis, its finality, and the very short time window we have to address it.

PNP Best Paper Session 1 (session 445)

The Effects of Mafia Infiltration on Public Procurement Performance

Designated as a "Best Paper" for PNP

Author: **Diego Ravenda**; TBS Business School

Author: **Michele Giuranno**; U. of Salento

Author: **Maika Valencia-Silva**; EAE Business School

Author: **Josep M. Argiles-Bosch**; U. of Barcelona

Author: **Josep García-Blandón**; U. Ramón Llull, IQS School of Management

We examine the effects of Mafia infiltration on public procurement performance based on a sample of 68,063 public work contracts (PWC) awarded by Italian municipalities over the period 2012-2017, of which 687 are identified as Mafia-infiltrated either because of being awarded by municipal councils subsequently dissolved due to Mafia infiltration or because of being won by Mafia-owned firms. Our results reveal that Mafia infiltration is positively associated with number of submitted bids, awarding rebates and execution cost overruns, whereas it is negatively associated with delivery delays for PWC. The effect of Mafia infiltration on execution cost overruns and the probability of their occurrence is weaker for larger PWC and the elections of the new municipal councils, after the dissolution of the previous ones, do not significantly influence the performance of PWC. Our findings suggest the presence of collusive schemes among bidding firms within the Mafia network and provide new insights for the implementation of more sound policies to tackle practices associated with Mafia infiltration in public procurement.

Two Studies on a Nomological Network of Public Employee Accountability

Designated as a "Best Paper" for PNP

Author: **Yousueng Han**; Yonsei U.

Author: **Peter J. Robertson**; U. of Southern California

While the field of public management has long emphasized the importance of holding public employees accountable for their actions, our understanding of how best to do so has been hindered by a dearth of empirical research on this topic. Recent literature has called for more examination of individual subjective experiences of being accountable – employee accountability – in order to research how macro accountability systems make a difference to individuals. To validate the employee accountability construct in the public domain, we collect data from two separate samples using a multidimensional scale to measure public employee accountability. We analyze these data to explore the nomological network of public employee accountability by assessing its relationship with both a logical antecedent and expected outcomes. Based on findings that validate the nomological network, we discuss how this research contributes to the literature on accountability and possible directions for future research.

Bureaucratic Red Tape: A Bibliometric and Meta-Analytic Study

Designated as a "Best Paper" for PNP

Author: **Janne Kalucza**; U. of Hamburg

Author: **Fabian Hattke**; U. of Hamburg

Red tape is one of public administration research's defining topics and has amassed a considerable amount of publications. This paper analyses 60 years of red tape research as reflected in articles published in journals listed in the SSCI Database. It combines bibliometric and meta-analytic methods to identify major academic debates and to elaborate on the most important correlates of red tape. Our results indicate that public management is at the core of red tape scholarship, but applications include a variety of disciplines, among them health care and economics. The analysis reveals that red tape negatively relates to beneficial attitudes and behaviours (e.g., job satisfaction and employee commitment) while it fosters detrimental attitudes and behaviours (e.g., negative affect and employee turnover). However, some of the evidence on red tape's correlates is sparse (alienation, deviance, trust) or contradictory, for example with regard to performance. We conclude by outlining a research agenda for red tape theory and measurement.
